Whiting Ranch Wilderness Park is located approximately one mile to the west and is separated from the subject property by the intervening Portola Hills development. As a designated regional wilderness park in the County's General Plan Recreation Element, the 1,557 acre Whiting Ranch Wilderness Park is intended to preserve the natural environment in a primitive unaltered state, conserving the parks natural resources for the future scientific benefit and enjoyment of area

residents. Primary activities include hiking, mountain bicycling, and horseback riding.

Cleveland National Forest

The Cleveland National Forest, encompassing over 450,000 acres, and extending from Orange County south to near the Mexican border, is located north of the project site. Land within the Cleveland National Forest is governed by the U.S. Forest Service who are responsible for the administration of the forest's adopted Land and Resource Management Plan. Plan goals are to provide and maintain biological variety, manage wildlife habitats to maintain viable populations of all existing native vertebrate species, and assure aesthetic values. Recreational opportunities are primarily focused on hiking.

Regional Bikeways

The proposed project abuts the Aliso Creek Bikeway, a regional Class I bikeway that begins in Aliso-Wood Canyons Regional Park and continues northerly along Aliso Creek. The bikeway enters the project vicinity from the west at the existing El Toro Road trail/bikeway underscrossing, and continues northerly, east of El Toro Road, just outside the project boundary (see Exhibits 7 and 63). The bikeway will need to remain open during construction of the subject project. If an interim route is needed, PF&RD, Harbors, Beaches and Parks must review the reroute plan before it is implemented.

Regional Riding and Hiking Trails

The proposed project includes a portion of the Live Oak Canyon Trail and a portion of the Aliso Creek Trail. Both of these are regional riding and hiking trails (see Exhibits 7 and 63). Riding and hiking trails are intended for use by equestrians, bicyclists, and pedestrians (walking, hiking, and jogging).

The Aliso Creek Trail begins in Aliso-Wood Canyons Regional Park and generally follows the same route as the Aliso Creek Bikeway, continuing northerly, east of El Toro Road, within the project boundary.

The Live Oak Canyon Trail traverses the southwestern section of the project site. Live Oak Canyon Trail is an existing and popular regional trail.

The proposed project will be providing access to the Orange County Regional Riding and Hiking Trail System, which currently includes 348 miles of existing and proposed trails throughout the region. Regional hiking and riding trails are intended for use by equestrian, pedestrian (walking, hiking, and jogging), and bicycling depending on the trail surface and its designated use The project will have access to two components of this trail system, the Aliso Creek Regional Ridding and Hiking Trail (#19) and the Live Oak Canyon Trail (#2). Existing and proposed trails are shown in Exhibit 63.

The Aliso Creek Trail commences east of Laguna Beach and proceeds northeast parallel to El Toro Road adjacent to the subject property. The trail continues past the project site to one mile north of Cook's Corner, where it becomes the Santiago Creek Regional Trail. The Class I El Toro Road Bikeway is adjacent to this trail. The existing onsite trail, which traverses the project site/St. Michael's Abbey boundary is a transferable easement and can be utilized to connect onsite open space areas to the Aliso Creek Trail.

The Live Oak Canyon Trail commences inside the main entrance to O'Neill Regional park west of the Arroyo Trabuco Trail. The trail travels in a northwest direction along a paved park road until it breaks off in a northeast direction along a dirt path. The trail continues heading north to a park summit-vista. On the downward slope, the trail continues northerly to just south of the Ramakrishna Monastery, there it turns westward and extends up the ridgeline through Hidden Ranch (residential tract south of the subject property) until it meets El Toro Raod. At El Toro Road, the trail then travels north adjacent to the western project site boundary until it reaches the Aliso Creek Trail underpass, about ½ mile downstream from Cook's's Corner.

4.10.2 EFFECTS FOUND TO BE INSIGNIFICANT

Potential impact to regional recreational facilities generated by the proposed project are not anticipated to be significant. Adverse impact to recreational facilities in general, and passive parks and wilderness areas in particular, stems primarily from over use by the public. Over use generates a host of problems including habitat disruption (animals avoiding the area due to high human presence), habitat destruction (due to trampling, fire, vandalism), air quality impacts, noise impacts, and loss of solitude. Population generation estimates contained in the County's Recreation Element indicate that the proposed project may increase the number of area residents by approximately 2.57 persons per household or 1,812 persons for the entire project. This population increase will only generate an incidental increase in the use of nearby regional recreation facilities and no significant negative impact is anticipated.

RE: Foothill/Trabuco Specific Plan

N

Exhibit 63
Regional Parks and Trails

4.10.3 PROJECT IMPACTS

A primary goal in the County's Recreation Element is to provide adequate local park sites to meet the recreation needs of existing and future residents and preserve the natural resources within unincorporated Orange County. To comply with this goal the County acquires park land by requiring residential developers to provide a minimum of 2.5 net useable acres for every prospective 1,000 residents. Based on the projected population, local park requirements would total approximately 4.0 acres.[12]

The project is proposing the construction of eight (8) private local park facilities. The nearest facility containing playground equipment is the Portola Hills Elementary School located approximately 3/4 of a mile west of the site. Playground equipment is also found near the entrance to O'Neill Park located over two miles southeast of the subject property.

Mitigation of project-related local park impacts may be provided by the payment of local park fees as required by the Orange County Department of Harbors, Beaches and Parks. County regulations permit the payment of fees in lieu of actual on site park construction, allowing for the construction and maintenance of local parks at other more appropriate locations.

Although the current project is not proposing to improve the view park site and connecting trail, the project is proposing the construction of other regional recreational facilities which may mitigate this omission. As previously indicated, the applicant will be providing on site relocation and connection to the Aliso Creek Regional Riding and Hiking Trail. Provision of these recreational trail improvements in conjunction with required park fees, will provide mitigation for the lack of onsite park facilities.

Impact Significance Criteria

The effects of a project on recreation are considered to be significant if the project will result in the following:

- The demand generated by the project meets or exceeds the capacity of existing park lands, bicycle trails and hiking trails, or otherwise requires their expansion or requires the construction of major new facilities.

---

12 *Memo, Chief, EMA/HBP PF&R/Harbors Beaches & Parks Division, Planning and Acquisition - 11/13/95.*

- The project will cause permanent removal or relocation of existing recreational trails, parks or other facilities in the area.

- The project would be in conflict with existing or planned recreational uses in the project area of effect.

4.10.4 SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the proposed project, prior to mitigation, would result in significant impacts to existing local public park demand. This impact however will be reduced by the provision of eight (8) private park sites.

4.10.5 CUMULATIVE IMPACTS

The proposed project will increase area population by approximately 1,812 persons which will contribute to the cumulative impact on local and regional recreational facilities. This potential impact is considered incidental given the overall increase of recreational facilities to be provided by other regional development and is not considered significant.

4.10.6 MITIGATION MEASURES

Project Design Features

PDF 10-1 The Live Oak and Aliso Creek riding and hiking trail shall be located on the Project Site as shown in Exhibit 7 and Exhibit 63 Site Plan.

PDF 10-2 Live Oak Canyon Trail shall be constructed onsite, ultimately connecting O'Neil Regional Park to the Aliso Creek riding and hiking trail, as shown in Exhibit 7, Site Plan.

PDF 10-3 Eight onsite private parks shall be constructed as shown on Exhibit 7 Site Plan, to offset project demand.

Standard County Conditions and Mitigation Measures

SC 10-4 The developer or his assigns and successors in interest shall maintain offered park

site(s) until such time as the County or its designer accepts the offer of dedication, all in a manner of meeting the approval of the Manager, PF&R/Harbors Beaches & Parks Division.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations:

AM 10-5 Prior to first building occupancy, the applicant shall pay all park mitigation as required by the Department Manager, PF&R/Harbors Beaches & Parks Division.

AM 10-6 Prior to final building occupancy the applicant shall dedicate and construct all required regional trail connections and improvements as approved and required by the Department Manager, PF&R/Harbors Beaches & Parks Division.

4.10.7 UNAVOIDABLE ADVERSE IMPACTS

No significant unavoidable adverse impacts to recreation are anticipated with the proposed project with the incorporation of the recommended mitigation measures.

4.11 HAZARDS

4.11.1 EXISTING ENVIRONMENTAL SETTING

Wildfire

A number of natural hazards are inherent in the area of interface between the man made and natural environment which may potentially effect the proposed project. Among these are increased risk from wildfire both to the built and natural environments. Wildfire is a naturally reoccurring part of the ecosystem, periodically burning off old dead growth to allow for a rejuvenation of fresh growth in the recently burned area. A significant threat to life and property is a distinct possibility when development encroaches into this environment. The project site and surrounding topography consist of moderate to steep grass and shrub covered hills interspace with steep sided canyons, typically with riparian habitat along the canyon floor and/or oak woodlands in areas containing sufficient water to support their growth. The project site is located within an area classified by the Orange County Fire

Authority as a high "Special Fire Protection" area due to its combination of natural combustible vegetation, topography, and weather conditions (frequent dry Santa Ana winds), in accordance with California Department of Forestry and Fire Protection (CDF) criteria and State Responsibility Area (SRA) high fire hazard map. The project site is also in the "Special Fire Protection Area" severity zone, as designated by the County of Orange.

Wildlife Interaction

Another possible project related hazard is from the potential increase of contact between wildlife and project residents and their pets. The surrounding wilderness areas are known to contain a high diversity of wildlife including both large and small mammals, birds and insect populations. Of particular concern is the potential conflict between the human environment and the two main top predators of the region, coyotes and mountain lions. Though contact between humans and mountain lions still remain rare, they have occurred previously in this region and the chance for conflict will only increase with more people moving into the area. Contact between project residents and coyotes is a very real possibility since coyotes are typically more numerous in the wild than mountain lions and coyotes are more adaptable to human presence.

Manmade Hazards

In addition to natural hazards, man made hazards also have the potential to effect a development project. With regard to the project site, only two potential man made hazards have been identified. The first is the risk of aircraft accident due to the proximity of the site to the El Toro Marine Corps Air Station (MCAS). The second is due to the remote possibility of flood damage in the event that the proposed water tank, which will be located on the ridgetop northeast of the project site, fails due to earthquake or other structural damage.

No toxic or hazardous materials, or potential sources, have been identified onsite or in the vicinity of the proposed project.

Electromagnetic Fields (EMF)

No high voltage power transmission lines are located in the vicinity of the proposed project, and existing EMF hazards are considered to be low.

4.11.2 EFFECTS FOUND TO BE INSIGNIFICANT

The potential risk from aircraft accident due to use of the El Toro MCAS is considered low and therefore insignificant for this project. The MCAS is located approximately 6.5 miles southwest of the project site. The main aircraft departure corridor crash hazard zone is located approximately 2.5 miles south of the subject property. Aircraft accidents are in general infrequent, and since the site is located 2.5 miles from the take off and landing air corridor, it appears the site will experience minimal risk due to aircraft accident. In addition, the air station is scheduled for closure by 1999, and unless subsequently utilized for commercial or private aircraft use, the risk of aircraft accident generated by this facility is further reduced.

A (1.4 million) gallon water tank will be constructed adjacent to the northeast corner of the project site. This water tank is being provided to ensure that the project has adequate water pressure for everyday use and emergency situations. The risk posed by this tank is due to flooding in the unlikely event of tank failure. Periodic inspection and maintenance by the Trabuco Canyon Water District will ensure the integrity of this structure and potential flood risk from tank failure is considered insignificant.

4.11.3 PROJECT IMPACTS

Impact Significance Criteria

The risks posed to public health and safety are considered to be significant if the project will result in the following:

- Provision of insufficient fire protection measures, and/or design plans inconsistent with the Development/Open Space policies of the LUP (Land Use Plan, Chapter 3M, I-3.35).

- The placement of habitable structures within 1,000 feet of a landfill boundary without monitoring gas migration to the satisfaction of the Local Enforcement Agency (LEA), as specified in Title 14, CC&R 17783.5.

- Exposure of humans to radio frequency (RF) energy that exceeds the standards and guidelines established by the American National Standards Institute (ANSI) or National Council on Radiation Protection and Measurements (NCRP). The Ansi standards are set in the *American National Standard for Safety Levels with Respect to Human Exposure to Radio Frequency*

Electromagnetic Fields, 3 kHz to 300 GHz (ANSI 1992), and are similar to the NCRP maximum personal exposure limits.

4.11.4 SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Wildfire

Due to topography, biology, and weather conditions the project site is located in area classified as a "Special Fire Protection Area" by the Orange County Fire Authority. To help mitigate property damage and risk to project residents in the event of a wildfire in the project vicinity, a number design measures would be incorporated into this project.

First the project site will implement a comprehensive fuel modification program in accordance with County standards. Typically fuel modification consists of a twenty-foot setback zone (Zone A), a minimum of fifty foot irrigated zone (Zone B), with an additional minimum of one hundred feet (100') of brush thinning zone (Zones C and D). Exhibits 64 and 65 illustrate these standards. Manufactured slope and remedial grading areas will be replanted with native low fuel plant species to further reduce the fire risk.

The site is also located ½ mile east of the Portola Hills Fire Station and less than a 30-second flight time from the upper Oso Reservoir, which will be used by OCFA helicopters, and a ten minute flight time to the site from the helicopter station at Fullerton Airport. (Helicopter dispatch is only included in dispatch to Wildland fires not structural fires onsite.) Therefore, during wildfire suppression operations, emergency response times to the subject property are expedite. To ensure fire fighter access to wilderness areas surrounding the site, individual lots around the project perimeter will provide a recorded unobstructed fire access easement through these properties ensuring adequate emergency access to all portions of the project's perimeter. Finally project construction will use alternative fire resistant materials and methods including concrete tile roofs, closed eaves and soffits, double paned/dual glazed windows, and noncombustible exterior building facing. Wet and dry utilities will be located on opposite sides of the street to minimize lane closures during maintenance periods.

Emergency Access

Due to site constraints, only one primary access roadway can be provided to the eastern portion of the site. The provision of only one main access road is of concern since this roadway could become obstructed and impassible in emergency situations creating an impact to public safety. As indicated

on the site plan, primary project access is provided from El Toro Road by the main spine road extending the length of the site, with secondary access via Valley Vista Way in the Hidden Hills tract south of the project site. This roadway design leaves a majority of the proposed lots with one single access point east of Valley Vista Way. In the event that this east access point is blocked or impassible in an emergency situation, residents and emergency personnel have no other all weather access alternatives. As indicated by the OCFA, mitigation of this restricted access may be provided by the proposed fire mitigation features and by providing internal fire sprinklers for the single access lots in the proposed project.

Wildlife Interaction

Conflict between wildlife and project residents and pets is an associated project risk due to the proximity of wild areas to the subject site. As more residential development occurs at the interface with wilderness areas, the potential for increased contact with dangerous wild animals increases. In the past, when development encroached into previously undeveloped areas, the wildlife would move on to new more remote foraging ranges. Unfortunately, due to developmental encroachment which now encircles the remaining wilderness areas, the ability for animals to relocate to new grounds is limited. A number of animal species, particularly coyotes and raccoons have proved particularly adaptable to human presence, foraging and hunting in proximity to residential housing tracts.

EXHIBIT No. 65

4.11.5 CUMULATIVE IMPACTS

Implementation of the proposed project will add to the cumulative encroachment of residential tract development into existing remaining rural and wilderness areas, further reducing the natural foraging habitat area available to area wildlife and increasing the opportunities for human/animal conflict within the interface zone between the built manmade and natural environments.

Project construction within extreme fire risk areas adds to the potential cumulative impact of increased fire frequency and increased property and human loss due to fire events

4.11.6 MITIGATION MEASURES

PDF 11-1 Implement a comprehensive fuel modification program in accordance with Section 27 of Appendix II-A of the 1994 Uniform Fire Code as adopted by County Ordinance 3954 (the Wildland Urban Interface Task Force report was not adopted and is not enforced by the OCFA). Exhibits 9 and 64 illustrate the fuel modification zones and, although adequately described, it should be noted that the distances are horizontal measurements rather than vertical and, therefore, may actually be larger zones as measured vertically up or down a slope (based on topography).

PDF 11-2 Incorporate the use of native, low fuel plant species into the landscape plan for both manufactured slope areas and remedial grading areas where appropriate as approved by the OCFA.

PDF 11-3 Provide for the construction of a water tank off site to ensure adequate on site water supply and OCFA fire flow requirements. The minimum fireflow requirements for this project of 1500 gpm for a minimum of 2 hours at 20 psi residual pressure. This flow must be available 24 hours per day .

PDF 11-4 Wet and dry utilities shall be constructed on opposite sides of the project streets to minimize land closure during maintenance periods.

PDF 11-5 Residential structures shall be constructed of fire-resistant material, including but not limited to, "Class A roof assemblies", closed eaves and offsets, double paned or dual glazed windows. The exterior walls of structures will be constructed of " 1-hour fire resistant materials" and all structures will have fire sprinklers.

PDF 11-6 All residential structures shall be required to have automatic interior fire sprinkler systems.

PDF 11-7 The interface area between residential lots and open space areas within the project boundary shall be wrought iron fenced to minimize intrusion of wildlife into the built portions of the project site.

Standard County Conditions and Mitigation Measures

SC 11-8 Prior to the issuance of any preliminary grading permits, applicant shall request that the Manager, HCA/Environmental Health, determine if vector control measures are necessary. If warranted, such measures shall be conducted by the developer in a manner meeting the approval of the Manager, HCA/Environmental Health.

SC 11-9 Prior to the issuance of any building permits for combustible construction, a letter and plan from the developer shall be submitted stating that water for fire fighting purposes and an all weather fire access road shall be in place before any combustible materials are placed on the site. Said letter shall be approved by the Fire Chief prior to the issuance of any building permits.

SC 11-10 Prior to the issuance of any building permits on those lots determined applicable by the Fire Chief, plans for an automatic fire sprinkler system shall be submitted to and approved by the Fire Chief prior to installation. This system shall be operational prior to the issuance of a certificate of use and occupancy.

SC 11-11 Prior to the issuance of any building permits, the applicant shall submit a detailed letter of intended use for each building to the Fire Chief for review and approval.

SC 11-12 Prior to the issuance of any grading permits, preliminary plans for all street and courts, public or private, shall be submitted to and approved by the Fire Chief. The plans shall include the plan view, sectional view, and indicate the width of the street or court measured flow line to flow line. All proposed fire apparatus turnarounds shall be clearly marked.

SC 11-13 Prior to the issuance of any certificates of use and occupancy, street improvement

plans with fire lanes shown shall be submitted to and approved by the Fire Chief. The plans shall indicate the locations of red curbing and signage, and provide a drawing of the proposed signage with the height, stroke and color of lettering and the contrasting background color.

SC 11-14 Prior to the issuance of any grading permits, construction details for any emergency access gate shall be submitted to and approved by the Fire Chief. Contact the Orange County Fire Department at (714)744-6623 for a copy of the "Guidelines for Fire Department Emergency Access".

SC 11-15 Prior to the issuance of any grading permits, a fuel modification plan and program shall be submitted and approved by the Fire Chief in consultation with the Manger, Environmental and Project Planning Services Division. The Planning and Development Section shall be contacted at 744-0403 for requirements to be met and clearance of this condition. The plan shall indicate the proposed means of achieving an acceptable level of risk to structures by vegetation, include the method (mechanical or hand labor) for removal of flammable vegetation and provide for the planting of drought tolerant fire resistant plants.

SC 11-16 Prior to the issuance of any building permits, the developer shall have completed, under the supervision of the Fire Chief, that portion of the approved fuel modification plan determined to be necessary by the Fire Chief before the introduction of any combustible construction material into the project area.

SC 11-17 Prior to the issuance of any certificates of use and occupancy, the remaining fuel modification shall be installed and completed under the supervision of the Fire Chief. Further, the installed fuel modification shall be established to a degree meeting the approval of the Fire Chief.

4.11.7 UNAVOIDABLE ADVERSE IMPACTS

Due to the proximity of the project to surrounding wilderness areas some contact between the human environment and wildlife is unavoidable, although not considered significant.

4.12 PUBLIC SERVICES

4.12.1 EXISTING ENVIRONMENTAL SETTING

Sheriff

The project is serviced by the Orange County Sheriff-Coroner's Department. The Sheriff's substation is located approximately 17 miles to the southwest at 30331 Crown Valley Parkway in Laguna Niguel. Two to four patrol cars service the area east of I-5, depending on the shift and day of the week.[13] There are currently 186 uniformed deputies assigned to this substation.

The average response time is nine (9) minutes, and varies based on the location of the deputies at the time of the call. Current response times vary from five (5) minutes to fifteen (15) minutes.

Fire

The project site is essentially undeveloped open space. The topography consists of moderately steep grass and shrub covered hillsides. Oak and sycamore woodlands are prevalent along canyon floors. The surrounding area is characterized by clustered residential developments and permanently preserved open space.

The project site is located within the service area of the Orange County Fire Authority (OCFA). OCFA provides fire safety and emergency services to the residents in the area. OCFA maintains a fire station (#42) at 19150 Ridgeline road in Trabuco Canyon approximately one-half mile from the project site and with a projected response time of less than five (5) minutes. The project site is also less than 30 seconds flight time from Upper Oso Reservoir, which can provide water for OCFA helicopters, and a ten minute flight time to the site from the helicopter station at Fullerton Airport. (Helicopter dispatch is only included in dispatch to Wildland fires not structural fires onsite.) Therefore, during wildfire suppression operations, emergency response times to the subject property are expedite.

The Trabuco Canyon Water District maintains a 14-inch water line in El Toro Road. Due to site constraints, the majority of the project site is served by only one access road. A second access road is located south of the project off of Valley Vista Way and is for emergency use only.

---

[13] *Kathryn Douglas, South Operations Division, County of Orange, Sheriff-Coroner Department - 11/10/95.*

Because of the topography, vegetation and climatic conditions, the OCFA has classified the project site to be in the Extreme Fire Hazard Severity Zone.

Education

The project site is located within the Saddleback Valley Unified School District which provides educational services to grades K-12. Existing and planned school enrollment and capacities are shown in Table 32.

Table 32
EXISTING AND PLANNED SCHOOL ENROLLMENT/CAPACITY[14]

Grade Level	School	Spring 1997 Enrollment	Capacity
K-6	Portola Hills Elementary 19422 Saddleback Ranch Rd. Trabuco Canyon	828	Near Capacity
7-8	Rancho Santa Margarita Intermediate 21931 Alma Aldia Rancho Santa Margarita	1,305	Near Capacity
9-12	Mission Viejo High School 25025 Chrisanta Drive Mission Viejo	2,085	—

Portable classroom facilities are currently in use at all of the above outlined district schools.

School Funding

The School Facilities Act (Government Code §65995) was enacted to allow school districts to assess developer fees to help cover the cost of constructing or reconstructing school facilities necessary to accommodate increases in student population. It also set out to limit the amount that local agencies

14 *Telephone conversation, Mary Lou Smith, Facilities Department, SVUSD - 4/2/97*

could require of developers to mitigate the impact of development on school facilities. These fees were never intended to cover the full cost of developing new school facilities. The Green-Hughes School Building Lease-Purchase Bond Law of 1976 was approved by the State Legislature to match the developer fees collected by a school district if the district could demonstrate that, even after collection of fees (currently up to $1.72 per square-foot of assessable for residential uses and $0.27 per square-foot for commercial/industrial uses), additional funding was still needed.

Because of the financial difficulties plaguing the State government and substantial demand for funds from school districts statewide, the State Legislature recently enacted a new program for the financing of new school facilities. Senate Bill No. 1287 (SB 1287) took effect on January 1, 1993, with the intent of diverting the primary financial responsibility for school facilities to the school districts and limiting the role of the State to districts with low assessed valuation, those that have met or exceeded their debt capacities, or those that are unable to supply the expected level of local revenues. In doing so, SB 1287 repealed the funding by the State Allocation Board under the Green-Hughes School Building Lease-Purchase Bond Law. It increased the residential developer fees $1.00 up to $2.72 per square-foot (Government Code §65995.3) and identified the developer fees as the exclusive method of mitigating project-related impacts on school facilities under the California Environmental Quality Act for both administrative and legislative acts (Government Code §65996). SB 1287 also prohibited public agencies from either denying approval of a project on the basis of the adequacy of school facilities of imposing conditions, other than the requirement to pay the developer fees, on the approval of a project for the purpose of providing school facilities.

However, the long-term standing of SB 1287 was dependent upon the results of the November 1993 general election when Proposition 170 (Assembly Constitutional Amendment 6) was voted on throughout the state. This proposition failed to receive a majority of votes and, as a result, school districts lost that ability to collect the additional $1.00 per square-foot of residential space and the districts once again have to rely on the State to provide matching funds for new school construction. The current residential school impact fee is $1.72 per square-foot. Also, public agencies may now impose conditions, in addition to the requirement to pay the developer fees, on the approval of a general plan amendment or zone change for the purpose of mitigating impacts on crowded school districts. Public agencies are still prohibited from denying approval of a project on the basis of the inadequacy of school facilities.

Additional mechanisms available to school districts to fund new school construction include community assessment districts and general obligation bonds to help fund new school construction. Because Proposition 170 was rejected by the majority of voters, State law requires a two-thirds

majority vote to pass either of these measures.

Library

The project lies within the service area of the Orange County Public Library System. The closest library branch is the Rancho Santa Margarita Branch Library at 30902 La Promesa in Rancho Santa Margarita. The Silverado Library is located at 28192 Silverado Canyon Road and could also serve the project site.

Solid Waste

Trash pickup in the vicinity of the project site is provided by Waste Management of Orange County which is contracted by the County of Orange and will be providing trash pickup to the project.

4.12.2 EFFECTS FOUND TO BE INSIGNIFICANT

Sheriff

The Initial Study prepared for the proposed project did not identify any sheriff related effects as insignificant.

Fire

The Initial Study prepared for the proposed project did not identify any fire related effects as insignificant.

Education

The Initial Study prepared for the proposed project did not identify any education related effects as insignificant.

Library

The Initial Study prepared for the proposed project did not identify any library related effects to as insignificant.

Solid Waste

Waste Management of Orange County will be able to provide trash pickup and recycling services for the proposed project. The Integrated Waste Management Department has available landfill space for the proposed project.

4.12.3 PROJECT IMPACTS

Sheriff

The Orange County Sheriff's Department has indicated that it can provide adequate police service to the project area. The new response time varies with the location of the deputies at the time of the call, and range from five (5) to fifteen (15) minutes. Based on an officer/population ratio of 2:1000, three additional officers would be required by the project.

Fire

The project proposes 705 manufactured single family residential dwelling units on 222.23 acres of land that is classified as a High Fire Hazard Severity Zone by the OCFA. A 1.4 million gallon water tank will be constructed in the northeast corner of the project site. This tank will be able to meet the water demand and fire flow requirements for the project (860,000 gallon water supply/540,000 gallon fire flow)[15].

The proposed project is residential community with two points of access (spine road at El Toro Road and Valley Vista Way). Valley Vista Way is proposed as an emergency access only. Portions of the project above Valley Vista Way would be served by only one access, El Toro Road. Emergency medical response to areas above Valley Vista Way could be delayed, if the single point of access is blocked or made impassable.

Education

Implementation of the proposed project would add additional students to an already overcrowded system. Project-related student generation is shown in Table 33.

---

15 *Fire flow based on 1,500 gallon per minute (GPM) for six (6) hours - Page Dougherty, OCFA.*

Table 33
PROJECT-RELATED STUDENT GENERATION

Grade	Units	Student Generation Factor[16]	Student Generation
K-6	705	0.340/du	240
7-8	705	0.065/du	46
9-12	705	0.160 du	113
Total			**399**

As shown, 399 K-12 students would be generated at buildout of the proposed project.

Library

Implementation of the proposed project would result in additional demand for library services in the project area.

The local branches of the Orange County Public Library System will be able to serve the needs of the project's residents. The system has established the following standards for service:

- .2 square feet of library space per capita;
- 1.3 volumes per capita.

Based on an average of 2.57 persons per dwelling unit countywide, the proposed project will increase population by 1,812 persons using the above figures. Development of the proposed project will require approximately 356 square feet of additional library space and approximately 2,314 additional volumes. Currently, according to the County, most Orange County public libraries are within current service guidelines. However, due to County budget constraints, branch libraries vary their hours and reduce services to cut spending. The County also requires participation in the County's Development

[16] *Saddleback Valley Unified School District*

Fee Program for Libraries. Currently the fee is set at $185.00 per dwelling unit.

Solid Waste

The project will have trash and recycling collection services provided by Waste Management of Orange County (WMOC). WMOC will provide storage containers for refuse collection and recycling bins for recyclable materials. Refuse is collected once a week and recyclable materials will be collected every other week. Currently WMOC charges $13.96 per dwelling unit per month. WOC estimates an average of 65 pounds of refuse per month per household unit in unincorporated Orange County. Table 34 shows the estimated solid waste generation for the proposed project.

Table 34
PROJECT-RELATED SOLID WASTE GENERATION

Land Use	# of Units	Generation Factor	Monthly		Annual	
			Lbs.	Tons	Lbs	Tons
Single Family Residential	705	65 lbs/du/mo	45,825	22.91	549,900	274.95

Refuse will be transported by the County run Integrated Waste Management Department to one of two (2) County owned landfills. They are Prima Deshecha, a 1500 acre facility in San Juan Capistrano and Frank Bowerman, a 725 acre facility in Irvine The Integrated Waste Management Department of Orange County runs five (5) landfills in Orange County and they indicate that they will have available landfill capacity for 50 years.

Recyclable materials are transported to Sunset Environmental in Irvine for processing.

Impact Significance Criteria

The effects of the project on public services is considered significant if the project will result in the following:

- The demand for school facilities, police and fire protection, library services, or solid waste facilities meets or exceeds their capacity.

4.12.4 SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Sheriff

The project will have no significant impact on the Orange County Sheriff's Departments ability to provide adequate police services.

Fire

Due to topography, vegetation and climatic conditions, the project site is located in an area classified as a "Special Fire Protection Area" by the OCFA.

Because much of the project would be served by a single access road, the OCFA has expressed concern that public safety could be compromised should this road become blocked or impassable.

Education

Implementation of the proposed project would result in the generation of about 400 additional students into the currently overcrowded Saddleback Valley Unified School District.

Library

The project will not have a significant impact on the Orange County Public Library System's ability to provide services.

Solid Waste

WMOC would be able to provide refuse collection and Integrated Waste management does have landfill space available. There are no significant impacts from the project.

4.12.5 CUMULATIVE IMPACTS

Sheriff

Anticipated countywide growth combined with the project impacts would have a cumulative impact on Sheriff Department services over time.

Fire

The anticipated countywide growth in combination with the project impacts would have a cumulative impact on fire and emergency services in Orange County.

Education

District-wide growth in combination with project-related impacts would result in cumulative impacts to the Saddleback Valley Unified School District.

Library

This project in combination with regional growth would have a cumulative impact on the Orange County Public Library System.

Solid Waste

The Integrated Waste Management Department indicates that landfill space is available for the next 50 years and the project will not have a significant impact on landfill capacity; however, regional development will have a cumulative impact on available landfill space.

4.12.6 MITIGATION MEASURES

Project Design Features

Sheriff

PDF 12-1 The Orange County Sheriff's Department shall be consulted during final project design to minimize security related impacts.

Fire

PDF 12-2 Implement a comprehensive fuel modification program in accordance with the guidelines established by the Wildland Urban Interface Task Force, July 1994, as approved by the Orange County Fire Authority (OCFA).

PDF 12-3 Incorporate the use of native, low fuel plant species into the landscape plan for both manufactured slope areas and remedial grading areas where appropriate as approved by the OCFA.

PDF 12-4 Provide for the construction of a 1.4 million gallon water tank offsite to ensure adequate onsite water supply for water supply and fire flow use.

PDF 12-5 Wet and dry utilities shall be constructed on opposite sides of the project streets to minimize land closure during maintenance periods.

PDF 12-6 Residential structures shall be constructed of fire resistant material, as approved by the OCFA. In addition, no ventilation openings shall be allowed on the side of residential structures facing natural areas.

PDF 12-7 OCFA shall have the ability to enter the property through the secondary access road located off of Valley Vista Way.

Education

No PDF proposed.

Library

PDF 12-8 The developer shall pay any development fees required by the County of Orange Development Fee Program for libraries.

Solid Waste

No PDF proposed.

Standard County Conditions and Mitigation Measures

SC 12-9 Prior to the issuance of building permits, the applicant shall pay development fees for general County facilities if an applicable fee program has been adopted by the Board of Supervisors pursuant to Section 7-9-700 through 7-9-713 of the Codified Ordinances of the County of Orange, and such fee program is in effect at the time of issuance of building permits, all, in a manner meeting the approval of the Manager,

PDS/Environmental and Project Planning Services.

Sheriff

SC 12-10 Prior to the issuance of the first building permit, the project proponent shall enter into an agreement to (a) participate in funding the provision of the Saddleback Sheriff's Station; and (b) fund the provision of patrol and investigator cars needed to serve the project.

Fire

SC 12-11 Prior to the issuance of any certificates of use and occupancy, all onsite fire protection devices, including fire sprinklers, fire hydrants, alarm systems and fire suppression facilities, shall be installed and maintained in good condition by the property owner in a manner meeting the approval of the Fire Chief.

SC 12-12 Prior to issuance of any building permits for combustible construction, a plan from the developer shall be submitted to and approved by the Fire Chief indicating that water for fire fighting purposes and an all weather fire access road shall be in place before any combustible materials are placed on the site.

SC 12-13 Prior to issuance of certificates of use and occupancy, emergency access shall be constructed in a manner meeting the approval of the Fire Chief.

SC 12-14 The approved fuel modification plan shall be installed prior to the issuance of building permits, under the supervision of the Fire Chief, and completed prior to the issuance of any use and occupancy permits. The CC&R's shall contain provision for maintaining the fuel modification zones including the removal of all dead and dying vegetation and the inspection and correction of any deficiencies in the irrigation system three times a year.

SC 12-15 Prior to the issuance of any grading permits, as part of the area plan, a fuel modification plan and program shall be submitted and approved by the Fire Chief. Contact the Wildland Fire Defense Planning Section at 744-0498 for requirements and clearance of this condition. The plan shall indicate the proposed means of achieving an acceptable level of risk to structures by vegetation. Include the method (mechanical or hand labor) for removal of flammable vegetation and the planting of

drought tolerant fire resistant plants.

SC 12-16 Prior to the issuance of any grading permits, the applicant shall submit a list of the quantities of all hazardous, flammable and combustible materials, liquids or gases. These materials shall be classified according to the "Orange county Fire Department Chemical Classification Handout", including a summary sheet listing each hazard class, the total quantity of chemicals stored per class and the total quantity of chemicals used in that class, all in a manner meeting the approval of the Fire Chief.

SC 12-17 Prior to the issuance of any certificate of use or occupancy, all fire hydrants shall have a "Blue Reflective Pavement Marker" indicating its location on the street or drive per the Orange County Fire Authority Standard. On private property these markers are to be maintained in good condition by the homeowners association.

SC 12-18 Prior to the issuance of any building permits, plans for the automatic fire sprinkler system shall be submitted to and approved by the Fire Chief prior to installation. The system shall be operational prior to the issuance of the certificate of use and occupancy.

SC 12-19 Prior to the issuance of any grading permit, street improvement plans with fire lanes shown shall be submitted to and approved by the Fire Chief indicating the locations of red curbing and signage. Provide a drawing of the proposed signage with the height, stroke and color of lettering and the contrasting background color. The CC&R's shall contain a fire lane map, provisions which prohibit parking in the fire lanes, and a method of enforcing fire lane requirements by the homeowners association.

Education

SC 12-21 Prior to the issuance of building permits, the applicant shall pay all applicable school fees required in accordance with State law. Current school impact fees are $1.72 per square-foot of residential.

Solid Waste

SC 12-22 The potential for the proposed project to impact solid waste collection and disposal has been reduced to a level of insignificance through engineering design and

construction techniques. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 12-23 Prior to the issuance of any building permits, a plot plan delineating the capacity, number, and location of all proposed solid waste collection areas shall be submitted to the Manager, HCA/Environmental Health, for review and acceptance. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 12-24 Prior to the approval of a building permit the applicant shall submit a Recycling/Source Reduction Plan to the Manager, PDS/Environmental and Project Planning Services Division, for review and approval. Said plan shall provide a strategy to facilitate compliance with waste diversion levels as mandated by AB 939, and may include elements which demonstrate commitment to a project specific operation, coordination with existing local or regional programs, and the use of recycled materials during and following construction of the project. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 12-25 Prior to the issuance of any certificates of use and occupancy, the applicant shall provide verification that the solid waste plan delineating the capacity, number, and location of all proposed solid waste collection areas, previously reviewed and accepted by the Manager, HCA/Environmental Health, has been implemented/incorporated into the project, in a manner meeting the approval of the Manager, Building Inspection Services Division.

SC 12-26 Prior to the approval of a Site Development Permit the applicant shall submit a Recycling/Source Reduction Plan to the Manager, EMA/Project Planning Division, for review and approval. Said plan shall provide a strategy to facilitate compliance with waste diversion levels as mandated by AB 939, and may include elements which demonstrate commitment to a project specific operation, coordination with existing local or regional programs, and the use of recycled materials during and following construction of the project.

SC 12-27 Prior to the issuance of any certificates of use and occupancy, the applicant shall provide verification that the solid waste plan delineating the capacity, number, and location of all proposed solid waste collection areas, previously reviewed and accepted by the Manager, HCA/Environmental Health, has been implemented/incorporated into the project, in a manner meeting the approval of the Manager, Building Inspection Services Division.

Library No SC mitigation measures proposed.

4.12.7 UNAVOIDABLE ADVERSE IMPACTS

Sheriff

No unavoidable adverse impacts would occur to sheriff services following implementation of all outlined mitigation measures; therefore, cumulative impacts would result.

Fire

No unavoidable adverse impacts from the project regarding OCFA's ability to provide fire and emergency services would occur following implementation of all outlined mitigation measures; therefore, cumulative impacts would result.

Education

No unavoidable adverse impacts would occur to education services following implementation of all outlined mitigation measures; therefore, cumulative impacts would result.

Library

No unavoidable adverse impacts would occur to library services following implementation of all outlined mitigation measures; therefore, cumulative impacts would result.

Solid Waste

No unavoidable adverse impacts would occur to solid waste services following implementation of all outlined mitigation measures; therefore, cumulative impacts would result.

4.13 UTILITIES AND SERVICE SYSTEMS

4.13.1 EXISTING ENVIRONMENTAL SETTING

Water

The project site is located within the service area of the Trabuco Canyon Water District (TCWD). The TCWD maintains a 10-inch and a 14-inch water main along El Toro Road and an 8-inch water main along Live Oak Canyon Road. An existing 12-inch steel water line, serving Tract 12724 at the property's southwest boundary, is a Santa Margarita Water District line. This line is capable of serving the property's building pads below elevation 1,152. However, the property's water system is not permitted to join this SMWD line without prior annexation to SMWD. Water service is not currently provided to the project site.

TCWD's water supply is derived primarily from the Baker Filtration Plan which provides 6 cubic feet per second of untreated water for TCWD use. Alternate water sources are: 1) periodic wells within the district which provide pumped, untreated water; and 2) capacity from the Allen-McCulloch pipeline transported via the Metropolitan Water District of Orange County and the Santa Margarita Water District.

The direct source of water for TCWD's 14-inch ACP water line along El Toro Road is a 63,000 gallon water tank (HWL-1165) located near St. Michael's Abbey at El Toro Road to the north of the property and approximately 200 feet south of the El Toro Road/Live Oak Canyon Road intersection.

Wastewater

The project site is located within the service area of the Trabuco Canyon Water District (TCWD). The TCWD maintain an existing trunk sewer line system which runs as a 15-inch gravity line in El Toro Road near the western project boundary. There is also an existing 8-inch line in Valley Vista Way just south of the project. This gravity line flows to and is connected to the TCWD 15-inch line in El Toro Road.

Sewer capacity in TCWD's system has been guaranteed for this project by means of previous payments made to TCWD through an Assessment District formed to benefit the project. Sewer capacity for over 700 single family dwelling units within sewer facilities downstream of TCWD facilities was previously paid for by the project's former developer.

Project area wastewater is conveyed to the Chiquita Water Reclamation Plan, located south of the project site near Ortega Highway.

The project's wastewater flows south on El Toro Road to a pump station at Santa Margarita Parkway and El Toro Road. It is then pumped east and south under Santa Margarita Parkway, and then gravity flows to the Santa Margarita Water District's (SMWD) Chiquita Water Reclamation Plant located near Ortega Highway.

SMWD's Chiquita Reclamation Plan presently has a total capacity of 6 million gallons daily (MGD) and a daily treatment average of approximately 2.5 MGD during the week. On Sundays the treatment average approaches 3 MGD. During rainy weather 4-5 MGD will be treated, however, such swells in treatment are rare. The plant has an ultimate planned capacity of 21 MGD.

Electricity

The project site is located within the service area of the Southern California Edison Company (SCE). SCE supplies electrical power to the area through an existing 12 kw line extending along Santiago Canyon Road.

Natural Gas

The project site is located within the service area of Southern California Gas Company (SCG). SCG has an existing 6-inch main beneath El Toro Road.

Cable

The project site is located within the service area of Cox Communications, which supplies cable TV service for the area.

Communications

The project site is located within the service area of Pacific Bell, which supplies telephone service for the area.

4.13.2 EFFECTS FOUND TO BE INSIGNIFICANT

Water

The project does not result in the need for new local or regional water distribution facilities. The proposed project is located within the TCWD's service area and they indicate that they will have capacity to serve the site.

Wastewater

TCWD will be able to provide waste water collection services for the proposed project. TCWD indicates that sufficient sewer capacity has been obtained for the property and no new local of regional facilities will need to be constructed.

Electricity

SCE will be able to provide electrical service to the area. The project does not result in the need for new or substantial alterations to existing electrical supply lines.

Natural Gas

SCG Will be able to provide natural gas service for the proposed project. The project will not result in the need for new or substantial alterations to existing natural gas supply lines.

Cable

Cox Communications will be able to supply cable service to the proposed project.

Communications

Pacific Bell will be able to supply telephone service to the proposed project.

4.13.3 PROJECT IMPACTS

Water

TCWD has indicated that the project's water needs can be met. Water demands were estimated using

current Orange County Fire Authority criteria plus current TCWD standard guidelines. TCWD has established the average annual water demand at 450 gallons per dwelling unit (du) per day for residential land uses. Table 35 shows the project-related water demand.

Table 35
PROJECT-RELATED WATER DEMAND

Land Use	#of Units	Generation Factor	Gallons Per Day
Single-Family Residential	705	450 gal/du/day	317,250
Irrigation	69.9 ac	2.5 af/ac/yr	157,900
Total			**475,150**

Water for irrigation has been estimated to require 2.5 acre feet per acre, per year (af/ac/yr). Maximum day demand has been calculated using TCWD's 2.0 multiplier for residential and 2.5 multiplier for irrigation uses.

Since the project will have a single water source it is classified as a "stand alone" zoned water distribution system. Proposed service zones for the project are:

Zone 0	Existing systems at point of connection 865-feet to 1065 feet.
Zone 1	Elevation 1,085 feet to 1,200 feet.
Zone 2	Elevation 1,200 feet to 1,400 feet.
Zone 3	Elevation 1,400 feet to 1,510 feet.

Because of the elevation gain at the project site a booster pump station near the main water line connection is necessary to pump water to a reservoir located just outside the property's northeast tract boundary at pad elevation 1,590 feet. The water tank site was dedicated to TCWD when Tract Map 10092 recorded. In addition, a $904,425 capital improvement charge was paid to the Trabuco Canyon Water District when Tract Map 10692 recorded in 1988. TCWD will construct the water tank concurrent with project development.

Wastewater

TCWD indicates that the project's waste water needs can be met. Most of the project will be served by an 8-inch line which will gravity flow beneath the collector street into the TCWD's 15-inch line

in El Toro Road. The remaining lots in the southwest corner of the project will connect to the 8-inch line in Valley Vista Way and gravity flow into the 15-inch line in El Toro Road.

TCWD has established a discharge factor of 90 gallons per person with 3 persons per unit. Table 36 shows the estimated project-related sewage discharge flow.

Table 36
PROJECT-RELATED WASTEWATER GENERATION

Land Use	# of Lots	Discharge Factor (90 gal/pp @ 3 persons/unit)	Discharge Gallons (per day)
Single Family Residential	705	270 gal/day	190,350

The existing TCWD 15-inch line serving the project has reserved capacity for the project in the amount of approximately 200,000 gallons per day. In addition, a sewer connection fee of $973,528.58 was paid to Trabuco Canyon Water District when the Tract Map recorded in 1988.

Electricity

SCE indicates that the electrical loads of the project are within parameters of the overall projected load growth which SCE is planning to meet.[17] Unless the demand for electrical generating capacity exceeds SCE's estimates, and provided that there are no unexpected outages to major sources of electrical supply, SCE expects to meet the demand for electricity from the project site. SCE's estimates for residential electrical consumption are based on a figure of 700 kilowatt (kwh) hours per dwelling unit (du) per month. Table 37 shows the monthly and yearly project related electrical consumption.

Table 37
PROJECT-RELATED ELECTRICAL CONSUMPTION

Land Use	Number of Units	Generation Factor	Monthly kwh of Electricity	Annual kwh of Electricity
Single-Family Residential	705	700 kwh/month	493,500	5,922,000

[17] *Written communication, Gary Bullard, SCE - 8/23/95.*

Natural Gas

SCG indicates that the project's natural gas needs can be met without major system expansion.

Gas consumption has been estimated by SCG at 1,095 therms per year per single family dwelling unit. Table 38 shows annual project-related natural gas consumption.

Table 38
PROJECT-RELATED NATURAL GAS CONSUMPTION

Land Use	No. of Lots	Generation Factor	Therms Per Year
Single Family Residential	705	1,095 Therms/du/yr	771,975

Note: 1 Therm = 100 cu.ft. of natural gas

Cable

Cox Communications has indicated that it can provide cable service to the area. There will be no charge to the applicant or homeowners to have cable TV services provided to the project site.

Communications

Pacific Bell has indicated that it can provide telephone service to the area. There will be no charge to the applicant or homeowners to have telephone services provided to the project site.

Impact Significance Criteria

The effects of a project on utilities and service systems is considered to be significant if the project will result in the following:

- The demand generated by the project meets or exceeds the capacity of existing, or otherwise requires their expansion, or requires the construction of major new facilities.
- The project's demands for fuel or energy meet or exceed existing supplies, or otherwise cause supply and/or capacity constraints.

- The project's demands exceed the capacity of existing utility systems, or otherwise require the expansion or construction of major new facilities.

- The project causes significant disruption of service.

4.13.4 SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Water

Project implementation would not result in significant impacts on TCWD's ability to provide water service. Due to the elevation change between the water line connection and the reservoir, a booster pump station will be required to provide adequate water supply for the site.

Wastewater

The project will have no significant impacts on TCWD's ability to provide wastewater service to the area.

Electricity

The project will have no significant impacts on SCE's ability to supply electricity to the area.

Natural Gas

The project will have no significant impacts on SCG's ability to provide natural gas service to the area.

Cable

The project will have no significant impact on Cox Communications ability to supply cable TV service to the area.

Communications

The project will have no significant impact on Pacific Bell's ability to supply telephone service to the area

4.13.5 CUMULATIVE IMPACTS

Water

The cumulative impacts of the project are not significant. The project falls within the plans of the TCWD for long range growth.

Wastewater

The cumulative impacts of the project are not significant. The project falls within the plans of the TCWD for long range growth.

Electricity

The cumulative impacts of the project are not significant. The project falls within the plans of SCE for long range growth.

Natural Gas

The cumulative impacts of the project are not significant. The project falls within the plans of SCG for long range growth.

Cable

This project along with other proposed projects would not have a cumulative impact on Cox Communication's ability to provide services to the area.

Communications

This project along with other proposed projects would not have a cumulative impact on Pacific Bell's ability to provide service to the area.

4.13.6 MITIGATION MEASURES

Project Design Features

Water

PDF 13-1 The new booster pump station shall be paid for by the applicant and designed and function according to TCWD's guidelines and standards.

PDF 13-2 Operational capacities and pressure parameters for design of the booster pump station (approved by OCFA) shall be determined at design stage and should incorporate but not be limited to the following requirements:

- It shall meet the maximum day demand for the "stand alone" zones of Saddleback Meadows with an operating time of 24 hours and without its largest unit in service.
- It shall be designed with a back-up generator for the booster pump, as well as fuel and maintenance provisions.
- It shall incorporate the typical 3 or 4 pump system with an alternating state sequence.
- It shall pump from TCWD's El Toro Road zone (1,165 feet HWL) to the storage facility (reservoir) proposed.
- It shall have the ability to refill the proposed reservoir, if it were empty, within 72 hours while also providing for maximum day demands on the water system during that time.

PDF 13-3 Water conservation measures to be implemented consist of water-conserving features in the design and construction of residential homes and uses, plus use of drought-tolerant plant materials in the slope and streetscape plantings. Proposed water conservation measures also include:

- Supply line pressure: Water pressure greater than 50 pounds per square inch (psi) reduced to 50 psi or less by means of pressure-reducing valves.

- Ultra-low-flush toilets: 1.5 gallon-per-flush toilets installed in all new construction.
- Landscape with low-water-using plants wherever feasible.
- Grouping of plants of similar water use to reduce over-irrigation of low-water-using plants.
- Extensive use of mulch as top cover to improve water-holding capacity of the soil.
- Installation of efficient irrigation systems that minimize runoff and evaporation, and maximize the amount of water reaching plant roots. Drip irrigation, soil moisture sensors, and automatic irrigation systems are proposed methods of increasing irrigation efficiency.

PDF 13-4 All design and landscape features shall comply with TCWD's guidelines and standards.

Wastewater

PDF 13-5 All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Electricity

PDF 13-6 All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Natural Gas

PDF 13-7 All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Cable

PDF 13-8 All utilities shall be installed by Cox Cable in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Communications

PDF 13-9 All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Standard County Conditions and Mitigation Measures

Water

SC 13-10 Prior to the issuance of any building permit(s), the applicant shall provide a report to the Manager, PDS/Building Permits Services Division, indicating that plans showing the location of all proposed reclaimed water lines used to irrigate open spaces, parks, and other landscaped areas, have been submitted to and approved by the Trabuco Canyon Water District.

SC 13-11 Prior to the issuance of building permits, water conservation measures shall be incorporated into the development design plans and which shall be submitted for approval to the Trabuco Canyon Water District.

Wastewater

SC 13-12 Prior to the issuance of a certificate of use and occupancy, sewer lines, connections, and structures shall be installed in a manner meeting the approval of the Manager, HCA/Environmental Health.

A. All waste water facilities and line shall be constructed and maintained to meet TCWD standards and requirements

B. All sewer lines shall be underground facilities.

C. The project shall comply with all State of California Health and Safety Codes.

Electricity

SC 13-13 Prior to the issuance of a building permit, project proponent shall consult with the local gas and electric companies regarding feasible energy conservation features that should be included in the design of the proposed project. A note on the building plans

and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 13-14 Prior to the issuance of a building permit, the project proponent shall incorporate passive or natural heating and cooling opportunities in the design of the proposed project including but not limited to the following: solar energy use; thermal insulation; tinted or solar reflective glass; orientation to sunlight; use of deciduous trees in landscaping; installation of roof fans; utilize fluorescent lighting, switches and thermostat, utilize time-controlled lighting; and, utilize AC units with 100% outdoor air economize. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

Natural Gas

SC 13-15 The applicant shall provide for all lines and mains necessary to provide natural gas to the project.

SC 13-16 The applicant shall obtain all required permits and follow all SCG, State and County regulations and requirements regarding natural gas service.

Cable

No standard condition requirements.

Communications

SC 13-17 Applicant shall comply with the requirements of the California Public Utilities Commission and Pacific Bell Telephone Company for the provision of telephone service.

4.13.7 UNAVOIDABLE ADVERSE IMPACTS

Water

The project would create additional demand for water in the area. Following implementation of all

recommended mitigation measures and standard code requirements, no significant adverse impacts would result for water supply.

Wastewater

The project will produce no unavoidable adverse impacts.

Electricity

There are no unavoidable adverse impacts from the project regarding SCE's ability to provide electricity.

Natural Gas

The project will produce no unavoidable adverse impacts.

Cable

There are no unavoidable adverse impacts from the project regarding Cox Communications ability to provide service to the area.

Communications

There are no unavoidable adverse impacts from the project regarding Pacific Bell's ability to provide service to the area.

5.0 LONG-TERM IMPLICATIONS OF THE PROPOSED PROJECT

5.1 SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES THAT WOULD BE INVOLVED IN THE PROPOSED ACTION SHOULD IT BE IMPLEMENTED

The environmental changes which would occur as a result of implementation of the project will occur mainly as a result of alterations to the physical environment. Most likely, once development occurs on the site, the land will not be returned to its current primarily natural state. There will be an incremental increase in air pollution as a result of vehicle emissions. Increased traffic and urban activity will also result in increased noise in the area. This EIR has identified cumulative and project specific air quality impacts, land-form modification, visual effects, and reduction of native habitats and sensitive and non-sensitive species dependent on those habitats on the project site as the significant unavoidable adverse impacts of the project.

5.2 GROWTH INDUCING IMPACTS OF THE PROPOSED ACTION

The proposed project would supply 705 manufactured single-family residential dwelling units into RSA 43-C, a jobs-rich, housing-poor area. This represents a significant addition to the County's existing stock of affordable housing units. Furthermore, per the Conditions of Approval originally placed on Tentative Tract 10692, a total of 470 lots are to be sold in the affordable range. This figure is further broken down as follows: 71 low/ moderate, 70 Medium I, and 329 Medium II as defined by the County.

The project would also be consistent with SCAG's Regional Comprehensive Plan (RCP), Growth Management Chapter. The project, through provision of residential units in a jobs rich region, will assist in meeting the RCP goals of enhancing housing growth in job rich areas, and encouraging local jurisdictions to achieve a balance between the jobs and the cost of available housing. The project also provides housing within close proximity to major employment centers, thus reducing vehicle trips and vehicles traveled. The proposed development, therefore, is consistent with the growth management policies of SCAG's RCP.

Secondary growth inducing impacts will result with the provision of urban services and extension of infrastructure to an undeveloped area within the Foothill-Trabuco Specific Plan. Although the project will result in the extension of urban services, no potential exists to stimulate development on adjacent parcels due to topographic, circulation system and utility sizing constraints. Since the project is consistent with the adopted General Plan, and there is little, if any, unplanned or uncommitted land use in the area, this is a minor effect.

6.0 *ALTERNATIVES*

Pursuant to CEQA, the EIR must assess a reasonable range of alternatives to the project action or location (Section 15126{d}0). The discussion must focus on opportunities for eliminating any significant adverse environmental effects, or reducing them to a level of insignificance "...even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly..." (Section 15126{d}[1]). The EIR must identify an environmentally-superior alternative among other alternatives. As with cumulative impacts, the discussion of alternatives is governed by the "rule of reason." The EIR need not consider an alternative whose effect cannot be reasonably ascertained, or does not contribute to an informed decision-making and public participation process.

The purpose of this section is to describe and evaluate a range of reasonable and feasible alternatives to the proposed project and to determine whether any alternative "may eliminate or reduce to a level of insignificance" adverse impacts associated with the proposed site development. The Foothill-Trabuco Specific Plan EIR identified two alternatives for the project site, staff Alternatives A and B. These alternatives are evaluated in this document as Alternatives 2 and 3 respectively.

Alternatives Objectives:

Pursuant to the requirements of CEQA, the alternatives have been developed to meet the following development objectives of the proposed project.

- Develop a residential community which preserves onsite sensitive biological, cultural and aesthetic resources and conforms to existing landform conditions, to the extent feasible, in response to County and community concerns.

- Minimize visual effects on surrounding properties through the application of sensitive grading design, habitat restoration and landscape screening.

- Remediate and provide geotechnical stabilization for onsite landslide areas affecting the proposed development area.

- Implement the policies contained in the General Plan, Foothill/Trabuco Specific Plan Aliso Creek Corridor Concept Specific Plan and The Air Quality Management Plan.

- Minimize adverse affects to surrounding properties, O'Neill Regional Park and Aliso Creek through buffer/setback zones, design features and landform grading.

- Implement design guidelines and development standards to ensure compliance with current planning and zoning laws requirements through the Area Plan Process.

- Create a fire safe community through incorporation of an area-wide fuel modification program.

- Provide trail connections to the regional riding and hiking trail system.

- Dedicate right-of-way and site stabilization for the widening and improvement of El Toro Road.

The following are alternatives evaluated in this document. Each are summarized in Table 39.

Alternative 1	No Project / No Development
Alternative 2	Foothill-Trabuco Specific Plan Alternative A - 150 Minimum 20,000 sq.ft. lots.
Alternative 3	Foothill-Trabuco Specific Plan Alternative B - 100 SFD Units on 31.7 acres.
Alternative 4	OCP&DS Staff Alternative (EIR 561) - 299 SFD , Minimum 5,000 sq. ft. lots.
Alternative 5	Cluster/Reduced Development Footprint - 318 SFD/MFD.

The alternatives are evaluated based on the following criteria:

1. Identification of specific impacts of each alternative.

2. Comparative analysis of each alternative to the proposed project and the recorded tract map with regard to:

   - Attaining project objectives
   - Feasibility
   - Eliminating/reducing project impacts

3. Identification of the environmentally superior alternatives

Table 39
ALTERNATIVES LAND USE PLAN COMPARISON

ALT NO	DESCRIPTION	NUMBER OF UNITS	MINIMUM LOT SIZE	DEVELOPMENT AREA[1]	REMEDIAL GRADING	CONVENTIONAL GRADING	% OPEN SPACE[2]	WILDLIFE CORRIDOR	TRAIL CONNECTION	COMMENTS

1 Does not include remedial grading or fuel modification requirements.

2 Total open space includes both disturbed, undisturbed, slopes, fuel modifications.

6.1 ALTERNATIVE 1 - NO PROJECT/NO DEVELOPMENT

This alternative is required by CEQA and the County of Orange Environmental Procedures for the Preparation of EIRs. Under the No Project Alternative, the project would remain in natural open space for the foreseeable future, with cattle grazing operations continuing. Implementation of the No Project Alternative would result in no development related impacts to the project site. Ongoing degradation of onsite biological resources related to cattle grazing operations would continue to occur.

The No Project/No Development Alternative would avoid any additional adverse or incremental impacts associated with Earth Resources, Air Quality, Water Resources, Biological Resources, Natural Resources, Land Use, Population/Housing, Transportation/Circulation, Public Services, Public Utilities, Hazards, Noise, Light, Aesthetics, and Cultural Resources.

Selection of the No Project/No Development Alternative would eliminate residential housing opportunities to Orange County and greater Southern California residents and not be in conformity with Orange County General Plan Housing Element goals. Moreover, selection of this alternative would require that the County of Orange refund previously paid developer exactions including water fees of $904,425.00 sewer connection fees of $973,528.00 and drainage assessment fees of $74,000.00. Furthermore, records indicate that $973,528.58 in sewer treatment capacity rights, and $904,475.00 in "capital improvement charges" have also been paid. Finally, the applicant has paid to date, over $9,147,700.00 in premiums for security and improvement bonds as a condition of Recorded Tract Map 10692. This includes $5,657,700.00 for street improvements, $3,240,000.00 for landscaping and $250,000.00 for monumentation. Conservatively, this amounts to just under $13 million in applicant expenditures to date, not including an additional amount for the water tank site dedicated to TCWD which has not yet been appraised. Presumably, all of these monies, including an additional amount for the dedicated water tank site, would have to be refunded to the applicant if the current project is not approved.

The No Project/No Development Alternative does not meet the objectives of the proposed project. Under this alternative, no development, including Recorded Tract 10692 for 705 manufactured homes would occur. In addition, no grading/stabilization for El Toro Road or trail connections would occur.

6.2 ALTERNATIVE 2 - 150-20,000 SQUARE FOOT LOTS (FTSP STAFF ALTERNATIVE A)

Alternative 2 proposes the construction of 150 single family lots, with minimum lot sizes of 20,000 sq.ft. Alternative No. 2 is summarized in Table 40.

Table 40
ALTERNATIVE NO. 2 LAND USE SUMMARY

Land Use	Area	% of Site
Single Family Residential	88.6 ac	40%
Streets	17.9 ac	8%
Manufactured Slope	31.6 ac	14%
Natural Open Space	84.1 ac	38%
Total	**222.2**	**100%**

As indicated on the proposed site plan, site access from El Toro Road will be provided by a double loaded roadway traversing the main ridgeline looping back through the oak woodland canyon, connecting with the access road near mid site. Emergency service access would occur via El Toro Road, through St. Michael's Abbey property. Residential lot access is provided either directly off this main road or from short cul-de-sac streets spaced throughout the site. Approximately 138 acres of the 222.23 acre site will be utilized to accommodate the proposed building sites, road circulation system, and conventional and remedial grading. The Alternative 2 site plan is shown in Exhibit 66.

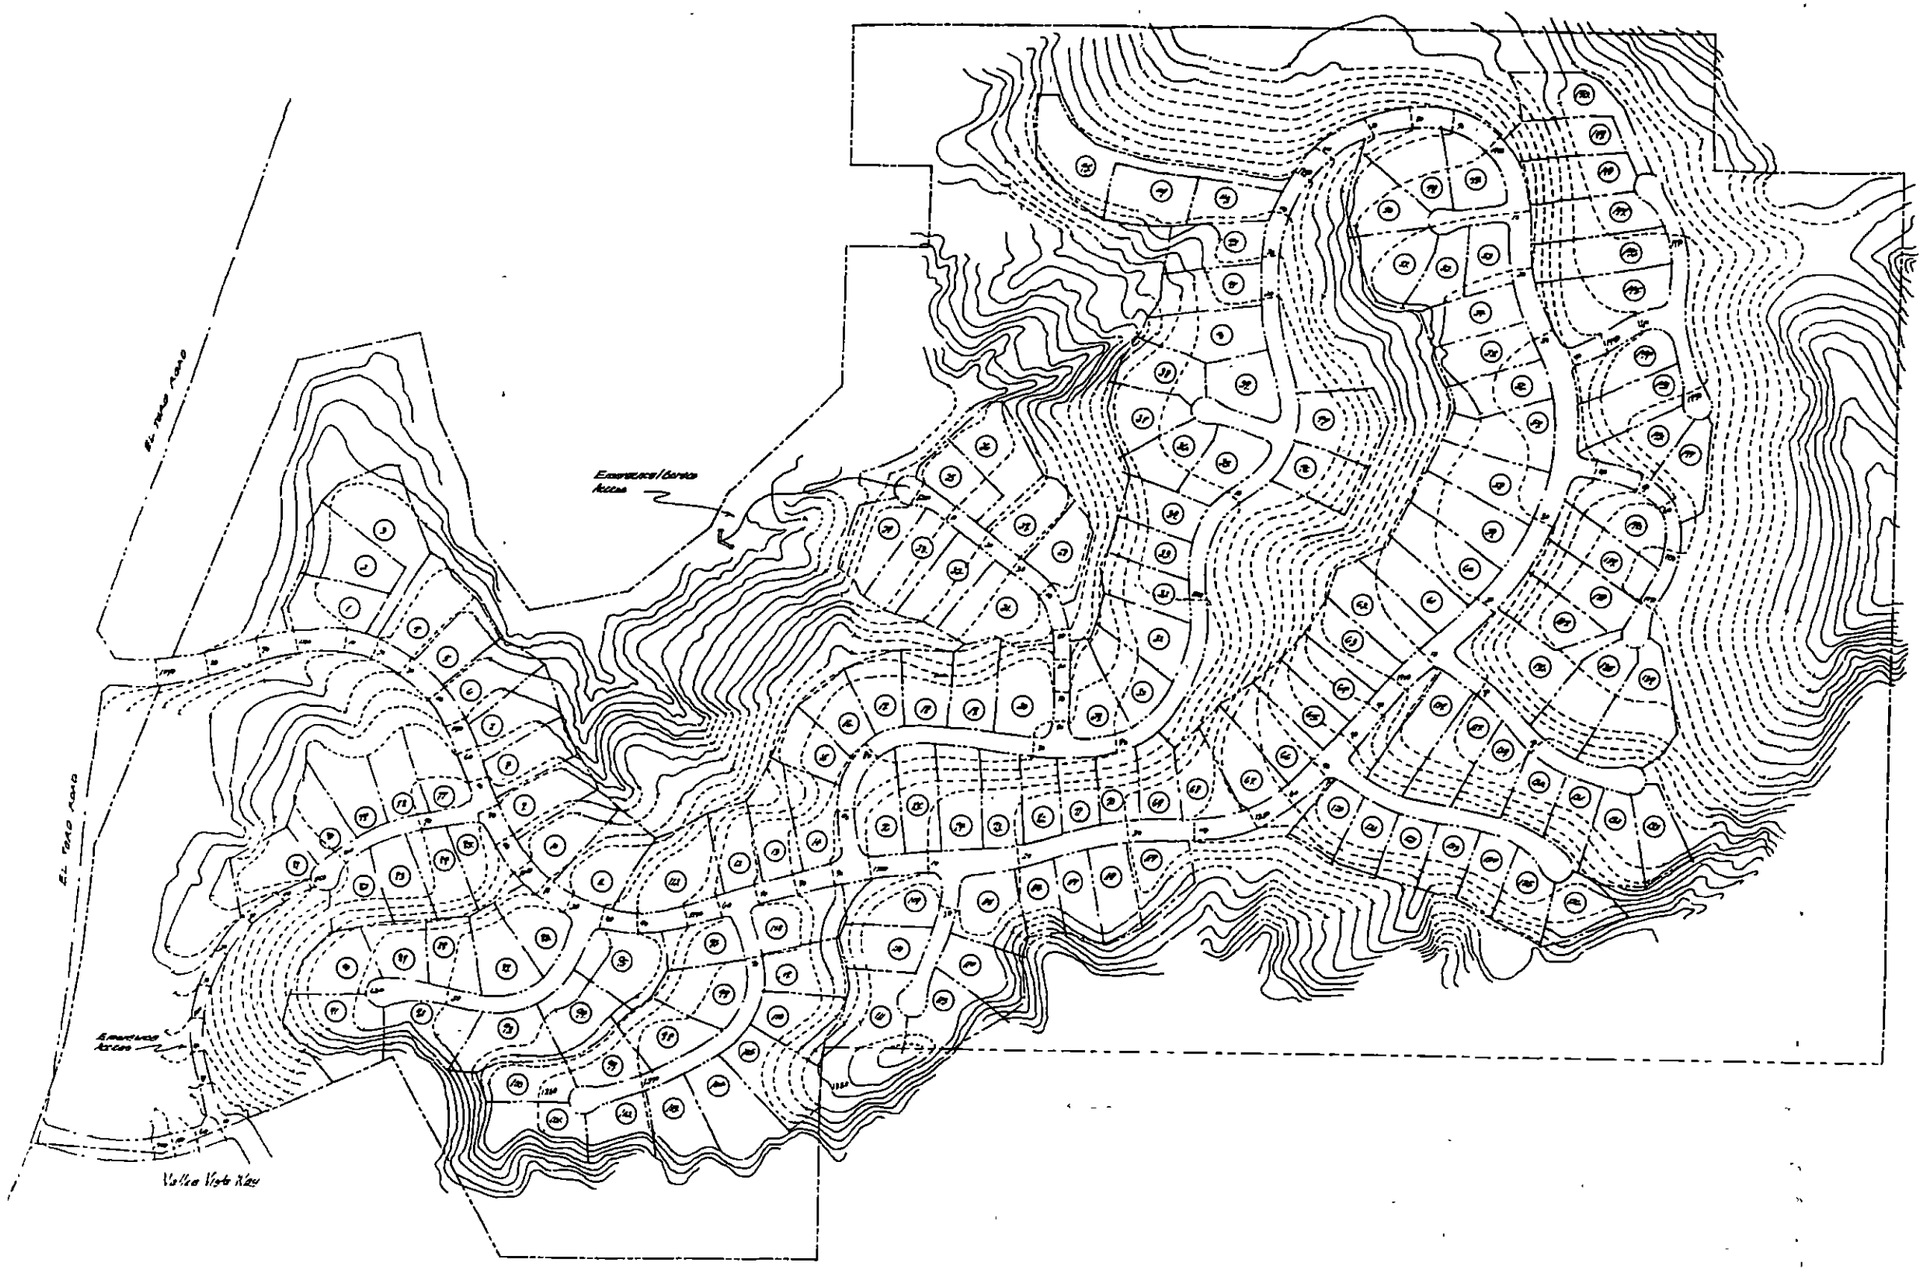
The document entitled "Fiscal Impact Analysis" prepared by Stanley Hoffman & Associates, which is included in this Draft EIR as Appendix J, indicates that this alternative would operate at an annual surplus of $20,667.00 after including fees associated with the Orange County General Fund; County Road Fund; County Library District; and the Harbor, Beaches, and Parks Department.

Land Use/Housing

The project site is located within the FTSP planning area which permits the highest residential density (less than 1 acre/dwelling unit). In terms of gross residential density, this alternative is in compliance with this density standard, however, the Specific Plan also has as an overriding goal which encourages preservation of significant landform, biological and scenic resources, all heavily impacted by this Alternative. However, Alternative 2 would impact a smaller portion of the site (138 acres as opposed to 191 acres for the proposed project), remove less oak woodlands, and provide significantly more open space than the proposed project.

Soils and Geology

To prepare the site for construction, alternative 2 would require a conventional grading volume of 2.5 mcy., not including remedial grading which would contour and blend man-made slopes into the existing natural topography. Remedial grading would amount to 10.0 mcy. Although nearly 75% of the site would experience some form of land alteration, requiring an additional one mcy of grading, this alternative would require less development area than the proposed project.



SADDLEBACK MEADOWS - RECORDED TRACT MAP 10692
DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT 566

URBAN VISION
County of Orange P&DS
Scale: 1"=400'
Source: N/A

N

Alternative No. 2 - 150 Single Family Development 20,000 SF Lots

EXHIBIT No. 66

Water/Hydrology

It is estimated that this alternative will generate a domestic water use demand of 60,000 gallons per day which is approximately 88% less than the anticipated domestic water use of the proposed project. In addition, this alternative will require less alteration of natural drainage courses on site, thereby reducing the potential for increased urban runoff impacts as compared to the proposed project. Accordingly, fewer BMP mitigation measures would be required under this alternative.

Transportation/Circulation

Estimated traffic volumes generated by this alternative would be approximately 1,800 vehicle trips per day, about 70% less than the proposed project. A reduction in site generated vehicle trips will have a corresponding reduction in the potential impact of site development on the area circulation system.

Air Quality

Development of 150 residential units as opposed to the proposed 705 units would reduce vehicular air emissions and potential impact to regional air quality by a corresponding percentage. Cumulative emissions would remain significant.

Noise

Surrounding the project site are a number of existing land uses considered sensitive to noise intrusion. Most notably are O'Neill Regional Park, the Ramakrishna Monastery, and St. Michael's Abbey. Since current property use is for grazing land, development of 150 residential units proposed by this alternative will generate an increase in noise levels emanating from the subject site. This change in noise levels, though anticipated to be lower than the proposed project, may still be perceived as intrusive to existing surrounding land use.

Biological Resources

Implementation of Alternative 2 would alter approximately 138 acres of vegetation/habitat on the site to accommodate the construction of 150 single family lots. Site alteration of this magnitude will severely impact onsite biological resources including the elimination of the oak woodlands, ephemeral ponds, coastal sage scrub habitat, and other resources. Alternative 2 would impact the adjacent Aliso Creek riparian habitat similar to the proposed project. A wildlife movement corridor would not be provided with this alternative.

Aesthetics

Similar to the proposed project, this alternative would substantially alter the natural site topography leaving little area of undisturbed open space. Although lot sizes would be much larger under Alternative 2 than with the proposed project, the overriding visual impact will nevertheless be one of an entirely man-made site, thereby imposing a lesser visual impact than the proposed project.

Cultural/Scientific Resources

Alternative 2 would impact a smaller percentage of the site and in turn will potentially have fewer impacts to onsite cultural and scientific resources.

Recreation

Alternative 2 would provide a connection to the regional riding, hiking and biking trail system, thereby creating a similar level of impact to the proposed project.

Hazards

The project site is located in a high fire hazard area. As a result, all future site development is potentially at risk during fire events. The loop circulation system proposed with this alternative provides for improved emergency access as compared with the proposed project, resulting in a higher level of emergency service than the proposed project.

Public Services

Implementation of this alternative would result in incrementally less demand for public services as compared to the proposed project.

Public Utilities

Implementation of this alternative would result in incrementally less demand for public utilities as compared to the proposed project.

6.3 ALTERNATIVE 3 - 100 SFD UNITS ON 30 ACRES (FTSP STAFF ALTERNATIVE B)

Alternative 3 would concentrate all site development on the western third of the project site, reducing the number of dwelling units to no more than 100. Alternative No. 3 is summarized in Table 41.

Table 41
ALTERNATIVE NO. 3 LAND USE SUMMARY

Land Use	Area	% of Site
Single Family Residential	11.3 ac	5%
Streets	5.6 ac	3%
Manufactured Slope	14.8 ac	7%
Natural Open Space	190.5 ac	85%
Total	**222.2**	**100%**

Primary access from El Toro Road would be provided by a two lane 60-foot wide roadway, terminating in a traffic circle which surrounds an overview park. Residential lot access will be provided off secondary cul-de-sac streets located on the south side of the primary tract road. A second emergency access road connection would be provided at Valley Vista Way near the southwest corner of the project site. The proposed development would consist of 100 single family residential lots, minimum lot size 4,000 sq.ft. on 31.7 acres of the site. Estimated conventional grading volumes are approximately 1.0 million cu. yds. Approximately 86% or 190.53 acres will be left as natural open space.

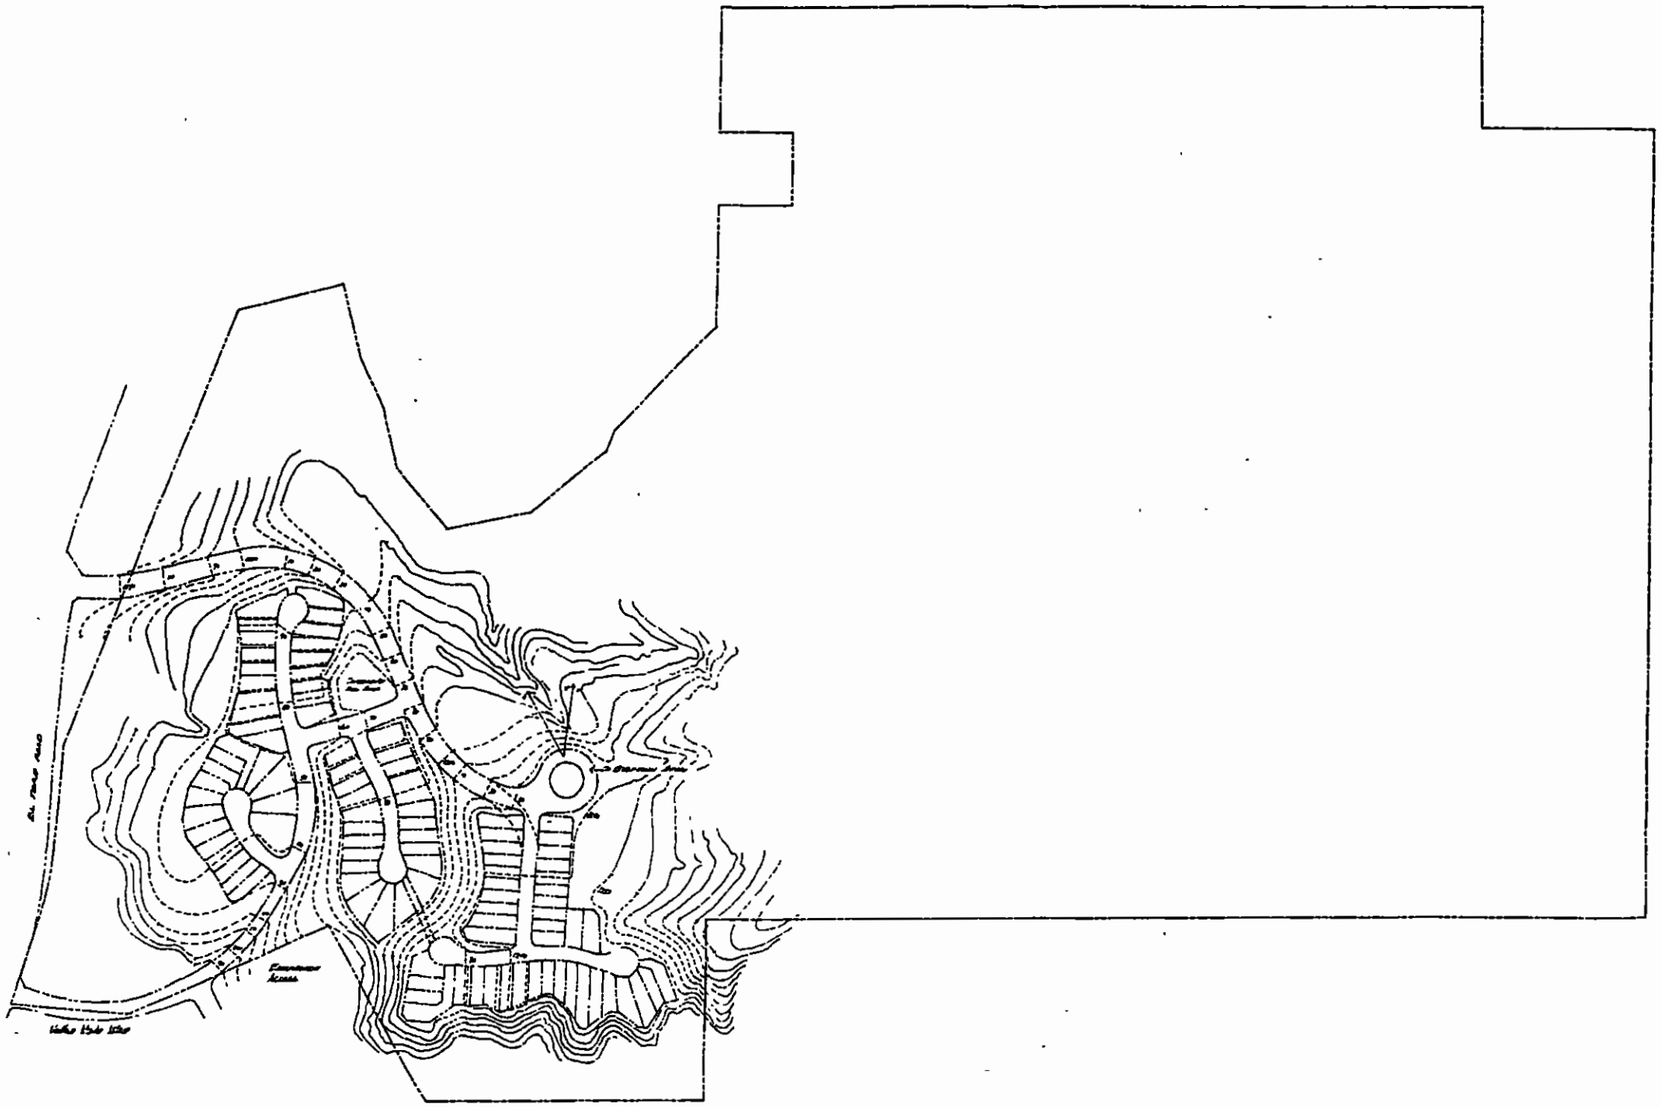
Financial analysis prepared for this project indicates that this alternative would operate at an annual deficit of $4,955.00 after including fees associated with the Orange County General Fund; County Road Fund; County Library District; and the Harbor, Beaches, and Parks Department.

Land Use

This alternative would cluster all development on the lower western portion of the site adjacent to El Toro Road and the Hidden Ridge/Hidden Hills community. Though proposed lots sizes are relatively small, the vast majority of the site will be retained in natural open space. Alternative 3 would preserve more significant landform, biological, cultural, and scenic resources than the proposed project.

Soils and Geology

Potential grading volumes and associated impacts would be approximately 70% less than for the proposed project. In addition, land form alteration will be confined to just 31.7 acres of the site leaving the remaining 190.53 acres of the site in a natural state. By comparison, the proposed project involves approximately 211.0 acres of land alteration leaving 14% of the site as undeveloped open space. Grading impacts associated with site development are thus substantially reduced under this alternative, as compared to the proposed project.



SADDLEBACK MEADOWS - RECORDED TRACT MAP 10692
DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT 566

URBAN VISION

County of Orange P&DS
Scale: 1"=400'
Source: N/A

N

Alternative No. 3 -
100 Single Family Development
30 Acres

EXHIBIT No. 67

Water/Hydrology

Domestic and common area water demand would be significantly reduced by this alternative. It is estimated that development of 100 residences will generate a domestic water use demand of approximately 40,000 gallons per day. Due to the relatively small area devoted to development, potential urban runoff and drainage impacts are significantly reduced by this alternative, as compared to the proposed project.

Transportation/Circulation

Alternative 3 would generate an estimated 1,200 vehicle trips per day a 80% reduction over proposed project estimates. Potential impacts to the surrounding circulation system would be significantly reduced under this alternative, as compared to the proposed project.

Air Quality

A reduction in the number of vehicle trips would have an associated reduction in auto borne air emissions, a corresponding reduction in potential air quality impacts, and a positive affect on SCAQMD goals.

Noise

Development of 100 residential lots clustered on the western portion of the site adjacent to El Toro Road would substantially reduce the potential noise impact to surrounding existing noise sensitive land uses, as compared to the proposed project.

Biological Resources

Alternative 3 would retain the majority of the subject property in natural open space preserving a majority of the significant biological resources onsite. Connection between wilderness areas south and west of the site would be provided by this large open space area, eliminating the need to provide a wildlife movement corridor through developed portions of the property.

Aesthetics

Development would be clustered on the lower less visible portion of the site, preserving views of the site's rolling topography and scenic oak woodlands, as well as reducing the amount of man-made structures from surrounding viewsheds. Alternative 3 would substantially reduce visual impacts to the Ramakrishna Monastery.

Cultural/Scientific Resources

The resulting smaller area of site disturbance under the alternative would significantly reduce the potential impact to cultural and scientific resources onsite, as compared to the proposed project.

Recreation

As indicated on the site plan, Alternative 3 would provide a community recreation area onsite in addition to the overview park area. Connection to the regional riding, hiking and biking trail system would also be provided with this alternative. Recreation impacts under this alternative would therefore be reduced in comparison to the proposed project.

Hazards

The project site is located in a designated very high fire risk area. All residential development onsite is potentially at risk in a fire event. Due to the proximity of the development to El Toro Road as well as the secondary entry road into the site, emergency access is significantly improved by this alternative, as compared to the proposed project.

Public Services

Public services are adequate to support this alternative with a substantially reduced demand, as compared to the proposed project.

Public Utilities

Public utilities are adequate to support this alternative with a substantially reduced demand, as compared to the proposed project.

6.4 ALTERNATIVE 4 - OCP&DS STAFF ALTERNATIVE, 299 SFD UNITS, ON 5,000 SF LOTS

This alternative has 299 single-family detached dwelling units. The average lot size for this project is approximately 6,400 s.f. Access to the project would be provided via a gate-guarded private street off El Toro Road immediately south of the existing Aliso Creek/Trail undercrossing. An emergency only access connects with Valley Vista Way. The project site is 222.2 acres in size. Total open space is approximately 72% (utilizing EMA's criteria for calculating open space). A total of approximately eight acres of offsite area would be affected as a result of project implementation to accommodate slope area, access roads, related remedial grading, the water tank, and County of Orange fuel modification requirements.

Prepared financial analysis indicates that this alternative would operate with recurring annual surpluses of $39,800.00 after including fees associated with the Orange County General Fund, County Road Fund, County Library District and the Harbor, Beaches, and Parks Department.

Alternative 4 is summarized in Table 42.

Table 42
ALTERNATIVE NO. 4 LAND USE SUMMARY

Onsite	Acreage	% Offsite
Residential Lots	44.7	20%
Streets (private)	18.0	8%
Other Dedicated Natural Open Spaces	91.9	41%
Trail Staging Area	.6	0%
Open Space (dedicated to H.O.A.)	67.0	31%
Subtotal	**222.2**	**100%**

* Acreages and percentages are approximations subject to refinement at the Tentative Map stage.

Land Use

The project has been designed to minimize impact on the existing land form. The homes have been located on the relatively level areas in a broad crescent shape flowing along the southern and eastern sides of the site, while the steep terrain of the central canyon area has been left as open space. Development is kept off the eastern major ridgeline bordering the property.

Soils and Geology

The grading concept for this alternative reflects a contour grading approach with utilizes techniques emphasizing variations and takes advantage of the curvilinear street and lotting design, rather than repetitive uniformity. This allows the project a more natural and organic ambiance in keeping with the rolling hillside setting. These contour grading techniques consist of the following:

- Integrate grading into the context of existing topography using horizontal rounding of contours;
- Blending of manufactured contours with natural existing contours;
- Rounding at the top and toe of slopes to avoid harsh transitions; and
- Design of development enclaves of varying size and irregular spacing to avoid a uniformly "terraced" appearance.

Earthwork Volumes:

Conventional Grading

- Balanced Cut/Fill (approximate)
  Cut Quantity: 2,100,000 **c.y.**
  Fill Quantity: 2,100,000 **c.y.**

- Total Import Quantity: **0**
  Total Export Quantity: **0**

Remedial Grading

- Total Remedial Grading (Remove & Replace): approximately **6,300,000 c.y.**

Based on the preceding alternative summary, grading volumes and geological impacts are substantially reduced under this alternative as compared to the proposed project.

Water/Hydrology

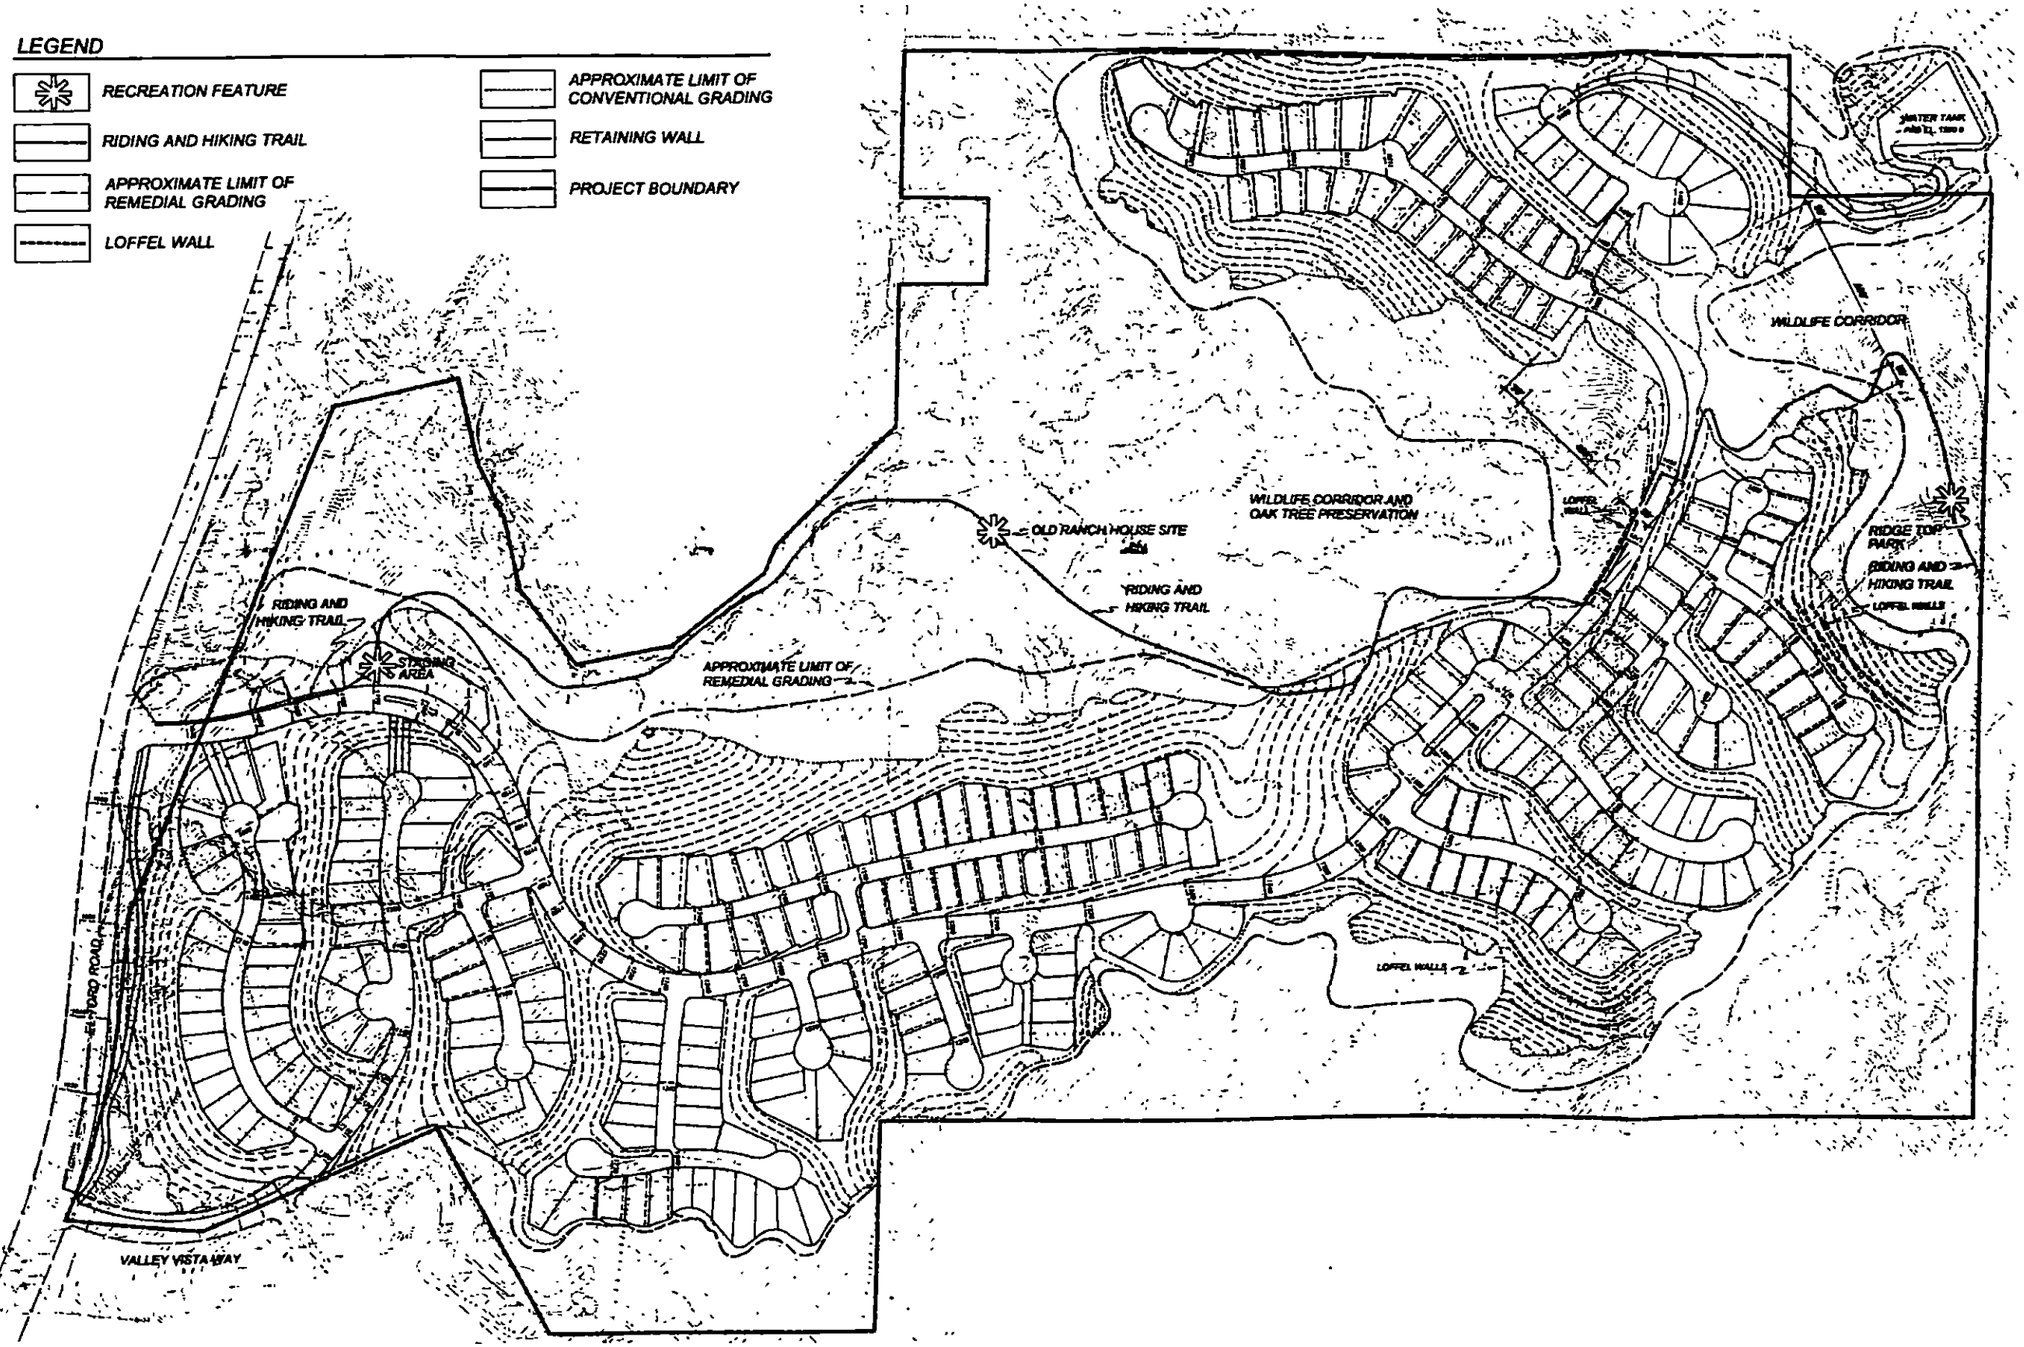
The project acreage (222.2 acres) does not include the adjacent offsite water tank site. A 1.4 million gallon water tank and associated access road is proposed offsite adjacent to the northeast corner of the project site to provide water service to the proposed project. The proposed water tank site was dedicated to the Trabuco Canyon Water District when the existing Final Tract Map was recorded (Tract No. 10692). The water tank will be approximately 30 feet tall, 100 to 110 feet in diameter, bermed, landscape, and painted a complimentary color to the surrounding setting.

Given the reduced residential density, and the substantially smaller development footprint, domestic and common area water demand would be significantly reduced by this alternative. In addition, potential urban runoff and drainage impacts are reduced under this alternative as composed to the proposed project.

Transportation/Circulation

Access to the project would be provided via a gate guarded private street off El Toro Road immediately south of the existing Aliso Creek/Trail undercrossing. An emergency only access connects with Valley Vista Way. Onsite circulation is proposed with a system of private streets consisting of a primary spine street (56-foot r.o.w.) And a series of cul-de-sacs (41-, 45-, and 52-foot r.o.w.). An encroachment easement is required from the County of Orange to accommodate the project access road where it traverses County owned property along the western most boundary of the site.

Given the reduced number of dwelling units under Alternative 4, this alternative would result in a commensurate reduction in vehicle trips as compared to the proposed project.



SADDLEBACK MEADOWS - RECORDED TRACT MAP 10692
DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT 566

URBAN VISION

County of Orange P&DS
Scale: 1"=400'
Source: N/A

N

Alternative No. 4 - 299 Single Family Development

EXHIBIT No. 68

Air Quality

A reduction in the number of vehicle trips would have an associated reduction in air emissions, a corresponding reduction in potential air quality impacts, and a positive affect on SCAQMD goals.

Noise

Development of 299 residential lots would substantially reduce the potential noise impact to surrounding noise sensitive land uses as compared to the proposed project.

Biological Resources

Total open space under Alternative 4 would amount to approximately 72% of the site. This represents a 58% increase over the proposed project. In addition, a wildlife movement corridor has been incorporated into the project design to address the importance of regional wildlife movement linkages between regionally important open space areas such as O'Neill Regional Park, Whiting Ranch Wilderness Park and the Cleveland National Forest. Unlike the proposed project, this alternative utilizes and east/west corridor alignment similar to that shown in the Foothill/Trabuco Specific Plan. The wildlife corridor that bisects the project (called the central corridor) is a component of a three corridor concept, which together is designed primarily to accommodate small and medium size mammals and birds, but would not preclude the occasional potential movement of large mammals as well. This corridor is comprised of a minimum 400-foot wide wildlife corridor with 50 foot setbacks located on either side. The onsite wildlife corridor is proposed to utilize an at-grade crossing (400 foot) where the wildlife corridor traverses the main spine road. Due to the low level of traffic on this end of the project, the at-grade crossing is not anticipated to inhibit wildlife movement.

Aesthetics

The project has been designed to minimize impact on the existing land form. The homes have been located on the relatively level areas in a broad crescent shape flowing along the southern and eastern sides of the site, while the steep terrain of the central canyon area has been left as open space. Development is kept off of the eastern major ridgeline bordering the property.

The grading concept for this alternative reflects a contour grading approach which utilizes techniques emphasizing variations and takes advantage of the curvilinear street and lotting design, rather than repetitive uniformity. This allows the project a more natural and organic ambiance in keeping with the rolling hillside setting. Potential project aesthetic impacts are significantly mitigated by this alternative.

Cultural Scientific Resources

The substantially smaller area of site disturbance under this alternative would significantly reduce the potential impacts to cultural and scientific resources onsite as compared to the proposed project.

Recreation

Trail connections are provided under Alternative 4, which link the project to existing regional riding/hiking trails and bikeways. The project proposed a trail staging area, ridgetop park and significant dedicated natural open space. The proposed Trail Staging Area provides a direct link to the regional trail located on El Toro Road and the other proposed recreation features (ridgetop park and old ranch house site). Recreation impacts under this alternative would therefore be reduced in comparison to the proposed project.

Hazards

The project site is located in a designated very high fire risk area. All residential development onsite is potentially at risk in a fire event. Due to the proximity of the development to El Toro Road, as well as the secondary entry road into the site, emergency access is significantly improved by this alternative, as compared to the proposed project.

Public Services

Given the reduced residential density of this alternative, potential impacts to public services and utilities would be significantly reduced as compared to the proposed project.

Public Utilities

Given the reduced residential density of this alternative, potential impacts to public utilities would be significantly reduced as compared to the proposed project.

6.5 ALTERNATIVE 5 - CLUSTER/REDUCED DEVELOPMENT FOOTPRINT -318 SFD

This alternative proposes the construction of 178 attached condominium units located on the western half of the site and 140 single family units on 4,000 square foot lots located along the eastern ridgeline. Alternative No. 5 is summarized in Table 43.

Table 43
ALTERNATIVE NO. 5 LAND USE SUMMARY

Land Use	Area	% of Site
Single Family Residential	16.9 ac	8%
Multi Family Residential	39.0 ac	18%
Streets	11.1 ac	5%
Manufactured Slope	43.5 ac	19%
Natural Open Space	111.7 ac	50%
Total	**222.2 ac**	**100%**

Primary access would be provided from a single main road traversing the site and ending in a cul-de-sac near the northeast project boundary. Secondary site access will be provide from Valley Vista Way through Hidden Ridge near the southwest corner of the subject property. Approximately 105 acres will be directly impacted by site development with conventional grading volume estimated to be 1.5 million cu. yds. 5.0 million cu. yds. of remedial grading would be required under this alternative. Approximately 50% of the site will be retained in natural open space. Alternative 5 is shown in Exhibit 69. Total open space is approximately 60% of the site.

Financial analysis prepared for this project indicates that this alternative would operate at an annual deficit after including fees associated with the Orange County General Fund; County Road Fund; County Library District; and the Harbor, Beaches, and Parks Department.

Land Use

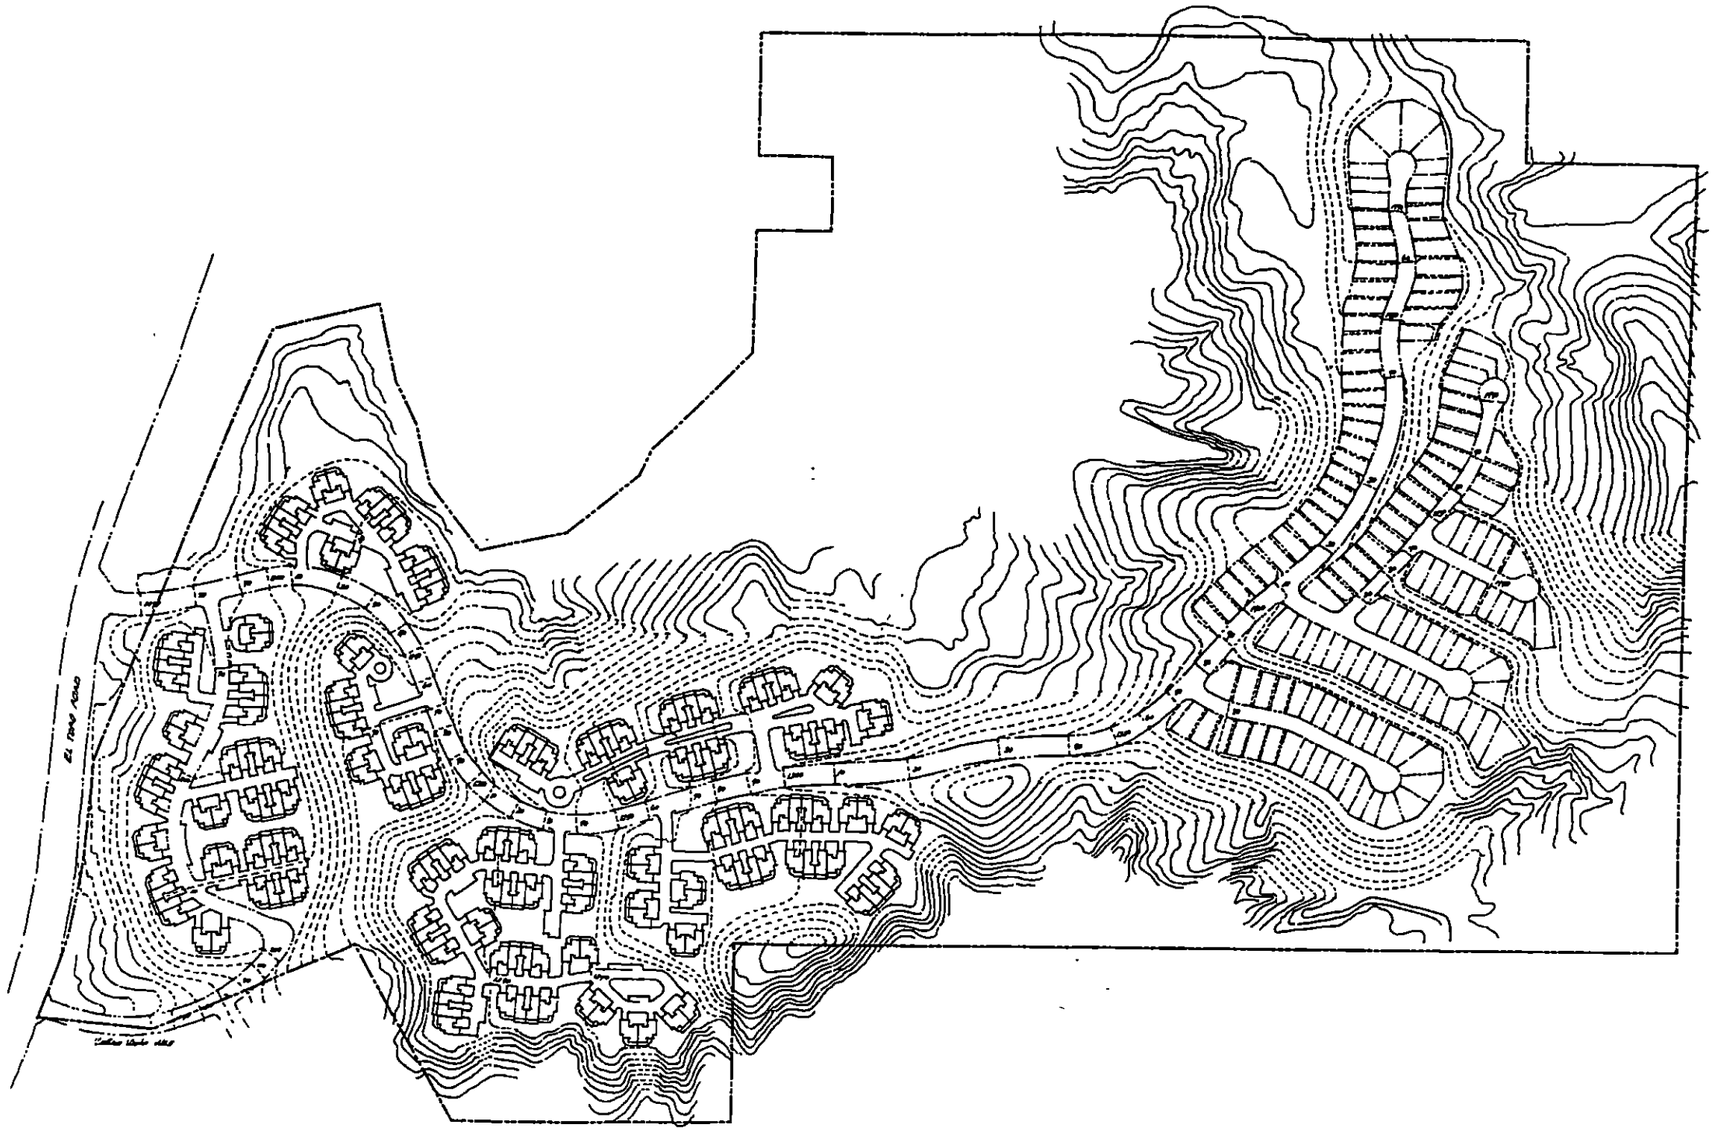
The proposed condominium units will be contained in either two- or four-plex structures which tend to create a more massive appearance than typical single family residences. Development of attached residential units would be more urban in scale and appearance; however, the much smaller development footprint associated with this alternative may be less in conflict with FTSP rural preservation goals than the proposed project. Moreover, by providing a greater variety of housing types and price ranges, this alternative better meets the housing goals of the General Plan.

Soils and Geology

The anticipated grading volumes and area of disturbance associated with this Alternative 5 are substantially less as compared to the currently proposed project (6.5 millions of cubic yards versus 11.5 millions of cubic yards). Similarly, soil, topographical and geological impacts are reduced commensurately.

Water/Hydrology

Water and hydrological impacts are anticipated to be substantially less than the proposed project,



SADDLEBACK MEADOWS - RECORDED TRACT MAP 10692
DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT 566

URBAN VISION

County of Orange P&DS
Scale: 1"=400'
Source: N/A

N

Alternative No. 5 - Cluster/Reduced Devel. Footprint 318 MF/SF

EXHIBIT No. 69

with substantially reduced runoff volumes and urban runoff as compared to the proposed project. This reduction in urban runoff would result in fewer BMP mitigation requirements.

Transportation/Circulation

Multi-family dwelling units have a lower estimated trip generation rate than single family residences. This, combined with the significant reduction in the number of dwelling units as compared to the proposed project, is anticipated to generate substantially lower traffic volumes. In addition, the secondary access from Valley Vista Way would reduce some of the anticipated use of the primary access road and have a corresponding mitigating effect on traffic congestion at the intersection of El Toro Road and primary site access road. Overall area circulation impacts are anticipated to be substantially less than those of the proposed project.

Air Quality

Potential air quality impacts are anticipated to be significantly reduced as compared to the proposed project, based upon a lower overall trip generation rate. Reduced trip generation would result in a positive impact on SCAQMD goals.

Noise

No substantial difference in potential noise related impacts as perceived by adjacent existing noise sensitive land use would be anticipated with this alternative, as compared to the proposed project.

Biological Resources

Over 30% more open space would be provided with this alternative, resulting in a corresponding reduction in the impact on biological resources associated with site development. A 700 foot wildlife movement corridor between wilderness areas located south and west of the project site would be provided with this alternative. Conversely, no wildlife corridor is proposed under the proposed project. In addition, impacts to oak woodland would be substantially reduced under Alternative 5.

Aesthetics

Attached units create a more urban appearance to project viewsheds, and may be perceived in terms of rural preservation goals for the area as a significant adverse aesthetic impact. However, given the substantially smaller development footprint associated with Alternative 5, overall aesthetic impacts are expected to be far less obtrusive than the project currently proposed. Also, because of the greater amount of open space associated with this alternative, aesthetic impacts with regard to alteration of the site's natural topography and scenic oak woodlands are anticipated to be substantially reduced in comparison to the proposed project.

Cultural/Scientific Resources

Potential impacts to onsite cultural and scientific resources would be greatly reduced in comparison

to the proposed project.

Recreation

This alternative shifts site development and associated remedial grading further west directly adjacent to the west property line, eliminating the ability for the project to provide connections to the regional riding, hiking and biking trail system.

Hazards

Potential fire hazard and emergency response impacts would be similar to the proposed project.

Public Services

Potential impacts to public services under this alternative would be significantly reduced as compared to the recorded tract map.

Public Utilities

Potential impacts to public utilities under this alternative would be significantly reduced as compared to the recorded tract map.

6.6 SUMMARY OF ALTERNATIVE FINDINGS

Although all the project alternatives propose different development scenarios for the subject site, their potential environmental impacts can be generally characterized as being less than the proposed project in almost every instance.

Of the alternatives evaluated, the Foothill-Trabuco Alternative A (Alternative 2) is considered environmentally inferior to all other alternatives. The development of 150 single-family residences on 20,000 square foot lots, as proposed under this alternative, will significantly alter site topography, remove sensitive biological resources, and change project site viewsheds much in the same way as the currently proposed project.

Having a somewhat less significant environmental impact is the proposed Cluster/Reduced Development Footprint (Alternative 5) which proposes the development of 178 attached condominium units and 140 single family residences on approximately 105 acres. This alternative retains a much larger percentage of open space as compared to the current project and consequently, topographical, biological, and geological impacts are substantially reduced. While aesthetic impacts may be perceived by some as being more adverse due to the more urban appearance of this alternative, the much smaller development footprint will likely result in aesthetic, and other impacts of substantially less magnitude.

The environmentally superior alternative is the No Project/No Development Alternative. CEQA requires that if the No Project Alternative is environmentally superior, the next least impacting

alternative be identified.

The environmentally superior alternative (not including the No Project Alternative) in nearly all categories is the Foothill-Trabuco Specific Plan Alternative B which proposes development of 100 single family residences on only the western most 31.7 acres of the site (Alternative 3). Associated environmental impacts of site development are significantly reduced with this alternative, primarily due to the fact that the majority of the site (190.53 acres) will be retained in natural open space.

An evaluation of alternative findings is shown in Table 44.

7.0 INVENTORY OF MITIGATION MEASURES

This section lists the Project Design Features (PDFs), Standard Conditions, and additional mitigation measures, as included in Section 4.0. The mitigation measures are numbered according to the specific impacts to which they pertain; for some impacts, there are no additional measures. Therefore, the numbering of mitigation measures and some PDFs is not always sequential.

LAND USE

Standard County Conditions and Mitigation Measures

SC 1-1 Prior to the issuance of any building permits for residential construction, the developer shall comply with Board of Supervisors Resolution 82-1368 (Buyer Notification Program) which requires the developer to prepare a map denoting the existing and proposed land uses, arterial highways, and public facilities within the surrounding area for the approval of the Manager, PDS/Current Planning Services Division. The map content, display, and distribution shall be in accordance with the Buyer Notification Program guidelines approved by the Board of Supervisors and available at the Development Processing Center.

SC 1-2 Prior to the issuance of any certificates of use and occupancy, the developer shall provide evidence to the Manager, PDS/Building Inspection Services Division, that the Department of Real Estate has been notified that the project area is within the boundaries of a Community Facilities District (CFD), and will be subject to special taxes for public facilities and/or services.

SOILS AND GEOLOGY

Project Design Features

PDF 2-1 A comprehensive remedial grading mitigation plan has been designed to stabilize the project site, in accordance with OCPDS requirements. The plan is depicted in Exhibit 19, included in Appendix D and proposes measures including shear keys, buttresses, removals/recompaction to reduce hazards associated with landslides, erosion and subsidence.

Standard County Conditions and Mitigation Measures

SC 2-2 Prior to the issuance of a grading permit, the applicant shall submit a geotechnical report to the Manager, PDS/Subdivision and Grading Services Division for approval. The report shall include the information and be in a form as required by the Grading Manual.

SC 2-3 Prior to the issuance of any grading permits, the Manager, PDS/Subdivision and Grading Services Division, shall determine if the proposed grading complies with the grading illustrated in the plans approved by the decision-maker with regard to grading concepts, slope heights, slope ratios, and pad elevations and configuration. Significant deviations shall be reviewed by the decision-maker for a finding of substantial conformance. Failure to achieve such a finding will require processing a revised application per Orange County Zoning Code Section 7-9-139 and 7-9-150.

SC 2-4 Prior to the issuance of the first grading permit, for projects located immediately adjacent to or including portions of regional parks, significant open space corridors, or other environmentally sensitive areas, the project proponent shall provide evidence acceptable to the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Harbors Beaches & Parks Division, that graded areas will be compatible with natural land characteristics of the adjacent open space areas including techniques to enhance a smooth and gradual transition, urban edge treatment plans and incorporating view enhancement through architectural and design techniques.

SC 2-5 Prior to the issuance of any grading permit, offsite grading and/or drainage shall be conducted in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-6 Prior to the issuance of a grading permit, substantial compliance with the following shall be certified by a registered engineer in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division:

- Fill soils shall be placed in layers that are less than 8 inches thick and moisture-conditioned generally 1- to 2-percent above optimum moisture content. The existing diatomaceous soils should be moisture-conditioned to 125-percent of optimum moisture content.

- For preliminary earthwork computations, the following shrinkage/bulking factors are recommended for the onsite material (these do not include handling losses): Bedrock - 5% bulking; slopewash - 5% shrinkage; and Other Soils - 15% shrinkage. Grading plans shall include an area where finish grades can be raised or lowered to accommodate changes in actual material quantities.

- Dewatering shall be achieved using sumps and pumps located strategically within the excavated area. However, the excavation shall be carefully observed; if the conditions warrant, supplementary dewatering provisions shall be made. It is the responsibility of the contractor to provide an adequate dewatering system during construction.

Seismic

SC 2-7 Conformance with the Uniform Building Code and Orange County codes will insure that seismic considerations are incorporated into the structural designs. All recommendations of the geotechnical report shall be incorporated and utilized in the final construction plans for the parcels in a manner meeting the approval of the Manager, PDS/Building Permit Services Division. Larger buildings, structures with extraordinary architectural configurations, or those of tilt-up construction may require seismic analysis.

SC 2-8 The seismic exposure of the site shall be considered in the design of the proposed structures in a manner meeting the approval of the Manager, Building Permit Servicies Division.

SC 2-9 Geologic inspections shall be required during site grading for each parcel to confirm the absence of major faults in the local area in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-10 Prior to the issuance of any grading permits, if review of the grading plan for this property by the Manager, PDS/Subdivision and Grading Services Division, indicates significant deviation from the proposed grading illustrated on the approved tentative tract map, specifically with regard to slope heights, slope ratios, and pad elevations and configuration, the plan shall be reviewed by the Subdivision Committee for a finding of substantial conformance. Failure to achieve such a finding will require processing a revised tentative tract map; or, if a final tract/parcel map has been recorded, a new tentative tract/parcel map or a site development permit application per Orange County Zoning Code Section 7-9-139 and 7-9-150. Additionally, a new environmental assessment and determination is required.

SC 2-11 Prior to the issuance of any grading permit, if determined necessary by the Manager, PDS/Subdivision and Grading Services Division, a letter of consent, in a form approved by the Manager, PDS/Subdivision and Grading Services Division, suitable for recording, shall be obtained from the affected property owners for offsite grading and/or drainage. The owner/applicant shall record said letters of consent for offsite drainage and/or cross-lot drainage prior to recordation of the tract/parcel map or prior to the issuance of any grading permit, whichever comes first.

SC 2-12 Prior to the issuance of any preliminary grading permits, the subdivider shall request that the Vector Control District initiate the survey process of the tract/parcel map site to determine if vector control measures are necessary. If warranted, such measures shall be conducted by the developer in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-13 Prior to issuance of grading permits, a Water Quality Management Plan (WQMP) shall be submitted to and approved by the Manager, PDS/Subdivision and Grading

Services Division. The WQMP shall identify, at a minimum, the application and incorporation of those routine structural and non-structural BMPs outlined in the Countywide NPDES Drainage Area Management Plan (DAMP) Appendix G detailing implementation of BMPs not dependent on specific land uses, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-14 Prior to the issuance of any grading or building permits, whichever comes first, the applicant shall provide, in accordance with criteria supply by EMA, a "Hazardous Materials Assessment" and a "Disclosure Statement" covering the property (both fee and easement) which will be offered for dedication to the County of Orange, for review and approval by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Monitoring Programs Division.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

Grading

AM 2-15 Multiple cuts and fills (2.6 million cubic yards) to achieve planned elevations and profiles, and associated access roadways shall be required.

AM 2-16 Remedial grading (8.9 million cubic yards) to stabilize the proposed slopes by means of buttresses, shear keys, and stabilization fills shall be required. Back cut failure guidelines shall be provided to the Grading Services Division prior to issuance of grading permits.

AM 2-17 Removal (clean out) of all or major portions of the graben materials and softer alluvium and colluvium under most of the variable thickness fills shall be required.

AM 2-18 Installation of appropriate subdrain systems within natural drainage courses and within stability fills prior to fill placement shall be required.

AM 2-19 Adequate foundation and slab subgrade conditioning for the proposed development, including overexcavation, capping and measures related to expansive soils shall be required.

AM 2-20 Achieving suitable surface gradients to preclude ponding anywhere onsite and to control water run-off via paved/closed drainage devices shall be required.

Compaction

AM 2-21 Wherever structural fills are to be placed, the upper 6 to 8 inches of the exposed

subgrade (after stripping and/or overexcavation/clean-out) shall first be scarified and reworked. In general, the dry density of the in-situ (native) material shall be at least 85 percent of maximum. In the event that lower densities are determined by field testing to exist, the depth of overexcavation will be determined onsite, given due consideration to the geology of the exposed material, as well as its relative location. It is at present expected that typical depths of overexcavation will be on the order of 4 to 5 feet.

AM 2-22 Fill shall be placed in lifts of 6 to 8 inches (loose) in thickness. Rocks exceeding 4 inches in maximum dimension are best not incorporated within the upper fill zone (say 3 feet) where foundations and most utility systems are expected to be housed.

AM 2-23 In all fill areas where active gradients are steeper than 5:1 (horizontal:vertical), those surfaces shall be prepared to receive fill by excavating standard keyways and benches in a stair-step configuration.

AM 2-24 Any loosening of reworked or in-place (native material, consequent to weathering and/or passage of construction traffic, shall be made competent.

AM 2-25 Temporary fills, typically associated with access ramps built to accommodate grading equipment shall be subject to removal when their use is discontinued.

AM 2-26 The depths of excavation shall be subject to onsite monitoring by the Soil Engineer, normally during the actual removal operations. Any surface or subsurface obstructions, or questionable material encountered during grading, shall be brought immediately to the attention of the Soil Engineer, for his determination as to proper exposure, removal and/or processing as directed.

Material Selection

AM 2-27 After the site has been stripped of any debris, vegetation and organic soils, such exposed onsite shall be considered satisfactory for reuse in the construction of onsite fills, provided the organic content does not exceed 3% by volume. It is recommended that highly expansive soils not be placed within the upper 4 to 5 feet thick zone underlying final pad and street grades. More importantly, no such soil is to be placed (as backfill)within a horizontal distance equal to the wall height immediately behind retaining walls.

AM 2-28 Any objectionable material, as determined by the Soil Engineer, shall be subject to relocation in deeper fill areas or removal offsite.

AM 2-29 All borrow sites shall be approved by the Soil Engineer/Geologist prior to onsite delivery. This will permit the timely allocation of such available materials for use on the project site.

Compaction Requirements

AM 2-30 Reworking/compaction shall include water addition or drying-out as needed, to bring the soils close to their optimum moisture content. All such reworked soils, placed as structural fills, shall be densified to achieve at least 90 percent relative compaction with reference to the laboratory compaction standard. The optimum moisture content and maximum dry density, for each identified soil type, will be determined in the laboratory in accordance with ASTM Test Designation D1557.

Shrinkage/Subsidence

AM 2-31 For preliminary earthwork computations, an approximate (overall) shrinkage factor of 12 percent shall be required, for the existing site soils. The above value does not include allowance for stripping nor handling losses.

AM 2-32 Subsidence shall be assumed as 3/4 to 1-1/2 inches for grading design purposes.

Excavating Conditions

AM 2-33 Excavation of onsite soils shall be accomplished with standard heavy duty earthmoving or trenching equipment. Some hard cemented sandstone beds were encountered during the field exploration on portions of the site and some minor, isolated blasting may be required to remove these hard materials.

AM 2-34 Heavy seepage was encountered, as indicated on the Boring Logs, at multiple elevations. Consequently, considerable water can be expected within planned excavations, typically reaching maximum discharge within 2 to 5 days after exposure. Additional nuisance water (seepage) is foreseen in nearly all major cuts decreasing in volume with time, and being less at higher site elevations as well as in cuts made late in the year. All nuisance water shall be accommodated in accordance with County requirements.

Expansion Potential

AM 2-35 Onsite materials are considered to be moderately expansive, generally. Soils of high and low expansivity are expected to comprise less than 25% of the overall pad areas. The expansivity of the actual soils placed within structural areas shall be verified during grading, prior to construction.

Utility Trenching

AM 2-36 The typical walls of temporary construction trenches shall stand nearly vertical, with only minor sloughing, provided the total depth does not exceed 4 to 5 feet. Shoring of excavation walls and/of flattening of side slopes may be required, if greater depths are necessary.

AM 2-37 Trenches shall be located so as not to impair the bearing capacity nor settlement under planned foundations. As a guide, trenches shall be aligned perpendicular to foundations, and the Structural Engineer so informed to modify the foundation at the crossing, as needed. All other trenches shall observe a lateral off-set equal to their total depth

AM 2-38 Existing soils shall be utilized for trench backfill, provided they are essentially free of organic materials and oversized materials (rock, gravel, etc., in excess of 1-inch maximum size, unless within an approved soil matrix). Alternately, select granular materials (sand equivalent of 30 or greater) may be imported as backfill. Compaction should be accomplished entirely by mechanical means, subject to onsite assessment during pipeline installation

Surface Drainage

AM 2-39 Positive surface gradients shall be provided away from slope tops per approved grading plans and adjacent to the future buildings, so as to direct surface water run-off away from structural areas and toward suitable discharge facilities.

Sulphate Content

AM 2-40 The soils sulphate content shall be ascertained during the concluding stages of rough grading, and the type of cement to be used determined at that time.

Grading Control

AM 2-41 All grading and earthwork shall be subject to on-going testing and observation by the applicants geotechnical consultant, including engineers, engineering geologists and/or technicians.

Slabs-on-Grade

AM 2-42 Concrete slabs shall be founded on approved (reworked) in-place soils and/or on properly compacted fill. The subgrade shall be proof-rolled just prior to construction to provide a firm, unyielding surface, especially if the surface has been disturbed by the passage of time and/or exposure to construction traffic.

AM 2-43 Floor slabs shall be at least 4 inches thick. The Finished Floor Level should be at least 6 inches above highest adjacent exterior grade. Joints shall be provided.

AM 2-44 If flooring that would be affected by moisture is to be used, the slab shall be underlain by 2 inches of sand, with a 10-mil plastic sheet between the sand and the subgrade.

AM 2-45 Precautions in respect of expansive soils shall be taken.

Foundations

AM 2-46 The proposed structures shall be supported on conventional spread footings, supported into approved compacted fill and/or reworked native material.

Long Term Settlements

AM 2-47 The grading concept, as presently proposed, includes several areas where deep fill will result, exceeding 50 feet in depth. These soil masses may experience significant settlements, with time, of 4 to 6 inches or more. Such downward movements can be tolerated by most improvements, provided these occur at a reasonably uniform rate and rather evenly over a well distributed area. However, the degrees and rates of settlement shall be analyzed during the final design phase.

Phasing of Earthwork

AM 2-48 Unstable Ground
Initial stability evaluations have determined that several natural slopes subject to grading are inherently unstable. Removals, therefore, shall be planned and carried out with care in order to minimize deep-seated, in-construction failures. Typically, about 10 percent of back cuts for buttresses will fail during grading. Allowances for schedule and budget contingencies should be made.

AM 2-49 Required Clean-Out Work
Prior to improving the gross stability of hillsides, clean-out work will be necessary along their lowest (toe) elevations. Whereas such selective removals are essential prior to placement of additional fill, this process can trigger undesired slippage. Therefore, selective unloading of the slide mass shall be required before stabilization can effectively begin.

AM 2-50 Slide Unloading
Where existing slope faces are marginally safe in their present condition, the higher portions of each such slide shall require removals toward the top, prior to clean-out, and subsequent loading at the toe.

WATER/HYDROLOGY

Project Design Features

PDF 3-1 A master drainage concept has been incorporated into the project design to mitigate hydrology impacts to existing OCPDS requirements and standards. The master drainage concept, shown in Exhibit 22, and contained in its entirety in Appendix L of this EIR, proposes a series of storm drains, catch basins, inlet/outlet structures, energy dissipators and slope drains to control project drainage.

Standard County Conditions and Mitigation Measures

SC 3-2 Prior to the issuance of any grading permits the applicant shall, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division:

a. Prepare a drainage study determining the effect the proposed development and associated drainage patterns will have on existing drainage facilities.

b. Mitigate either by on-site retardation or by providing improvements appropriately to impacted existing drainage facilities.

SC 3-3 Prior to the issuance of any grading permits the applicant shall, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division:

a. Design and convey construction funds for surface drainage improvements; and

b. Design all necessary storm drain facilities extending to a satisfactory point of disposal for the proper control and disposal of storm runoff; and

c. Dedicate the associated easements to the County of Orange, if determined necessary.

SC 3-4 Prior to the issuance of any certificates of use and occupancy, said improvements shall be constructed in a manner meeting the approval of the Manager, PF&R/Construction Division.

SC 3-5 Prior to the issuance of any grading permit, and if determined necessary by the Manager, PDS/Subdivision and Grading Services Division, a letter of consent, in a form approved by the Manager, PDS/Subdivision and Grading Services Division, suitable for recording, shall be obtained from the upstream and/or downstream property owners permitting drainage diversions and/or unnatural concentrations.

SC 3-6 Prior to issuance of any building permits, the applicant shall participate in the applicable Master Plan of Drainage in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division, including payment of fees and the construction of the necessary facilities.

SC 3-7 Potential for the proposed project to impact the site's hydrology shall be reduced to a level of insignificance through engineering design and construction techniques incorporated into the project in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

Water Quality

SC 3-8 Prior to issuance of building permits, or grading permits, whichever come first, permit

applicant shall submit for approval of the Manager, PDS/Subdivision and Grading Services Division, a Water Quality Management Plan (WQMP) specifically identifying Best Management Practices (BMPs) that will be used onsite to control predictable pollutant runoff. This WQMP shall identify at a minimum the routine structural and non-structural measures specified in the Countywide NPDES Drainage Area Management Plan (DAMP) Appendix which details implementation of the BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, lessee, etc.); and, shall reference the location(s) of structural BMPs.

SC 3-9 Prior to the issuance of precise grading permits or building permits, whichever comes first, the applicant shall submit and obtain approval from the Manager, PDS/Subdivision and Grading Services Division, of a Water Quality Management Plan (WQMP) specifically identifying Best Management Practices (BMPs) that will be used on-site to control predictable pollutant runoff. This WQMP shall identify, at a minimum, the routine, structural and non-structural measures specified in the Countywide NPDES Drainage Area Management Plan (DAMP) Appendix which details implementation of BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association shall reference the location(s) of structural BMPs.

Flood Plain Elevation

SC 3-10 Prior to issuance of any grading permits, the applicant shall submit evidence to the Manager, PDS/Subdivision and Grading Services Division, that the applicant has obtained coverage under the NPDES statewide General Stormwater Permit from the State Water Resources Control Board.

Easements

SC 3-11 Prior to the issuance of any certificates of use and occupancy, the applicant shall not grant any easements over any property subject to a requirement of dedication or irrevocable offer to the County of Orange or the Orange County Flood Control District, unless such easements are expressly made subordinate to the easements to be offered for dedication to the County. Prior to granting any of said easements, the subdivider shall furnish a copy of the proposed easement to the Manager, PDS/Subdivision and Grading Services Division, for review and approval. Further, a copy of the approved easement shall be furnished to the Manager, Building Inspection Services, prior to the issuance of any certificate of use and occupancy.

TRANSPORTATION/CIRCULATION

Project Design Features

Primary project access will be off of El Toro Road with an emergency access at Valley Vista Way.

PDF 4-1 The onsite circulation system is proposed as shown in Exhibit 45 to accommodate project related traffic generation, including design of the entry street as a Collector roadway with a curb-to-curb width of 58 feet at its intersection with El Toro Road. This provides for two 12-foot exiting lanes and two 12-foot entering lanes with a 10-foot median. The entry's cross-section shall be maintained for approximately 160 feet where it could then be transitioned to a standard 40-foot wide curb-to-curb width Collector roadway. Secondary emergency only access will be provided via a gated connection to existing Valley Vista Way. Minimum fire access roadway width of 28 feet shall be required.

PDF 4-2 The entry street will be designed with a traffic signal and a southbound left-turn pocket and northbound right-turn lane. The applicant shall provide a cash deposit for the design and construction of the traffic signal.

PDF 4-3 All weather access to the proposed water tank shall be provided by the applicant. This access shall be designed with a minimum 28 foot width and a maximum grade of 10%.

Standard County Conditions and Mitigation Measures

SC 4-4 Prior to the issuance of any building permits, the applicant shall participate in design, construction, and/or financing of the cost of a traffic signal in the project vicinity in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 4-5 Prior to the issuance of building permits, the applicant shall pay fees for the Major Thoroughfare and Bridge Fee Program listed below, in a manner meeting the approval of the Manager, PF&R/Programs Division.

a. Foothill Circulation Phasing Program

b. Prior to recordation of a final tract map, the subdivider shall enter into an agreement with the County of Orange for participation in a fee program for participation in a fee program (if adopted by the Board of Supervisors) for implementation of the Foothill/Eastern Transportation Corridor. Said agreement shall provide that:

1. The fee shall be $158.00 per trip end times the County standard trip end generation rate for the type of development proposed, times the number of units (footage) proposed, or the fee payable under the program, whichever is less.

2. Subdivider's obligation to pay fees would arise only after the County establishes the fee program, prior to issuance of building permits.

3. Subdivider's obligation to pay the fee would be extinguished if the fee program were not established within three (3) years of the date of issuance of the first building permit for subject development.

4. Subdivider shall furnish surety bond, letter of credit, money or such other security approved by the Director, PF&RD, to assure payment of the fees related to subject development.

5. This condition shall be void if a trial court of competent jurisdiction, in a final judgement, or an appellate court, if the matter is appealed, sets aside a condition imposed by the County which was substantially the same as said condition.

c. El Toro Road

d. Santiago Canyon Road

SC 4-6 Building permit issuance shall be phased in accordance with the Foothill Circulation Phasing Plan (FCPP) Development Phasing Plan, and shall also be subject to any other Board of Supervisors approved growth management phasing plan pertaining to the timely provision of public services and facilities.

SC 4-7 Building permit issuance shall be phased in accordance with any Board of Supervisors approved Growth Management Phasing Plan pertaining to the timely provision of public services and facilities.

SC 4-8 Prior to the issuance of any grading permits, adequate sight distance shall be provided at all street intersections per Standard Plan 1117, in a manner meeting the approval of the Manager, PF&R/Programs Division. This includes any necessary revisions to the plan such as removing slopes or other encroachments from the limited use area.

SC 4-9 Prior to the issuance of any certificates of use and occupancy, the developer shall construct the approved internal circulation improvements in a manner meeting the approval of the Manager, PF&R/Construction Division. Further, a copy of the approved plans shall be furnished to the Manager, Building Inspection Services, prior to the issuance of any certificates of use and occupancy.

SC 4-10 When monuments exist which control the location of subdivisions, streets or highways, or provide survey control, the monuments shall be located and referenced prior to any street construction or relocation, and shall be reset after construction as required by Section 8771 of the Business and Professions Code, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 4-11 Prior to issuance of a building permit, the applicant shall pay a cash fair share contribution for the design and construction of improving Santiago Canyon Road

from Live Oak Canyon Road to Jamboree Road, in a manner meeting the approval of the Manger, Traffic Engineering. In addition, the applicant shall participate in the Santiago Canyon Road Safety Improvement Program.

SC 4-12 Prior to issuance of a building permit, the applicant shall design and construct roadway improvements for El Toro Road including a deceleration lane and a left turn pocket into the project entrance based on a 60 mph minimum design speed in a manner meeting the approval of the Manager, PF&R/Programs Division.

SC 4-13 Prior to issuance of a building permit, the applicant shall provide a cash deposit for the difference in cost of designing and constructing the roadway improvements proposed with the project as compared to the costs associated with the ultimate configuration of El Toro Road, as determined by PDS/Environmental & Project Planning ServicesDivision, all in a manner meeting the approval of the Manager, PF&R/Programs Division.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations in a manner meeting the approval of the Manager, Transportation Planning.

AM 4-15 El Toro Road lane improvements needed at the Project Entrance to serve Year 2000 and 2020 conditions shall be completed in conjunction with development.

AM 4-16 Traffic signing/striping shall be implemented in conjunction with detailed construction plans for the project. Verification of adequate parking shall be analyzed for the project site in conjunction with approval of the site plan.

AM 4-17 The project shall participate in existing road fee programs, including the Foothill/Eastern Transportation Corridor Fee Programs, Foothill Circulation Phasing Program (FCPP), El Toro Road Fee Program and the Santiago Road Fee Program.

Both existing traffic patterns and SCTM traffic projections for Years 2000 and 2020 indicate the attraction of Glenn Ranch Road, Portola Parkway, and the Foothill Transportation Corridor (SR-241) for increased traffic volumes in the project study area. North of the Foothill Transportation Corridor, El Toro Road can accommodate projected traffic volumes with the proposed project on four travel lanes divided by a raised or striped median.

AIR QUALITY

Project Design Features

No air quality PDF's have been proposed.

Standard Conditions and Mitigation Measures

SC 5-1 Grading and excavation shall be halted during periods of high winds meeting the approval of the Manager, EA, Subdivision and Grading Services Division. According to AQP Measure F-4, high winds are defined as 25 mph or greater. This level occurs only under unusually extreme conditions, such as Santa Ana wind conditions. Notations in the above format, included with other notations on the front sheet of grading plans, will be considered as adequate evidence of compliance with this condition.

SC 5-2 Prior to issuance of grading permits, the project applicant shall demonstrate measures to ensure compliance with SCAQMD Rule 403, and shall identify the dust suppression measures, such as regular watering, which shall be implemented to reduce emissions during construction and grading in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division. This will help reduce the short-term impacts from particles which could result in nuisances that are prohibited by Rule 403.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provision of existing codes and regulations:

AM 5-3 As previously noted, no credit was taken for mobile source emissions reductions either from technology improvements (reformulated gasoline, alternative fuels and/or electric cars), nor from transportation behavior modification in response to programs such as South Coast AQMD Reg. XV or by the trip reduction programs. These programs will mitigate the identified significant growth-related cumulative air quality impact to some extent. Because the projected effectiveness of such programs and because the time frame for technology development is uncertain, the degree of possible mitigation can not be quantified with certainty. Similarly, the buildout date for Saddleback Meadows will depend on economic forces that can not be predicted. The following discussion structures the recommended mitigation as comprehensively as possible, but quantification of mitigation effectiveness is speculative at currently known levels of detail.

AM 5-4 Contractors will comply with SCAQMD Rule 403.

AM 5-5 Contractors will utilize measures to prevent dirt from being tracked, washed, blown or otherwise conveyed onto paved roadways, and will wash or sweep the construction access points at El Toro Road on a routine basis on a frequency specified by the County of Orange as well as whenever dirt is visible more than 50 feet from the access point independent of the routine clean-up schedule.

AM 5-6 Trucks hauling dirt on public roads to and from the site will be covered or will

maintain a six inch differential between the maximum height of any hauled material and the top of the haul trailer. Haul truck drivers will water the load prior to leaving the site to prevent soil loss during transport.

AM 5-7 Construction management procedures required by the County of Orange and other jurisdictions shall be implemented. Contractor personnel responsible for supervision and the appropriate actions to be taken for the following measures shall be identified:

- Cessation of activities during a Stage-2 smog episode. Call 1-800-242-4022 for the daily forecast.
- Truck routes and schedules for receipt of materials shall be coordinated with County of Orange staff.
- Where feasible, on-road vehicles and off-road equipment shall be turned off and subsequently restarted if the anticipated duration of idling is expected to exceed five (5) minutes.

AM 5-8 Graded surfaces used for off-road parking, materials lay-down or awaiting future construction shall be stabilized for dust control as needed. Frequently accessed unpaved areas shall be paved as early as possible to minimize dirt trackout to public rights of way.

AM 5-9 Equipment will be maintained in proper tune to prevent visible soot from reducing light transmission through the exhaust stack exit by more than 20 percent for more than three (3) minutes per hour and use low-sulfur fuel as required by SCAQMD regulation.

Flag persons and appropriate traffic control devices will be used as needed to minimize construction activity interference with off-site traffic.

AM 5-11 Implementation of the above measures is expected to maintain construction activity air quality impacts at less than significant levels.

Operational Activities:

- Traffic flow at the project access will be maintained at acceptable levels of service through mitigation measures identified in the project traffic study.
- 220v electric power for future use to charge electric-powered vehicles will be made available in homeowner garages.

AM 5-12 Emissions calculations and the corresponding ambient air quality impact assessment for project-related construction and Saddleback Meadows operations presumed compliance with SCAQMD rules regarding dust control. The potential for additional

emissions reduction beyond the mandatory requirements of existing rules and regulations was evaluated based on Appendix 11 of the SCAQMD Air Quality Handbook which quantifies reduction potential of a variety of project construction and operation emissions control measures.

Dust emissions can be controlled from their 50 percent control assumed for Rule 403 compliance by an additional 50-80 percent of the uncontrolled fraction. The net effective dust control level is therefore 75-90 percent.

Unless the entire project site is under simultaneous massive grading, attaining the optimum level of dust control will maintain dust impacts at less than significant levels.

Operational emissions reduction from mobile sources of 5 percent of their non-TCM implementation level can not reduce the substantial emission level to less than the SCAQMD advisory level significance thresholds. A number of secondary considerations were identified, however, that would either allow for a finding of an individually less than significant air quality impact.

NOISE

Project Design Features

No PDF mitigation measures are proposed.

Standard County Conditions and Mitigation Measures

SC 6-1 All residential lots and dwellings shall be sound attenuated against present and projected noise which shall be the sum of all noise impacting the project so as not to exceed a composite interior standard of 45 dBA CNEL all habitable rooms and a source specific exterior standard of 65 DBA CNEL in outdoor living areas. Evidence prepared by a County-certified acoustical consultant, that these standards will be satisfied in a manner consistent with Zoning Code Section 7-9-137.5, shall be submitted as follows:

a. Prior to the issuance of grading permits, as determined by the Manager, PDS/ Building Permit Services Division, the applicant shall submit an acoustical analysis report to the Manager, PDS/Building Permits Services Division, for approval. The report shall describe in detail the exterior noise environment and preliminary mitigation measures. Acoustical design features to achieve interior noise standards may be included in the report, in which case it may also satisfy "B" below.

b. Prior to the issuance of any building permits for residential construction, the applicant shall submit an acoustical analysis report describing the acoustical design features of the structures required to satisfy the exterior and interior

noise standards to the Manager, PDS/Building Permits Services Division, for approval along with satisfactory evidenced which indicates that the sound attenuation measures specified in the approved acoustical report have been incorporated into the design of the project.

c. Prior to the issuance of any building permits, the applicant shall show all freestanding acoustical barriers on the project's plot plan illustrating height, location and construction in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 6-2 Prior to the issuance of grading permits, as determined by the Manager, PDS/Building Permits Services Division, an acoustical analysis report shall be submitted to the Manager, PDS/Building Permits Services Division, for approval. The report shall describe in detail the exterior noise environment and preliminary mitigation measures. Acoustical design features to achieve interior noise standards may be included in the report in which case it may also satisfy SC 6-3 below.

SC 6-3 Prior to the issuance of any building permits for residential construction, an acoustical analysis report describing the acoustical design features of the structures required to satisfy the exterior and interior noise standards shall be submitted for review and approval to the Manager, PDS/Building Permits Services Division, along with satisfactory evidence which indicates that the sound attenuation measures specified in the approved acoustical report have been incorporated into the design of the project.

SC 6-4 Prior to the issuance of any building permits, all freestanding acoustical barriers must be shown on the project's plot plan illustrating height, location and construction in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 6-5 Prior to the issuance of any certificates of use and occupancy, the developer shall produce evidence acceptable to the Manager, PDS/Building Inspection Services Division, that information stating this property is subject to the overflight, sight, and sound of aircraft operating from (El Toro Marine Corps Air Station) has been provided to the Department of Real Estate of the State of California for inclusion into the Final Subdivision Public Report.

SC 6-6 Prior to the issuance of any certificates of use and occupancy, the applicant shall post aircraft noise impact notification signs in all sales offices associated with new residential development located within an aircraft 63 dB CNEL contour. The number and location of said signs shall be as approved by the Manager, PDS/Building Permits Services Division.

SC 6-7 Prior to the issuance of any building permit, an aviation easement over this property shall be offered for dedication to the County of Orange in a manner meeting the

approval of the Manager, PDS/Building Permits Services Division.

SC 6-8 Prior to the sale, lease or rental of any structure or portion thereof, the applicant/owner shall provide to each prospective purchaser, lessee, or tenant a notice and statement of acknowledgment that the property is subject to overflight, sight, and sound of aircraft operating from (El Toro Marine Corps Air Station). The form and method of distribution of said notice and statement of acknowledgment shall be as approved by the Manager, PDS/Building Permits Services Division.

A. Prior to the issuance of any grading permits, the proponent shall produce evidence acceptable to the Manager, Building Permit, that:

(1) all construction vehicles or equipment, fixed or mobile, operated within 1000 feet of a dwelling shall be equipped with properly operating and maintained mufflers.
(2) All operations shall comply with Orange County "Codified Ordinance Division 6 (Noise Control); and
(3) Stockpiling and/or vehicle staging areas shall be located as far as practicable from dwellings.

B. Notations in the above format, appropriately numbered and included with other notations on the front sheet of grading plans, will be considered as adequate evidence of compliance with this requirement.

SC 6-9 Prior to issuance of any grading permits, the project proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division that excavation, grading and other construction-related activities shall be restricted to daytime hours as promulgated in the County's Codified Ordinance Division 6 (Noise Control).

SC 6-10 Prior to issuance of any grading permits, the project proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division that all construction equipment, stationary or mobile, shall be equipped with properly operating and maintained mufflers.

SC 6-11 Prior to the issuance of any grading permits, the project proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division, that:

a) All construction vehicles or equipment, fixed or mobile, operated within 1,000-feet of a dwelling shall be equipped with properly operating and maintained mufflers.

b) All operations shall comply with Orange County Codified Ordinance Division 6 (Noise Control).

c) Stockpiling and/or vehicle staging areas shall be located as far as practicable

from dwellings.

Notations in the above format, appropriately identified and included with other notations on the front sheet of grading plans, will be considered as adequate evidence of compliance with this condition.

BIOLOGICAL RESOURCES

Project Resign Features

No PDFs proposed.

Standard County Conditions and Mitigation Measures

SC 7-1 Pursuant to Section 711.4 of the Fish and Game Code, the applicant shall comply with the requirements of AB 3158, prior to the filing of the Notice of Determination for the project, in a manner meeting the approval of the Manager, PDS/Environmental and Project Planning Services Division.

SC 7-2 Prior to the issuance of any grading permits, the applicant shall obtain a Streambed Alteration Agreement covering the affected water courses and wetland areas within the proposed project area from the California Department of Fish and Game. A 1603 Streambed Application has been submitted to CDFG. All Streambed alteration activities shall be carried out in accord with the requirements of an approved Streambed Alteration Agreement.

SC 7-3 Prior to the issuance of any grading permits, the applicant shall obtain the necessary individual or nationwide permit (pursuant to Section 404 of the Federal Clean Water Act) covering all affected wetland areas from the U.S. Army Corps of Engineers, Los Angeles District All wetland areas shall be subject to the specifications of the 404 permit as determined by the Corps of Engineers. A copy of the 404 permit shall be submitted with the first grading permit application for the proposed project to the Manager, PDS/Subdivision and Grading Services Division.

SC 7-4 Prior to the issuance of a grading permit, as required by participation in the Natural Community Conservation Planning/Coastal Sage Scrub (NCCP) agreement signed by the County on May 1, 1992, the project applicant shall provide an accounting summary, in acres or portions thereof, of coastal sage scrub scheduled to be impacted by removal through grading in a manner meeting the approval of the Administrator, Planning & Zoning. (See Section 4.7.3.)

SC 7-5 Prior to the issuance of a grading permit, the applicant shall provide proof that the appropriate Federal approvals required for impacts to Coastal Sage Scrub have been obtained from the U.S. Fish and Wildlife Service, in a manner meeting the approval of the Administrator, Planning & Zoning and Manager, PDS/Grading Services

Division, in consultation with the Administrator, Planning & Zoning.

SC 7-6 Notwithstanding the tentative map, no grading shall occur within the Natural Community Conservation Plan (NCCP) enrolled area except as in a manner meeting the approval of the Administrator, Planning and Zoning.

SC 7-7 Prior to the issuance of any grading permit, approval of any activity that involves removal of any native vegetation from subject site including clearing, grubbing, mowing, discing, trenching, grading, fuel modification, or other related construction-related activities, the applicant shall obtain written proof from the U.S. Fish and Wildlife Service that said activity complies with the Federal Endangered Species Act. This evidence shall be submitted to the Manager, PDS/Subdivision and Grading Services Division, for review and approval, in consultation with the Administrator, Planning and Zoning.

SC 7-8 Prior to the issuance of grading permits the applicant shall submit a landscape and tree preservation plan to the Manager, PF&R/Harbors Beaches and Parks Division, for review and approval in accordance with the following guidelines:

A. To the maximum extent feasible, all existing native and exotic trees and other significant vegetation shall be preserved in conjunction with any development activity.

B. A tree preservation plan shall be prepared by a landscape architect for all development projects which identifies the location, size and species of all trees having a trunk diameter of 5 inches or greater (measured at four and one-half feet above ground level) and shrubs having a trunk or branch diameter of 3 inches or greater. The plan shall show which plants are proposed for removal and where transplanted and/or replacement plants will be located. Tree preservation plans shall be approved prior to issuance of grading permits, or where grading permits are not required, prior to issuance of building permits.

C. Trees removed in accordance with an approved tree preservation plan shall be replaced by a combination of transplanting to another location on the subject property and/or replacement by a combination of 1 and 15-gallon plants at a minimum ratio of 5:1. The following sliding scale shall also be used for trees to determine if more than the minimum number of replacement trees are required.

Tree Replacement Scale

Trunk Diameter (inches) of Tree Removed At 4½ Feet Above Ground Level	Total Number of Replacement
5 to 11	5 (1-15 gal / 4-1 gal)
12 to 17	7 (1-15 gal / 6-1 gal)
18 to 23	10 (2-15 gal / 8-1 gal)
24 to 35	12 (2-15 gal / 10-1 gal

Any oak exceeding 35 inches in diameter should be preserved, transplanted or replaced in accordance with the provisions outlined in Section E of the mitigation measure. In the event that all required replacement trees will not fit on the property, increase in container size will be considered in conjunction with reductions in replacement quality.

D. Significant shrubs removed in accordance with an approved tree preservation plan should be replaced by a combination of transplanting to another location on the subject property and/or replacement by 5-gallon plants at a minimum ration of 3:1.

E. All other plants not specified in Guidelines C and D above that are removed in accordance with an approved tree preservation plan should be either transplanted to another location on the subject property or replaced by 15-gallon plants for trees and 5-gallon plants for shrubs at a minimum ration of 1:1. The two 35" + oak trees impacted by project implementation, will be mitigated by an enhanced replacement ratio (5-15 gal/10-1 gal) to the satisfaction of the Manager, PF&R/Harbors Beaches and Parks Division.

F. All transplanting of trees shall be performed by an experienced nursery or other landscape contractor, who shall care for the trees for at least six months after transplanting.

G. Prior to issuance of final certificates of use and occupancy, all transplanted or replacement trees and shrubs shall be installed in accordance with the tree preservation plan.

H. Oak trees shall not be subjected to increased runoff from irrigation systems, impermeable surfaces, storm drain discharge, etc.

I. Natural drainage courses and natural grades in proximity of, and providing seasonal irrigation to oak trees shall not be altered.

J. Grading, placement of fill, storage of building materials and heavy equipment,

structural development, and hardscape (e.g., roads, sidewalks, patio slabs and pool decks) shall be prohibited within the drip line (outer edge of branches) of any tree. During grading and construction operations, all trees shall be temporarily fenced off with chain link fencing to protect such areas.

K. Use of pre-emergent weed killers shall be prohibited within 10 feet of the drip line of any individual tree and within any natural drainage course which seasonally irrigates trees.

L. Use of soil sterilizers shall be prohibited because they kill everything in the soil.

SC 7-9 Specify areas/lots to be dedicated or irrevocably offered to the County in fee or easement for landscape maintenance purposes, scenic or resource preservation purposes or resource replacement shall be landscaped, equipped for irrigation, and improved in accordance with an approved plan as stated below:

a) Preliminary Plan -An agreement shall be entered into and financial security posed guaranteeing landscape improvements and the maintenance thereof based on a preliminary landscape plan showing major plant material and uses, with a cost estimate for the landscape improvements. The preliminary plan and cost estimates shall be reviewed and approved by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PFR/Harbors Beaches and Parks Division. Said plan shall take into account the previously approved landscape plan for AP 95-7, the EMA Standard Plans for landscape areas, adopted plant palette guides, applicable scenic and Specific Plan requirements, Water Conservation Measures contained in Board Resolution 90-487 (Water Conservation Measures), and Board Resolution 90-1341 (Water Conservation Implementation Plan).

b) Detailed Plan - Prior to the issuance of any building permit(s), a detailed landscape plan shall be submitted to and approved by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PFR/Harbors Beaches and Parks Division. Detailed plans shall show the detailed irrigation and landscaping design.

c) Installation Certification - Prior to the issuance of final certificates of use and occupancy and the release of the financial security guaranteeing the landscape improvements, said improvements shall be installed and shall be certified by a licensed landscape architect or licensed landscape contractor, as required, as having been installed in accordance with the approved detailed plans. Said certification, including an irrigation management report for each landscape irrigation system, and any other required implementation report determined applicable, shall be furnished in writing to the Manager, PFR/Construction Division, and the Manager, PDS/Building Inspection Services Division, prior

to the issuance of any certificates of use and occupancy.

SC 7-10 Prior to the issuance of precise grading permits, landscaping for privately maintained areas shall be designed in accordance with a plan. The plan shall be certified by a licensed landscape architect or a licensed landscape contractor, as required, as taking into account approved preliminary landscape plan (if any), EMA Standard Plans, area plan 95-7, scenic corridor and Specific Plan requirements, Grading and Excavation Code erosion control requirements, Subdivision Code, Zoning Code, and conditions of approval, Water Conservation Measures contained in Board Resolution 90-487 (Water Conservation Measures) and Board Resolution 90-1341 (Water Conservation Implementation Plan). Said plan shall be reviewed by the future homeowners association and be reviewed and approved by the Manager, PDS/Subdivision and Grading Services Division.

SC 7-11 Prior to the issuance of grading permits, the applicant shall provide additional evidence that the onsite coastal sage scrub habitat is not occupied by California gnatcatchers, in accordance with current USFWS protocol (7 in season/9 out of season pass surveys) to the satisfaction of the USFWS and the Administrator, Planning and Zoning. Should occupied coastal sage scrub habitat be identified onsite by the surveys consultation shall be initiated with the USFWS, and a coastal sage scrub/gnatcatcher mitigation plan shall be developed to the satisfaction of the USFWS and the Administrator, Planning and Zoning prior to the issuance of grading permits.

SC 7-12 Prior to the issuance of grading permits, the applicant shall provide appropriate measures to mitigate the project related impacts to onsite wildlife movement, to the satisfactin of the USFWS, CDFG and the Administrator, Planning and Zoning. Mitigation shall consider onsite as well as offsite mitigation options, and established fee programs.

SC 7-13 Prior to the issuance of grading permits, the applicant shall provide assurances to the satisfactin of the County NCCP coordinator and the Administrator, Planning and Zoning, that the proposed project will participate in the NCCP planning process and not preclude the finalization of the Southern Subregional reserve component of the NCCP.

SC 7-14 Prior to the issuance of grading permits, the applicant shall prepare a relocation and establishment mitigation plan, designed to mitigate impacts to Riverside fairy shrimp/pond habitat, wetlands, and southern sycamore woodland, to the satisfaction of the Administrator, Planning and Zoning, in consultation with USFWS and CDFG. Mitigation shall consider onsite as well as offsite mitigation options, as well as, established fee programs.

Additional Mitigation Recommendations

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations in a manner acceptable to the Manager, Environmental and Project Planning Services Division, in consultation with the Manager, PF&R/Harbors Beaches & Parks Division.

AM 7-15 The following recommendations are proposed to further minimize some of the proposed impacts.

- Where possible, bulbs of individual Catalina Mariposa Lily and Intermediate Mariposa Lily that are to be impacted shall be dug up and transplanted to a suitable habitat with similar soil, slope exposure, etc.

- Lighting within development projects adjacent to conserved habitat should be selectively placed, shielded, and directed away from that habitat. In addition, lighting from homes abutting conserved habitat should be screened with vegetation, and large spotlight-type lighting that may affect conserved habitat should be prohibited. These lighting restrictions should be incorporated into the project's CC&Rs.

AESTHETICS

Project Design Features

PDF 8-1 All public utilities shall be situated underground.

PDF 8-2 Where feasible, drainage devices (terrace drains, benches, and intervening terraces) shall be bermed and placed in swales.

PDF 8-3 Concrete drainage swales and other similar drainage infrastructure shall be tinted with an appropriate earth tone to effectively conceal them from surrounding view.

PDF 8-4 The water tank shall be bermed, landscaped and painted to blend with the surrounding environment.

Standard County Conditions and Mitigation Measures

SC 8-5 Prior to the issuance of any building permits, an agreement shall be entered into and financial security posted guaranteeing landscape improvements and the maintenance thereof based upon a detailed landscape plan showing landscape design and irrigation with a cost estimate for the landscape improvements approved by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Harbors Beaches

& Parks Division. Said plan shall take into account previously approved landscape plan(s), PF&RD Standard Plans for landscape areas, adopted plant palette guides, applicable scenic and specific plan requirements, water conservation measures contained in Board Resolutions 90-487 (Water Conservation Measures), and 90-1341 (Water Conservation Implementation Plan).

SC 8-6 Prior to the issuance of preliminary grading permits, landscaping for privately maintained areas shall be designed in accordance with a plan certified by a licensed landscape architect or a licensed landscape contractor, as required, as taking into account approved preliminary landscape plan(s), PF&RD Standard Plans, area plan 95-7 scenic corridor and Specific Plan requirements, Grading and Excavation Code erosion control requirements, Subdivision Code, Zoning Code, and conditions of approval, Water Conservation Measures contained in Board Resolutions 90-487 (Water Conservation Measures) and 90-1341 (Water Conservation Implementation Plan). Said plan shall be reviewed and approved by Manager, PDS/Building Permits Services Division, Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Harbors Beaches & Parks Division, and Manager, PDS/ Environmental and Projects Planning Services Division.

SC 8-7 Prior to the issuance of certificates of use and occupancy and release of financial security, applicant shall install the approved landscaping and irrigation system and shall have a licensed landscape architect or licensed landscape contractor, as applicable, certify that it was installed in accordance with the certified plan. Said certification, including an irrigation management report for each landscape irrigation system, and any other implementation report determined applicable, shall be furnished in writing to the Manager, Building Inspection Services, prior to the issuance of any certificates of use and occupancy.

SC 8-8 Prior to issuance of any building permit, the applicant shall demonstrate that all exterior lighting has been designed and located so that all direct rays are confined to the property in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations:

AM 8-9 Prior to issuance of any grading permit, the project proponent shall provide evidence to the Manager, PDS/Subdivision and Grading Services Division indicating that

graded areas will be compatible with natural landform characteristics to the greatest extent possible. Criteria to achieve the desired effect shall include:

a) Recontouring the existing landforms to provide a smooth and gradual transition between graded slopes and existing grade while preserving the basic topographic character of the site.

b) Variation and combination of slopes 2:1, 3:1 and 4:1 to create a more natural character wherever possible within the graded areas.

c) Attempting to balance cut and fill within the overall project area to eliminate offsite and import/export related grading operations.

d) Obscuring slope drainage structures with a variety of plant materials.

e) Preservation of visual opportunities from hillsides by providing for panoramic views from selected locations (e.g., view corridors, sensitive landscape placement).

AM 8-10 Manufactured slopes shall be replanted with vegetation native to the site to blend the new topography with existing natural on site vegetation, immediately following precise grading operations.

AM 8-11 Fuel modification areas shall be planted with fire resistant vegetation.

AM 8-12 Use of the California Sycamore or other species similar to trees currently existing onsite shall be used in appropriate common area and street landscape locations where feasible.

AM 8-13 Common area landscaping and habitat transition zones shall utilize the FTSP recommended plant palette (Appendix H) when selecting plant material.

AM 8-14 Slope landscaping shall occur as soon as feasible after grading and be maintained by the applicant until a homeowners association has been organized and assumes long term maintenance responsibility.

Light and Glare

AM 8-15 Prior to issuance of any certificate of use and/or occupancy, the potentially adverse impact of night lighting on surrounding land use shall be mitigated to the satisfaction of the Manager, PDS/Subdivision and Grading Services Division by the following measures:

a) Street lights shall only be installed at intersections and as required to insure

public safety.

b) Low intensity halogen street lamps shall be used.

c) Street lights shall be shielded to direct the light beam downward and to avoid direct glare into open space areas and adjacent property.

CULTURAL/SCIENTIFIC RESOURCES

Standard County Conditions and Mitigation Measures

Archaeology

SC 9-1 Prior to the issuance of any grading permit, a County-certified archaeologist shall be retained by the applicant to complete a literature and records search for recorded sites and previous surveys. In addition, a field survey shall be conducted by a County-certified archaeologist unless the entire proposed project site has been documented as previously surveyed in a manner which meets the approval of the Manager, PF&R/Harbors Beaches and Parks Division. A report of the literature and records search and the field survey shall be submitted to and approved by the Manager, PF&R/Harbors Beaches and Parks Division. Mitigation measures may be required depending upon the recommendations of this report. This mitigation measure has been completed as part of the Draft EIR.

SC 9-2 Prior to issuance of any grading permit, a county-certified archaeologist shall be retained by the applicant to perform a subsurface test level investigation and surface collection as appropriate. The test level report evaluating the site shall include discussion of significance (depth, nature, conditions and extent of the resources), final mitigation recommendations and cost estimates and shall be approved by the Manager, PF&R/Harbors Beaches and Parks Division. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis.

SC 9-3 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified archaeologist has been retained to conduct pregrade salvage excavation of the archaeological resources in the permit area. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis. A final report of the salvage operation shall submitted to and approved by the Manager, PF&R/Harbors Beaches and Parks Division, prior to any grading.

SC 9-4 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified archaeologist has been retained, shall be present at the pregrading conference, shall establish procedures for archaeological resource surveillance, and

shall establish, in cooperation with the project developer, procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of the artifacts as appropriate. If the archaeological resources are found to be significant, the archaeological observer shall determine appropriate actions, in cooperation with the project developer, for exploration and/or salvage. The archaeologist shall submit a follow-up report to the Manager, PF&R/Harbors Beaches and Parks Division, which shall include the period of inspection, an analysis of any artifacts found and the present repository of the artifacts. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis. These actions, as well as final mitigation and disposition of the resources, shall be subject to the approval of the Manager, PF&R/Harbors Beaches and Parks Division.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provision of existing codes and regulations in a manner acceptable to the Manager, PF&R/Harbors Beaches and Parks Division Facilities.

AM 9-5 Prior to site grading the project site shall be examined by a qualified archeologist, all potential archeological sites identified, and surface collection and documentation of artifacts be conducted.

AM 9-6 As indicated by the project archeologist, sites warranting further study shall be disced to ascertain the extent and significance of the deposit. If the project archeologist determines that a site is potentially of cultural worth, then additional excavation in a manner determined by the project archeologist shall occur prior to further grading or construction activities at these locations.

AM 9-7 During initial grading, the project site shall be monitored by a qualified archeologist who shall have the authority to order a temporary cessation of grading activities and take appropriate action to preserve any culturally significant materials if uncovered.

AM 9-8 If human remains of Native American origin are encountered during the project the County Coroner's Office and the Native American Heritage Commission shall be contacted for preservation and protection of the remains.

Paleontology

SC 9-9 Prior to the issuance of any grading permit, a County-certified paleontologist shall be retained by the applicant to complete a literature and records search for recorded sites and previous surveys. In addition, a field survey shall be conducted by a County-certified paleontologist unless the entire proposed project site has been documented as previously surveyed in a manner which meets the approval of the Manager, PF&R/Harbors Beaches and Parks Division. A report of the literature and records

search and field survey shall be submitted to and approved by the Manager, PF&R/Harbors Beaches and Parks Division, Future mitigation shall depend upon the recommendations of the report. This mitigation measure has been completed.

SC 9-10 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified paleontologist has been retained by the applicant to conduct pregrade salvage and prepare a catalogue of the exposed resources. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis. The paleontologist shall submit a follow-up report for approval by the Manager, PF&R/Harbors Beaches and Parks Division, for review and approval, which shall include methodology, an analysis of artifacts found, a catalogue of artifacts, and their present repository. This mitigation measure has been completed.

SC 9-11 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified paleontologist has been retained to observe grading activities and salvage and catalogue fossils as necessary. The paleontologist shall be present at the pregrading conference, shall establish procedures for paleontological resource surveillance, and shall establish, in cooperation with the project developer, procedures for temporarily halting or redirecting work to permit sampling, identification, and evaluation of the fossils. If major paleontological resources are discovered, the paleontologist shall determine appropriate actions, in cooperation with the project developer, which ensure proper exploration and/or salvage. Excavated finds shall be offered to the County of Orange, or its designee, on a first-refusal basis. The paleontologist shall submit a follow-up report for approval by the Manager, PF&R/Harbors Beaches and Parks Division, which shall include the period of inspection, a catalogue and analysis of the fossils found, and present repository of the fossils. These actions, as well as final mitigation and disposition of the resources, shall be subject to approval by the Manager, PF&R/Harbors Beaches and Parks Division.

Additional Mitigation Measures

AM 9-12 A qualified paleontologist shall be retained to perform periodic inspections of excavations and, if necessary, salvage exposed fossils. The frequency of inspections will depend on the rate of excavation, the materials being excavated, and the abundance of fossils. Initially, monitoring shall be on a full time basis in all excavations because of the high potential for the discovery of fossils in all the rock units present in the study area.

AM 9-13 The paleontologist shall be allowed to divert or direct grading in the area of an exposed fossil to facilitate evaluation and if necessary, salvage.

AM 9-14 To recover small fossils, it will be necessary to collect sediment samples from

promising horizons discovered during grading monitoring for processing through fine mesh screens. Once the samples have been screened, they will be examined microscopically for small fossils.

AM 9-15 Fossils shall be prepared to the point of identification and catalogued before they are donated to their final repository.

AM 9-16 All fossils collected should be donated the County of Orange's designated repository.

AM 9-17 A report detailing the results of these efforts, listing the fossils collected, and naming the repository shall be submitted to the lead agency at the completion of the project.

Historical Resources

SC 9-18 Prior to issuance of a grading permit, project applicant shall provide written evidence to Manager, PF&R/Harbors Beaches and Parks Division that an historian has been retained by the applicant to implement final mitigation measures. A final report shall be submitted to and approved by the Manager, PF&R/Harbors Beaches & Parks Division prior to any alteration of the historical site area.

SC 9-19 Development adjacent to a place, structure, or object of historic significance shall be designed so that permitted uses and architectural design will protect the visual setting of the historic site. Such design shall be submitted to and approved by the Manager, PF&R/Harbors Beaches & Parks Division prior to any alteration of the historical site area.

RECREATION

Project Design Features

PDF 10-1 The Live Oak and Aliso Creek riding and hiking trail shall be located on the Project Site as shown in Exhibit 7 and Exhibit 63 Site Plan.

PDF 10-2 Live Oak Canyon Trail shall be constructed onsite, ultimately connecting O'Neil Regional Park to the Aliso Creek riding and hiking trail, as shown in Exhibit 7, Site Plan.

PDF 10-3 Eight onsite private parks shall be constructed as shown on Exhibit 7 Site Plan, to offset project demand.

Standard County Conditions and Mitigation Measures

SC 10-4 The developer or his assigns and successors in interest shall maintain offered park site(s) until such time as the County or its designer accepts the offer of dedication, all

in a manner of meeting the approval of the Manager, PF&R/Harbors Beaches & Parks Division

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations:

AM 10-5 Prior to first building occupancy, the applicant shall pay all park mitigation as required by the Department Manager, PF&R/Harbors Beaches & Parks Division.

AM 10-6 Prior to final building occupancy the applicant shall dedicate and construct all required regional trail connections and improvements as approved and required by the Department Manager, PF&R/Harbors Beaches & Parks Division.

HAZARDS

PDF 11-1 Implement a comprehensive fuel modification program in accordance with Section 27 of Appendix II-A of the 1994 Uniform Fire Code as adopted by County Ordinance 3954 (the Wildland Urban Interface Task Force report was not adopted and is not enforced by the OCFA). Exhibits 9 and 64 illustrate the fuel modification zones and, although adequately described, it should be noted that the distances are horizontal measurements rather than vertical and, therefore, may actually be larger zones as measured vertically up or down a slope (based on topography).

PDF 11-2 Incorporate the use of native, low fuel plant species into the landscape plan for both manufactured slope areas and remedial grading areas where appropriate as approved by the OCFA.

PDF 11-3 Provide for the construction of a water tank off site to ensure adequate on site water supply and OCFA fire flow requirements. The minimum fireflow requirements for this project of 1500 gpm for a minimum of 2 hours at 20 psi residual pressure. This flow must be available 24 hours per day .

PDF 11-4 Wet and dry utilities shall be constructed on opposite sides of the project streets to minimize land closure during maintenance periods.

PDF 11-5 Residential structures shall be constructed of fire-resistant material, including but not limited to, "Class A roof assemblies", closed eaves and offsets, double paned or dual glazed windows. The exterior walls of structures will be constructed of " 1-hour fire resistant materials" and all structures will have fire sprinklers.

PDF 11-6 All residential structures shall be required to have automatic interior fire sprinkler systems.

PDF 11-7 The interface area between residential lots and open space areas within the project boundary shall be wrought iron fenced to minimize intrusion of wildlife into the built portions of the project site.

Standard County Conditions and Mitigation Measures

SC 11-8 Prior to the issuance of any preliminary grading permits, applicant shall request that the Manager, HCA/Environmental Health, determine if vector control measures are necessary. If warranted, such measures shall be conducted by the developer in a manner meeting the approval of the Manager, HCA/Environmental Health.

SC 11-9 Prior to the issuance of any building permits for combustible construction, a letter and plan from the developer shall be submitted stating that water for fire fighting purposes and an all weather fire access road shall be in place before any combustible materials are placed on the site. Said letter shall be approved by the Fire Chief prior to the issuance of any building permits.

SC 11-10 Prior to the issuance of any building permits on those lots determined applicable by the Fire Chief, plans for an automatic fire sprinkler system shall be submitted to and approved by the Fire Chief prior to installation. This system shall be operational prior to the issuance of a certificate of use and occupancy.

SC 11-11 Prior to the issuance of any building permits, the applicant shall submit a detailed letter of intended use for each building to the Fire Chief for review and approval.

SC 11-12 Prior to the issuance of any grading permits, preliminary plans for all street and courts, public or private, shall be submitted to and approved by the Fire Chief. The plans shall include the plan view, sectional view, and indicate the width of the street or court measured flow line to flow line. All proposed fire apparatus turnarounds shall be clearly marked.

SC 11-13 Prior to the issuance of any certificates of use and occupancy, street improvement plans with fire lanes shown shall be submitted to and approved by the Fire Chief. The plans shall indicate the locations of red curbing and signage, and provide a drawing of the proposed signage with the height, stroke and color of lettering and the contrasting background color.

SC 11-14 Prior to the issuance of any grading permits, construction details for any emergency access gate shall be submitted to and approved by the Fire Chief. Contact the Orange County Fire Department at (714)744-6623 for a copy of the "Guidelines for Fire Department Emergency Access".

SC 11-15 Prior to the issuance of any grading permits, a fuel modification plan and program shall be submitted and approved by the Fire Chief in consultation with the Manger, Environmental and Project Planning Services Division. The Planning and

Development Section shall be contacted at 744-0403 for requirements to be met and clearance of this condition. The plan shall indicate the proposed means of achieving an acceptable level of risk to structures by vegetation, include the method (mechanical or hand labor) for removal of flammable vegetation and provide for the planting of drought tolerant fire resistant plants.

SC 11-16 Prior to the issuance of any building permits, the developer shall have completed, under the supervision of the Fire Chief, that portion of the approved fuel modification plan determined to be necessary by the Fire Chief before the introduction of any combustible construction material into the project area.

SC 11-17 Prior to the issuance of any certificates of use and occupancy, the remaining fuel modification shall be installed and completed under the supervision of the Fire Chief. Further, the installed fuel modification shall be established to a degree meeting the approval of the Fire Chief.

PUBLIC SERVICES

Project Design Features

Sheriff

SC 11-8 Prior to the issuance of any preliminary grading permits, applicant shall request that the Manager, HCA/Environmental Health, determine if vector control measures are necessary. If warranted, such measures shall be conducted by the developer in a manner meeting the approval of the Manager, HCA/Environmental Health.

SC 11-9 Prior to the issuance of any building permits for combustible construction, a letter and plan from the developer shall be submitted stating that water for fire fighting purposes and an all weather fire access road shall be in place before any combustible materials are placed on the site. Said letter shall be approved by the Fire Chief prior to the issuance of any building permits.

SC 11-10 Prior to the issuance of any building permits on those lots determined applicable by the Fire Chief, plans for an automatic fire sprinkler system shall be submitted to and approved by the Fire Chief prior to installation. This system shall be operational prior to the issuance of a certificate of use and occupancy.

SC 11-11 Prior to the issuance of any building permits, the applicant shall submit a detailed letter of intended use for each building to the Fire Chief for review and approval.

SC 11-12 Prior to the issuance of any grading permits, preliminary plans for all street and courts, public or private, shall be submitted to and approved by the Fire Chief. The plans shall include the plan view, sectional view, and indicate the width of the street or court measured flow line to flow line. All proposed fire apparatus turnarounds shall be

clearly marked.

SC 11-13 Prior to the issuance of any certificates of use and occupancy, street improvement plans with fire lanes shown shall be submitted to and approved by the Fire Chief. The plans shall indicate the locations of red curbing and signage, and provide a drawing of the proposed signage with the height, stroke and color of lettering and the contrasting background color.

SC 11-14 Prior to the issuance of any grading permits, construction details for any emergency access gate shall be submitted to and approved by the Fire Chief. Contact the Orange County Fire Department at (714)744-6623 for a copy of the "Guidelines for Fire Department Emergency Access".

SC 11-15 Prior to the issuance of any grading permits, a fuel modification plan and program shall be submitted and approved by the Fire Chief in consultation with the Manger, Environmental and Project Planning Services Division. The Planning and Development Section shall be contacted at 744-0403 for requirements to be met and clearance of this condition. The plan shall indicate the proposed means of achieving an acceptable level of risk to structures by vegetation, include the method (mechanical or hand labor) for removal of flammable vegetation and provide for the planting of drought tolerant fire resistant plants.

SC 11-16 Prior to the issuance of any building permits, the developer shall have completed, under the supervision of the Fire Chief, that portion of the approved fuel modification plan determined to be necessary by the Fire Chief before the introduction of any combustible construction material into the project area.

SC 11-17 Prior to the issuance of any certificates of use and occupancy, the remaining fuel modification shall be installed and completed under the supervision of the Fire Chief. Further, the installed fuel modification shall be established to a degree meeting the approval of the Fire Chief.

UTILITIES AND SERVICE SYSTEMS

Project Design Features

Water

PDF 13-1 The new booster pump station shall be paid for by the applicant and designed and function according to TCWD's guidelines and standards.

PDF 13-2 Operational capacities and pressure parameters for design of the booster pump station (approved by OCFA) shall be determined at design stage and should incorporate but not be limited to the following requirements:

- It shall meet the maximum day demand for the "stand alone" zones of Saddleback Meadows with an operating time of 24 hours and without its largest unit in service.

- It shall be designed with a back-up generator for the booster pump, as well as fuel and maintenance provisions.

- It shall incorporate the typical 3 or 4 pump system with an alternating state sequence.

- It shall pump from TCWD's El Toro Road zone (1,165 feet HWL) to the storage facility (reservoir) proposed.

- It shall have the ability to refill the proposed reservoir, if it were empty, within 72 hours while also providing for maximum day demands on the water system during that time.

PDF 13-3 Water conservation measures to be implemented consist of water-conserving features in the design and construction of residential homes and uses, plus use of drought-tolerant plant materials in the slope and streetscape plantings. Proposed water conservation measures also include:

- Supply line pressure. Water pressure greater than 50 pounds per square inch (psi) reduced to 50 psi or less by means of pressure-reducing valves.

- Ultra-low-flush toilets: 1.5 gallon-per-flush toilets installed in all new construction.

- Landscape with low-water-using plants wherever feasible.

- Grouping of plants of similar water use to reduce over-irrigation of low-water-using plants.

- Extensive use of mulch as top cover to improve water-holding capacity of the soil.

- Installation of efficient irrigation systems that minimize runoff and evaporation, and maximize the amount of water reaching plant roots. Drip irrigation, soil moisture sensors, and automatic irrigation systems are proposed methods of increasing irrigation efficiency.

PDF 13-4 All design and landscape features shall comply with TCWD's guidelines and standards.

Wastewater

PDF 13-5 All utilities shall be installed by the applicant in accordance with Department/County

requirements, per the requirements outlined on the Final Tract Map.

Electricity

PDF 13-6 All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Natural Gas

PDF 13-7 All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Cable

PDF 13-8 All utilities shall be installed by Cox Cable in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Communications

PDF 13-9 All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Standard County Conditions and Mitigation Measures

Water

SC 13-10 Prior to the issuance of any building permit(s), the applicant shall provide a report to the Manager, PDS/Building Permits Services Division, indicating that plans showing the location of all proposed reclaimed water lines used to irrigate open spaces, parks, and other landscaped areas, have been submitted to and approved by the Trabuco Canyon Water District.

SC 13-11 Prior to the issuance of building permits, water conservation measures shall be incorporated into the development design plans and which shall be submitted for approval to the Trabuco Canyon Water District.

Wastewater

SC 13-12 Prior to the issuance of a certificate of use and occupancy, sewer lines, connections, and structures shall be installed in a manner meeting the approval of the Manager, HCA/Environmental Health.

A. All waste water facilities and line shall be constructed and maintained to meet TCWD standards and requirements.

B. All sewer lines shall be underground facilities.

C. The project shall comply with all State of California Health and Safety Codes.

Electricity

SC 13-13 Prior to the issuance of a building permit, project proponent shall consult with the local gas and electric companies regarding feasible energy conservation features that should be included in the design of the proposed project. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 13-14 Prior to the issuance of a building permit, the project proponent shall incorporate passive or natural heating and cooling opportunities in the design of the proposed project including but not limited to the following: solar energy use; thermal insulation; tinted or solar reflective glass; orientation to sunlight; use of deciduous trees in landscaping; installation of roof fans; utilize fluorescent lighting, switches and thermostat, utilize time-controlled lighting; and, utilize AC units with 100% outdoor air economize. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

Natural Gas

SC 13-15 The applicant shall provide for all lines and mains necessary to provide natural gas to the project.

SC 13-16 The applicant shall obtain all required permits and follow all SCG, State and County regulations and requirements regarding natural gas service.

Cable

No standard condition requirements.

Communications

SC 13-17 Applicant shall comply with the requirements of the California Public Utilities Commission and Pacific Bell Telephone Company for the provision of telephone service.

8.0 INVENTORY OF UNAVOIDABLE ADVERSE IMPACTS

In accordance with CEQA Guidelines, Section 15126(b), EIRs must include a discussion describing significant impacts of the proposed project that cannot be mitigated to a level of insignificance.

In accordance with the incorporation by reference process, the analysis in this EIR provides a greater level of detail on the specific project within the FTSP than was available during preparation of FEIR No. 531. It has been determined in this analysis that, following implementation of all mitigation measures, the project will have the following unavoidable adverse impacts:

- Land use incompatibility with: 1) O'Neill Regional Park, 2) the Ramakrishna Monastery, and 3) St. Michael's Abbey;
- Major landform alteration including cut and fill slopes up to 120-feet in height;
- Cumulative contribution to regional adverse air quality conditions, since the project is located in a non-attainment area;
- Loss of 154.13 acres of onsite habitat, including: 1) southern sycamore woodland, 2) coast live oak woodland, 3) coastal sage scrub, 4) mulefat scrub, and 5) ephemeral ponds;
- Loss of Riverside fairy shrimp habitat (ephemeral ponds) and individuals, a federally listed endangered species;
- Urban landform visual impacts to: 1) O'Neill Regional Park, 2) Ramakrishna Monastery, and 3) St. Michael's Abbey.

9.0 MITIGATION MEASURE MONITORING PROGRAM

Effective January 1, 1989, the California Environmental Quality Act (CEQA) was amended to add Section 21081 6 of the Public Resources Code, implementing Assembly Bill (AB) 3180.

As part of CEQA environmental review procedures, Section 21081.6 requires a public agency to adopt a monitoring or reporting program for assessing and ensuring efficacy of any required mitigation measures applied to proposed developments. As stated in Section 21081.6 of the Public Resources Code:

> *"...the public agency shall adopt a reporting or monitoring program for the changes to the project which it has adopted, or made a condition of project approval, in order to mitigate or avoid significant effects on the environment."*

Section 21081.6 provides general guidelines for implementing monitoring and reporting programs. Specific reporting and/or monitoring requirements, to be enforced during project implementation, shall be defined prior to final approval of the project proposal by the responsible decision maker(s). In response to established CEQA requirements and Public Resources Code Section 21000 et seq., the proposed mitigation monitoring program shall be submitted to the Planning Department for consideration prior to completion of the environmental review process to enable the decision maker's appropriate response to the proposals.

The proposed program should be included in the Draft EIR to allow public circulation of the proposal; a mitigation monitoring program must be provided as part of the Final EIR.

In addition, pursuant to Section 21081(a) of the Public Resources Code, findings must be adopted by the decision maker coincidental to certification of the EIR. The following language shall be incorporated as part of the decision maker's Findings of Fact in response to AB 3180, and in compliance with requirements of the Public Resources Code.

1. In accordance with section requirements of Section 21081(a) and 21081.6 of the public Resources Code, the County has made the following additional findings:

   - That a mitigation reporting and monitoring program shall be implemented as specified in the final decision relative to the subject project;

   - That through covenant and agreement, prior to the recordation of the final map, certificate of occupancy and/or building permit, the applicant shall identify and appropriate licensed professional to provide certification that compliance with the required mitigation measures has been effected;

   - Site plans and/or building plans, submitted for approval by the responsible monitoring

agency, have included required mitigation measures/conditions; and,

- That an accountable enforcement agency and monitoring agency shall be identified for mitigation measures/conditions adopted as part of the decision maker's final determination.

Consistent with currently applicable law there is mutual incorporation by reference of mitigation measures contained in the Mitigation Monitoring Program and substantive conditions to the project entitlements.

Attention: Messrs. Pike Oliver & Michael McKnight

Subject: Geotechnical Environmental Impact Report
for Draft EIR #566 for Final Tract Map 10692
Saddleback Meadows Development
Orange County, California

Gentlemen:

Transmitted herewith is the report for the Geotechnical EIR for Draft EIR #566 for Final Tract Map 10692, Saddleback Meadows Development, Orange County, California.

Included in this report are our findings, conclusions and recommendations regarding the development of the site. Included is a geologic hazards assessment and a summary of principal favorable and unfavorable geotechnical conditions.

The opportunity to be of service is sincerely appreciated. If you have any questions or if we can be of further assistance, please call.

Very truly yours,

G. A. NICOLL AND ASSOCIATES, INC.

GEOTECHNICAL ENVIRONMENTAL IMPACT REPORT
FOR
DRAFT EIR NUMBER 566
FINAL TRACT MAP 10692
SADDLEBACK MEADOWS DEVELOPMENT
ORANGE COUNTY, CALIFORNIA

1. INTRODUCTION

1.1 General

a) This report presents the geotechnical conditions at the Saddleback Meadows Development site and the impact that the subject development will have on the property.

b) The current plan, prepared by Michael Madden Associates, and entitled "Final Tract Map 10692", is a graphically scaled-down representation of the 705 Lot approved Entitled Plan for Tentative Tract 10962, prepared by Hunsaker Associates Irvine, Inc. This plan was utilized as the base map for the *Geotechnical Plan, Plate 1,* for this report

c) This report presents the geotechnical aspects of the site, prepared for inclusion into Draft Subsequent EIR Number 566 for the recorded tract map.

d) The geologic conditions at the site and the proposed major buttress and shear key locations are illustrated on *Plate 1.*

e) Reports and other literature cited during the preparation of this report are presented in *References, Appendix.*

1.2 Summary of Principal Favorable and Unfavorable Conditions

1.2.1 Principal Favorable Geotechnical Conditions

a) At the site, a number of soil and geologic conditions are present that will be favorable to site development.

b) These conditions include:

   i) The presence of bedrock materials and large landslide blocks having a low settlement potential;

   ii) the presence of sufficient low to non-expansive materials to generate select fills;

   iii) the potential for the occurrence of liquefaction is low;

   iv) bedrock excavatability is favorable and no blasting is anticipated.

c) Grading east of the Abbey property will produce fill in the gully area which will tend to stabilize the slope on the Abbey property in this area.

d) No known active faults are present at the site and surface rupture during earthquakes is not expected.

e) Planned remedial grading will reduce the potential for the occurrence of earthquake-induced landsliding.

f) The site does not lie within the 100-year flood zone limits.

g) Subsidence at the site due to fluid withdrawal should not occur since no known major ground water aquifers or petroleum reservoirs underlie the site.

h) At the present time, the potential for the occurrence of tsunamis and seiches is non-existent.

i) Site grading will reduce the potential for surficial erosion and the consequential siltation of nearby Alisos Creek.

1.2.2 Principal Unfavorable Geotechnical Conditions

a) A number of unfavorable conditions are present including the presence of unstable landslides, the occurrence of some moderately to highly expansive soils and bedrock units, and the presence of adverse bedding conditions and some ground water.

b) These unfavorable conditions can be mitigated by implementing corrective grading concepts; such as the construction of buttresses and shear keys, selective grading to place expansive materials in the deep fills, the buttressing of cut slopes where necessary, and the construction of canyon subdrains and back drains to minimize or eliminate the affects of ground water.

c) Furthermore, compressible materials will be removed and replaced with compacted fill. Large buttress cuts will be constructed in segments to reduce the possibility of backcut failure.

2. PROPOSED IMPROVEMENTS

a) Proposed improvements for the Entitled Plan include 705 single-family residential lots and accompanying arterial and secondary streets and slope areas. Several park site lots, equestrian trails, and open space areas are planned.

b) It is anticipated that conventional grading methods will be used in the construction of building pads and streets. Remedial grading to produce a stable site is planned, which will include buttresses, shear keys, and stabilization slope.

3. SCOPE

The scope of services we have provided for the preparation of this EIR is outlined below:

a) Review of available geotechnical reports and literature pertaining to the site, and preliminary consultation and planning;

b) Examination of stereoscopic aerial photographs;

c) A geologic site reconnaissance to review the current site conditions;

d) Preparation of a geotechnical plan utilizing the Final Tract Map 10692 as a base map;

e) Preparation of geotechnical cross sections showing the general subsurface structure;

f) Geologic and engineering analyses of accumulated geotechnical data;

g) The preparation of this report presenting our findings, conclusions, and recommendations.

4. QUALIFICATIONS

This report was prepared at an EIR level. A more detailed evaluation of the slope stability, including analyses of buttress backcuts and forecuts, individual cut slope buttresses, etc. will be conducted during the 40-scale grading plan review to accompany the grading permit application.

5. SITE CONDITIONS

5.1 Location

a) The project site is an irregularly-shaped 232± acre tract located on the east side of El Toro Road and about 1,000 feet south of Live Oak Canyon Road in the County of Orange, California

b) The site location is shown on the *Location Map, Figure 1.*

BISHOP GRAPHICS/ACCUPRESS
REORDER NO A28843

5.2 Surface Conditions

a) The proposed development is partially cradled within a re-entrant of Canada de Los Alisos. Ridges, ravines and gullies form the dominant physiographic features, providing moderate to high topographic relief. Elevations above Mean Sea Level range from approximately 1,000 to 1,550 feet. Natural slope gradients range from nearly level along some ridge crests and valley bottoms to 1:1 (horizontal:vertical) within deeply incised gullies. The site drains generally toward the west and southwest into Alisos Creek and Oso Creek.

b) Vegetation at the site consists primarily of annual grasses, coastal sage scrub and some areas of oak woodland. An olive tree orchard is located in the central portion of the property. Numerous dirt ranch roads cross the site. At the time of our investigation, the site was utilized for livestock grazing. A more in-depth account of the site vegetation is presented in the biological resources section of the project EIR.

c) Man-made structures on the property include an abandoned ranch house, barn and related structures; several ponds for watering livestock were constructed during the period the ranch was operated, which are still in use for the grazing livestock.

6. GEOLOGY

6.1 Geologic Setting

a) The subject tract is located within Canada De Los Alisos in the low coastal foothills of the Santa Ana Mountains. These hills are part of the Peninsular Ranges Geomorphic Province and are generally underlain by sedimentary bedrock of Tertiary Age.

b) At the site, the bedrock consists of a thick sequence of interbedded, fine- to coarse-grained SANDSTONE and SILTSTONE of the Tertiary Age Vaqueros-Sespe Undifferentiated and Sespe Formations. Ancient to active landslides underlie much of the project area. Recent and older alluvial deposits are confined to the major gullies and Alisos Creek drainage. Topsoil and colluvium mantle the bedrock and landslides throughout

most of the site Fill soils underlie areas where man-made features, such as roads and berms associated with livestock ponds were constructed Some pond sediments are present in the cattle ponds. Geologic features of the site are shown on the *Geotechnical Plan, Plate 1, and the Geotechnical Cross Sections, Plates 2-4.*

6.2 Geologic and Soil Units

6.2.1 Sespe Formation (ts)*

The late Eocene to early Miocene Sespe Formation is generally confined to the northwest corner of the tract where it is in fault contact with the undifferentiated Vaqueros-Sespe Formation. These rocks, where they were observed, consisted of red-brown to gray SANDSTONE and interbedded, greenish-gray, Clayey SILTSTONE.

6.2.2 Vaqueros-Sespe Formation, Undifferentiated (Tvs)*

The bedrock underlying the majority of the site exhibits characteristics similar to both the Vaqueros and Sespe Formation. Therefore, these rocks have been classified together as an undifferentiated formation. The rocks consisted of a rhythmic sequence of orange-brown, red-brown, gray to gray-green SANDSTONE and SILTSTONE with thin interbeds of bentonite-like CLAY and less weathered volcanic ash and/or tuff. The bentonitic CLAY beds are generally soft to stiff and plastic in consistency; whereas the SANDSTONE and SILTSTONE units were more often found to be dense and stiff, respectively. Occasionally, fossil-rich beds consisting mainly of broken clam shells were encountered. Some carbonate cementation of sandstone beds has occurred.

*Refers to Geologic Symbols. See Key, Plate 1

6.2.3 Landslide Material (Qls)*

a) The site is occupied by an interrelated collection of active and inactive slides. The extent of the slides is comparable to other sites in the general area which have accommodated residential development, such as the nearby Portola Hills site. Between prehistoric and recent times, it appears that there were several episodes of slide movement. The larger, older slides generally failed as block slides, usually along 3 to 12-inch thick CLAY beds. Some of the smaller, more recent slides have failed as rotational-type failures, following oversteepening of the flanks of the major drianage on the site. The characteristics of the observed landslide materials varied from a soft, intensely fractured, sheared and weathered condition to nearly intact, unweathered blocks of displaced, interbedded SANDSTONE and SILTSTONE.

b) The Saddleback Meadows project is characterized by three general generations of landsliding:

i) *Recent Shallow Sliding* are the youngest and shallowest of the landslides and are characterized by active slumps, high moisture contents, depths of less than 50 feet and maximum dimensions of 100 to 400 feet. Their present movements are periodic and small and largely controlled by water content variations. These are most prevalent east of the St. Michaels' property.

ii) *The Intermediate Age and Intermediate Landslides* are approximately 50 to 120 feet deep. They often occur in series and their movements are at a much slower rate than the overlying younger landslides. An example of this is found at the west end of the site, at the existing entrance road, where a landslide has covered some old alluvial deposits *(see Plates 2 and 3)*.

*Refers to Geologic Symbols See Key, Plate 1.

iii) *The Oldest and Deepest Landslides* are estimated to be between 100 to possibly exceeding 250 feet in depth. The deepest slide surfaces *(see Plates 2-4)* are hypothetical surfaces, based on the projection of shear zones observed in borings at shallower depths and projected along the general geologic structure. These deeper shear zones may have a tectonic origin.

6.2.4 Older Alluvium (Qalo)*

a) Quaternary Alluvium Deposits are present along the lower portions of the slopes located on the west side of the project site. These deposits consist of moist to wet, moderately dense to loose/soft, Silty SAND, Sandy SILT, Sandy CLAY, CLAY and occasional layers of Gravel.

b) Disturbed Older Alluvium is present along the east side of El Toro Road at the toe of the major slides. This material consists of disturbed SAND, SILT and CLAY layers containing some Gravel that were mixed with blocks of displaced SANDSTONE and SILTSTONE during landsliding.

6.2.5 Alluvium (Qal)*

Alluvium of recent origin is present in Canada De Los Alisos and its tributaries that enter the project site. The Alluvium consists of interbedded deposits of predominately SAND and SILT with some CLAY and layers of GRAVEL. These soils range from dry to wet and are generally poorly consolidated. Alluvial depths range from less than 1 foot to approximately 12 feet in the tributary drainage, to roughly 20 feet in Canada De Los Alisos which borders the site on the west.

6.2 6 Soil slumps (Ss)*

A number of soil slumps are present. Only the dominant ones are shown on *Plate 1*. These features represent downhill movement and slumping of topsoil, colluvial soil and weathered bedrock material, generally to a depth of 5 to 10 feet

*Refers to Geologic Symbols. See Key, Plate 1

6.2.7 Colluvium (Qcol)*

Colluvial deposits cover most of the slopes on the site to average depths of 2 to 3 feet. Within depressions related to landsliding and along the margins of ancient landslides, colluvial depths range from 15 to over 40 feet. The colluvium consists of brown to black, moist to very moist, soft to stiff, Silty CLAY, Sandy CLAY, Clayey SAND and Silty SAND. In some areas, the colluvial deposits contain cobble to boulder-size, cemented SANDSTONE clasts.

6.2.8 Fill (Fill)*

The soil placed in association with the construction of cattle watering ponds and/or access roads on the subject property is considered Uncertified Fill. The method and effort of compaction is not known. Fill placed essentially on St. Michael's Priory property for landslide stabilization is certified fill. However, no distinction between the two types of fill was made on the Geotechnical Plan. Fill is also present beneath the completed portion of El Toro Road.

6.2.9 Pond Sediments (Qp)*

Pond sediments generally consist of dark gray and dark brown SILTS and CLAYS that are moist and soft. Pond sediments on-site probably average 5 feet in thickness.

6.3 Structural Geology/Faulting

a) The project area is bordered on the north and south by generally northwest-trending prehistoric faults. Between these faults, the bedding appears to be warped gently downward, resulting in generally southwest-dipping strata in the central and northern portions of the site and northwest- to northeast-dipping strata in the southern areas; where the bedrock units appear to be warped upwards along a suspected northwesterly-trending fault zone that crosses beneath El Toro Road, forming a synclinal structure at the west end of the site. This synclinal feature, which appears

*Refers to Geologic Symbols. See Key, Plate 1

asymmetric, probably governed the configuration and direction of movement of the landslides on the subject property. Bedding planes under landslides dip at shallow angles (predominantly 6-17 degrees).

b) The potentially active Cristianitos Fault is situated 1 mile west of the site. Ancient (probably much greater than 10,000 years) movement along this fault and subsequent compressional forces probably attributed to the folding and faulting and bedding plane shearing that is present on the site.

c) Fracturing or jointing was most prevalent in the landslide blocks and in areas within close proximity to faults. Nearly vertical open fractures were observed in some borings. Jointing, in general, dips steeply (between 45 and 90 degrees).

d) No evidence for active faulting has been found on the site. No active faults are known to be present near the site.

7. GROUND WATER

a) Ground water occurs on the site as free ground water within the alluvial deposits, and within the deeper sandstone bedrock; and as perched ground water within the various landslide blocks. The amount of ground water observed in several of the borings indicates that some dewatering may be required prior to and during remedial grading. No significant ground water aquifer is present.

b) Planned subdrain systems in buttresses, shear keys and fill keys, and within canyon fills should control any potential ground water level increased from the increase in surface water infiltration from future irrigation.

8. SEISMICITY

a) Seismic risk in Southern California is a well recognized factor, and is directly related to geologic fault activity. Seismic damage potential depends on the proximity to active or potentially active fault zones, and on the type of geologic structures. In relative terms, seismic damage is generally less intense in consolidated formations, i.e., bedrock, than in unconsolidated materials, such as alluvium.

b) In Southern California, most of the seismic damage to man-made structures results from ground shaking and to a lesser degree from liquefaction and ground rupture caused by earthquakes along active fault zones. In general, the greater the magnitude of the earthquake, the greater the potential damage.

c) Seismic hazards at this site are attributed to ground shaking as a result of an earthquake epicentered on a nearby active fault. Ground rupture is not expected to occur on the property as a consequence of the following listed faults.

d) *Figure 2* shows the geographical relationships among the site location, nearby faults and the epicenters of significant occurrences. *Figure 3* gives the seismic parameters affecting the subject site.

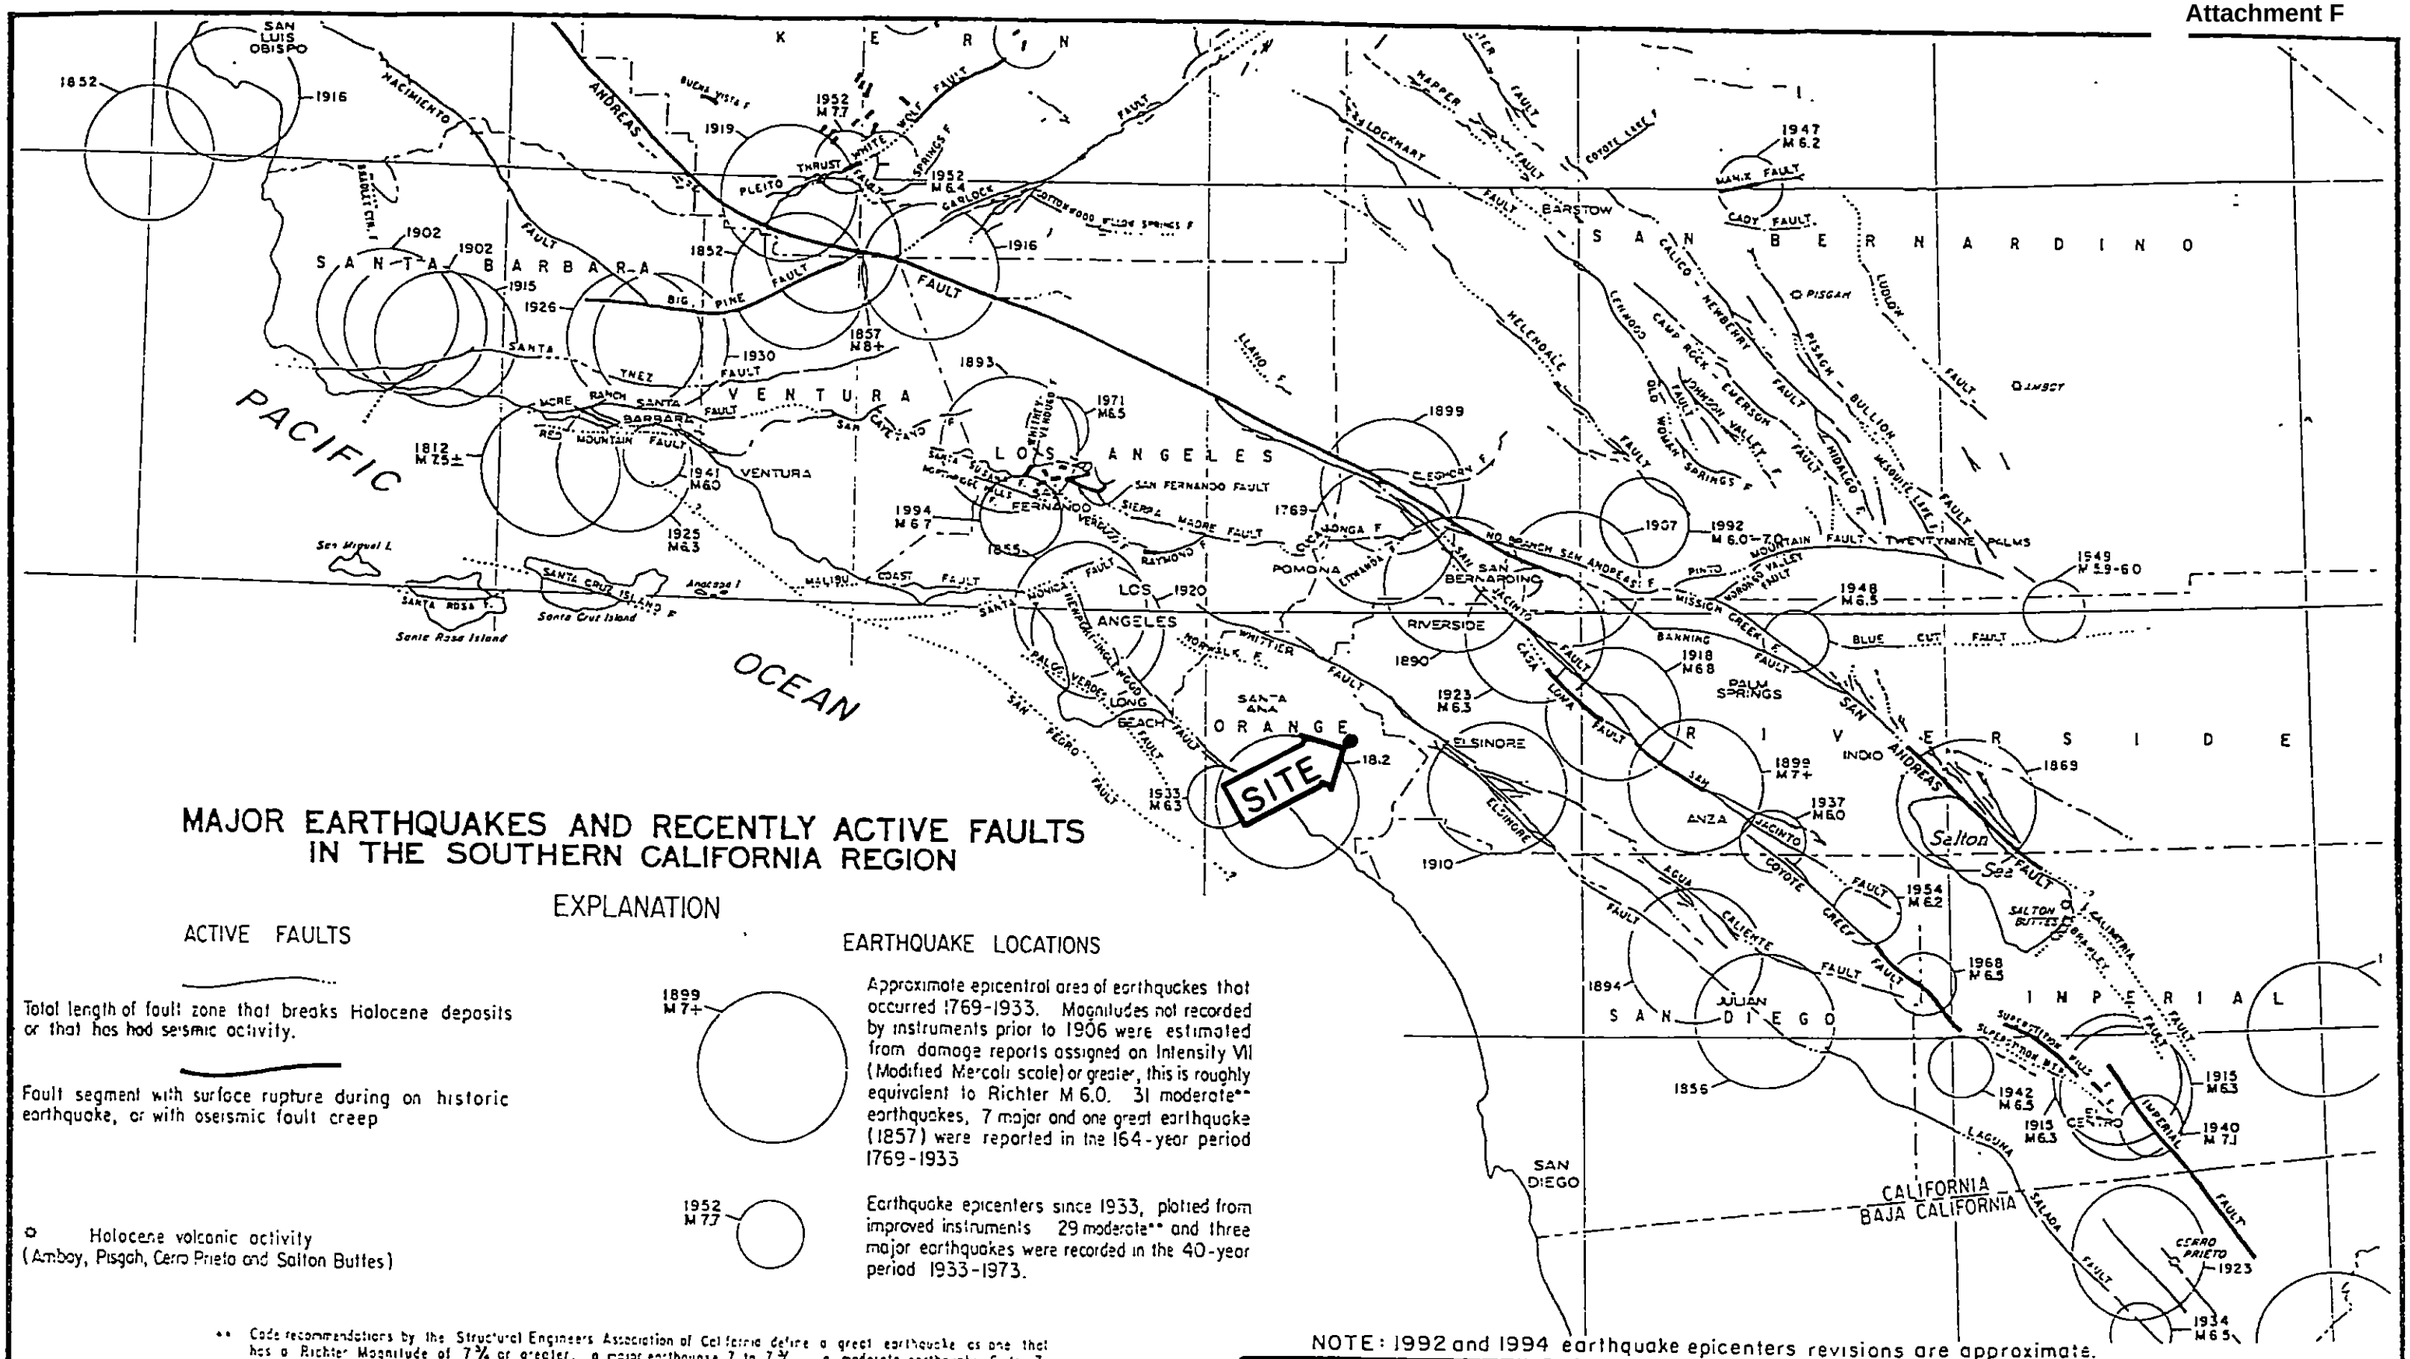
9. GEOLOGIC HAZARDS ASSESSMENT

This section generally follows the guidelines prepared by the California Division of Mines and Geology and most of the conclusions are presented on a subjective scale.

9.1 Seismic Hazards

9.1.1 Ground Surface Rupture

Ground rupture along a fault plane is not expected at the site since no known active faults are present on the site.



MAJOR EARTHQUAKES AND RECENTLY ACTIVE FAULTS IN THE SOUTHERN CALIFORNIA REGION

EXPLANATION

ACTIVE FAULTS

Total length of fault zone that breaks Holocene deposits or that has had seismic activity.

Fault segment with surface rupture during an historic earthquake, or with aseismic fault creep

Holocene volcanic activity (Amboy, Pisgah, Cerro Prieto and Salton Buttes)

EARTHQUAKE LOCATIONS

1899 M7+

Approximate epicentral area of earthquakes that occurred 1769-1933. Magnitudes not recorded by instruments prior to 1906 were estimated from damage reports assigned an Intensity VII (Modified Mercalli scale) or greater, this is roughly equivalent to Richter M 6.0. 31 moderate** earthquakes, 7 major and one great earthquake (1857) were reported in the 164-year period 1769-1933

1952 M7.7

Earthquake epicenters since 1933, plotted from improved instruments 29 moderate** and three major earthquakes were recorded in the 40-year period 1933-1973.

** Code recommendations by the Structural Engineers Association of California define a great earthquake as one that has a Richter Magnitude of 7¾ or greater, a major earthquake 7 to 7¾, a moderate earthquake 6 to 7

Compiled by Richard J Proctor mainly from published and unpublished data of the *California Division of Mines and Geology*, *California Department of Water Resources Bulletin 116-2* (1964); selections from bulletins of the *Geological* and *Seismological Societies of America*, from C.F Richter, *Elementary Seismology* (1958); and the *National Atlas*, p 66.

NOTE: 1992 and 1994 earthquake epicenters revisions are approximate.

*The repeatable high ground acceleration taken as 65 percent of the peak acceleration for sites within 20 miles of the epicenter may be more applicable for design analysis

Saddleback Meadows, Orange County, California

Date: March 1997

Project No: 4816-04 Figure No: 3

G. A. NICOLL *and Associates, Inc.*
Geologic and Soil Engineers

9.1.2 Seismic Ground Shaking

a) Slight to moderate ground shaking is possible at the site if an earthquake occurs on a segment of the active faults listed in *Figure 3*.

b) Some areas of the project site are underlain by unconsolidated alluvium and colluvium which tends to amplify earthquake produced ground motion. However, it is planned to remove these materials within proposed structural areas of the site. Nevertheless, buildings should be designed to resist seismic lateral loads.

c) Ground shaking is not expected to be any more intense than that expected at other nearby developments.

9.2 Secondary Seismic Hazards

9.2.1 Liquefaction

The potential for liquefaction at the site is considered low since the alluvial materials will be removed in structural areas.

9.2.2 Seismically-Induced Landslides

a) In its natural, undeveloped state, the site may experience seismically-induced landsliding in the form of re-activation of the existing smaller, shallower landslides.

b) With the implementation of site grading and corrective grading, the potential for seismically-induced landsliding will be reduced significantly. Corrective grading, in the form of major buttresses and shear keys, will increase the pseudostatic factor of safety of the larger landslides to an acceptable level of 1.1 or greater.

9.2.3 Seismically-Induced Settlement

Strong seismic shaking can cause settlement by allowing sediment particles to become more tightly packed, thereby reducing pore space. Some soft colluvial and alluvial deposits are more susceptible to this phenomenon than others. Artificial fills, if not adequately compacted, may also experience seismically-induced settlement. Since the alluvial and colluvial soils will be removed during grading, and since the proposed fills will be adequately compacted, the potential for seismically-induced settlement is considered low.

9.2.4 Flooding Attributable to Dam/Levee Failure

Since the site is situated well above the adjacent valley bottom and since no dams or levees will be present, the potential for flooding is considered nil.

9.2.5 Seiches and Tsunamis

a) Confined bodies of water may be subject to large, earthquake-induced waves known as seiches. These waves can cause flooding and other related property damage to adjacent areas. Since no large bodies of water are present on or adjacent to the site, the potential for seiching is considered nil.

b) Low-lying coastal areas may be subject to flooding or other damage from large, earthquake-induced ocean waves known as tsunamis. The site is well outside the limits of possible tsunami inundated areas, and therefore, the geotechnical hazard posed by tsunami damage is considered to be nil at the subject site.

9.3 Compressible Soils/Hydroconsolidation

a) Since all alluvial and colluvial soils and compressible landslide materials will be removed during grading at the site, settlement due to compressibility of these soils will not be a consideration.

b) Fill soils will be placed at or slightly above optimum moisture during grading to reduce the potential for the occurrence of hydroconsolidation of the proposed fills.

c) Backcuts in removal areas and for buttress keys will be constructed at gradients of 1.5:1 (horizontal to vertical) to 2:1 in cut areas and areas of planned shallow fills, to reduce the effects of differential settlement.

9.4 Flooding, Erosion, and Sedimentation

a) The site is situated well above the flood plain of the Los Alisos Creek, and therefore, flooding will not affect the site.

b) Erosion and subsequent sedimentation on the site will be reduced because the future development will be constructed so as to improve the drainage of surface water on the site. Sedimentation of Los Alisos Creek will not be increased as a consequence of site development.

9.5 Loss of Mineral Resources

Since no known economic mineral resources are present on the site, the loss of mineral resources as a consequence of development does not apply.

10. CONCLUSIONS AND RECOMMENDATIONS

10.1 General

a) We consider that the site will be suitable for the proposed current development plan, from the geotechnical aspects, provided the recommendations given below and the recommendations presented in the final geotechnical report are implemented.

b) Grading will be required as follows:

i) Multiple cuts and fills to achieve planned elevations and profiles, and associated access roadways;

ii) Remedial grading to stabilize the proposed slopes by means of buttresses, shear keys, and stabilization fills;

iii) Removal (clean out) of all or major portions of landslide graben materials and alluvium and colluvium under the variable thickness fills;

iv) Installation of appropriate subdrain systems within natural drainage courses and within buttress and stability fill keys prior to fill placement;

v) Adequate foundation and slab subgrade conditioning for the proposed development, including overexcavation, capping and measures related to expansive soils;

vi) Achieving suitable surface gradients to preclude ponding anywhere on-site and to control water run-off via paved/closed drainage devices.

10.2 Remedial Grading

a) Remedial grading will incorporate one or more of several devices, including: buttress fills, shear keys, flattening of slopes to dip-slope gradients, surcharge toe fills, stabilization fills, and keys along the daylight cuts. The major buttress keys and shear keys are shown on the *Geotechnical Plan, Plate 1,* and in the *Geotechnical Cross Sections, Plates 2-4.*

b) Softer alluvium, existing fill, colluvium, pond sediments, and compressible landslide debris are all subject to selective removal, either partially or in their entirety. Removals in areas of deep colluvial soils and shallow landsliding may reach depths averaging 40 feet; such as the area south of the olive tree grove.

c) Cut areas which will expose firm landslide materials will require a minimum of 4-5 feet of overexcavation; the replacement of these materials as a compacted fill cap will serve to reduce future infiltration of moisture. Deeper removals may be required, the depths of which will be determined during grading.

d) i) Subdrains and surface drains shall be provided in compliance with the Grading Code.

ii) The lengths, dimensions and locations of subdrains should be finalized on-site during actual grading excavation work, when subsurface conditions become exposed, and the patterns of ground water/seepage flow(s) become apparent. Subdrain locations should be surveyed.

e) Complete details of the corrective grading will be illustrated in the final geotechnical report for the site, which will be submitted for grading plan permitting purposes.

11. LIMITATIONS

a) Soils and bedrock over an area show variations in geological structure, type, strength and other properties from what can be observed, sampled and tested from specimens extracted from necessarily limited exploratory borings. Therefore, there are natural limitations inherent in making geologic and soil engineering studies and analyses. Our findings, interpretations, analyses and recommendations are based on observation, laboratory data and our professional experience; and the projections we make are professional judgments conforming to the usual standards of the profession No other warranty is herein expressed or implied.

b) In the event that during construction, conditions are exposed which are significantly different from those described in this report, they should be brought to the attention of the Soil Engineer.

The opportunity to be of service is sincerely appreciated. If you have any questions or if we can be of further assistance, please call. The primary investigator and author of this report was Mr. Gerald D. Horton, with principal review by the undersigned.

Very truly yours,

Subject: Saddleback Meadows (TT 10692) Growth Management/CMP Traffic Analysis - Revised

Dear Mr. McKnight:

ROBERT KAHN, JOHN KAIN & ASSOCIATES, INC. (RKJK) is pleased to submit the revised Saddleback Meadows (TT 10692) Growth Management/CMP traffic analysis. This report provides a summary of the findings, analysis procedures and evaluation of the proposed project with respect to on-site and off-site traffic impacts pursuant to County of Orange requirements.

This traffic impact analysis report includes an evaluation of traffic for existing conditions, existing plus project conditions, Year 2000 conditions, and Year 2020 conditions. Based upon this review, the project can be accommodated within the planned circulation system, if the recommended improvements are implemented. These recommendations are included in the "Project Recommendations" section of this report.

If you have any questions regarding this study, please do not hesitate to call at (714) 474-0809.

Sincerely,

ROBERT KAHN, JOHN KAIN & ASSOCIATES, INC.

SADDLEBACK MEADOWS (TT 10692)
GROWTH MANAGEMENT/CMP TRAFFIC ANALYSIS
ORANGE COUNTY, CALIFORNIA
(REVISED)

I. INTRODUCTION AND SUMMARY

A. Purpose of Report and Study Objectives

The purpose of this traffic study is to evaluate the development of the Saddleback Meadows (TT 10692) from a traffic circulation standpoint. The proposed development is included within the unincorporated portion of Orange County.

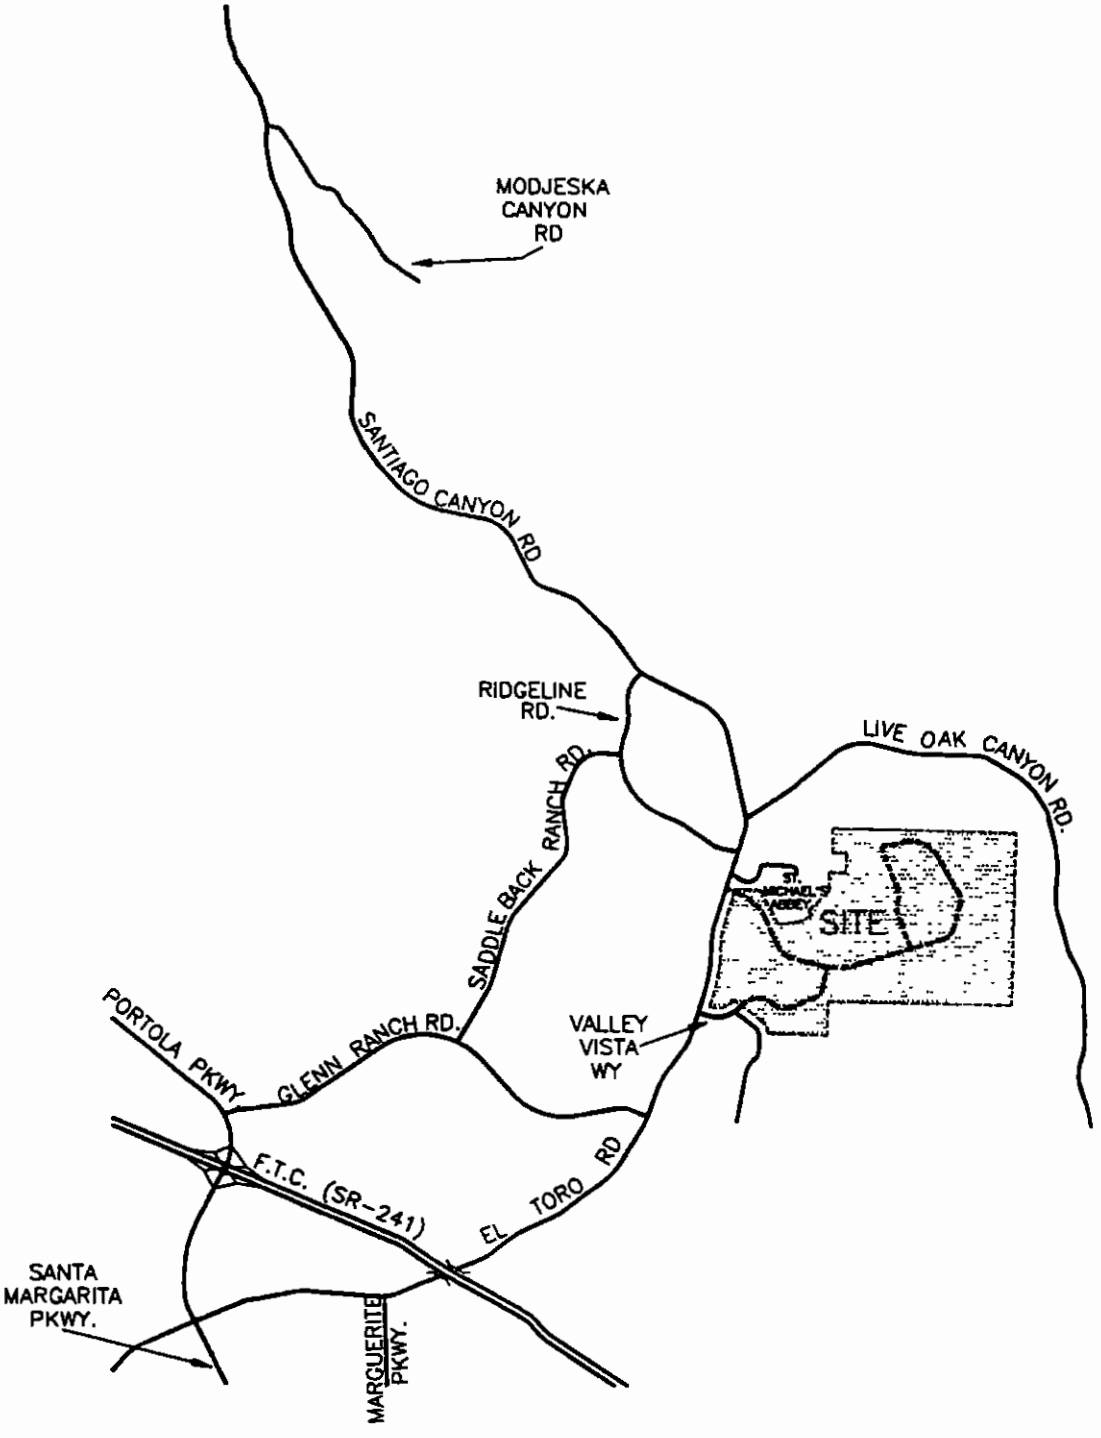
Study objectives include (1) documentation of existing traffic conditions in the vicinity of the site; (2) calculation of existing plus project traffic conditions; (3) evaluation of traffic conditions for the Year 2000; (4) analysis of traffic conditions for Year 2020; and (5) determination of off-site improvements and system management actions needed to achieve County of Orange level of service requirements.

B. Executive Summary

1. Site Location and Study Area

The project site is located east of El Toro Road and south of Live Oak Canyon Road in the County of Orange. Exhibit A illustrates the traffic analysis study area.

EXHIBIT A
LOCATION MAP



685-95-001.75A
SADDLEBACK MEADOWS, Orange County, California

RKJK
ROBERT KAHN - JOHN KAHN & ASSOCIATES INC.

The study area includes the following intersections:

Santiago Canyon Road (NS) at:

- Modjeska Canyon Road (EW)
- Ridgeline Road (EW)

El Toro Road (NS) at:

- Live Oak Canyon Road (EW)
- Ridgeline Road (EW)
- Valley Vista Way (EW)
- Glenn Ranch Road (EW)

Saddleback Ranch Road (NS) at:

- Glenn Ranch Road (EW)

Marguerite Parkway (NS) at:

- El Toro Road (EW)

Portola Parkway (NS) at:

- Glenn Ranch Road (EW)
- Foothill Transportation Corridor (EW)
- El Toro Road (EW)

2. Development Description

The approximately 223 acre project site is currently undeveloped and does not generate any significant traffic. Proposed uses for the project site include 705 manufactured housing dwelling units and 20,000 square

feet of commercial retail. The site plan for the project is shown on Exhibit B.

3. Principal Findings

The proposed development is projected to generate a total of approximately 8,340 trip-ends per day with 540 vehicles per hour during the AM peak hour and 825 vehicles per hour during the PM peak hour.

For existing traffic conditions, the intersections in the vicinity of the site are operating at Level of Service "D" or better during the peak hours, as shown in Table 2. Traffic signals appear to presently be warranted at the following intersections (see Appendix "I"):

Santiago Canyon Road (NS) at:

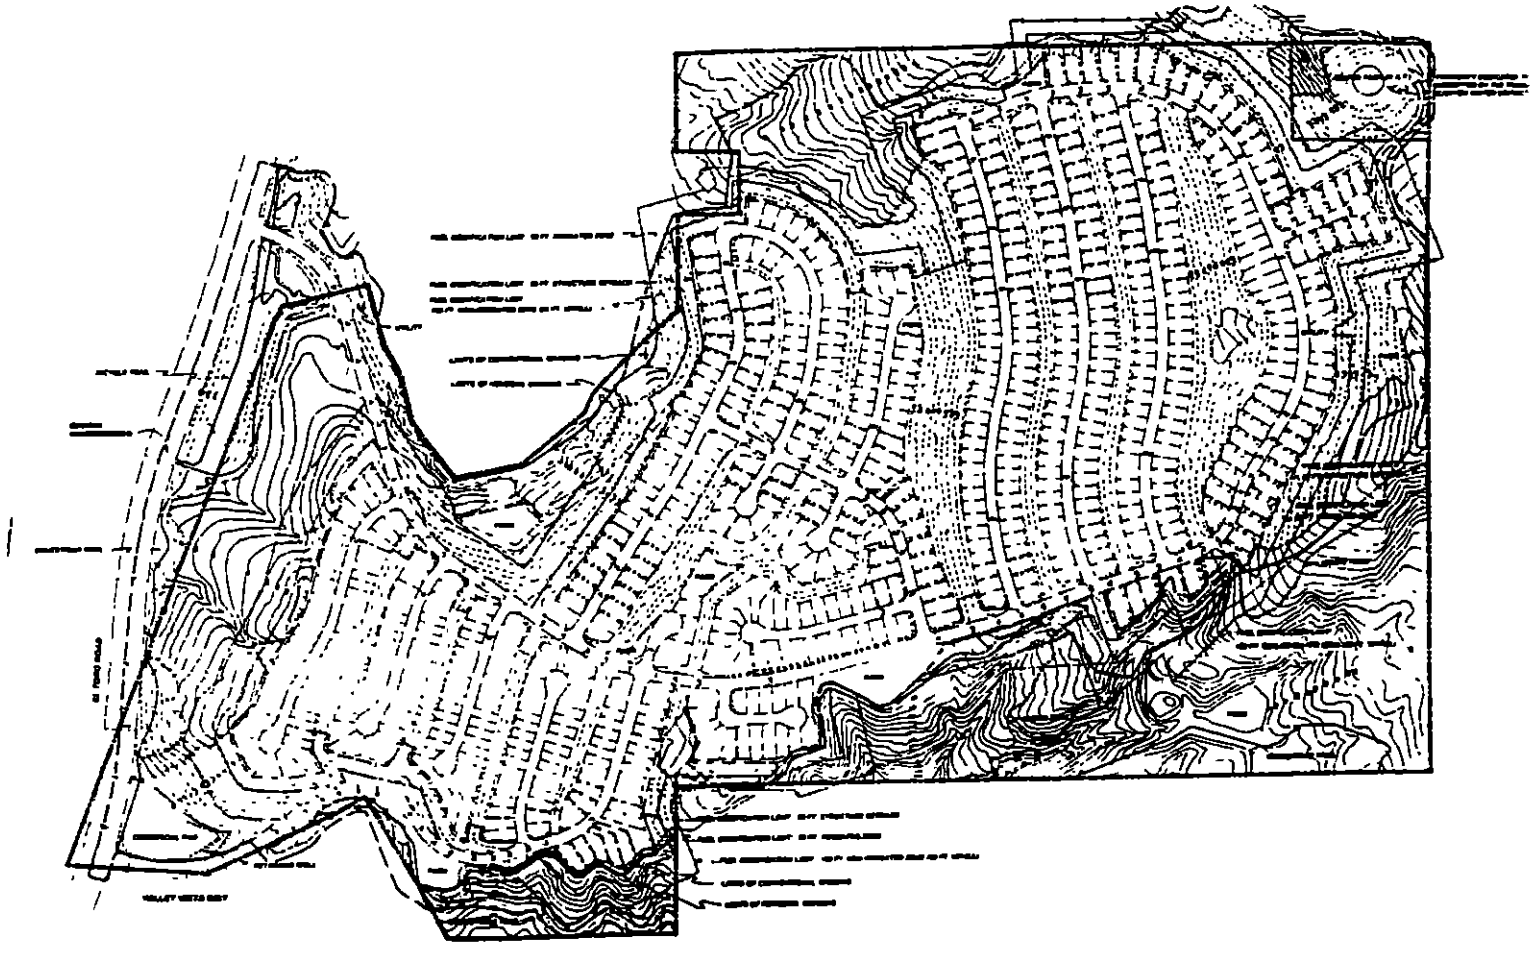
- Ridgeline Road (EW)

El Toro Road (NS) at:

- Live Oak Canyon Road (EW)

For existing plus project traffic conditions, the intersections in the vicinity of the site are projected to continue to operate at Level of Service "D" or better during the peak hours, as shown in Table 7. A traffic signal is projected to be warranted at the intersection of El Toro Road/Project Entrance for existing plus project traffic conditions (see Appendix "I").

EXHIBIT B
SITE PLAN



N

685-95-001:48A
SADDLEBACK MEADOWS, Orange County, California

RKJK
ROBERT KAHN · JOHN KAHN & ASSOCIATES INC.

For Year 2000 traffic conditions, the intersections in the vicinity of the site are projected to operate at Level of Service "D" or better during the peak hours with improvements, as shown in Table 10. A traffic signal is projected to be warranted at the intersection of Santiago Canyon Road/Modjeska Canyon Road for Year 2000 without project traffic conditions (see Appendix "I").

For Year 2020 traffic conditions, the intersections in the vicinity of the site are projected to operate at Level of Service "D" or better during the peak hours with improvements that include the ultimate widening of El Toro Road and Santiago Canyon Road to four through travel lanes (two in each direction), as shown in Table 14.

Pursuant to the County of Orange Growth Management Plan (GMP), segments of Santiago Canyon Road are required to function at a Level of Service "C". Capacity improvements along Santiago Canyon Road will be required in conjunction with future growth to achieve Level of Service "C". The Santiago Canyon Road Major Thoroughfare and Bridge Fee Program has been designed to provide up to $34 million in improvements to Santiago Canyon Road from Chapman Avenue to Live Oak Canyon Road. However, the March, 1994 Project Report for improvements to Santiago Canyon Road indicates that the total cost of improvements is approximately $52.3 million for a "limited project" scenario. To address the difference between the ultimate cost of $52.3 million and the fee program allocation of $34 million, the project should provide an additional contribution beyond the payment of normal fees based upon its traffic share.

4. Project Recommendations

The proposed project will have primary access to El Toro Road. The El Toro Road turn-lane improvements needed at the Project Entrance to serve Year 2000 conditions should be completed in conjunction with development. Secondary access will be provided via an access to Valley Vista Way.

For Year 2000 and Year 2020 traffic conditions with the project and with off-site improvements, study area intersections that are impacted by the proposed development are projected to operate at Level of Service "D" or better during the peak hours. Significant off-site improvements will be needed at study area intersections to accommodate Year 2020 traffic conditions. Improvements are programmed to be implemented through existing funding programs (i.e., Measure "M", existing road fee programs, etc.) and pro-rata participation by individual developments based upon vesting tentative map conditions and existing development agreements. Potential roadway fees for the Saddleback Meadows (TT 10692) development are shown in Table 15.

Both existing traffic patterns and SCTM traffic projections for Years 2000 and 2020 indicate the attraction of Glenn Ranch Road, Portola Parkway, and the Foothill Transportation Corridor (SR-241) for increased traffic volumes in the project study area.

North of the Foothill Transportation Corridor, El Toro Road can accommodate cumulative Year 2020 traffic volumes with the proposed project on four travel lanes divided by a raised or striped median. Exhibit

HH illustrates the alternative cross-sections for El Toro Road in the vicinity of the project. Implementation of a full Major arterial cross-section (six lanes divided) is not needed to serve future traffic volumes. Exhibit HH depicts an alternative section which would provide four travel lanes along El Toro Road divided by a striped median. This alternative section represents a modification of the typical cross-section for a Primary arterial. Appropriate transitions would be required between this cross-section and other modified cross-sections along El Toro Road south of Glenn Ranch Road.

Table 16 depicts the project share of peak hour traffic along segments of Santiago Canyon Road. The residential project peak hour traffic increases range from 5.8 percent during the AM peak hour traffic north of Ridgeline Road, to 9.2 percent of PM peak hour traffic between Live Oak Canyon Road and Ridgeline Road. The commercial project peak hour traffic increases range from 0.2 percent during the AM peak hour traffic north of Modjeska Canyon Road, to 2.5 percent of PM peak hour traffic between Live Oak Canyon Road and Ridgeline Road. Pursuant to the County of Orange Growth Management Plan (GMP) and discussions with Environmental Management Agency staff, it has been determined that the project should contribute a fee beyond the normal Santiago Canyon Road Major Thoroughfare and Bridge Fee Program to address ultimate improvement requirements based upon the project's fare share traffic contribution. The difference between the long range improvement costs for Santiago Canyon Road and the amount estimated to be provided by the Santiago Canyon Road Major Thoroughfare and Bridge Fee Program is approximately $18,300,000. A conservative estimate of the project's residential traffic share is approximately 7.3 percent based

upon the values presented in Table 16. This amounts to a residential project contribution of $1,335,900, which in turn equates to a fee per dwelling unit of $1,895. The project should therefore participate in a supplemental fee contribution to Santiago Canyon Road of $1,895 per dwelling unit. A conservative estimate of the project's commercial traffic share is approximately 1.1 percent based upon the values presented in Table 16. This amounts to a commercial project contribution of $201,300, which in turn equates to a fee per square foot of $10.07. The project commercial area should therefore participate in a supplemental fee contribution to Santiago Canyon Road of $10.07 per square foot.

It is anticipated that the main project access point to El Toro Road will require a traffic signal in conjunction with the first project phase (approximately 208 dwelling units). The project should provide this improvement as well as a southbound left turn lane and northbound right turn lane on El Toro Road at the project entry.

In order to accommodate the anticipated traffic and the potential traffic signal, it is recommended that the entry street to Saddleback Meadows (TT 10692) be designed as a Collector roadway with a curb-to-curb width of 58 feet at its intersection with El Toro Road. This provides for two 12 foot exiting lanes and two 12 foot entering lanes with a 10 foot median. The Collector cross-section should be maintained for approximately 160 feet where it could then be transitioned to a standard 40 foot wide curb-to-curb width Collector roadway, as shown on Exhibit II.

Traffic signing/striping should be implemented in conjunction with detailed construction plans for the project. Verification of adequate parking should be analyzed for the project site in conjunction with approval of the site plan.

The project should participate in existing road fee programs, including the Foothill/Eastern Transportation Corridor Fee Program, Foothill Circulation Phasing Program (FCPP), El Toro Road Fee Program and the Santiago Road Fee Program.

Sight distance at each of the project access intersections should be reviewed with respect to Standard Plan Number 1117 (see Appendix "J") in conjunction with the preparation of precise grading and landscape plans.

II. AREA CONDITIONS

A. Study Area

1. Area of Significant Traffic Impact

Existing roadways in the study area include the Foothill Transportation Corridor (SR-241), Santiago Canyon Road, El Toro Road, Marguerite Parkway, Portola Parkway, Santa Margarita Parkway, Live Oak Canyon Road, Ridgeline Road, Saddleback Ranch Road and Glenn Ranch Road.

Foothill Transportation Corridor (SR-241) has been extended southerly to Antonio Parkway. This corridor, in conjunction with Portola Parkway and Irvine Boulevard, provides a connection from the communities of Coto de Caza and Santa Margarita to the City of Tustin.

Santiago Canyon Road is classified as a Primary (four-lane divided) Arterial highway on the Orange County Master Plan of Arterial Highways (MPAH). It is currently two lanes in the vicinity of the site. Santiago Canyon Road currently accommodates approximately 10,000 to 14,000 ADT in the study area.

El Toro Road is classified as a Major (six-lane divided) Arterial highway south of Live Oak Canyon Road on the Orange County MPAH. It is partially constructed to its Master Plan classification near Santa Margarita Parkway and has yet to be improved (two lanes) in the vicinity of the project site. El Toro Road currently accommodates approximately 13,000 to 23,000 ADT in the study area.

Marguerite Parkway is classified as a Primary (four-lane divided) Arterial highway south of El Toro Road on the Orange County MPAH. Marguerite Parkway in the study area has been fully constructed and currently carries approximately 12,000 ADT in the study area.

Portola Parkway is classified as a Major (six-lane divided) Arterial highway north of El Toro Road to Alton Parkway on the Orange County MPAH. It is fully improved and currently accommodates approximately 20,000 to 22,000 ADT in the study area.

Santa Margarita Parkway is classified as a Major (six-lane divided) Arterial highway on the Orange County MPAH. It has been fully improved to its Master Plan of Arterial Highways classification in the study area. Traffic volumes on Santa Margarita Parkway are approximately 26,000 ADT in the study area.

Live Oak Canyon Road is currently two lanes east of El Toro Road. It currently carries approximately 5,000 ADT in the study area.

Ridgeline Road is currently two lanes west of El Toro Road. It currently carries approximately 1,000 to 2,000 ADT in the study area.

Saddleback Ranch Road is currently two to four lanes in the study area. It currently carries approximately 3,000 ADT.

Glenn Ranch Road has recently been completed to provide a direct connection between El Toro Road south of the project site and Portola Parkway north of the Foothill Transportation Corridor (SR-241). Glenn Ranch Road is classified as a Primary (four-lane divided) Arterial highway

on the Orange County MPAH. It is fully constructed and currently carries approximately 5,000 ADT in the study area.

B. Site Accessibility

1. Area Roadway System

Exhibit C identifies the existing roadway conditions for study area roadways. The number of through travel lanes for existing roadways and the existing intersection controls are identified.

2. Existing Master Plan of Arterial Highways

Existing and future roadways are included in the latest Orange County Master Plan of Arterial Highways (MPAH) and are illustrated on Exhibit D. This exhibit shows the nature and extent of arterial highways that are needed to adequately serve the ultimate development depicted by the Land Use Element of the General Plan and serves to coordinate future arterial highways between local jurisdictions. Exhibit E illustrates the typical Orange County cross-sections and design capacity values for various roadway classifications.

3. Traffic Volumes and Conditions

Existing average daily traffic (ADT) on arterial highways throughout the study area are shown on Exhibit F. Existing ADT volumes are based upon the traffic data collected by the County of Orange and counts made for RKJK in June, 1995 (see Appendix "B"). Typical daily capacity values for arterial highways are shown in Table 1.

TABLE 1

ROADWAY CAPACITY VALUES[1]

FREEWAY SIZES	AT ULTIMATE CAPACITY (LOS "E")
4 lanes	96,000
6 lanes	144,000
8 lanes	192,000
10 lanes	240,000
12 lanes	288,000
14 lanes	336,000

TYPE OF ARTERIAL	LEVEL OF SERVICE				
	A	B	C	D	E
8 lanes divided	45,000	52,500	60,000	67,500	75,000
6 lanes divided	33,900	39,400	45,000	50,600	56,300
4 lanes divided	22,500	26,300	30,000	33,800	37,500
4 lanes undivided	15,000	17,500	20,000	22,500	25,000
2 lanes divided	11,300	13,200	15,000	17,000	18,800
2 lanes undivided	7,500	8,800	10,000	11,300	12,500

[1] These roadway capacities are approximate figures only, and are used at the General Plan level. They are affected by such factors as intersections (numbers & configuration), degree of access control, roadway grades, design geometrics (horizontal & vertical alignment standards), sight distance, level of truck and bus traffic, and level of pedestrian and bicycle traffic. Average daily traffic (ADT) is used by the County as a long range planning tool to assist in determining arterial highway classification (number of through lanes) needed to meet traffic demand.

The technique used to assess the operation of an intersection is known as Intersection Capacity Utilization (ICU). To calculate an ICU the volume of traffic using the intersection is compared with the capacity of the intersection. ICU is usually expressed as a percent. The percent represents that portion of the hour required to provide sufficient capacity to accommodate all intersection traffic if all approaches operate at capacity. An explanation of Level of Service is included in Appendix "A".

Calculation Method:

a. Intersection Capacity Utilization (ICU) for study area intersections;

b. Daily volume/capacity ratio (V/C) for study links.

c. Saturation Flow Rate:

Saturation flow value of 1,700 vehicles per lane per hour for intersections; no adjustments are used for protection movements with dedicated lanes (including both right and left turns).

d. Lost Time:

A lost time factor of 5% (.05) is applied to the ICU calculations.

e. Level of Service Ranges:

The following thresholds are used in assigning a letter value to the resulting LOS:

LOS	CRITICAL VOLUME TO CAPACITY RATIO
A	0.00 - 0.60
B	0.61 - 0.70
C	0.71 - 0.80
D	0.81 - 0.90
E	0.91 - 1.00
F	>1.00

f. Peak-Periods:

Weekday peak-hour analysis periods are defined as follows:

7:00 to 9:00 AM
4:00 to 6:00 PM

g. Peak-Hour:

The highest one-hour period in both the AM and PM peak periods, as determined by four consecutive 15-minute count periods are used in the ICU calculations. Both AM and PM peak hours are studied.

h. Peak-Hour Data Consistency:

Variations in peak-hour volumes can affect LOS calculations because they vary from day-to-day. To minimize these variations, no counts are taken on Mondays, Fridays, holidays or weekends.

i. Right Turn Movements:

If the distance from the edge of the outside through lane is at least 19 feet and parking is prohibited during the peak period, right turning vehicles may be assumed to utilize this "unofficial" right turn lane. Otherwise, all right turn traffic is assigned to the through lane. If a right turn lane exists, right turn activity is checked for conflicts with other critical movements. It is assumed that right turn movements are accommodated during non-conflicting left turn phases (e.g., northbound right turns during westbound left turn phase), as well as non-conflicting through flows (e.g., northbound right turn movements and north/south through flows. Right turn movements become critical when conflicting movements (e.g., northbound right turns, southbound left turns, and eastbound through flows) represent a sum of V/C ratios which are greater than the normal through/left turn critical movements. Right turn volumes have been reduced by 15% to account for right turns on red.

If a free right turn lane exists (right turns do not have to stop for the signal), a flow rate of 1,700 vehicles per hour per lane is assumed. The V/C ratio of the right turn lane is reported but not included in the sum of the critical V/C ratios.

The ICU's for the intersections in the vicinity of the site are shown in Table 2. Existing ICU's are based upon manual AM and PM peak hour turning movement counts made for RKJK in June and August, 1995 (see Exhibits G and H). The existing intersection lanes for the study area intersections are depicted on Exhibit I.

Traffic count worksheets are included in Appendix "B". The intersections in the vicinity of the site are currently operating at Level of Service "D" or better during the peak hours. ICU calculation worksheets are provided in Appendix "C".

Traffic signals appear to presently be warranted at the following intersections (see Appendix "I"):

Santiago Canyon Road (NS) at:

- Ridgeline Road (EW)

El Toro Road (NS) at:

- Live Oak Canyon Road (EW)

III. PROJECTED TRAFFIC

A. Site Traffic

1. Trip Generation

Trip generation represents the amount of traffic which is attracted and produced by a development. The recorded map for Tract 10692 shows 705 manufactured housing dwelling units. The project site also includes 20,000 square feet of commercial retail.

Trip generation rates for this project are shown in Table 3. The trip generation rates are based upon the County of Orange and Institute of Transportation Engineers (ITE).

Both daily and peak-hour trip generation for the proposed project are shown in Table 4. The Saddleback Meadows (TT 10692) development is projected to generate a total of approximately 8,340 trip-ends per day with 540 vehicles per hour during the AM peak hour and 825 vehicles per hour during the PM peak hour.

It should be noted that for commercial retail land uses, a portion of the traffic would come from pass-by or diverted trips from adjacent roadways, trips which are currently on the roadway system (see Appendix "K"). In order to analyze a "conservative" scenario in terms of the assignment of traffic, the traffic volumes from the project site have been reduced by 30% as a result of pass-by or diverted trips.

TABLE 3

TRIP GENERATION RATES

LAND USE	UNITS[2]	PEAK HOUR[1]				DAILY
		AM		PM		
		IN	OUT	IN	OUT	
Manufactured Housing	DU	0.17	0.50	0.47	0.36	8.00
Commercial Retail	TSF	1.98	1.16	5.88	5.88	135.00[3]

[1] Source: Institute of Transportation Engineers (ITE), Trip Generation, Fifth Edition Update, February, 1995, Land Use Categories 231 and 820.

[2] DU = dwelling units
TSF = thousand square feet

[3] Source: County of Orange, Daily Vehicle Trip Generation Rates, August, 1982.

TABLE 4

PROJECT TRIP GENERATION

LAND USE	UNITS[2]	PEAK HOUR[1]				DAILY[3]
		AM		PM		
		IN	OUT	IN	OUT	
Manufactured Housing	705.0 DU	120	355	330	255	5,640
Commercial Retail	20.0 TSF	40	25	120	120	2,700
• Pass-By/Diverted Trips[4] (30%)		-10	-5	-35	-35	-810
Total						
• W/O Pass-By/Diverted Reduction		160	380	450	375	8,340
• W/Pass-By/Diverted Reduction		150	375	415	340	7,530

[1] All peak hour trips rounded to nearest 5.

[2] DU = dwelling units
TSF = thousand square feet

[3] All daily trips rounded to nearest 10.

[4] A portion of the commercial retail traffic would come from pass-by or diverted trips from adjacent roadways, trips which are currently on the roadway system (see Appendix "K").

A trip generation comparison to four other alternatives of the project site is shown in Table 5. All of the alternatives decrease the AM and PM vehicles per hour and daily trip-ends as compared to the proposed project.

2. Trip Distribution

Trip distribution represents the directional orientation of traffic to and from the project site. Trip distribution is heavily influenced by the geographical location of the site, the proximity to the regional freeway system, existing/future residential development, other commercial and community facilities. The directional orientation of traffic was determined by evaluating existing and proposed land uses within the community and the Master Plan of Arterial Highways (MPAH).

Trip distribution for this study has been based upon near-term conditions, based upon those highway facilities which are in place. The trip distribution patterns for the project are graphically depicted on Exhibits J and K.

3. Modal Split

The traffic reducing potential of public transit has not been considered in this report. Essentially the traffic projections are "conservative" in that public transit might be able to reduce the traffic volumes.

TABLE 5

TRIP GENERATION COMPARISON FOR OTHER ALTERNATIVES

LAND USE	QUANTITY[2]	PEAK HOUR[1]				DAILY[3]
		AM		PM		
		IN	OUT	IN	OUT	
Single-Family Detached Residential	150 DU	30	85	100	55	1,800

4. Trip Assignment

The assignment of traffic from the site to the adjoining roadway system has been based upon the site's trip generation, trip distributions, proposed arterial highway and local street systems. Based on the identified project traffic generation and distributions, the project related traffic volumes are shown on Exhibit L. The project AM and PM peak hour intersection turning movement volumes are shown on Exhibits M and N, respectively.

B. Other Development Traffic

1. Method of Projection

During 1995, RKJK staff interfaced with the County of Orange regarding the Year 2000 and Year 2020 traffic projections in the study area. The modeling source for traffic projections in the study area has been the Orange County Transportation Analysis Model (OCTAM), Version 2.5, South County Subarea (SCTM). SCTM projections for the Year 2000 incorporate 366 single-family residential units in traffic analysis zone 2695 which encompasses the project site. The Year 2000 and 2020 ADT volume forecasts were projected to include the residential portion of the project, therefore, Year 2000 and 2020 traffic conditions without the project involved subtracting the residential project volumes from the SCTM model volumes. The entire proposed project including the commercial retail portion was then added to this baseline data to determine the "with project" volumes.

The Year 2000 and 2020 peak hour forecasts were developed using the previously described daily forecasts, along with peak hour traffic count data collected at each analysis location. Each existing turning movement was initially multiplied by the average growth in daily traffic for the two legs of the intersection involved. The resulting initial estimate of the future Year 2000 and 2020 peak hour turning movements were then reviewed for reasonableness. The reasonableness checks performed include review of flow conservation, as well as comparison to both the existing actual counted volume and the overall relationship between the forecast peak hour volume and daily volume on each individual intersection leg. Where necessary, the initial estimates were adjusted to achieve flow conservation, reasonable growth, and acceptable relationships between the peak hour and daily traffic volume forecasts.

2. Non-Site Traffic for Study Area

The Live Oak Plaza Traffic Analysis prepared by Kunzman Associates (January 7, 1997) has been included as other development in this traffic study.

Table 6 depicts the daily and peak hour vehicle trips generated by the other development in the study area. Exhibit O illustrates the directional distribution and assignment of the other development traffic. Based on the identified trip distribution for other development on arterial highways throughout the study area, other development average daily traffic (ADT) are shown on Exhibit P. Other development AM and PM peak hour intersection turning movement volumes are shown on Exhibits Q and R, respectively.

C. Total Traffic

Once the project related traffic is assigned to the street network (see Exhibit L) and added to existing volumes in the study area, existing plus project ADT volumes can be assessed (see Exhibit S).

Exhibit T shows the ADT volumes which can be expected for Year 2000 traffic conditions without the project.

Exhibit U shows the SCTM ADT volumes which can be expected for Year 2000 traffic conditions with the project. Traffic volume increases along El Toro Road and Santiago Canyon Road caused by both the project site and surrounding development are moderated by the incremental extension of the Foothill Transportation Corridor (SR-241) and the availability of Glenn Ranch Road to service traffic generated west of El Toro Road and north of the corridor.

Exhibit V shows the ADT volumes which can be expected for Year 2020 traffic conditions without the project. Exhibit W shows the SCTM ADT volumes which can be expected for Year 2020 traffic conditions with the project.

IV. TRAFFIC ANALYSIS

A. Capacity and Level of Service and Improvement Analysis, Existing Plus Project

1. Level of Service at Existing Plus Project

Intersection Capacity Utilization (ICU) for existing plus project traffic conditions have been calculated and are shown in Table 7. Table 7 shows ICU calculations at the study area intersections without improvements. Existing plus project AM and PM peak hour turning movement volumes are shown on Exhibits X and Y, respectively.

As shown in Table 7, intersections in the vicinity of the site are projected to continue to operate at Level of Service "D" or better during the peak hours. ICU calculation worksheets are included in Appendix "D". A traffic signal is projected to be warranted at the intersection of El Toro Road/Project Entrance for existing plus project traffic conditions (see Appendix "I").

B. Capacity and Level of Service and Improvement Analysis, Year 2000

1. Level of Service at Year 2000 Without Project

Intersection Capacity Utilization (ICU) for Year 2000 traffic conditions without the project have been calculated and are shown in Table 8. Table 8 shows ICU calculations at the study area intersections without the project, without improvements. Year 2000 AM and PM peak hour

[3] Level of Service (LOS)

turning movement volumes without the project are shown on Exhibits Z and AA, respectively.

As shown in Table 8, intersections in the vicinity of the site are projected to operate at Level of Service "D" or better during the peak hours without the proposed project, without improvements. ICU calculation worksheets are included in Appendix "E". A traffic signal is projected to be warranted at the intersection of Santiago Canyon Road/Modjeska Canyon Road for Year 2000 without project traffic conditions (see Appendix "I").

2. Level of Service at Year 2000 With Project

Intersection Capacity Utilization (ICU) for Year 2000 traffic conditions with the project have been calculated and are shown in Tables 9 and 10. Table 9 shows ICU calculations at the study area intersections with the project, without improvements. ICU calculations with the project and with improvements are shown in Table 10. Year 2000 AM and PM peak hour turning movement volumes with the project are shown on Exhibits BB and CC, respectively.

As shown in Table 10, intersections in the vicinity of the site are projected to operate at Level of Service "D" or better during the peak hours with the proposed project, with site access improvements. ICU calculation worksheets are included in Appendix "F".

C. Capacity and Level of Service and Improvement Analysis, Year 2020

1. Level of Service at Year 2020 Without Project

Intersection Capacity Utilization (ICU) for Year 2020 traffic conditions without the project have been calculated and are shown in Tables 11 and 12. Table 11 shows ICU calculations at the study area intersections without the project, without improvements. ICU calculations without the project and with improvements are shown in Table 12. Year 2020 AM and PM peak hour turning movement volumes without the project are shown on Exhibits DD and EE, respectively.

As shown in Table 12, intersections in the vicinity of the site are projected to operate at Level of Service "D" or better during the peak hours without the proposed project, with improvements that include the ultimate widening of El Toro Road and Santiago Canyon Road to four through travel lanes (two in each direction). ICU calculation worksheets are included in Appendix "G".

2. Level of Service at Year 2020 With Project

Intersection Capacity Utilization (ICU) for Year 2020 traffic conditions with the project have been calculated and are shown in Tables 13 and 14. Table 13 shows ICU calculations at the study area intersections with the project, without improvements. ICU calculations with the project and with improvements are shown in Table 14. Year 2020 AM and PM peak hour turning movement volumes with the project are shown on Exhibits FF and GG, respectively.

ROBERT KAHN · JOHN KAHN & ASSOCIATES INC.

As shown in Table 14, intersections in the vicinity of the site are projected to operate at Level of Service "D" or better during the peak hours with the proposed project, with improvements that include the ultimate widening of El Toro Road and Santiago Canyon Road to four through travel lanes (two in each direction). ICU calculation worksheets are included in Appendix "H".

D. Santiago Canyon Road Analysis

Pursuant to the County of Orange Growth Management Plan (GMP), segments of Santiago Canyon Road are required to function at a Level of Service "C". Capacity improvements along Santiago Canyon Road will be required in conjunction with future growth to achieve Level of Service "C". The Santiago Canyon Road Major Thoroughfare and Bridge Fee Program has been designed to provide up to $34 million in improvements to Santiago Canyon Road from Chapman Avenue to Live Oak Canyon Road. However, the March, 1994 Project Report for improvements to Santiago Canyon Road indicates that the total cost of improvements is approximately $52.3 million for a "limited project" scenario. To address the difference between the ultimate cost of $52.3 million and the fee program allocation of $34 million, the project should provide an additional contribution beyond the payment of normal fees based upon its traffic share.

V. RECOMMENDATIONS

A. Site Access

The proposed project will have primary access to El Toro Road. The El Toro Road turn-lane improvements needed at the Project Entrance to serve Year 2000 conditions should be completed in conjunction with development. Secondary access will be provided via an access to Valley Vista Way.

It is anticipated that the main project access point to El Toro Road will require a traffic signal in conjunction with the first project phase (approximately 208 dwelling units). The project should provide this improvement as well as a southbound left turn lane and northbound right turn lane on El Toro Road at the project entry.

Traffic signing/striping should be implemented in conjunction with detailed construction plans for the project. Verification of adequate parking should be analyzed for the project site in conjunction with approval of the site plan.

B. Roadway Improvements

1. Off-Site

The project should participate in existing road fee programs, including the Foothill/Eastern Transportation Corridor Fee Programs, Foothill Circulation Phasing Program (FCPP), El Toro Road Fee Program and the Santiago Road Fee Program. Potential roadway fees for the Saddleback Meadows (TT 15230) development are shown in Table 15.

TABLE 15

POTENTIAL ROADWAY FEES

EXISTING ROAD FEE PROGRAMS	ROADWAYS TO BE CONSTRUCTED	ADOPTION DATE	RATES (EFFECTIVE FROM JULY 1, 1996 THROUGH JUNE 30, 1997)	APPROXIMATE PROJECT FEES (705 DU's AND 20,000 SQ. FT.)
1. Eastern/Foothill Transportation Corridor Road Fee Program (Zone A)	Portion of the cost of the future Eastern/Foothill Transportation Corridor from the Southern Orange County line at Interstate Route 5 to the Riverside Freeway (State Route 91).	Oct., 1984	$3,594/DU $4.99/Sq. Ft. Commercial	$2,533,770.00 $99,800.00
2. Santiago Canyon Road Major Thoroughfare and Bridge Fee Program	Improvements of Santiago Canyon Road from Chapman Avenue to Live Oak Canyon Road to its Master Plan of Arterial Highways designation as a primary arterial highway.	Aug., 1990	$510/DU $0.45/Sq. Ft. Commercial	$359,550.00 $9,000.00
3. El Toro Road Fee Program	Widen El Toro Road from a two lane to four lane highway from Live Oak Canyon Road to Trabuco Road.	Oct., 1983	$1,026/DU $59,498/Acre Commercial	$723,330.00 $101,146.60
4. Foothill Circulation Phasing Program (FCPP), Including Special FTC Fees (Zone 4)	Provides for a Backbone System of arterial highways and intersection improvements in the northern El Toro area. Roadways to be constructed include the extension of Portola Parkway/Santa Margarita Parkway (with the FTC), Bake Parkway, Oso Parkway, Alicia Parkway, Sand Canyon, Jeffrey, Irvine Boulevard/Trabuco Road and various intersection upgrades.	Oct., 1987	$2,759/DU $155/DU $2.483/Sq. Ft. Commercial $0.140/Sq. Ft. Commercial	$1,945,095.00 $109,275.00 $49,660.00 $2,800.00
TOTAL	--	--		$5,933,426.60

Both existing traffic patterns and SCTM traffic projections for Years 2000 and 2020 indicate the attraction of Glenn Ranch Road, Portola Parkway, and the Foothill Transportation Corridor (SR-241) for increased traffic volumes in the project study area.

North of the Foothill Transportation Corridor, El Toro Road can accommodate cumulative Year 2020 traffic volumes with the proposed project on four travel lanes divided by a raised or striped median. Exhibit HH illustrates the alternative cross-sections for El Toro Road in the vicinity of the project. Implementation of a full Major arterial cross-section (six lanes divided) is not needed to serve future traffic volumes. Exhibit HH depicts an alternative section which would provide four travel lanes along El Toro Road divided by a striped median. This alternative section represents a modification of the typical cross-section for a Primary arterial. Appropriate transitions would be required between this cross-section and other modified cross-sections along El Toro Road south of Glenn Ranch Road.

Table 16 depicts the project share of peak hour traffic along segments of Santiago Canyon Road. The residential project peak hour traffic increases range from 5.8 percent during the AM peak hour traffic north of Ridgeline Road, to 9.2 percent of PM peak hour traffic between Live Oak Canyon Road and Ridgeline Road. The commercial project peak hour traffic increases range from 0.2 percent during the AM peak hour traffic north of Modjeska Canyon Road, to 2.5 percent of PM peak hour traffic between Live Oak Canyon Road and Ridgeline Road. Pursuant to the County of Orange Growth Management Plan (GMP) and discussions with Environmental Management Agency staff, it has been determined that the project should contribute a fee beyond the normal Santiago

• Commercial[1]	8	32	6	24	4	16
Project Increases						
• Residential	6.4%	9.2%	5.8%	8.1%	5.8%	8.5%
• Commercial	0.5%	2.5%	0.4%	1.7%	0.2%	1.2%

[1] Includes pass-by/diverted traffic reduction.

Canyon Road Major Thoroughfare and Bridge Fee Program to address ultimate improvement requirements based upon the project's fare share traffic contribution. The difference between the long range improvement costs for Santiago Canyon Road and the amount estimated to be provided by the Santiago Canyon Road Major Thoroughfare and Bridge Fee Program is approximately $18,300,000. A conservative estimate of the project's residential traffic share is approximately 7.3 percent based upon the values presented in Table 16. This amounts to a residential project contribution of $1,335,900, which in turn equates to a fee per dwelling unit of $1,895. The project should therefore participate in a supplemental fee contribution to Santiago Canyon Road of $1,895 per dwelling unit. A conservative estimate of the project's commercial traffic share is approximately 1.1 percent based upon the values presented in Table 16. This amounts to a commercial project contribution of $201,300, which in turn equates to a fee per square foot of $10.07. The project commercial area should therefore participate in a supplemental fee contribution to Santiago Canyon Road of $10.07 per square foot.

2. On-Site

In order to accommodate the anticipated traffic and the potential traffic signal, it is recommended that the entry street to Saddleback Meadows (TT 10692) be designed as a Collector roadway with a curb-to-curb width of 58 feet at its intersection with El Toro Road. This provides for two 12 foot exiting lanes and two 12 foot entering lanes with a 10 foot median. The Collector cross-section should be maintained for approximately 160 feet where it could then be transitioned to a standard

40 foot wide curb-to-curb width Collector roadway, as shown on Exhibit II.

Traffic signing/striping should be implemented in conjunction with detailed construction plans for the project. Verification of adequate parking should be analyzed for the project site in conjunction with approval of the site plan.

Sight distance at each of the project access intersections should be reviewed with respect to Standard Plan Number 1117 (see Appendix "J") in conjunction with the preparation of precise grading and landscape plans.

APPENDIX A

LEVEL OF SERVICE DESCRIPTION

LEVEL OF SERVICE - DEFINITIONS*

Service Level	General Definition	Freeways Criteria for measurement: Density (cars per lane-mile)	Arterials Criteria for measurement: Average travel speed (mph)
A	Free flow. Individual users are virtually unaffected by the presence of others in the traffic stream. Freedom to select desired speeds and to maneuver within the traffic stream is extremely high. The general level of comfort and convenience provided to the motorist, passenger, or pedestrian is excellent.	Free flow operations. Average travel speeds near 60 mph generally prevail on 70-mph freeway elements. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream. The average spacing between vehicles is about 440 ft, or 22 car-lengths, with a maximum density of 12 cars/mi/ln. The effects of minor incidents or breakdowns are easily absorbed at this level. Although they may cause a deterioration in LOS in the vicinity of the incident, standing queues will not form, and traffic quickly returns to LOS A on passing the disruption.	Primarily free flow-operations at average travel speeds usually within 90 percent of the free flow speed. Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Stopped delay at signalized intersections is minimal.
B	Stable flow, but the presence of other users in the traffic stream begins to be noticeable. Freedom to select desired speeds is relatively unaffected, but there is a slight decline in the freedom to maneuver within the traffic stream from LOS A. The level of comfort and convenience provided is somewhat less than at LOS A, because the presence of others in the traffic stream begins to affect individual behavior.	Reasonably free-flow conditions, and speeds of over 57 mph are maintained on 70-mph freeway elements. The average spacing between vehicles is about 260 ft, or 13 car-lengths, with a maximum density of 20 cars/mi/ln. The ability to maneuver within the traffic stream is only slightly restricted. The effects of minor incidents and breakdowns are still easily absorbed, though local deterioration in service would be more severe than for LOS A.	Unimpeded operations at average travel speeds usually within 70 percent of the free flow speed. The ability to maneuver within the traffic stream is slightly restricted and stopped delays are not bothersome.
C	Stable flow, but marks the beginning of the range of flow in which the operation of individual users becomes significantly affected by interactions with others in the traffic stream. The selection of speed is affected by the presence of others, and maneuvering within the traffic stream requires substantial vigilance on the part of the user. The general level of comfort and convenience declines noticeably at this level.	Stable operations, but flows approach the range in which small increases in flow will cause substantial deterioration in service. Average travel speeds are still over 54 mph. Freedom to maneuver within the traffic stream is noticeably restricted at LOS C, and lane changes require additional care and vigilance by the driver. Average spacings are in the range of 175 ft, or 9 car-lengths, with a maximum density of 30/cars/mi/ln. Minor incidents may still be absorbed, but the local deterioration in service will be substantial. Queues may be expected to form behind any significant blockage. Additional vigilance by driver required for safe operation.	Stable operations. Ability to maneuver and change lanes in midblock locations may be more restricted than in LOS B, and longer queues and/or adverse signal coordination may contribute to lower average travel speeds of about 50 percent of the average free flow speed.

D	High-density, but stable, flow. Speed and freedom to maneuver are severely restricted, and the driver or pedestrian experiences a generally poor level of comfort and convenience. Small increases in traffic flow will generally cause operational problems at this level.	Borders on unstable flow. In this range, small increases in flow cause substantial deterioration in service. Average travel speeds of 48 mph or more can still be maintained on 70-mph freeway elements. Freedom to maneuver within the traffic stream is severely limited. Even minor incidents can be expected to create substantial queuing, because the traffic stream has little space to absorb disruptions. Average spacings are about 125 ft, or 6 car-lengths, with a maximum density of 42 cars/mi/ln.	Borders on a range on which small increases in flow may cause substantial increases in approach delay and, hence, decreases in arterial speed. This may be due to adverse signal progression, inappropriate signal timing, high volumes, or some combination of these. Average travel speeds are about 40 percent of free flow speed.
E	Operating conditions at or near the capacity level. All speeds are reduced to a low but relatively uniform value. Freedom to maneuver within the traffic stream is extremely difficult, and it is generally accomplished by forcing a vehicle or pedestrian to "give way" to accommodate such maneuvers. Comfort and convenience levels are extremely poor, and driver or pedestrian frustration is generally high. Operations at this level are usually unstable, because small increases in flow or minor perturbations within the traffic stream will cause breakdowns.	The boundary between LOS D and LOS E describes operation at capacity. Operations in this level are extremely unstable, because there are virtually no usable gaps in the traffic stream. Vehicles are spaced at approximately 80 ft, or 4 car-lengths, at relatively uniform headways. This, however, represents the minimum spacing at which stable flow can be accommodated. Any disruption to the traffic stream, such as a vehicle entering from a ramp, or a vehicle changing lanes, causes following vehicles to give way to admit the vehicle. At capacity, the traffic stream has no ability to dissipate even the most minor disruptions. Any incident can be expected to produce a serious breakdown with extensive queuing. The range of flows encompassed by LOS E is relatively small compared to other levels, but reflects a substantial deterioration in service. Maneuverability within the traffic stream is extremely limited. Average travel speeds at capacity are approximately 30 mph.	Significant approach delays and average travel speeds of one-third the free flow speed or lower. Such operations are caused by some combination or adverse progression, high signal density, extensive queuing at critical intersections, and inappropriate signal timing.
F	Level-of-service F. Forced or breakdown flow. This condition exists wherever the amount of traffic approaching a point exceeds the amount which can traverse the point. Queues form behind such locations. Arrival flow exceeds discharge flow.	Level F describes forced or breakdown flow. Such conditions generally exist within queues forming behind breakdown points. Breakdown occurs when the ratio of actual arrival flow rate to actual capacity or the forecasted flow rate to estimated capacity exceeds 1.00. Operations at such a point will generally be at or near capacity, and downstream operations may be better as vehicles pass the bottleneck (assuming that there are no additional downstream problems). The LOS F operations observed within a queue are the result of a breakdown or bottleneck at a downstream point.	Arterial flow at extremely low speeds below one-third to one-quarter of the free flow speed. Intersection congestion is likely at critical signalized locations, with high approach delays resulting. Adverse progression is frequently a contributor to this condition.

Adopted: Res. 77-92 Revised: Res. 82-718; 86-114; 88-1341; 91-1481

INTERSECTION SIGHT DISTANCE

STD. PLAN 1117

SHT. 1 OF 3

NOTES:

1. The distance S represents the corner sight distance measured along the centerline of the road. The corner sight distance is the distance required to allow 7 1/2 seconds for the driver on the cross road (or left turn pocket) to safely cross the main roadway or turn left while the approach vehicle travels at the assumed design speed of the main roadway.
2. The distance S should be increased by 20% from the amount shown on the table on sustained downgrades steeper than 3% and longer than one mile.
3. Points A and A' are the locations of a driver's line of sight (3.5 foot eye height) to oncoming vehicles (4.25 foot object height) located at Points C and C' while in a vehicle at an intersection 10 feet back from the projection of the curb line. In no case shall Points A or A' be less than fifteen feet from the edge of the traveled way.
4. The distance Y' is the distance measured from the centerline of the main road to the far right through travel lane. The distance Y' is equal to zero for T-intersections. The distance X is the distance measured from the centerline of the main road to the center of the far right through travel lane. The distance X' is the distance measured from the centerline of the main road to the center of the travel lane nearest the centerline of the road.
5. The Limited Use Area is determined by the graphical method using the appropriate distances given in the above table. It shall be used for the purpose of prohibiting or clearing obstructions in order to maintain adequate sight distance at intersections.
6. The Line of Sight line shall be shown at intersections on all landscaping plans, grading plans and tentative tract plans where safe sight distance is questionable. In cases where an intersection is located on a vertical curve, a profile of the line of sight may be required.
7. Obstructions such as bus shelters, walls or landscaping within the Limited Use Area which could restrict the line of sight shall not be permitted.
   a. Plants and shrubs within the Limited Use Area shall be of the type that will grow no higher than 12 inches above the ground and shall be maintained at a maximum height of 12 inches above the ground. Maintenance at a lower height may be required on crest vertical curves per Note 6 above.
   b. A profile of the line of sight may be required to verify 12" minimum vertical clearance above variable height obstructions such as slope landscaping, plants and shrubs.
   c. The toe of slope may encroach into the Limited Use Area provided that the requirements of (b) above are satisfied.
   d. In lieu of providing a profile of the line of sight, the toe of slope shall not encroach into the Limited Use Area, and the Limited Use Area shall slope at 2% maximum to the roadway.

APPENDIX K

PASS-BY/DIVERTED TRIPS

VII. Quantifying Pass-By and Diverted Linked Trips

Background

The trip generation rates and equations contained in this report were derived from actual measurements of traffic on the driveways of land uses or buildings. However, in some cases, the driveway volume at a generator is different than the amount of traffic *added* to the street system. Buildings such as retail establishments, restaurants, banks, service stations and convenience markets attract a portion of their trips from traffic passing the site on the way from one location to another.

Trip making where this phenomenon occurs can be broken down into the following four categories of trips:

- Primary Trips (N_{Pr})
- Pass-by Trips (N_{Pb})
- Diverted Linked Trips (N_D)
- Non Pass-by Trips (N_{nPb})

These trips are defined as follows:

Primary Trips are trips made for the specific purpose of visiting the generator. The stop at that generator is the primary reason for the trip. For example, a home-to-shopping-to-home combination of trips is a primary trip set.

Pass-By Trips are trips made as intermediate stops on the way from an origin to a primary trip destination. Pass-by trips are attracted from traffic passing the site on an adjacent street which contains direct access to the generator. These trips do not require a diversion from another roadway.

Diverted Linked Trips are trips attracted from the traffic volume on roadways within the vicinity of the generator but which require a diversion from that roadway to another roadway to gain access to the site. These roadways could include streets or freeways adjacent to the generator but without access to the generator.

Non Pass-By Trips refer to the total of the primary trips and the diverted linked trips. This term is used when diverted linked trips are not quantified, but pass-by trips are quantified (i.e., the non pass-by trips are equal to the total trips minus the pass-by trips).

Figure VII-1 indicates an example of roadways from which pass-by trips and diverted linked trips are produced. It should be noted that the vicinity of the generator has not been defined. Research is needed to determine the size of the area or distance from a generator from which diverted linked trips are produced (much like the market area of a shopping center for primary trips).

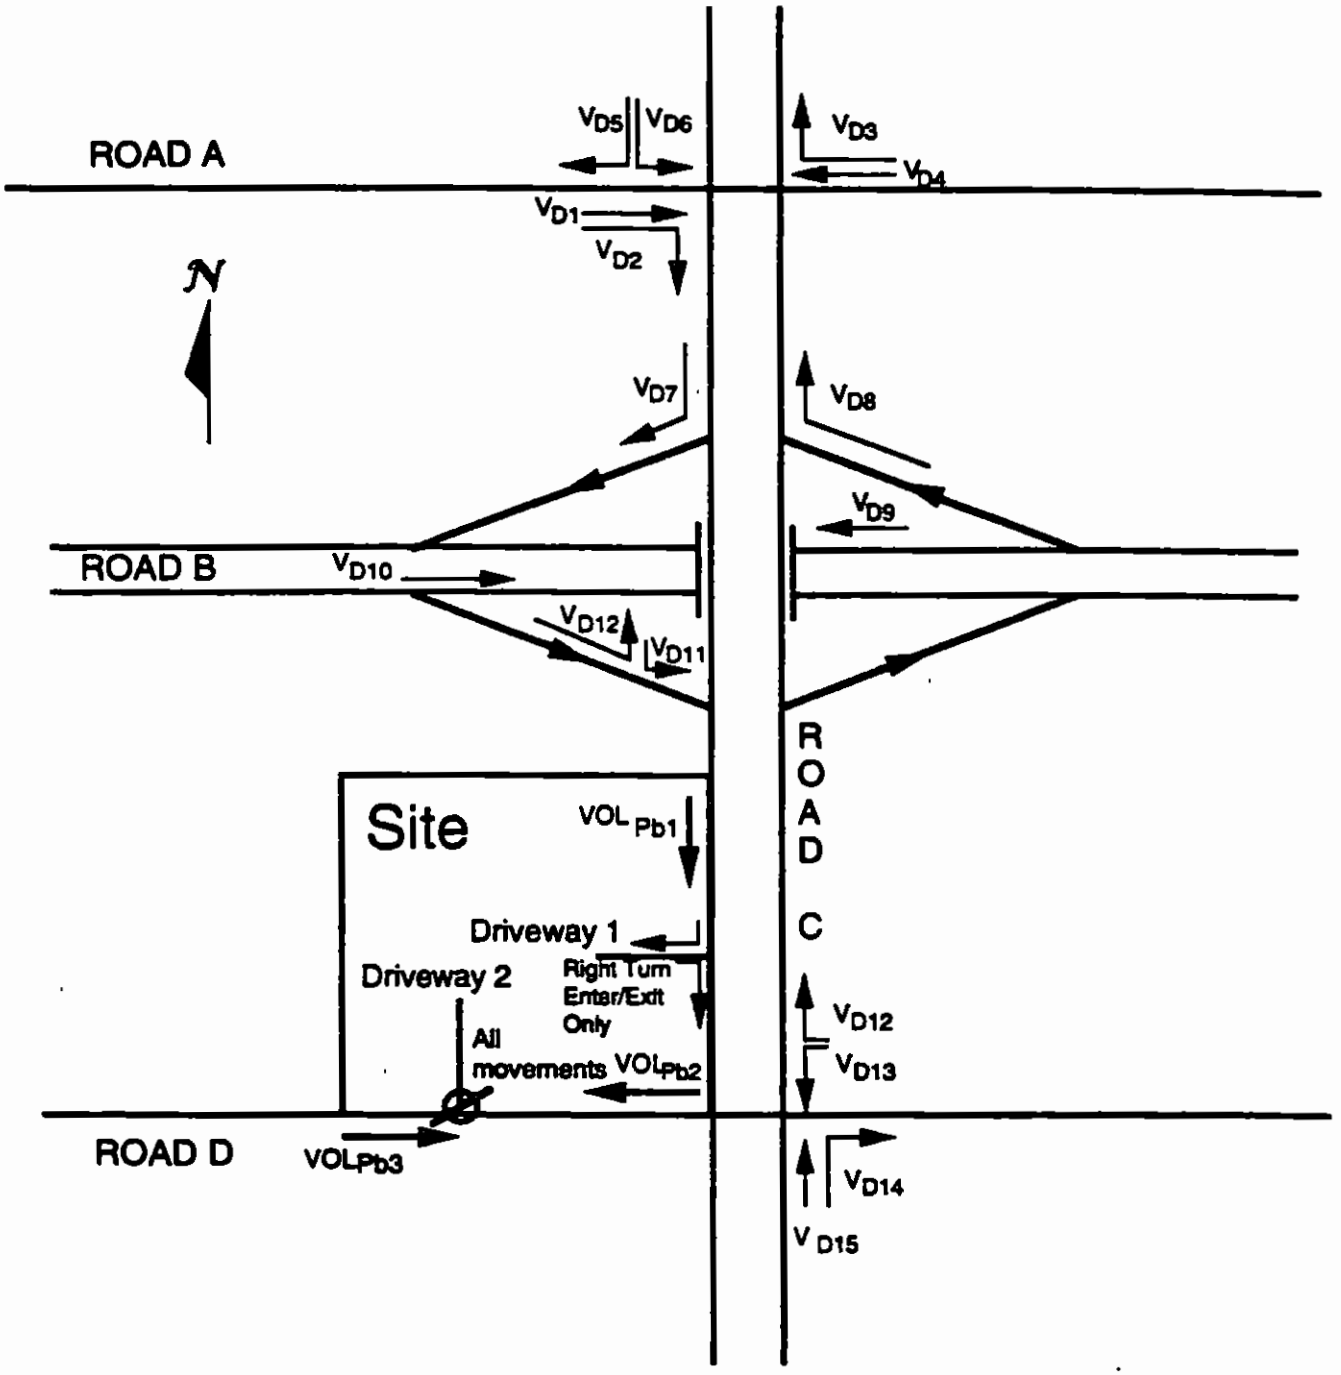
It is essential that this phenomenon be recognized when examining the traffic impact of a development on the street system. The pass-by and diverted linked trip estimation method initiated in previous editions is calculated as a percentage of the total number of trips entering the generator. Statistical correlation of the data collected by the professional community has proven difficult, with resulting low correlation indices. The results of the pass-by trip percentages analyzed to date and presented herein can be enhanced further with an expanded methodology that also accounts for the effects of the magnitude of the passing traffic stream volume on the adjacent road system. Additionally, more detailed data are needed before this estimation methodology can be statistically analyzed and formally adopted. To assist in this regard, the interview survey forms have been expanded to assist the professional community in collecting this data in a standard format for use in future analyses. The fifth edition of *Trip Generation* contains additional theoretical discussion on pass-by and diverted linked trips.

The professional community should continue to use the results of the analyses of pass-by trip percentages tempered with engineering judgment until more data are attained and the methodology produces results with higher correlation to the actual events.

Database on Pass-By Trip and Diverted Linked Trip Percentages

Surveys conducted to date have been limited to interviewing a limited sample of people to determine a pass-by trip and diverted linked trip percentage based on the interviews and relating the percentage to the size of the generator or shopping center. Some recent surveys also provided information on ADT, but not in sufficient detail

Figure VII-1: Identification of Pass-By and Diverted Linked Trip Volumes



Legend

$$V_{Pb\ TOT} = \sum VOL_{Pb1} + VOL_{Pb2} + VOL_{Pb3} \quad (VPH)$$

$$V_{D\ TOT} = \sum VOL_{D1} + VOL_{D2} + VOL_{D.....} + VOL_{D15} \quad (VPH)$$

to identify traffic volume related to true pass-by trips and diverted linked trips. The data available for the land uses presented in this update are contained in the following tables.

Table VII-1	High-Turnover (Sit-Down) Restaurant (832) P.M Peak Hour
Table VII-2	Fast-Food Restaurant with Drive-Through Window (834) A.M. Peak Hour
Table VII-3	Fast-Food Restaurant with Drive-Through Window (834) P.M Peak Hour
Table VII-4	Gasoline/Service Station (844) A.M. Peak Hour
Table VII-5	Gasoline/Service Station (844) P.M. Peak Hour
Table VII-6	Gasoline/Service Station with Convenience Market (845) A.M. Peak Hour
Table VII-7	Gasoline/Service Station with Convenience Market (845) P.M. Peak Hour
Table VII-8	Convenience Market with Gasoline Pumps (853) A.M. Peak Hour
Table VII-9	Convenience Market with Gasoline Pumps (853) P.M. Peak Hour

Good correlation between the pass-by trip percentage and size of the generator has been illusive. The database needs to be further expanded before better predictive relationships can be developed. Therefore, the user is cautioned to use engineering judgment to establish the pass-by trip and diverted linked trip percentage before application. Whenever possible, and especially at planned expansion to existing facilities, it is recommended that the pass-by trip and diverted linked trip percentages be determined on the basis of site-specific data collected with the expanded forms provided.

Application of Pass-By Trip and Diverted Linked Trip Percentage Results

Until the estimation methodology is further developed, the results of the pass-by trip and diverted linked trip percentages may continue to be applied with caution, as explained herein. The pass-by trips and diverted linked trips estimated to enter and exit a development does not affect the driveway volumes but does affect the amount of traffic added to the adjacent street system. The following example and Figure VII-2 illustrate this point for pass-by trips.

- The p.m peak hour traffic passing a retail center is 1,200 vehicles per hour, as shown in Figure VII-2(a).
- The driveway volumes are estimated to be 200 vehicles per hour entering and leaving the center as shown in Figure VII-2(b).
- The pass-by trips are estimated to be 25 percent of the driveway volumes, as shown in Figure VII-2(b).
- The trip distribution for the primary trips is shown in Figure VII-2(c).
- The distribution of the pass-by trips is based on the volume of traffic passing the driveway, as shown in Figure VII-2(d).
- The assignment of the pass-by trips is shown in Figure VII-2(f).
- The final assignment of all the trips entering and leaving and passing the driveway is shown in Figure VII-2(g).

Data Needs for Pass-By Trips and Diverted Linked Trips

More data are needed to further quantify the pass-by trips and diverted linked trips for all land uses where this phenomenon exists. It is essential that the data in this report be expanded through the uniform collection of data suggested in the survey forms. Following is a questionnaire to be used for conducting interviews for the purpose of collecting pass-by trip and diverted linked trip data, and a summary form. The summary form is designed to list the summary of survey results, but must also provide information related to the generator, location and traffic volumes associated with both true pass-by trips and diverted linked trips.

METEOROLOGY/CLIMATE

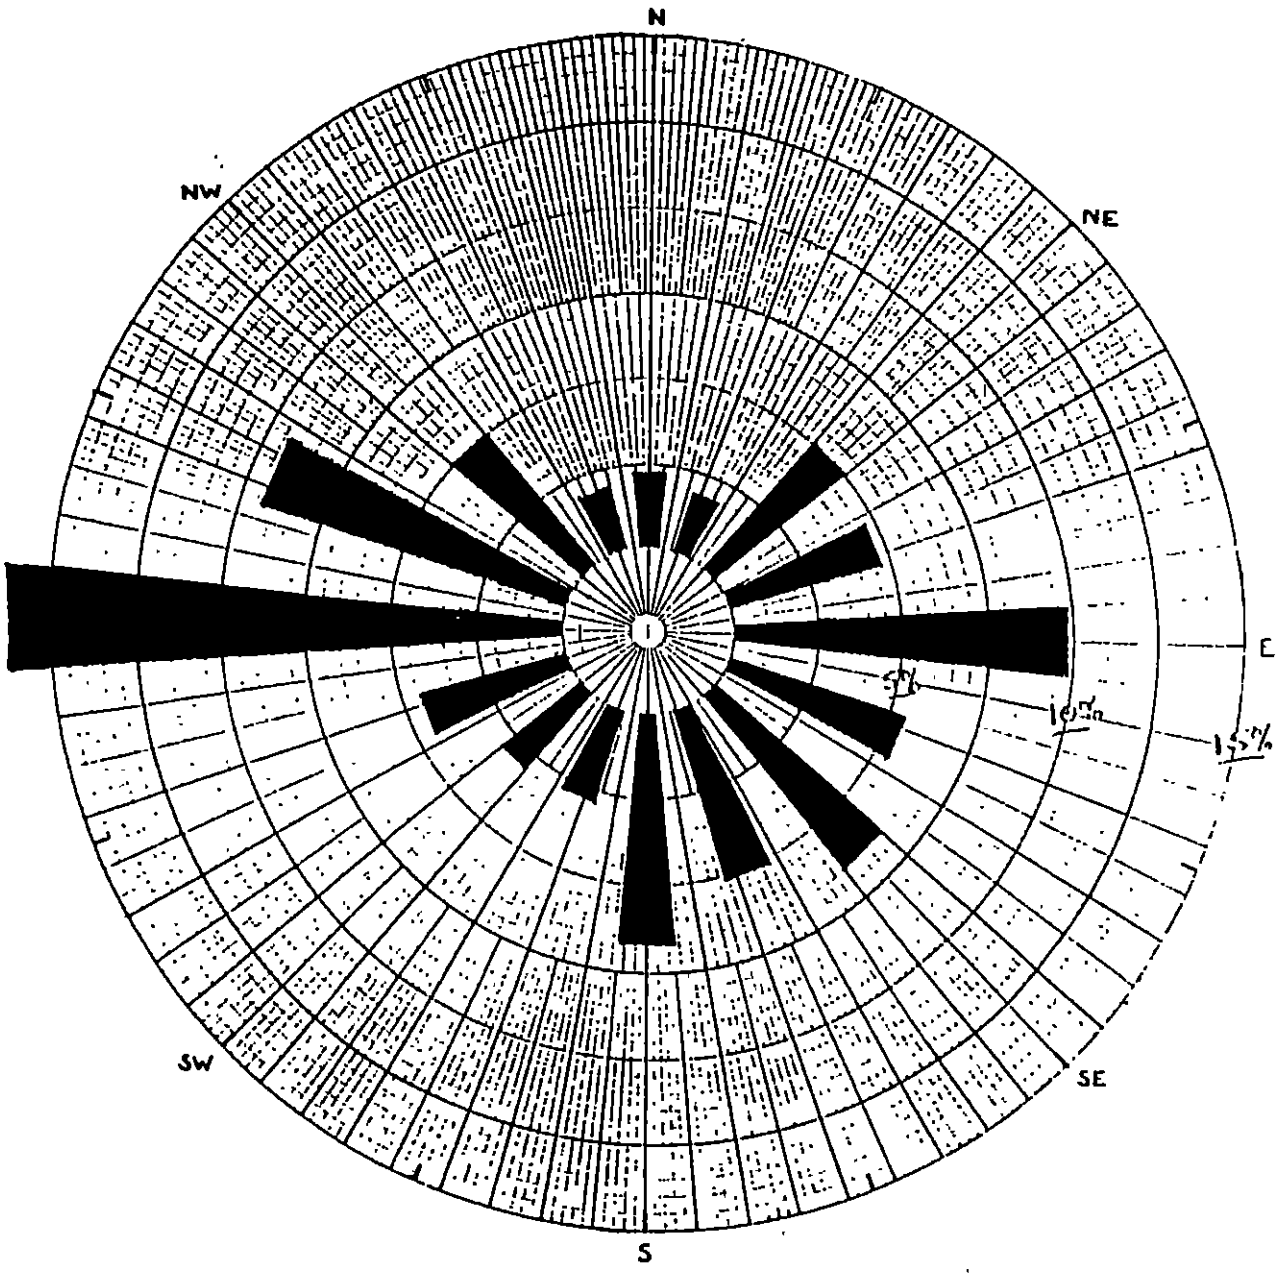
The project site's climate, as with all of Southern California, is dominated by the strength and position of the semi-permanent high pressure center over the Pacific Ocean near Hawaii. It creates cool summers, mild winters, infrequent rainfall, it drives the cool daytime sea breeze, and it maintains comfortable humidities and ample sunshine. Unfortunately, the same atmospheric processes that create the desirable living climate combine to restrict the ability of the atmosphere to disperse the air pollution generated by the large population attracted in part by the comfortable climate. Portions of the Los Angeles Basin therefore experience some of the worst air quality in the nation for certain pollutants.

Temperatures in El Toro average 62°F annually. Daily and seasonal oscillations of temperature are small because of the moderating effects of the nearby oceanic heat reservoir. In contrast to the steady temperature regime, rainfall is highly variable, and confined almost exclusively to the "rainy" period from early November to mid-April. Rainfall in the project area averages around 12 inches annually with January typically the wettest month of the year.

Winds near the project site, based on long-term monitoring from nearby El Toro MCAS, display several characteristic regimes. During the day, especially in summer, winds are from the west at 7-9 miles per hour. At night, especially in winter, the land becomes cooler than the ocean and an offshore wind of 3-5 miles per hour develops. After sunrise, the wind direction rotates through the southeast and south at 5-7 miles per hour until the west wind again becomes dominant in the early afternoon. One other important wind regime occurs when a high pressure center forms over the western United States and creates strong, hot, dry, gusty, Santa Ana winds from the northeast and east across El Toro.

Figure 1 shows the annual average wind direction pattern (frequency of winds <u>from</u> a given direction) in the project vicinity. The dominance of winds from the west is clearly seen. The data in Figure 1 also show a high frequency of winds of less than 3 mph. Such light winds lead to limited local ventilation and resulting in possibly elevated pollution levels near freeways, shopping centers and other traffic concentrations. The Saddleback Meadows project site is, however, sufficiently separated from traffic stagnation conditions as to preclude the formation of any local pollution "hot spots."

The net effect of the area wind pattern is that any locally generated air pollutant emissions will be carried from east to west



AVG. SPEED = 5.5 MPH
WINDS ≤ 3 MPH = 29.4%

EL TORO MCAS WIND ROSE

FIGURE
1

at night, and then reverse from west to east by day. Although the daytime windspeeds are generally stronger and therefore better ventilate the project area, the offshore flow, once well-organized late in the evening and during the night, is also strong enough to minimize any significant localized air stagnation. The least ventilated period is typically during the morning and evening directional transition when winds become near calm until the new flow component becomes fully established.

In addition to winds that govern the horizontal rate and trajectory of any air pollutants, Southern California experiences several characteristic temperature inversions that control the vertical depth through which pollutants can be mixed. The daytime onshore flow of marine air is capped by a massive dome of warm air that acts like a giant lid over the basin. As the clean ocean air moves inland, pollutants are continually added from below without any dilution from above. As this layer slows down in inland valleys of the basin and undergoes photochemical transformations under abundant sunlight, it creates very unhealthful levels of smog (mainly ozone).

A second inversion forms at night as cool air pools in low elevations while the air aloft remains warm. Shallow radiation inversions are formed (especially in winter) that trap pollutants near intensive traffic sources such as freeways, shopping centers, etc., and from localized violations of clean air standards called "hot spots." Although inversions are found during all seasons of the year, the regional capping inversion is far more prevalent in summer while the localized radiation inversions are strongest in winter. The strong seasonal split in inversion intensity thus contributes significantly to the completely different air quality climate found in summer in the project vicinity than in winter. Because traffic concentrations in the project area are low, and because individual cars are becoming progressively "cleaner," air quality concerns in the El Toro area are more centered on the regional, summertime intrusion of photochemical smog (ozone) than on any winter microscale stagnation conditions.

AIR QUALITY SETTING

Ambient Air Quality Standards (AAQS): In order to assess the air quality impact of any proposed new development such as Saddleback Meadows, that impact, together with baseline air quality levels, must be compared to the applicable ambient air quality standards. These standards are the levels of air quality considered adequate to protect the public health and welfare. They are designed to protect that segment of the public most susceptible to respiratory distress or infection, such as asthmatics, the elderly, the very young, people weak from other disease or illness, and persons engaged in heavy work or exercise, called "sensitive receptors". Healthy adults can tolerate periodic exposure to air pollution levels well above these standards before adverse health effects are observed. Recent research has shown, however, that adverse health effects may occur from life-long chronic exposure to ozone concentrations that just meet the hourly standard. Barely meeting clean air standards may, therefore, not be enough to insure public health protection until some additional margin of safety is established to overcome chronic exposure health effects.

The Clean Air Act Amendments of 1970 established national AAQS with states retaining the option to adopt more stringent standards or to include other pollution species. Because California already had standards in existence before federal AAQS were established, and because of unique meteorological problems in California, there is considerable diversity between state and federal standards currently in effect in California as shown in Table 1.

Baseline Air Quality: Existing and probable future levels of air quality in the project area can be best inferred from ambient air quality measurements conducted by the South Coast Air Quality Management District (AQMD) at its El Toro monitoring station. Monitoring at this station include both regional pollutants such as dust and smog, as well as primary vehicular pollution levels such as carbon monoxide. Table 2 summarizes the last seven years of published data from this monitoring station. Although the entire spectrum of air pollutants is not monitored at the El Toro station, the following conclusions can be drawn from this data:

a. Photochemical smog (ozone) levels continue to exceed standards by a wide margin. However, the frequency of first stage smog episodes has ranged from 0-2 per year with a noticeable trend toward fewer episodes within the last several years. First-stage smog episodes have dropped by 90% the last 10-15 years. 1990 was the first year without a first-stage smog alert (one hour $\geq$ 0.20 ppm) since ozone monitoring began at El Toro. There have been no first-stage smog alerts from 1992 to the present.

TABLE 1

Ambient Air Quality Standards

AIR POLLUTANT	STATE STANDARD CONCENTRATION/ AVERAGING TIME	FEDERAL PRIMARY STANDARD CONCENTRATION/ AVERAGING TIME	MOST RELEVANT EFFECTS
Ozone	0 09 ppm, 1-hr. avg. >	0.12 ppm, 1-hr avg.>	(a) Short-term exposures (1) Pulmonary function decrements and localized lung edema in humans and animals (2) Risk to public health implied by alterations in pulmonary morphology and host defense in animals, (b) Long-term exposures· Risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals after long-term exposures and pulmonary function decrements in chronically exposed humans; (c) Vegetation damage, (d) Property damage
Carbon Monoxide	9 0 ppm, 8-hr avg. > 20 ppm, 1-hr avg. >	9 ppm, 8-hr avg > 35 ppm, 1-hr avg.>	(a) Aggravation of angina pectoris and other aspects of coronary heart disease, (b) Decreased exercise tolerance in persons with peripheral vascular disease and lung disease, (c) Impairment of central nervous system functions, (d) Possible increased risk to fetuses
Nitrogen Dioxide	0.25 ppm, 1-hr avg >	0 053 ppm, ann avg >	(a) Potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups, (b) Risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes, (c) Contribution to atmospheric discoloration
Sulfur Dioxide	0 04 ppm, 24-hr avg.> 0.25 ppm, 1-hr. avg. >	0 03 ppm, ann avg > 0.14 ppm, 24-hr avg.>	(a) Bronchoconstriction accompanied by symptoms which may include wheezing, shortness of breath and chest tightness, during exercise or physical activity in persons with asthma
Suspended Particulate Matter (PM_{10})	30 $\mu g/m^3$, ann. geometric mean > 50 $\mu g/m^3$, 24-hr average>	50 $\mu g/m^3$, annual arithmetic mean > 150$\mu g/m^3$, 24-hr avg >	(a) Excess deaths from short-term exposures and exacerbation of symptoms in sensitive patients with respiratory disease, (b) Excess seasonal declines in pulmonary function, especially in children
Sulfates	25 $\mu g/m^3$, 24-hr avg. >=		(a) Decrease in ventilatory function, (b) Aggravation of asthmatic symptoms; (c) Aggravation of cardio-pulmonary disease, (d) Vegetation damage; (e) Degradation of visibility; (f) Property damage
Lead	1.5 $\mu g/m^3$, 30-day avg. >=	1.5 $\mu g/m^3$, calendar quarter>	(a) Increased body burden, (b) Impairment of blood formation and nerve conduction
Visibility-Reducing Particles	In sufficient amount to reduce the visual range to less than 10 miles at relative humidity less than 70 percent, 8-hour average (10am - 6pm)		Visibility impairment on days when relative humidity is less than 70 percent

Source: South Coast Air Quality Management District, El Toro Monitoring Station, El Toro Road @ Jeronimo Road.

(a) = California ambient air quality standard
(b) = National ambient air quality standard
(c) = California first-stage smog episode alert level.

b. Annual maximum ozone levels rose in the early '80s to close to the second stage alert level of 0.35 ppm for 1 hour, but they since dropped sharply to the sub-0.20 ppm level. For several years, El Toro had the worst smog of any station in Orange County. In the last several years, however, El Toro, and by inference all of the South County, had some of the lowest smog readings on record.

c. Measurements of carbon monoxide have shown relatively low baseline levels for a monitoring station located near two busy arterials (El Toro Road and Jeronimo Road). With lower traffic volumes and more complex terrain reducing stagnation potential, CO levels near Saddleback Meadows are probably even lower than the AQMD readings at the El Toro monitoring station.

d. Respirable dust (PM-10) levels periodically exceed the state standard, but the less stringent federal PM-10 standard has never been violated since PM-10 measurements began at El Toro.

Despite substantial South County growth in the last two decades, area air quality, as inferred from the El Toro SCAQMD data, continues to improve.

Lowest number of state ozone violations	(15)	-	1995
Lowest number of federal ozone violations	(1)	-	1995
Lowest one-hour ozone maximum	(0.15 ppm)	-	1995
Lowest one-hour CO maximum	(6 ppm)	-	1995
Lowest 8-hour CO maximum	(4.1 ppm)	-	1993, 95

Although complete attainment of every clean air standard is not yet imminent, extrapolation of the steady improvement trend suggests that such attainment will occur within the reasonably near future.

Air Quality Management Planning: The Federal Clean Air Act (1977 Amendments) stated that designated agencies in any area of the nation not meeting national clean air standards must prepare a plan demonstrating the steps that would bring the area into compliance with all national standards by December 31, 1987. The South Coast Air Basin (SCAB) could not meet the deadline for ozone, nitrogen dioxide, carbon monoxide, or PM-10. In the South Coast Air Basin, the agencies designated by the governor to develop regional air quality plans are the South Coast Air Quality Management District and the Southern California Association of Governments (SCAG). The two agencies first adopted an Air Quality Management Plan (AQMP) in 1979 and revised it in 1982 to project attainment of the standards in 2000.

In 1988, because of uncertainty in federal Clean Air Act reauthorization, the California Legislature enacted the California Clean Air Act (CCAA). The CCAA requires that regional emissions be reduced by 5 percent per year, averaged over 3 year periods, until attainment can be demonstrated. Each area that did not meet a national or state ambient air quality standard was required to prepare a plan which demonstrated how the 5 percent reductions was to be achieved. The plan was to be locally adopted and submitted to the CARB by June 30, 1991. Areas with the most heavily degraded air quality were required to reduce emissions 50 percent from 1987 levels by December 31, 2000. In July 1991, the SCAQMD adopted a revised AQMP which was designed to meet the CCAA requirements. The 1991 AQMP deferred the attainment date to 2010, consistent with the 1990 federal Clean Air Act.

The 1990 federal Clean Air Act Amendments required that all states with airsheds with "serious" or worse ozone problems submit a revision to the State Implementation Plan (SIP). The 1991 AQMP was modified/adapted and submitted as the South Coast Air Basin portion of the SIP. The 1991 SIP submittal estimated that an 85% basinwide reduction in volatile organic compound (VOC) emissions and a 59% reduction in oxides of nitrogen (NO_x) between 1990 to 2010 was needed to meet federal clean air standards. About 40% of these reductions were to come from existing pollution control programs. The rest would come from new rules, technologies or other reduction programs.

EPA recently approved the 1994 submittal of the SCAB portion of the SIP. The plan was finally approved after considerable debate on the contingency measures that should be implemented if progress is not as rapid as anticipated in the 1994 SIP. The currently approved plan will not be in effect for long because the federal Clean Air Act required that an updated plan be submitted by February 8, 1997 which includes attainment plans for all pollutants exceeding federal standards. The CCAA requires an update of the state-mandated clean air plan every three years. The next update is due December 31, 1997.

An updated 1997 AQMP has been locally adopted. The California Air Resources Board (ARB) has forwarded this plan on to EPA for its consideration and recommended approval. The 1997 AQMP is designed to meet both federal (EPA) and state (ARB) air quality planning guidelines. Components of the 1997 plan update include:

- Demonstration of attainment for ozone, CO, and PM-10
- Updated emissions inventories (1993 base year) of VOC, NO_x, CO, SO_x and PM-10

- Emissions budgets for future years of the inventoried compounds.

- An updated pollution control strategy

- Contingency measures if the plan as presently proposed fails to meet stated timetables.

Additional research and photochemical computer modeling, as well as improved emissions estimates, now suggest that formerly predicted emissions reductions required to meet standards need not be quite as severe as thought earlier. Table 3 summarizes the currently proposed regional attainment planning for ozone (VOC and NO_x) and for carbon monoxide (CO). Emissions reductions of around 68 percent for VOC, 57 percent for NO_x and 68 percent for CO are anticipated from the currently proposed AQMP update. Within the plan, some measures considered "long-term reductions" require additional technological development whose development schedule is uncertain. There is therefore no clear scientific consensus that the 1997 AQMP update will be able to achieve its mandatory clean air objectives by the end of 2010. For new projects that are developed within the next few years, the 1997 AQMP and its underlying plans for mobility, infrastructure development, population, housing, employment and land use, etc., will, however, be the benchmark by which project consistency with air quality planning objectives will be judged.

A residential development such as the proposed Saddleback Meadows project does not directly relate to the AQMP. Any relationship is indirect via the growth assumptions used in the regional air quality plan. To the degree that project residential growth has been forecast by SCAG in its regional comprehensive plan (RCP), the project creates no regional impacts that have not already been analyzed as part of the RCP adoption process.

AIR QUALITY IMPACTS

Methodology

The analysis methodology utilized procedures outlined in the SCAQMD 1993 "CEQA Air Quality Handbook" where appropriate. In areas where more site-specific information was available beyond the default values recommended in the handbook, they were used to supplement the AQMD-suggested input parameters.

Vehicular emissions were calculated using the SCAQMD "MAAQI" computer model. Microscale emissions impacts were calculated using one generic run of the CALINE4 computer model adjusted for site-specific traffic volumes, travel speeds and emission data for intersections near Saddleback Meadows potentially affected by project-related traffic.

Standards of Significance

Many air quality impacts from dispersed mobile sources, i.e., the dominant pollution generators in the basin, often occur hours later and miles away after photochemical processes have converted primary exhaust pollutants into secondary contaminants such as ozone. The incremental regional air quality impact of an individual source is generally immeasurably small. The SCAQMD has therefore developed suggested significance thresholds based on the volume of pollution emitted rather than on actual ambient air quality because the direct air quality impact of a project is not quantifiable on a regional scale. The 1993 SCAQMD Handbook states that any projects in the SCAB with daily emissions that exceed any of the following thresholds should be considered as having an individually and cumulatively significant air quality impact:

55 lbs per day of ROC*

55 lbs per day of NO_x**

550 lbs per day of CO

150 lbs per day of PM-10

150 lbs per day of SO_x

* - 75 lbs/day during construction

** - 100 lbs/day during construction

These thresholds do not take into account several important considerations, namely:

1. Emission levels from one large project may exceed thresholds while those from numerous smaller projects with identical emissions might not, even though the regional impact is the same.

2. Large developments have a greater opportunity to effectively implement TCMs because of a greater potential participant pool in trip/VMT diversion programs.

3. Project-related emissions and their regional impact may already have been incorporated into regional growth projections.

4. Emissions generated in or near El Toro have essentially the same regional air quality impact if they were released in a nearby community. If the anticipated demand for residential use is not met at Saddleback Meadows but in some other community, the no-project alternative will have basically the same regional air quality impact.

These considerations can be used by the Lead Agency as a basis for supporting a finding of a less than significant impact, even if the SCAQMD advisory thresholds are exceeded. Alternately, the Lead Agency may make a finding of a significant impact for projects exceeding the SCAQMD thresholds, but use as many of the above criteria in a statement of overriding considerations as are applicable.

Additional indicators should be used as screening criteria to evaluate the need for further analysis with respect to air quality. Whenever possible, the project should be evaluated in a quantitative analysis; otherwise a qualitative analysis is appropriate. The additional indicators are as follows:

- Project could interfere with the attainment of the federal or state ambient air quality standards by either violating or contributing to an existing or projected air quality violation;

- Project could result in population increases within the regional statistical area which would be in excess of that projected in the AQMP;

- Project could generate vehicle trips that cause a CO hot spot;

- Project might have the potential to create or be subjected to objectionable odors;

- Project could have hazardous materials on site and could result in an accidental release of air toxic emissions;
- Project could emit an air toxic contaminant regulated by District rules or that is on a federal or state air toxic list;
- Project could involve disposal of hazardous waste;
- Project could be occupied by sensitive receptors near a facility that emits air toxics or near CO hot spots;
- Project could emit carcinogenic air contaminants that could pose a cancer risk.

Project-Related Sources of Potential Impact

Intensification of land uses in Orange County potentially impacts ambient air quality on two scales of motion. As cars drive throughout Southern California, the small incremental contribution to the basin air pollution burden from any single vehicle is added to that from several million other vehicles. The impact from this project, even if it generates a significant number of new vehicle trips, is very small on a regional scale. Basinwide air quality impacts are, therefore, addressed in terms of project compatibility with regional air quality plans. If any given project or plan has been properly incorporated into basinwide growth projections which are the basis for regional air quality/transportation planning, then the basinwide impact of any proposed development is presumed, by definition, to be less than significant.

Locally, changes in the location of any collection of automotive sources, or changes in the number of vehicles or travel speeds may impact the microscale air quality around any given development site. Traffic increases not only contribute air pollutants in direct proportion to their cumulative percentage of traffic volume growth, but they may slow all existing traffic to slower, more inefficient travel speeds. The development traffic/air quality impact is thus potentially compounded.

Temporary construction activity emissions will occur during project buildout. Such emissions include on-site generation of dust and equipment exhaust, and off-site emissions from construction employee commuting and/or trucks delivering building materials. Because of their temporary nature, air quality impacts from construction have often been considered as individually less than significant. Also, construction activity emissions are difficult to quantify, since the exact type and amount of equipment that will be used or the acreage that may be disturbed on any given day in

the future is not known with any reasonable certainty. The emphasis in environmental documents relative to construction activity emission impacts has therefore been to minimize the emissions as fully as possible through comprehensive mitigation even if the precise amount of emissions can not be precisely quantified.

Historical use of agricultural pesticides or herbicides on the project site may have left residues within the soil that may be lofted during site development. Such concern, however, are more common for cultivated fields where DDT or other chlorinated compounds were used than for open rangeland such as the project site.

Construction workers, and to some extent the public at large, could also be exposed to any spores, viruses or other materials in the soil released during site grading. Grading activities are not likely to create any unacceptable health impacts from biological organisms in that organisms such as Valley Fever are not endemic to the El Toro area. Thousands of acres of Orange County have been tilled for many years or graded for new development with minimal evidence of any health impacts from soil-borne pathogens.

Construction Activity Impacts

Dust is normally the primary concern during construction of new buildings and infrastructure. Because such emissions are not amenable to collection and discharge through a controlled source, they are called "fugitive emissions". Emission rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). Because of such variations, regulatory agencies use one universal factor based on the area disturbed assuming that all other input parameters into emission rate prediction fall into mid-range average values.

The PM-10 fraction of fugitive dust emissions are predicted to be around 55 pounds per day per acre disturbed in the absence of any dust control measures being applied (AQMD CEQA Handbook, Table 9-2). Mandatory measures required by South Coast AQMD Rule 403 (Fugitive Dust) are generally assumed to reduce this rate by 50%. Average daily PM-10 emissions during site grading and other disturbance are stated in the SCAQMD Handbook to be 26.4 pounds/acre. Best available control measures (BACMs) such as continual soil wetting, use of supplemental binders, early paving, etc. can achieve a substantially higher PM-10 control efficiency. Use of BACMs in dust control from construction is an important component of the 1997 PM-10 regional attainment plan.

The Saddleback Meadows project site totals 223 acres. Some steep slopes will be left in open space, but a very substantial part of the site would be graded to accommodate 705 manufactured homes. Rough grading over a large part of the site would likely occur initially with finish grading completed in response to market demand. The area of simultaneous disturbance on any given day could be 10-20 acres. Use of the SCAQMD "default" PM-10 emission factor of 26.4 pounds per acre per day would predict daily PM-10 emissions during rough grading of 264-528 pounds per day. Such emissions would exceed the daily PM-10 significance threshold of 150 pounds per day by a wide margin.

Recent studies of dust control with BACMs have demonstrated, however, that emissions rates of 10.7 pounds per acre per day are attainable when such measures are applied. A 10-20 acre disturbance area with use of all BACMs would contribute 107-214 pounds per day of PM-10. Use of BACMs plus limiting the daily grading area to approximately 14 acres or less could be used in tandem to keep PM-10 emissions at less than significant levels.

It is possible that impact significance in terms of PM-10 emissions may not be wholly relevant in light of current understanding of health effects from airborne dust exposure. Recent research indicates that only the very tiniest particulates of 2.5 micron in diameter or smaller (called "PM-2.5") dominate health response to particulate inhalation. Mechanical soil abrasion creates very little PM-2.5. Measurements in Orange County have shown that one-third of PM-10 is made up of "crustal material", i.e., dirt. Among the PM-2.5 fraction, less than one percent is soil material. Replacement of the PM-10 standard by one for PM-2.5 would likely change the conclusion regarding health impacts from grading operations.

In addition to the fine particulates that remain suspended in the air semi-indefinitely, soil disturbance during construction may release considerable amounts of larger particles that have short atmospheric residence times. These larger particulates are generally inert silicates that are readily filtered out in the upper respiratory tract. They therefore have no adverse health effects. They may, however, create a soiling nuisance as they settle out on parked cars, landscaping foliage or other horizontal surfaces. Clouds of such dust may also locally impair visibility. Soiling nuisance at St. Michael's Abbey during daytime on-shore flow or in Hidden Hills during early morning drainage winds is therefore a possible concern that further prompts the use of efficient dust control.

It is through these larger particulates that the public is aware of a dust problem in a construction area rather than through PM-10.

Because such large particles are more readily lofted by turbulence during strong winds, extra dust control or cessation of soil disturbance activities is recommended when wind speeds exceed a heavy particulate lofting threshold of around 25 mph.

Construction also entails use of internal combustion engines to power on-road trucks and off-road mobile, semi-mobile and semi-stationary equipment. Such sources are mainly diesel-powered and are poorly regulated in terms of allowable emission levels. Off-road sources are sometimes not well maintained because there is no regulatory mechanism to enforce efficient combustion as there is for on-road sources. The SCAQMD has calculated the total area under construction that would cause the significance thresholds to be exceeded from construction-related equipment combustion emissions. For single family residences, the threshold is 1.3 million sq. feet of gross floor area (SCAQMD Handbook, Table 6-2). For 705 units of manufactured housing, even at 2,000 square feet per unit (triple-wides), total improved footage from simultaneous construction of the entire project will be less than the stated threshold. With the use of a comprehensive dust control program, construction activity air quality impacts in the project vicinity can be maintained at less than significant levels.

Construction activities are concentrated at the construction site, but they also spill over into the adjacent community. Spill-over may be physical spillage, or it may be from off-site congestion effects. Vehicles may track dirt off-site, lane closures may create congestion on public roadways and construction worker vehicles and supply trucks may compete with the general public for sometimes inadequate roadway capacity. Trucks may be left idling near off-site sensitive receptors while waiting to load or unload. Each of these small impacts nevertheless may be cumulatively significant when spread over several years of project area buildout. As with the on-site impacts, a heightened level of impact mitigation will need to be utilized to maintain an overall tolerable level of impact from site activity construction. Housekeeping and construction activity management procedures are identified in the impact mitigation discussion relative to "spill-over" minimization.

Mobile Source Impacts

The bulk of the proposed project's impact will derive from the approximately 7,530 "new" daily trips that will be generated at full site buildout. At a typical trip length of around 9 miles per trip, project implementation would add around 70,000 vehicle miles traveled (VMT) to the basinwide mobile source emissions burden.

The emissions associated with project buildout can be readily calculated using the SCAQMD's MAAQI computer model. Emissions from project-related travel were calculated for a buildout year of 1998 as the earliest likely project completion year. The results of these calculations are summarized in Table 4. The computer output from the emissions model is attached as an appendix to this report.

Mobile source emissions for the three primary exhaust pollutants (ROG, CO and NO_x) exceed the SCAQMD significance threshold by a wide margin. This conclusion is generally consistent with the SCAQMD Handbook ... which, in Table 6-2, states that single family residential projects of 166 units or more may have a significant environmental impact.

Although the SCAQMD Air Quality Handbook states strongly that such emission levels will have a significant impact on the environment, that finding is not necessarily binding. The SCAQMD is only an advisory agency on this project, such that the Lead Agency must evaluate whether there will actually be a measurable degradation of the regional air quality environment resulting from project implementation. While the proposed project would cause the suggested AQMD emissions threshold to be exceeded by a wide margin, several considerations may mitigate against considering the resulting air quality impact as individually significant as follows:

1. Similar emissions would result from development of the same project in an adjacent jurisdiction or elsewhere in Orange County.

2. The project is consistent with growth assumptions that were used for regional emissions forecasts in the AQMP. The AQMP forecasts regional attainment of the federal ozone standard by 2010 as long as the rate of predicted regional growth is not exceeded. The Saddleback Meadows project is only a minute part of predicted Orange County growth.

3. The transportation infrastructure is in place to efficiently service the site with good access to multiple transportation modes.

4. The project is located near the Foothill Corridor that provides good linkage between the Orange County concentrated employment centers and the project site.

The above considerations would allow for the Lead Agency to find that the air quality impact is individually less than significant

TABLE 4

SADDLEBACK MEADOWS DEVELOPMENT
REGIONAL EMISSIONS SUMMARY (pounds/day)

despite the considerable emissions magnitude. If the emissions total alone were to be judged as sufficient evidence for a finding of significance, then the above considerations should be incorporated into a statement of overriding consideration.

Relative to a finding of (in)significance for the mobile source emissions, traffic from all future growth will contribute significantly to the sub-regional and regional air pollution burden, and, therefore, creates a cumulatively significant air quality impact, regardless of project size. This is a function of growth and the dependence upon the single occupant fossil-fueled vehicle as the primary means of transportation. All growth delays the ultimate attainment of regional clean air standards. This project, within a loose definition of "cumulative projects", would contribute to that impediment to clean air. Regardless of any finding of individual impact significance, the proposed Saddleback Meadows development should be identified as having a cumulatively significant air quality impact.

Because vehicular sources from all combined growth will contribute so substantially to regional emissions total, it correspondingly represents a significant opportunity to reduce that contribution. A reasonable reduction percentage through the implementation of an aggressive transportation system management (TSM) will achieve a measurable reduction when applied to such a large baseline emissions level. The degree of "excess" emissions, however, is so substantial as to preclude reduction to sub-threshold levels through any project-specific mitigation.

Orange County has been extensively involved in trip/VMT reduction programs through the trip reduction ordinances (TRO) and various geographically focused transportation management programs. Several countywide programs that monitor city and county response to AQMP TCMs have shown that the county collectively has exceeded the 1994 trip reduction target of the 1991 AQMP when the county is allocated its fair share of the basinwide reduction target. While progress toward reducing the dependence on the single occupant vehicle (SOV) is slow, continued progress toward higher average vehicle ridership (AVR) is to be expected during the Saddleback Meadows buildout timeframe.

While regional mobile source emissions do not have a very direct impact on local El Toro air quality, the incremental addition of growth-related traffic over a wide area may change microscale air quality distributions. To determine whether future traffic changes will create an adverse air quality impact, a microscale air quality analysis was performed for the traffic analysis grid around the project site. A screening procedure based on the California line source roadway dispersion model CALINE4 was run for a number of

traffic scenarios to evaluate any changes due to changes in patterns of growth anticipated as part of the Saddleback Meadows development.

The model combines the results of the traffic analysis with very restrictive dispersion conditions in order to generate a worst-case impact assessment. Carbon monoxide (CO) was used as an indicator of any "hot spot" potential because CO, unlike regional pollutants such as ozone, is directly related to source activity immediately adjacent to the receptor (a primary, unreacted pollutant impact). Calculations were made for an hourly exposure in the immediate vicinity of 10 roadway intersections where baseline traffic volumes were calculated in the traffic analysis.

The results of the microscale impact analysis are summarized in Table 5. The values in Table 5 must be added to any non-local background CO distribution. If one assumes that the maximum level measured near the El Toro and Jeronimo Roads intersection is the regional background, and that the worst-case, one-hour level of 6 ppm observed in 1995 occurs at the exact same hour as any worst-case project impact, then it would take a local contribution of 14 ppm to threaten the one-hour California CO standard of 20 ppm. Microscale hourly CO levels, both without and with the proposed project are forecast to be below the 14 ppm threshold. The maximum future (2000) microscale CO exposure is predicted to be 12 ppm above background at Portola Parkway and Glenn Ranch Road. With improvements, the local increment reduces to 9 ppm. Even under worst-case ("no improvement") assumptions, the theoretical combination of maximum local impacts (12 ppm) plus the maximum background (6 ppm) remains below the most stringent 20 ppm California 1-hour and/or the 35 ppm federal 1-hour standards.

By the year 2000, project-related CO contributions are seen in Table 5 to range from 0.2 to 3.0 ppm compared to no-project conditions without roadway improvements. Increases exceeding 1 ppm occur at El Toro Road and Ridgeline and along Portola Parkway. The average increase at all intersections is 0.9 ppm compared to the most stringent standard of 20 ppm (4.5 percent average change). There are not now, nor will there be with the project, any microscale air pollution "hot spots" at any project area intersections.

Increased areawide traffic and associated congestion is offset by continued improvements in vehicular CO emissions per average vehicle. Future (2020) CO levels with the proposed project and with anticipated intersection improvements are generally less than in 1997. At no intersection are 2020 "with project" levels greater than in 1997 by more than 1.0 ppm for the "with mitigation" (w/Mit.) scenario. SCAQMD Rule 1303 identifies a CO increment of

less than 5 percent of the hourly standard of 20 ppm, i.e., 1.0 ppm, to be a de minimis increment requiring no further impact analysis. The findings of the microscale impact assessment are therefore that CO levels under theoretical worst-case conditions do not exceed clean air standards and the Saddleback Meadows traffic will add an insignificant amount to the total CO exposure. Microscale impacts are less than significant.

MITIGATION

Potentially significant impacts were identified during construction from dust (PM-10) generated by surface disturbance and from construction equipment operations. Operational emissions will be in excess of thresholds of significance for regionally significant pollutants as identified by the South Coast AQMD. As a minimum, vehicular emissions from project-related traffic should be identified as having a cumulatively significant air quality impact. A number of mitigations, as related to the project, are already incorporated into rules, regulations or ordinances. They are included in the following list of mitigation measures in that compliance mitigates a potentially adverse impact. They are not discretionary measures, however, which a developer can implement or the County of Orange can additionally require since compliance is already assumed in the impact analysis.

In particular, dust control during construction requires compliance with SCAQMD Rule 403 (rev. 1997). Rule 403 requires the use of best available control measures, requires that visible dirt track-out at construction access be promptly removed, and prohibits visible dust clouds beyond the property boundary. Any discretionary actions would be those measures that go beyond the already established Rule 403 minimum requirements.

The SCAQMD in its CEQA Handbook (1993) has developed a menu of mitigation options for consideration into project planning where applicable or appropriate. Some measures are not considered feasible for the proposed project. Many transportation control measures (TCMs) are already incorporated into actions required by the County of Orange. Mitigation potential, beyond what is already required, is therefore somewhat limited. The following measures are recommended:

Construction Dust

- Contractors will comply with SCAQMD Rule 403. In addition to meeting minimum compliance requirements, the contractor will utilize any additional reasonable and feasible methods of dust control from the measures shown in the list in the SCAQMD Rule 403 Implementation Handbook.

  Responsible Party: Construction Contractor

  Supervising Agency: County of Orange
  South Coast AQMD

- Contractors will implement a high wind dust control program when wind gusts exceed 25 mph as measured by an on-site wind monitor or as reported by weather observers at El Toro MCAS. High wind dust control will entail:

  - Termination of operation of scrapers, graders or dozers on unpaved surfaces until winds subside.

  - Application of water hourly to any unpaved surface with vehicle or equipment operations.

  - Application of water or other dust control material to any previously graded surface if dust emanation is visible from such surface.

- Contractors will utilize measures to prevent dirt from being tracked, washed, blown or otherwise conveyed onto paved roadways, and will wash or sweep the construction access points at El Toro Road on a routine basis on a frequency specified by the County of Orange as well as whenever dirt is visible more than 50 feet from the access point independent of the routine clean-up schedule.

  Responsible Party: Construction Contractor

  Supervising Agency: County of Orange

- Trucks hauling dirt on public roads to and from the site will be covered or will maintain a six inch differential between the maximum height of any hauled material and the top of the haul trailer. Haul truck drivers will water the load prior to leaving the site to prevent soil loss during transport.

  Responsible Party: Construction Contractor

  Supervising Agency: California Highway Patrol

- Construction management procedures required by the County of Orange and other jurisdictions shall be implemented. Contractor personnel responsible for supervision and the appropriate actions to be taken for the following measures shall be identified:

  - Cessation of activities during a Stage-2 smog episode. Call 1-800-242-4022 for the daily forecast.

- Truck routes and schedules for receipt of materials shall be coordinated with County of Orange staff.

- Where feasible, on-road vehicles and off-road equipment shall be turned off and subsequently restarted if the anticipated duration of idling is expected to exceed five (5) minutes.

Responsible Party: Construction Contractor

Supervising Agency: County of Orange

- Graded surfaces used for off-road parking, materials laydown or awaiting future construction shall be stabilized for dust control as needed. Frequently accessed unpaved areas shall be paved as early as possible to minimize dirt trackout to public rights of way.

Responsible Party: Construction Contractor

Supervising Agency: County of Orange

- Equipment will be maintained in proper tune to prevent visible soot from reducing light transmission through the exhaust stack exit by more than 20 percent for more than three (3) minutes per hour and use low-sulfur fuel as required by SCAQMD regulation.

Responsible Party: Construction Contractor

Supervising Agency: South Coast AQMD

- Lane closures or detour will require coordination with the County of Orange. Flagpersons and appropriate traffic control devices will be used as needed to minimize construction activity interference with off-site traffic.

Responsible Party: Construction Contractor

Supervising Agency: County of Orange EMA
Orange County Sheriff Department

Implementation of the above measures is expected to maintain construction activity air quality impacts at less than significant levels.

Operational Activities:

- Traffic flow at the project access will be maintained at acceptable levels of service through mitigation measures identified in the project traffic study.

  Responsible Party: Project Developer

  Supervising Agency: County of Orange Transportation Planning

- 220v electric power for future use to charge electric-powered vehicles will be made available in homeowner garages.

  Responsible Party: Site Developer

  Supervising Agency: County of Orange EMA

Emissions Reduction Quantification

Emissions calculations and the corresponding ambient air quality impact assessment for project-related construction and Saddleback Meadows operations presumed compliance with SCAQMD rules regarding dust control. The potential for additional emissions reduction beyond the mandatory requirements of existing rules and regulations was evaluated based on Appendix 11 of the SCAQMD Air Quality Handbook which quantifies reduction potential of a variety of project construction and operation emissions control measures.

Table 6 shows the emission reduction estimate for the menu of recommended measures for the proposed project. Dust emissions can be controlled from their 50 percent control assumed for Rule 403 compliance by an additional 50-80 percent of the uncontrolled fraction. The net effective dust control level is therefore 75-90 percent, seen as follows.

Control = 0.50 + (0.50 - 0.80) X (0.50)

= Rule 403 + Add'l. Control X Not Contr.

= 0.50 + (0.25 - 0.40)

= 0.75 - 0.90

Unless the entire project site is under simultaneous massive grading, attaining the optimum level of dust control will maintain dust impacts at less than significant levels.

TABLE 6

MITIGATION EFFECTIVENESS ESTIMATE

	Pollutant Control	
Construction Measures	Particulates	Gaseous
Rule 403 Additional Measures	25-40%	---
High Wind Response Plan	NQ	NQ
Off-Site Dirt Deposition Control	5-10%	---
Covered Trucks or Watered Loads	5%	---
Construction Mgmt. Procedures	---	10%
Surface Stabilization	10-20%	---
Equipment Tune-ups	5%	10%
Traffic Interference Minimization	---	5%
Composite:	50-80%	25%
Operational Measures:		
Congestion Management	5%	5%
Electric Vehicle Access	NQ	NQ
Composite:	5%	5%

--- = minimal reduction

NQ = not quantified. Compliance with regulations already presumed in the impact analysis and generates no new reduction.

Operational emissions reduction from mobile sources of 5 percent of their non-TCM implementation level can not reduce the substantial emission level to less than the SCAQMD advisory level significance thresholds. A number of secondary considerations were identified, however, that would either allow for a finding of an individually less than significant air quality impact. If the impact were judged by the Lead Agency in any CEQA process to be significant, those secondary mitigating factors may become part of any statement of overriding considerations.

Alternatives

Four lesser intensity alternatives have been considered for the project site. Emissions associated with each alternative were presumed directly proportional to the "new" average daily traffic (ADT) generated by each alternative. Table 7 shows that all alternatives except the two lowest intensity single-family residential uses cause the SCAQMD threshold to be exceeded. Any development intensity that causes more than around daily trips is forecast to exceed the NO_x threshold.

Air quality, however, occurs mainly within a regional context. The air quality impact from lesser intensity alternatives may therefore not necessarily be environmentally preferred for the following reasons:

a. The same level of growth is likely to occur at some other Orange County location with similar impacts.

b. Transportation corridor access for goods and services may be less adequate at another location.

c. Development of this site is a natural expansion of already completed developments at Hidden Hills, Portola Hills or Foothill Ranch.

TABLE 7

REGIONAL EMISSIONS FROM PROJECT ALTERNATIVES
(pounds/day)

	ROG	CO	NOx	SOx	PM-10
100 S.F. Detached	22.8	278.7	29.9	2.1	3.2

NOISE SETTING

Sound is mechanical energy transmitted by pressure waves in a compressible medium such as air. Noise is generally described as unwanted sound. Sound is technically described in terms of the loudness (amplitude) of the sound and frequency (pitch) of the sound. The standard unit of measurement of the loudness of sound is the decibel (dB). Since the human ear is not equally sensitive to sound at all frequencies, a special frequency dependent rating scale has been devised to relate noise to human sensitivity. The A-weighted decibel scale (dBA) performs this compensation by discriminating against frequencies in a manner approximating the sensitivity of the human ear.

Several rating scales have been developed for the analysis of adverse effects of community noise on human beings. Based on these effects, the observation has been made that the potential for a noise to impact people is dependent on the total acoustical energy content of the noise. Upon this premise, a number of noise scales have been developed including the Equivalent Noise Level (LEQ) and the Community Noise Equivalent Level (CNEL).

LEQ is the sound level corresponding to a steady state sound level containing the same total energy as a time varying signal over a given sample period. LEQ is the "energy" average noise level. CNEL is similar to LEQ but is based on a 24 hour period, and applies a time-weighting factor that places greater significance on noise events occurring during the evening and night hours (when sleep disturbance is a concern). "Time-weighted" refers to the fact that noise occurring during certain sensitive time periods is penalized for occurring at these times. The evening period (7 p.m. to 10 p.m.) penalizes noises by 5 dB, while nighttime (10 p.m. to 7 a.m.) noises are penalized by 10 dB. The CNEL scale is specified by the County of Orange for community noise analysis.

An interior CNEL of 45 dB(A) has been required by the State noise insulation standards (Title 24 of the California Code of Regulations) for all multiple family dwelling units and hotel/motel rooms since 1974. In 1988, the State Building Standards Commission expanded that standard to include all habitable rooms, including single family or low density residential uses. All development in close proximity to automotive traffic, rail or industrial noise sources with baseline levels exceeding 60 dB CNEL must undergo an analysis to verify that the 45 dB interior standard is attainable.

Exterior to interior noise attenuation is typically 20 dB for all windows closed. A 65 dB CNEL exterior noise exposure thus generally allows the 45 dB CNEL interior standard to be met as long as windows can normally be closed to shut out the noise. A level of 65 dB is also the threshold where noise begins to intrude

significantly into normal activities such as having a conversation. Although people may express annoyance if traffic noise levels in usable exterior space such as yards, patios, porches, etc. are below 65 dB, the percentage of "highly annoyed" people increases dramatically when noise exceeds 65 dB.

Noise/land use compatibility standards for various classes of land uses are generally expressed in the Noise Element of the General Plan to insure that noise exposure is considered in any development decisions. Local noise suitability criteria are based on state model guidelines shown in Figure 1.

Figure 1 contains four classes of acceptability and has a number of overlapping compatibility noise levels within several criteria. In order to reduce the potential ambiguity of various conditional acceptabilities, Orange County developed a more clear-cut matrix of acceptable noise levels shown in Table 1 and explained in Table 2.

Noise standards for residential projects such as Saddleback Meadows are as follows:

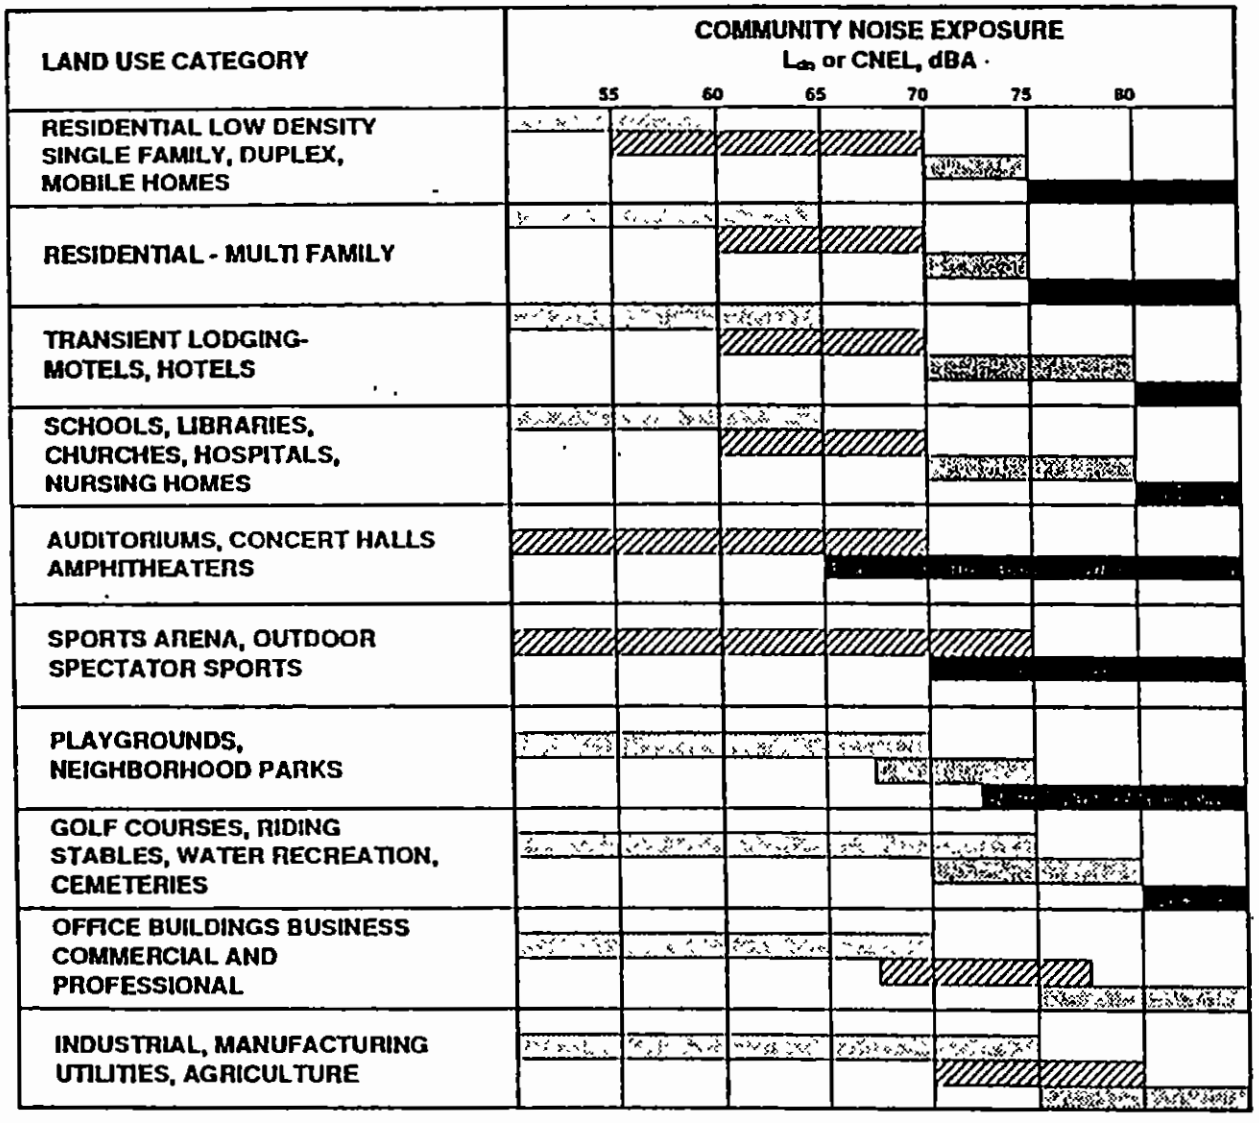
Exterior Level	Requirement
<60 dB CNEL	None
60-65 dB CNEL	Indoor Level <45 dB CNEL
>65 dB CNEL	Outdoor Level Mitigated to <65 dB CNEL Indoor Level <45 dB CNEL

Baseline Noise Levels

Existing noise levels on the project site are normally low except in close proximity to El Toro Road. Periods of quiet are interspersed with occasionally noisy periods of aircraft overflights. The project site also is near a flight corridor for military helicopter training operations in Santiago, Black Star and other interior canyons.

The project site is located near one of the primary landing/ takeoff routes from El Toro MCAS. Aircraft above the site, however, are sufficiently high such that the noise exposure is only marginally degraded. Figure 2 shows that the site is traversed by the 60 CNEL contour in the El Toro noise footprint shown in the Orange County Noise Element as determined in the 1981 El Toro MCAS Air Installation Compatible Use Zone (AICUZ) study. The 60 dB

FIGURE 1 - NOISE/LAND USE COMPATIBILITY STANDARDS



INTERPRETATION

NORMALLY ACCEPTABLE

Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.

CONDITIONALLY ACCEPTABLE

New construction or development should be undertaken only after a detailed analysis of the noise reduction requirement is made and needed noise insulation features are included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

NORMALLY UNACCEPTABLE

New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirement must be made and needed noise insulation features included in the design.

CLEARLY UNACCEPTABLE

New construction or development should generally not be undertaken.

TABLE 2

EXPLANATION AND DEFINITIONS ON TABLE 1

Action Required to Ensure Compatibility Between Land Use and Noise from External Sources

1. Allowed if interior and exterior community noise levels can be mitigated.

2. Allowed if interior levels can be mitigated.

3. New residential uses are prohibited in areas within the 65-decibel CNEL contour from any airport or air station; allowed in other areas if interior and exterior community noise levels can be mitigated. The prohibition against new residential development excludes limited "in-fill" development within an established neighborhood.

Standards Required for Compatibility of Land Use and Noise

a. Interior Standard: CNEL of less than 45-decibels (habitable rooms only)

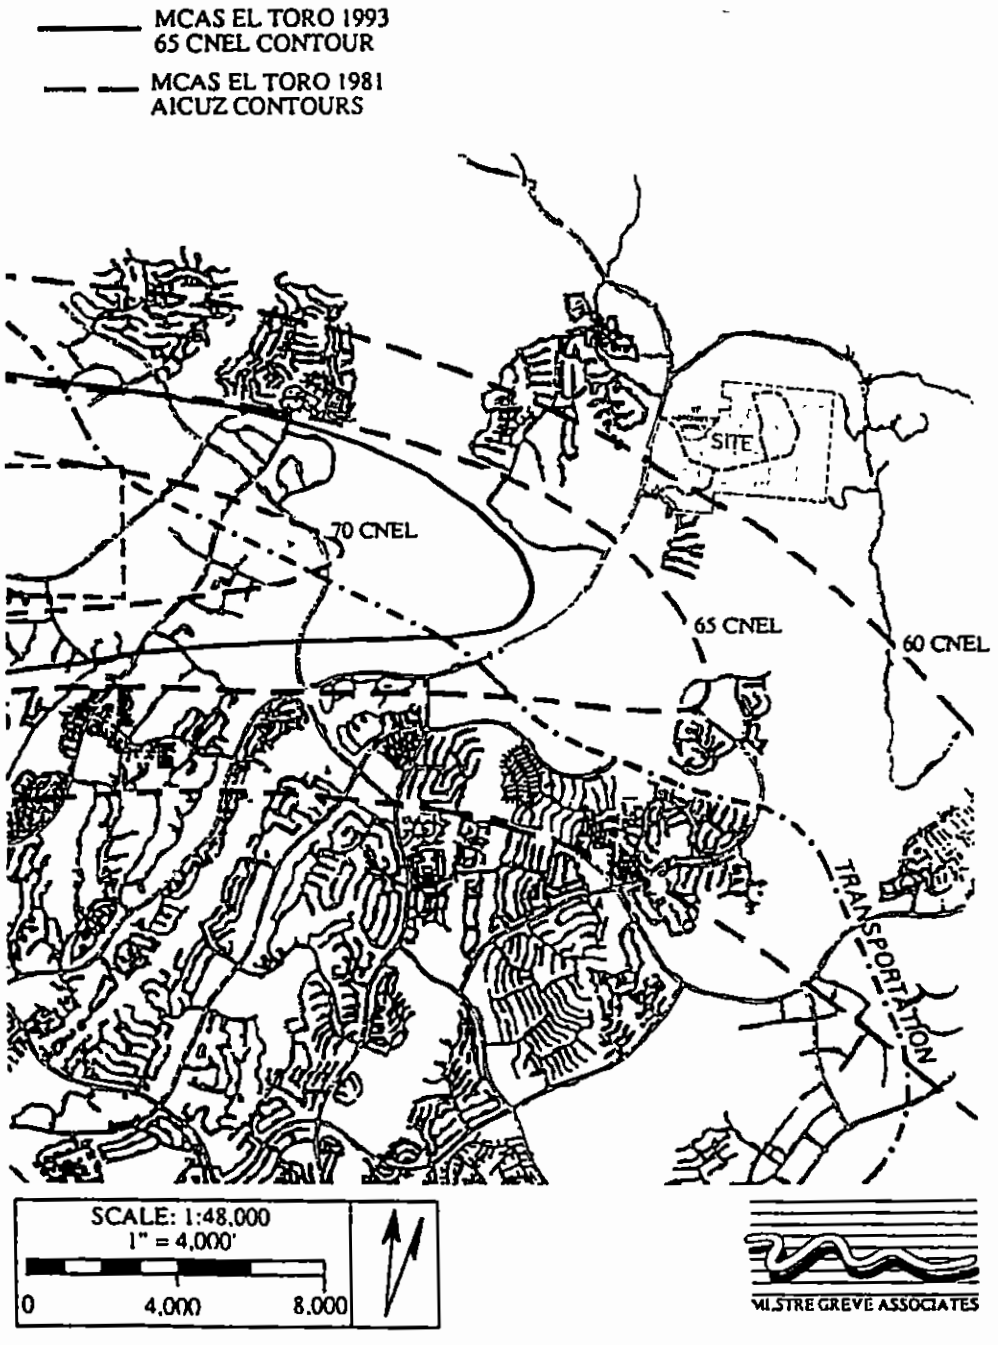
b. Exterior Standard: CNEL of less than 65-decibels in outdoor living areas

c. Interior Standard: LEQ(h) = 45 to 65 decibels interior noise level, depending on interior use

TYPICAL USE	LEQ(h)
Private Office, Church Sanctuary, College, Preschool, Schools (Grade K-12), Board Room, Conference Room, etc.	45
General office, Reception, Clerical, etc.	50
Schools (Grades K-12)	52
Bank Lobby, Retail Store, Restaurant, Typing Pool, etc.	55
Manufacturing, Kitchen, Warehousing, etc.	65

d. Exterior standard: LEQ(h) of less than 65 decibels in outdoor living areas.

e. Interior Standard: As approved by the Board of Supervisors for sound events of short duration such as aircraft fly-overs or individual passing railroad trains.



Project Location Relative to El Toro MCAS Noise Contours

FIGURE 2

contour just touches a few lots in the southwestern corner of the project site. Almost all developed lots are outside the 60 dB CNEL contour. However, County policy relative to aircraft noise exposure is to use the highest exposure anywhere on the property as the noise reference level. At the property line adjacent to Valley Vista Way in an area of proposed commercial development, the maximum EL Toro MCAS noise exposure is 62 dB CNEL. To be consistent with County policy, this level was thus used as an impact evaluation/mitigation criterion with the understanding that its use is overpredictive to varying degrees across the project site.

Aircraft fleet conversion since the noise element was adopted have slightly reduced the project site noise exposure. Whereas the project site is shown as being traversed by the 60 dB CNEL contour near the southwest corner of the property in the County Noise Element, its current location is south of the project site. Figure 2 also shows the results of more recent (1993) noise impact calculations. The 65 dB CNEL contour (and presumably the 60 dB CNEL contour as well) is seen to have shrunk by about 1 mile along the point of maximum extent. Distance reduction in the cross-lobe direction of the noise contour is smaller, but is enough to pull the 60 dB CNEL contour off the site. Because the 1993 (or any more current year) noise contours have not been officially adopted, the noise requirements for the project will be those engendered by the 1981 contours. Compliance with the 1981-based noise constraints may require a small amount of extra mitigation than if more current noise levels were used. In an aircraft noise environment, any small extra margin of safety, if achieved without great cost, is a desirable circumstance.

Because aircraft noise contours are constructed based upon average annual operations, and because the contours represent extended periods of quiet with isolated noise peaks, CNEL is not necessarily the best indicator of noise nuisance potential. Individual fly-over events may thus be intrusive even if the CNEL is below levels considered unacceptable for noise-sensitive uses. Mitigation for single event intrusion has therefore been incorporated for much new South County development near EL Toro MCAS flight tracks even if the CNEL itself did not trigger such requirements.

In order to characterize existing project site noise levels, a brief noise measurement program was undertaken on August 28, 1995. Noise levels were measured for 30-minute periods near El Toro Road, and again near the caretaker's trailer by the cattle corral. There was no observed El Toro MCAS flight activity during these measurements. There were, however, several USMC helicopter overflights during the site interior noise measurements. The observed noise levels (in dB) were as follows:

Parameter	50' to El Toro Rd.	Cattle Corral[a]	Cattle Corral[b]
LEQ	67.8	62.4	48.0
Lmax	86.5	86.5	----
Lmin	38.0	39.0	----
L10	71.0	55.5	----
L50	59.5	46.0	----
L90	43.5	42.5	----

[a] - with helicopter overflights
[b] - without helicopter activity

The dramatic effect of just a few single loud noise events skewing the average is seen in the difference between periods of helicopter traffic versus flight-free periods. Without the helicopters, the site interior has a semi-rural noise character. With the flight activity, the average noise level, as expressed by LEQ, is only around 5 dB less than directly adjacent to El Toro Road. As noted above, average noise exposure alone is therefore not a completely sufficient criterion for evaluating possible impacts of the ambient acoustic environment on development plans for Saddleback Meadows.

Single event noise can vary substantially with individual overflights. An unusual flight altitude, power setting or even atmospheric conditions can substantially alter the instantaneous maximum. As a rule of thumb, the instantaneous maximum tends to be around 25 dB higher than the CNEL. With a 60 dB aircraft CNEL adjacent to the site, peaks of 85 dB would likely be experienced from single aviation events passing over/near the proposed project site.

NOISE IMPACTS

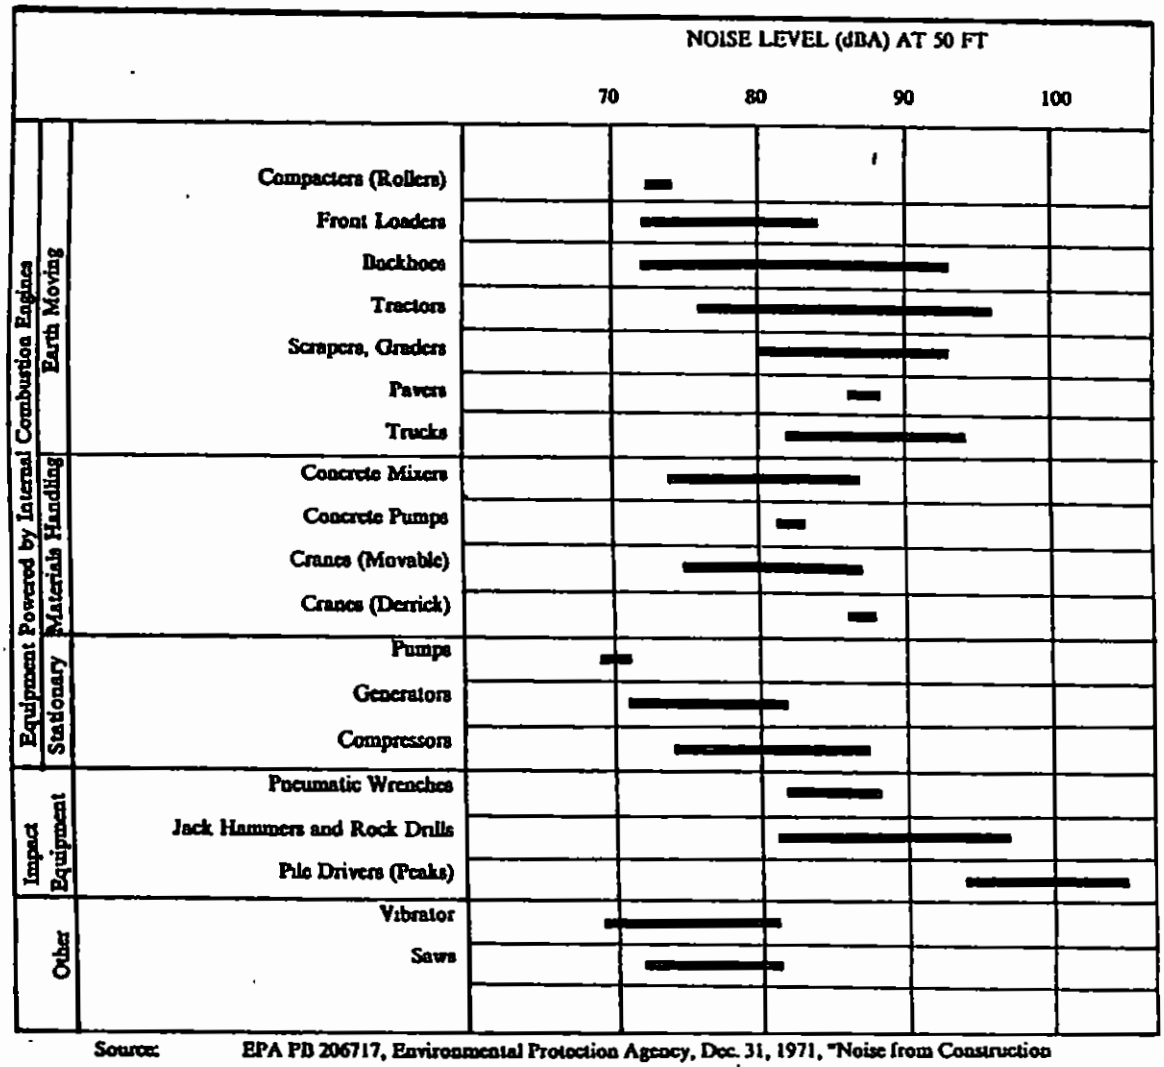
Three noise concerns are typically identified with land use intensification such as that proposed for the project area. Construction activities, especially heavy equipment, will create short-term noise increases near the project site. Upon completion, project-related traffic will cause an incremental increase in areawide noise levels throughout the El Toro area. Since, however, the number of trips generated by the proposed project is limited, the impact of ambient noise on the project site, rather than project traffic noise impacts on the rest of the community, is likely the important noise environment concern.

Construction Noise Impacts

Temporary construction noise impacts will vary markedly because the noise strength of construction equipment ranges widely as a function of the equipment used and its activity level. Short-term construction noise impacts tend to occur in discrete phases dominated initially by site clearing and grading, then by foundation construction, and finally for finish construction. The earth-moving (grading) activities are seen in Figure 3 to be the noisiest sources during construction with equipment noise ranging from 75 to 90 dB(A) at 50 feet from the source. The range of noise levels shown in Figure 3 is meant to indicate that long-term (hourly or more) noise levels are at the lower end of the range, while short-term peaks are at the upper end.

Spherically radiating point sources of noise emissions are atmospherically attenuated by a factor of 6 dB per doubling of distance. The quieter construction noise sources will, therefore, drop below 60 dB by about 300 feet from the source while the loudest sources might still be detectable above the local background beyond 1,000' from the construction area. With hilly topography in the project vicinity, the terrain shielding effects will limit the "noise envelope" around each construction site to considerably less than its theoretical maximum.

Construction noise sources are not strictly relatable to a noise standard because they occur only during selected times and the source strength varies sharply with time. The penalty associated with noise disturbance during quiet hours and the nuisance factor accompanying such disturbance usually leads to time limits on grading activities imposed as conditions on grading permits. The weekday (including Saturday) hours from 7 a.m. to 8 p.m. are the times allowed in the Orange County Noise Ordinance for construction or grading. Division 6 (Sec. 4-6-1, et seq.) of the County Code



Source: EPA PB 206717, Environmental Protection Agency, Dec. 31, 1971, "Noise from Construction Equipment & Operations"

TYPICAL CONSTRUCTION EQUIPMENT NOISE GENERATION LEVELS

FIGURE 3

also contains standard requirements related to the distance separation between construction activities and any occupied dwellings. EMA's "Standard Condition for Approval" N10 requires:

1. All powered equipment operating within 1,000 feet of a dwelling must have a properly operating and maintained muffler.

2. Stockpiling and staging activities must be located as far as practicable from dwellings.

Construction activities in areas of noise-sensitive biotic habitats such as coastal sage scrub containing gnatcatchers may affect bird behavior. Little actual evidence of noise effects on gnatcatchers has been documented, but many wildlife management agencies believe such effects exist. In San Diego County, a standard of 60 dB Leq (one hour average) derived from studies on least Bell's Vireo has been applied to gnatcatchers. Use of this standard ignores the fact that a large number of successful breeding pairs have been found directly under the take-off end of major airport runways or next to freeways where peak hourly noise levels reach almost 80 dB. Many San Diego County grading projects have nevertheless been conditioned to avoid the breeding season for possibly noise-sensitive birds, or to erect temporary berms or other buffers to reduce avian noise exposure if seasonal avoidance is not practical.

Development-Related Vehicular Noise Impacts

Off-Site Noise Levels

Long term noise concerns from the increased urbanization of the project area center primarily on mobile source emissions surrounding the project site. These concerns were addressed using the California specific vehicle noise curves (CALVENO) in the federal highway noise prediction model (FHWA-RD-77-108) in a computerized version of the model developed by Caltrans. The model calculates the Leq noise level for a particular reference set of input conditions, and then makes a series of adjustments for site-specific traffic volumes, distances, speeds, or noise barriers.

Project-related traffic may incrementally contribute to the noise exposure of off-site receiver locations. Of the 7,530 "new" daily project-generated trips, 60% will travel south on El Toro Road, while the other 40% will travel inland. At each subsequent turning opportunity, fractions of each traffic stream will split into different directions and thus dilute any off-site project traffic noise impact. The CNEL at 100 feet from area roadways for various scenarios is shown in Table 3.

N/A = no data available Source: FHWA-RD-77-108 (Calveno mod.)

In areas of greater concentration of site-related traffic, high non-project traffic levels will substantially mask any small project noise contribution. Detectable project-related noise increases will only occur in areas of low baseline traffic volumes. The maximum project-related traffic noise impact of +4 dB will occur along Valley Vista Way. Table 4 shows, however, that the 65 dB CNEL contour along Valley Vista Way will remain within the roadway right-of-way (<50' from centerline) along this segment for "with-project" conditions. Similarly, a project-related traffic noise increase of +2 dB along Glenn Ranch Road is again characterized by no substantial expansion of the 65 dB CNEL noise contour as a significant noise exposure for sensitive receivers.

Maximum off-site traffic noise impacts in areas of already elevated non-project traffic noise are 1 dB or less. Noise level differences of less than 1 dB are not distinguishable even in a laboratory setting -- much less in an ambient environment. Maximum expansion of the 65 dB CNEL contour is seen in Table 4 to occur along El Toro Road directly adjacent to the project site. An increase of 20 feet in contour distance occurs for "plus project versus existing", "2000 with project versus no project" and "2020 with project versus no project" scenarios. Away from the project site with dilution of project-related traffic, the project-related increment drops steadily to 10-foot, then a 5-foot, and quickly to an immeasurably small increase. The project is too limited in scope to create a discernible change in off-site traffic noise levels. The noise impact of the project on the ambient acoustic environment is judged to be less than significant.

On-Site Noise Exposure

The roadway that could affect project on-site noise exposure is El Toro Road. At the maximally exposed lot at around 400 feet from El Toro Road, the traffic noise level will be 63.5 dB CNEL at area buildout for an acoustically "hard" underlying surface. The El Toro MCAS aircraft noise contribution at this location is 60 dB CNEL. Their combined exposure is 65 dB CNEL. This just meets the Orange County exterior noise standard for residential use and requires no exterior noise mitigation. This calculation is a theoretical worst-case condition that assumes:

1. The maximally exposed residence in the year 2020 has a 180 degree field of view of El Toro Road without terrain irregularities or any vegetative noise absorption, and,

2. Aircraft noise in 2020 is characterized by El Toro MCAS aircraft mixes and operational conditions that existed almost twenty (20) years before today.

N/A = no data available Source: FHWA-RD-77-108 (Calveno mod.)

Both assumptions probably somewhat over-state horizon year noise exposures. There is likely an extra margin of safety relative to meeting the 65 dB CNEL exterior standard without any supplemental noise mitigation.

Mitigation in the form of exterior to interior noise attenuation will be required to meet the 45 dB CNEL interior standard for all units within the development since a maximum 62 dB CNEL aircraft noise contour will cover the site as long as El Toro MCAS operations occur. With open windows, exterior to interior noise reduction is approximately 12 dB. Any project site exposure exceeding 57 dB CNEL can not meet the 45 dB CNEL interior standard with open windows. Meeting the interior standard thus requires the option to close the window. Such ability, in turn, requires that there is supplemental mechanical ventilation to replace the natural draft eliminated by such closure. For new homes in inland valleys of Orange County, air conditioning is normally a standard feature meeting this requirement.

Noise reduction of 20 dB is normally attainable with closed single-paned windows. That will reduce any aircraft-related CNEL from 62 to 42 dB. As previously noted, however, CNEL is not the best predictor of noise annoyance due to single event phenomena such as individual overflights. Measured peak noise levels from helicopter operations were 86.5 dB in the center of the project site. A comparable level would likely occur from El Toro jet aircraft operations. A 20 dB attenuation would create a 65+ dB single event level that may be annoying to occupants even with windows closed. Most new developments within the fringes of the El Toro MCAS noise impact envelope thus have been built with acoustically enhanced windows. Such windows reduce single event noise, reduce vibration response (rattle) to aircraft noise often found in single-pane windows and are more energy efficient. Use of windows rated with a sound transmission class (STC) of 25 or better is therefore recommended to reduce noise annoyance potential from single events.

Residential activities may affect adjacent noise-sensitive land uses such as contemplative religious facilities. These facilities are, however, already exposed to single event aircraft noise that is much louder than a distant barking dog, lawnmower or auto horn associated with project residential use. The combination of irregular terrain, distance buffering and normally quiet residential activities are not expected to create a significant noise impact on any adjacent abbey or monastery uses.

NOISE IMPACT MITIGATION

The project noise impact study indicates a less than significant noise impact from project-related traffic on project vicinity receptors. Ambient noise levels were also shown to present no development constraint as the project site has more than adequate setback from El Toro Road to meet Orange County standards.

Construction activities may create a temporary adverse impact if new construction occurs adjacent to already completed residences. This potential will be minimized by completion of all mass grading before any homes are constructed. Construction noise could adversely affect any sensitive biotic species such as gnatcatchers if such species are present in the project vicinity. Although monitoring in high noise environments has shown gnatcatchers to be less noise-sensitive than sometimes believed, noise protection during construction has been required in some projects. Projects in Orange County have generally not been conditioned for gnatcatcher noise protection. Construction activity mitigation measures recommended for this project thus only include standard County requirements as follows:

- All construction and general maintenance activities, except in an emergency, shall be limited to the hours of 7 a.m. to 8 p.m. Monday through Saturday and should utilize the quietest equipment available.

- All on-site construction equipment should have properly operating mufflers.

- All construction staging areas should be as far away as possible from any surrounding completed development.

Single event noise from aircraft (fixed or rotary wing) may be intrusive in homes with "standard" construction. Aircraft noise is expected to subside with the elimination of military aviation in Orange County. Given, however, that a commercial airport may replace military operations, enhanced acoustical window treatment is recommended as follows:

- All operable windows exceeding 6 square feet of total glazing should be rated STC = 25 or greater.

EXECUTIVE SUMMARY

This biotechnical report describes existing conditions, anticipated impacts, and mitigation for the Project (Project). The biological data used in this report are from the results of previous surveys of the site vicinity (PSBS 1993; 1994) and survey work by Sweetwater Environmental Biologists, Inc. (SEB) in 1994 and 1995.

The Project site is approximately 222.2 acres located in an unincorporated portion of east-central Orange County, south of El Toro Road, and east of the Foothills Transportation Corridor. The Project proposes the development of 705 residential lots, two parks, a water tank, and associated surface streets. Approximately 206.2 acres (including 17.4 acres off site) will be impacted, including remedial grading and fuel modification zones outside of grading limits, leaving 33.4 acres on site designated as open space. Most of the site would be graded except for a canyon side that overlooks O'Neill Regional Park. Under the current plan, no wildlife corridors would be maintained across the Project site.

Two alternatives are being considered for the Project: the 299 Unit Single Family Housing Alternative and the Cluster/Reduced Development Footprint. Under both of these alternatives there would be increased open space and maintenance of a wildlife corridor across the site.

Early surveys conducted by PSBS (1993; 1994) mapped sensitive plant and animal species, vegetation communities, and manmade stock (ephemeral) ponds, and completed a federal wetland delineation. Recent surveys by SEB were conducted to update this information. This report places special emphasis on the results of these recent surveys, the occurrence of Riverside fairy shrimp (*Streptocephalus woottoni*), and additional sensitive resources found on site. No coastal California gnatcatchers (*Polioptila californica californica*) occur on site.

Four sensitive vegetation communities occur on site: Venturan-Diegan transitional coastal sage scrub (undisturbed and disturbed), coast live oak woodland, southern sycamore riparian

woodland, and mule fat scrub. For this report, ephemeral ponds are also considered sensitive because they support the Riverside fairy shrimp. Annual grassland, southern mixed chaparral, and agricultural land also occur on the site, but these are not sensitive communities.

The site supports two sensitive plant species: Catalina mariposa lily (*Calochortus catalinae*) and intermediate mariposa lily (*Calochortus weedii* ssp. *intermedius*). The site also supports eight sensitive animal species: Riverside fairy shrimp, western spadefoot (*Spea hammondi*), coastal whiptail (*Cnemidophorus tigris multiscutatus*), orangethroat whiptail (*Cnemidophorus hyperythrus beldingi*), cactus wren (*Campylorhynchus brunneicapillus*), loggerhead shrike (*Lanius ludovicianus*), southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*), and Cooper's hawk (*Accipiter cooperii*). Of particular interest is the Riverside fairy shrimp, which is listed as endangered by the U.S. Fish and Wildlife Service.

Approximately 50.3 acres of Venturan-Diegan transitional coastal sage scrub (including 6.1 acres off site), 14.6 acres of coast live oak woodland (289 individual oaks), 3.3 acre of southern sycamore riparian woodland (including 2.8 acres off site), and 3.8 acres of mule fat scrub (including 1 acre off site) will be impacted by the Project. In addition, 0.6 acre of the manmade stock ponds supporting the Riverside fairy shrimp will be directly impacted. All of the above impacts are significant according to the California Environmental Quality Act. A federal Clean Water Act Permit issued by the U.S. Army Corps of Engineers will be necessary for direct impacts to 1.65 acres of wetlands (0.84 acre of mule fat scrub and 0.81 acre including approximately 0.71 acre off site) of southern sycamore riparian woodland [already included in the acreage stated above) and 1.78 acres of Waters of the U.S. (intermittent streams and manmade stock ponds). A streambed alteration agreement with the California Department of Fish and Game will also be required for the 1.65 acre of impacts to wetlands.

Seven stands of Catalina mariposa lily and one stand of intermediate mariposa lily will be at least partially impacted by the Project. One stand of Catalina mariposa lily and two stands of intermediate mariposa lily will likely remain despite the impact. An estimated 314 (72 percent) of the 435 individuals of Catalina mariposa lily will likely be lost, leaving an estimated 121 individuals in one stand in open space. These impacts are not significant because of the low level of sensitivity of the plant, its generally wide distribution in southern California, and the relatively small population size on site. One stand of intermediate mariposa lily (one individual) will be graded, while two stands (18 individuals) are within the non-irrigated fuel modification zone, (or within open space) and are assumed to remain. This impact is not significant because of the small amount of impact and small regional significance of the on-site population.

Impacts totaling 50.3 acres to Venturan-Diegan transitional coastal sage scrub will impact the orangethroat whiptail, coastal whiptail, at least four cactus wren territories, and at least 12 southern California rufous-crowned sparrow territories. These impacts are significant but mitigable considering the low level of sensitivity of these species. Cooper's hawks were found foraging on site, but no nests were observed. Impacts to Cooper's hawks will therefore be limited to foraging habitat and are not significant. The 0.6 acre of impacts to ephemeral ponds will significantly impact the Riverside fairy shrimp.

The Project adheres to the State of California's Natural Communities Conservation Program (NCCP). The NCCP establishes guidelines for conservation of coastal sage scrub and is the basis for a preserve system in Orange County. The Project site, which occurs in the southern subregion of the Orange County NCCP preserve, has undergone extensive planning, and three corridors are proposed to meet wildlife corridor needs in this area. In accordance with the NCCP, the loss of coastal sage scrub due to the Project is less than the allowable 5 percent of the total coastal sage scrub in the subregion. According to the NCCP Evaluation Logic Flow Chart, the coastal sage scrub on the Project site has intermediate value for long-term conservation because although it is not the most dense coastal sage scrub in the region, it is located next to a higher value district (O'Neill Regional Park).

Wildlife corridor design is important in counteracting the effects of wildlife habitat fragmentation. Three wildlife corridors are proposed in the site vicinity because it is thought that a single corridor will not be adequate for all wildlife. One corridor would be required on Saddleback Meadows while the other two would occur off site to the north and south. The corridor on site (Central Corridor) would not be suitable for the gnatcatcher because the site is not occupied and does not support enough coastal sage scrub to be adequate. Rather, the Central Corridor is planned to primarily facilitate movement of certain bird species and small- to medium-sized mammals. The corridor to the south would primarily facilitate gnatcatcher and other bird movement, and the corridor to the north would be most appropriate for large mammal movement. Neither off-site corridor is within the scope of the Project, but each has potential for incorporation into future land use planning.

As designed, the Central Corridor is not to be implemented. Thus, the Project would have significant, unmitigated impacts on regional wildlife corridors. The two alternatives maintain a wildlife corridor across the site—across the central ridge of the site under the 299 Unit Single Family Housing Alternative and across the northeast corner of the site under the Cluster/Reduced Development Footprint.

Mitigation for Project impacts to habitat and sensitive resources will primarily involve dedication of non-developed areas on site to open space, revegetation of remedial grading areas, and contribution to the NCCP. Despite these measures, certain impacts would remain unmitigated by the Project.

Approximately 40.4 acres of the remedial grading areas (outside of fuel modification areas) will be revegetated with Venturan-Diegan transitional coastal sage scrub. The remaining Venturan-Diegan transitional coastal sage scrub mitigation requirement will be met by a combination of enhancement/restoration within the wildlife corridor and making a financial contribution to the Endowment Fund for the NCCP (to be used for programs such as the Adaptive Management Program).

In applying Orange County's municipal code, the amount of oak transplantation is established based on the diameter and number of oaks impacted Since mitigation areas are not available on site, mitigation will have to take the form of off-site acquisition, off-site restoration, or contribution to the Orange County NCCP. Southern sycamore riparian woodland that is impacted will need to be replaced at a ratio of 3:1. As with the oak mitigation, restoration sites will be limited on site after development, although some may be possible within Aliso Creek. The majority of riparian mitigation will have to be conducted off site through acquisition, restoration, or contribution to the Orange County NCCP. Mitigation for Riverside fairy shrimp impacts is not possible on site. The possible mitigation option for the Riverside fairy shrimp is purchase of Riverside fairy shrimp habitat off site. The exact amount required for mitigation would be determined during consultation with the resource agencies.

Approximately 22.9 acres of Venturan-Diegan transitional coastal sage scrub, 0.5 acre of coast live oak woodland, 0.1 acre of mule fat scrub, and 3.6 acres of southern mixed chaparral will not be impacted but will be directly dedicated to open space on site. The remaining mitigation will be met through on-site revegetation, off-site restoration or acquisition, and/or monetary contribution.

INTRODUCTION

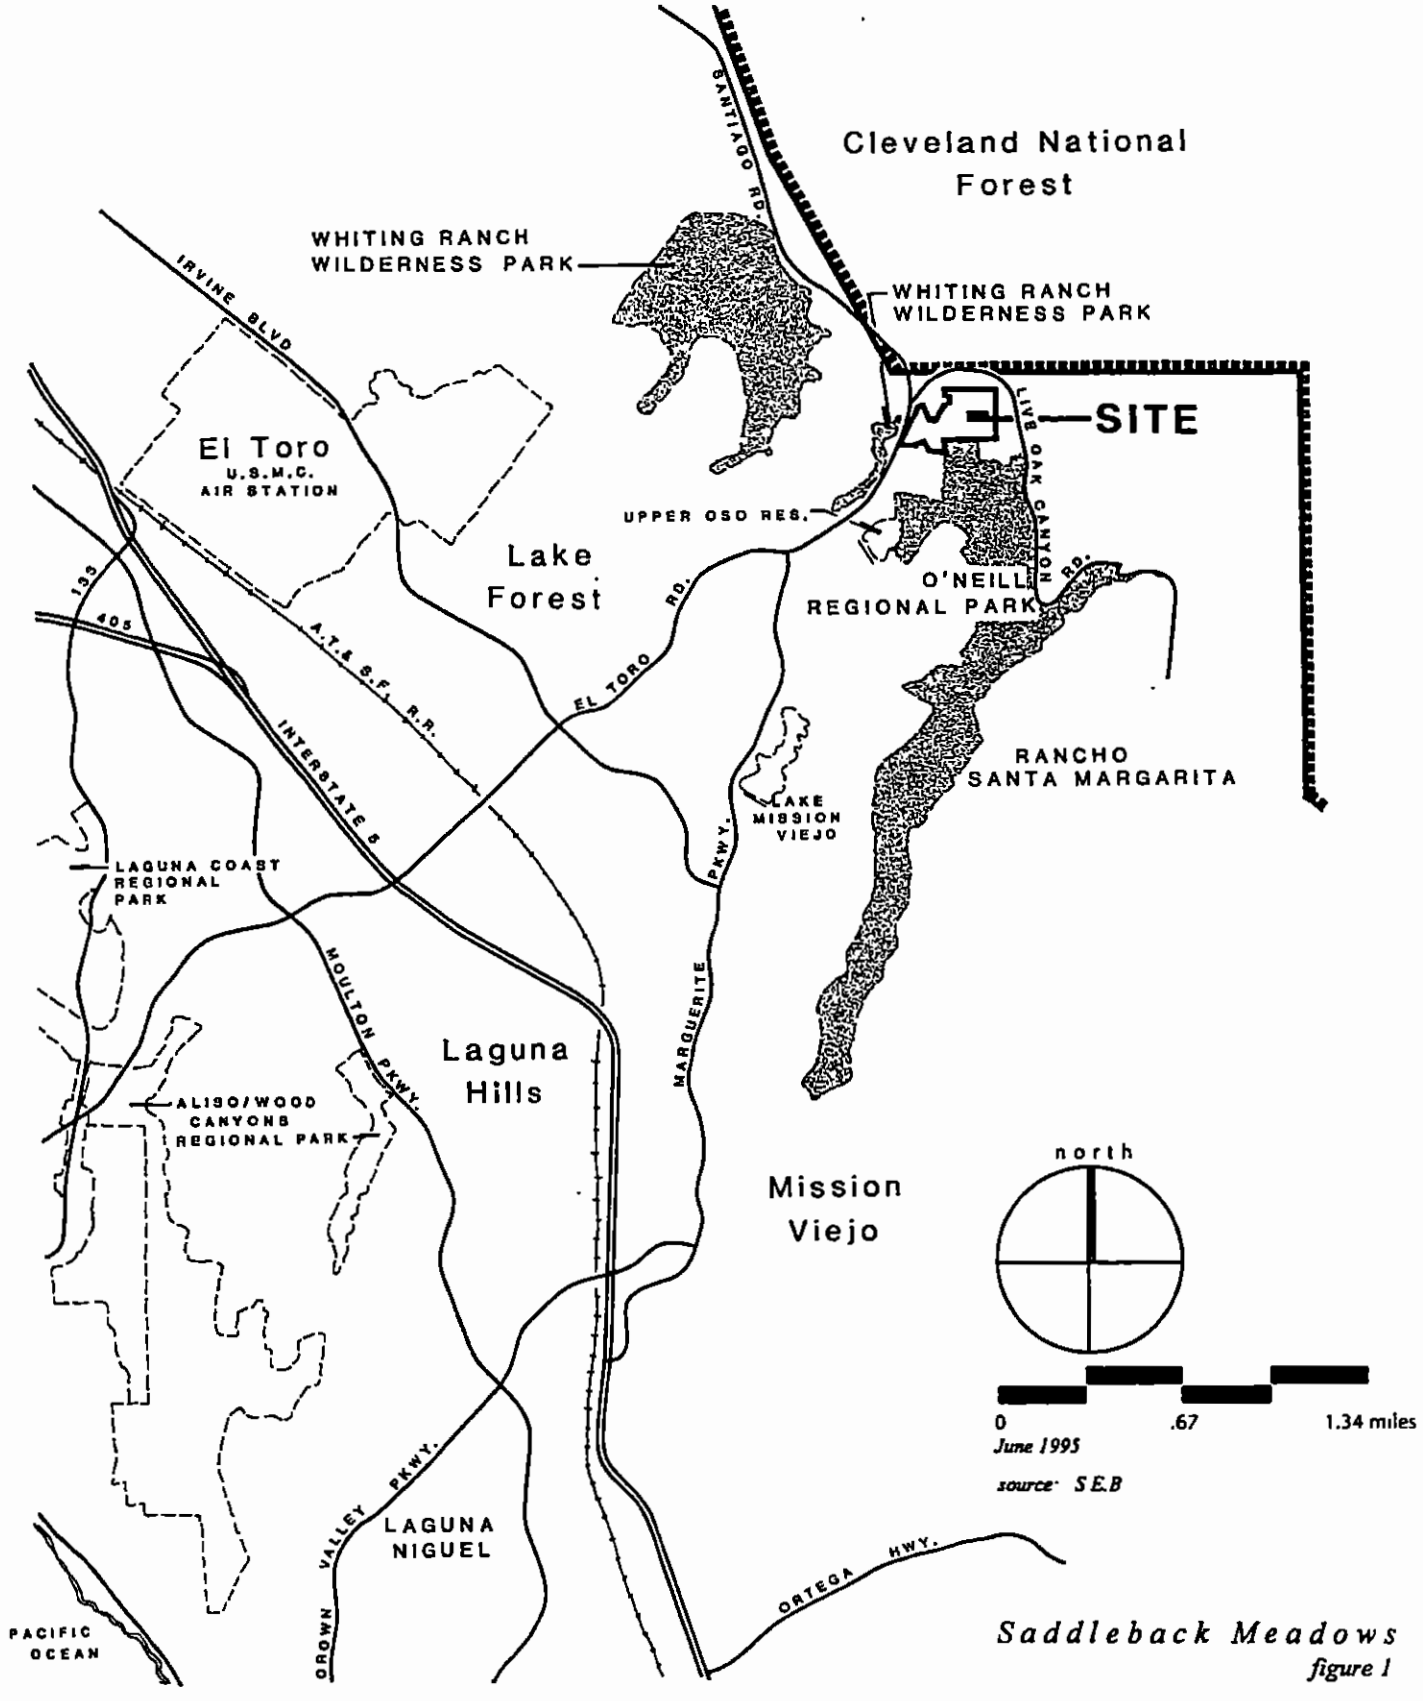
This report documents existing biological conditions, evaluates project impacts, and identifies mitigation measures that would reduce impacts to biological resources to less than significant levels on the Saddleback Meadows Project (Project) site. It also provides the County of Orange with information necessary to assess Project impacts of Saddleback Meadows under the California Environmental Quality Act (CEQA), the California Natural Communities Conservation Program (NCCP), state and federal Endangered Species Acts (ESAs), and Orange County ordinances. The Project site is approximately 222.2 acres. It is located in an unincorporated portion of east-central Orange County, south of El Toro Road and east of the Foothills Transportation Corridor (Figures 1 and 2).

Orange County's NCCP is currently being prepared and consists of northern, central, and southern subregions. The Project site occurs on the northern boundary of the southern NCCP subregional preserve and the southern boundary of the central NCCP preserve. The site is positioned in such a way that it plays a key role in the maintenance of a wildlife corridor between the central and southern subregional NCCP preserves. Other Projects surrounding the site received approval prior to approval of the Project site, reducing the flexibility of open space strategy in the area.

The Foothill Trabuco Specific Plan (Orange County Environmental Management Agency 1991) for the Project vicinity was adopted by the County of Orange in 1991. Originally the Project site was recorded as a final map in 1988.

PROJECT DESCRIPTION

The Project proposes the development of 705 residential lots, two parks, a water tank, and associated surface streets within the 222.2-acre site. The minimum lot size is 3,200 square feet and the housing density is 3.17 units per acre. Primary access to the property will be



Saddleback Meadows

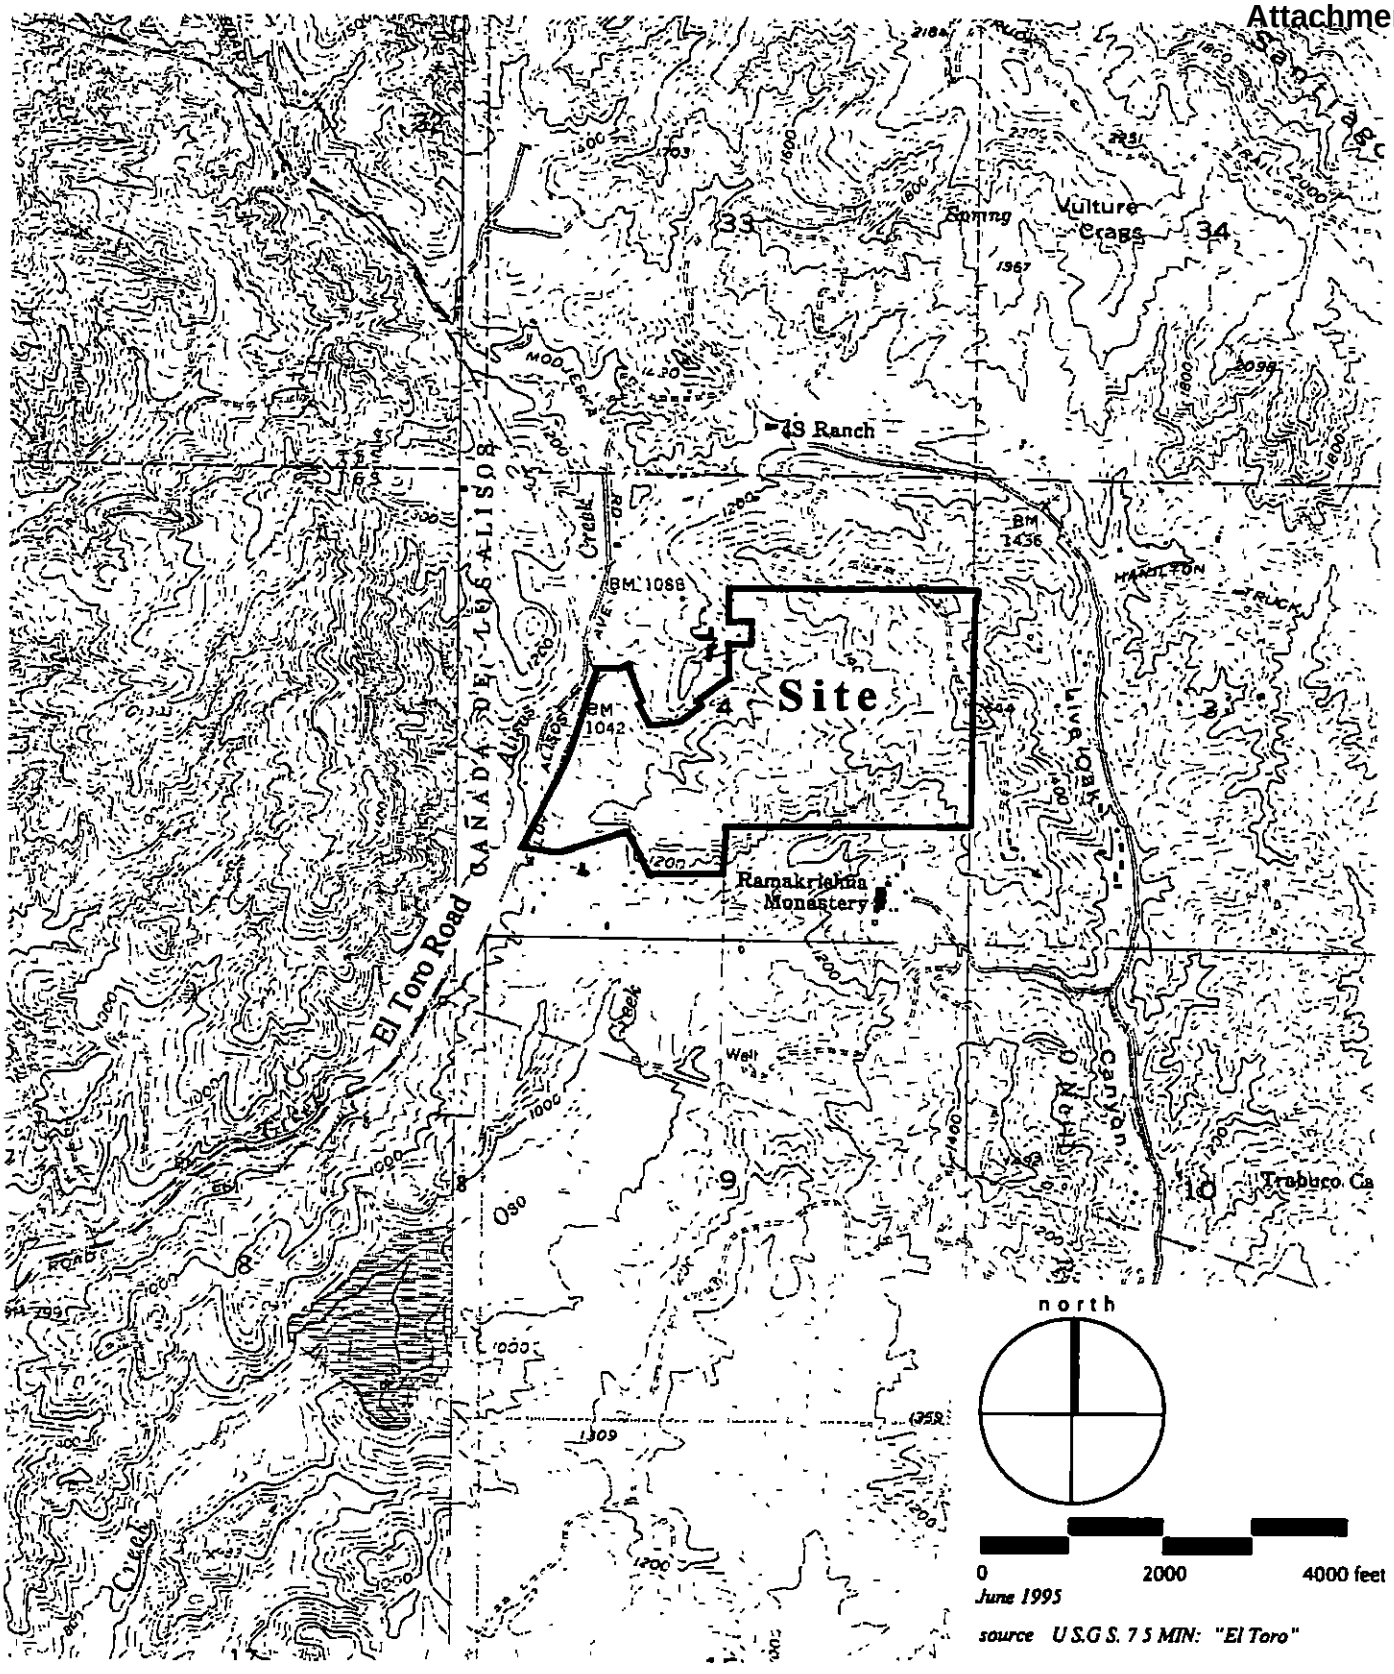
prepared by Sweetwater Environmental Biologists, Inc



Saddleback Meadows
figure 2

Location Map

prepared by: Sweetwater Environmental Biologists, Inc

from El Toro Road to the west, while secondary emergency access only will be from Valley Vista Way in the Hidden Ridge Project to the south.

Of the 222.2-acre site, approximately 188.8 acres on site and 17.4 acres off site will be impacted with 33.4 acres on site remaining unmodified. Included within the impacted areas are remedial slope areas outside of the development limits that are necessary due to on-site geological stability issues and fuel modification zones. All of the remedial slopes occurring outside of the fuel modification zones will be revegetated with native vegetation after grading and are part of the Project's mitigation requirement. Although not part of the Project's mitigation, remedial slopes within the fuel modification zone will also be planted with native vegetation.

Two alternative development schemes are being considered that achieve the Project's objectives while reducing Project impacts. The first alternative is a 299 Unit Single Family Housing Alternative that accommodates a wildlife corridor across the northeast portion of the site (Figure 3). The second alternative is a Cluster/Reduced Development Footprint that maintains a wildlife corridor across the central portion of the site (Figure 4). These two alternatives are not analyzed in detail in this document.

PHYSICAL DESCRIPTION AND LAND USE

The Project site is situated amid the lower, southwestern foothills of the Santa Ana Mountains (Figure 2). The topography on site is hilly with several steep slopes and ravines. Aliso Creek generally follows El Toro Road near the western site boundary. Drainage is to the west into Aliso Creek and to the south into O'Neill Regional Park.

Past and present land use was/is primarily cattle grazing. Cattle grazing has reduced the coverage of shrub communities on site. Otherwise, the land is undeveloped. The largest nearby developments are Hidden Ridge to the south and Portola Hills just off site to the west.

An abby also occurs just off site in the northwest corner while a monastery occurs just off site of the southeast corner.

Three large blocks of designated open space occur within the site's vicinity. O'Neill Regional Park abuts the site on the south while the Cleveland National Forest occurs off site to the north and east. Another large block of open space, Whiting Ranch Regional Park, occurs to the west. Part of Whiting Ranch Regional Park lies directly across El Toro Road from the Project site, while the remaining larger block of open space in Whiting Ranch Regional Park is to the west on the opposite side of intervening residential development. Site elevation ranges from 1,000 feet to 1,544 feet above mean sea level.

SOILS

Soils on site consist primarily of clay loams. Several pockets of sandy loam occur in the drainages, and true clay soils occur in a few scattered areas throughout the site. The clay loams that dominate the site, especially on the hill tops and along the gentler sloping areas, are of the Calleguas and Balcom series. The other series occurring on site are Basamo Clay, Alo Clay, and the Myford Sandy Loam series.

METHODS

Prior to visiting the site, Sweetwater Environmental Biologists, Inc. (SEB) consulted previous site-specific biological reports completed by Pacific Southwest Biological Services ([PSBS] 1993; 1994). SEB performed a literature search for sensitive species that may potentially occur on site, including a search through an in-house database containing information from the California Natural Diversity Data Base.

A total of eight wildlife surveys were completed by PSBS. These included two general wildlife surveys in 1989, a general wildlife survey and three coastal California gnatcatcher (*Polioptila californica californica*) surveys in 1993, and three gnatcatcher surveys in 1994.

The 1993 and 1994 surveys for gnatcatchers satisfied U.S. Fish and Wildlife Service (USFWS) accepted protocol for gnatcatcher presence/absence surveys. Taped vocalizations of the coastal California gnatcatcher were played in all of the Venturan-Diegan transitional coastal sage scrub habitats on site. Field investigators spent more than one hour per 25 acres of habitat during the surveys.

The overall wildlife data appear adequate for assessing the general presence and distribution of the various groups of vertebrates on the site. The PSBS surveys had limitations in coverage, most of which were identified in PSBS's 1994 report when they stated that for detection of certain species (that is, nocturnal, underground-living, or seasonal species) certain focused surveys would be required. We feel that, as PSBS expressed, their research and literature review adequately predicted the potential for occurrence of sensitive vertebrate species.

Vegetation mapping and sensitive plant surveys were conducted by W. Larry Sward and Brenda Stone of SEB in June and July of 1995. Vegetation was mapped with the aid of a color aerial photograph and a topographic map of the same scale. Rare plant surveys focused on native and naturalized habitats. An oak inventory was completed in 1994 (PSBS 1994)

and then updated by SEB in 1995 to assess specific impacts under this revised Project. Additional vegetation mapping for certain areas off site were completed in 1996 by Scott Taylor of SEB.

On June 28, 1994, PSBS documented the presence of the Riverside fairy shrimp and the potential for additional fairy shrimp in the ponds on site. On October 12, 1994, Barry Jones and Scott Taylor of SEB and Phil Behrens of Dudek and Associates assessed the site for potential corridors. W. Larry Sward and Deborah Pudoff performed a wetland delineation on August 8 and 9, 1995 in accordance with the 1987 U.S. Army Corps of Engineers (ACOE) Wetlands Delineation Manual (Environmental Laboratory 1987). This delineation took place within the development portion of the site including the remedial grading zone.

On April 9, 1996 a survey for western spadefoot (*Spea hammondi*) was conducted in all the ponds on site by Scott Taylor of SEB. Ponds were examined for the presence of tadpoles and any tadpoles were dipnetted, identified, and subsequently released. On April 3, 5, and 9, 1996 the site was surveyed for the presence of the Quino checkerspot (*Euphydras editha quino*) by John Brown, Ph.D. of Dudek and Associates, and Scott Taylor and Brenda Stone of SEB. Butterfly surveys were conducted primarily by the use of binoculars, although 12-inch cloth nets were carried as well.

Nomenclature for this report is from the following sources: flora - Hickman (1993) and Skinner and Pavlik (1994); vegetation communities - Gray and Bramlett (1992) and Holland (1986); amphibians and reptiles - Collins (1990); birds - American Ornithologist Union (1983); and mammals - Jones, et al. (1992). Sensitive animal and plant nomenclature and status are taken from the California Department of Fish and Game (CDFG) (1992; 1994) and Skinner and Pavlik (1994).

EXISTING CONDITIONS

VEGETATION COMMUNITIES

Five types of native vegetation occur on the Saddleback Meadows site. Venturan-Diegan transitional coastal sage scrub, coast live oak woodland, southern sycamore riparian woodland, mule fat scrub, and southern mixed chaparral (Figure 5). Portions of the Venturan-Diegan transitional coastal sage scrub are disturbed. Annual grassland, agricultural land, and manmade stock ponds (ephemeral ponds) also occur on the site (Figure 5). The ponds on site are not vernal pools because of their morphology and plant associates (see following text).

Table 1

SUMMARY OF VEGETATION COMMUNITIES ON SADDLEBACK MEADOWS

VEGETATION COMMUNITY	ACREAGE*
Venturan-Diegan transitional coastal sage scrub	64.8
Disturbed Venturan-Diegan transitional coastal sage scrub	2.3
Coast live oak woodland	14.5
Southern sycamore riparian woodland	0.5
Mule fat scrub	2.9
Southern mixed chaparral	5.4
Annual grassland	125.3
Agriculture	4.6
Ephemeral ponds	0.8
Disturbed	1.1
TOTAL	222.2

*Acreage is approximate.

VENTURAN-DIEGAN TRANSITION COASTAL SAGE SCRUB

Coastal sage scrub is found in coastal areas of California from the San Francisco Bay Area to the Mexican border, and beyond. The coastal sage scrub plant community is composed of low statured, drought-deciduous shrubs. Four floristic associations are recognized in distinct

geographical areas along the California coast with the Diegan association occupying an area from Orange County to northwestern coastal Baja California, Mexico (O'Leary 1990). The Venturan association occupies an area from San Luis Obispo County to Orange County. Venturan-Diegan transitional coastal sage scrub is found throughout Orange County and is a transitional scrub community between two floristic associations of coastal sage scrub: Venturan and Diegan. Approximately 67.1 acres of this plant community occur on site, 2.3 acres of which is disturbed.

Some of the typical plants found within the Venturan-Diegan transitional coastal sage scrub on site include California sage brush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), laurel sumac (*Malosma laurina*), black sage (*Salvia mellifera*), and coastal prickly-pear (*Opuntia littoralis*). Disturbed portions of Venturan-Diegan transitional coastal sage scrub (2.3 acres) have a higher component of annual grasses and noticeably less shrub cover than undisturbed Venturan-Diegan transitional coastal sage scrub areas. Much of the Venturan-Diegan transitional coastal sage scrub on site is unconnected and subject to continued degradation because of previous and continued cattle grazing.

COAST LIVE OAK WOODLAND

Coast live oak woodlands occur in the outer portion of the central California coastal mountain ranges and extend south into Baja California, Mexico occurring between 500 and 4,500 feet in elevation. The dominant plant in this oak woodland are coast live oaks (*Quercus agrifolia*), which typically reach a height of 12 to 70 feet, forming an incompletely closed canopy, with an understory herbaceous layer approaching 80 percent cover.

On Saddleback Meadows, coast live oak woodland is found mainly along moderate, north-facing slopes and in ravines. Areas within small drainages or swales (central portion of the site) have the most dense canopy. The understory is, for the most part, dominated by annual grassland and has been heavily grazed, making the woodland of an overall moderate quality.

The ongoing grazing is precluding natural recruitment of new seedlings in the oak woodlands. Approximately 14.5 acres of coast live oak woodland occur on site.

SOUTHERN SYCAMORE RIPARIAN WOODLAND

Southern sycamore riparian woodland is composed of tall, open, broad-leaved, winter-deciduous trees that require water near the soil surface. Western sycamore (*Platanus racemosa*) is the dominant species forming an open, medium height woodland. Associated understory species include mule fat (*Baccharis salicifolia*), Mexican elderberry (*Sambucus mexicana*), and poison oak (*Toxicodendron diversilobum*). This habitat occurs along very rocky streambeds subject to seasonally high-intensity flooding (Holland 1986) and occurs along large intermittent streams in Orange County. An estimated 0.5 acre of this habitat occurs along Aliso Creek near El Toro Road on the western boundary of the site.

MULE FAT SCRUB

Mule fat scrub is a depauperate, tall, herbaceous, riparian scrub community that often occurs along intermittent stream channels but is also found around ponds or other wet areas. This early seral community thrives in areas that are subject to disturbances (for instance, by flooding); the absence of which could lead to a riparian woodland or forest (Holland 1986). On the site it occurs on fringes of the manmade stock ponds and in areas where there is not enough water to support riparian tree species. Approximately 2.9 acres of mule fat scrub occur on site.

SOUTHERN MIXED CHAPARRAL

Southern mixed chaparral is composed of deep-rooted shrubs that are usually not deciduous and grow to about 6 to 10 feet tall forming dense, often nearly impenetrable, stands. The plants of this association typically include lemonadeberry (*Rhus integrifolia*), toyon (*Heteromeles arbutifolia*), chamise (*Adenostoma fasciculatum*), and mission manzanita

(*Xylococcus bicolor*). Southern mixed chaparral occurs on canyon slopes in the extreme northeast and southeast quadrants of the site. Approximately 5.4 acres of southern mixed chaparral occur on site.

ANNUAL GRASSLAND

Annual grassland is a dense to sparse cover of mostly non-native grasses, often associated with numerous species of showy-flowered, annual forbs. This association occurs on gradual slopes with deep, fine-textured soils. Characteristic species include oats (*Avena* sp.), red brome (*Bromus madritensis* ssp. *rubens*), ripgut (*B. diandrus)*, and mustard (*Brassica* spp.). Cardoon (*Cynara cardunculus*) is dominant in some areas on site while virtually lacking in others. In conjunction with agriculture and grazing in California, many of these plants were imported. Annual grassland is in every quadrant of the site, but the most dense coverage is on the less steeply sloped portions of the western half of the site. Approximately 125.3 acres of annual grassland occur throughout the site.

AGRICULTURE

Agriculture in the form of olive trees (*Olea europaea*) is found in the central portion of the site. Approximately 4.6 acres of agriculture occur on site.

EPHEMERAL PONDS

All of the ponds appear to have been artificially created with earthen dams a number of years ago to provide water for cattle. The earthen dams of two of the ponds have breached, and as a result, no longer retain water. Existing use of the ponds by cattle severely impact vegetation and water quality. Seven existing and two former ponds occur on site. The seven existing ponds total 0.8 acre in size. The smaller of the two former ponds lacks significant vegetation in the bottom of the pond, but it is still rimmed with mule fat scrub. The larger pond still supports mule fat scrub.

None of the plant species observed in the ponds are primarily or typically found in vernal pools in southern California. Several species observed on site can occur in vernal pools but typically occur elsewhere. These species include salt-grass (*Distichlis spicata*) and curly dock (*Rumex crispus*). Salt-grass is a species typically found in salt marshes, and moist, alkaline areas. Curly dock is a species typically found in disturbed places. The typical habitats of the plant species observed in or near the ponds include fresh or salt water marsh, riparian, moist places, and disturbed areas.

Based on the absence of vernal pool indicator species and the presence of species typically found in other wetland or disturbed habitats, the vegetation of the ponds is atypical of vernal pools. We regard this conclusion with a fairly high degree of certainty because of the timing of the field observations (June and July). This timing will have facilitated observing vernal pool species which may occur in standing water and the drying pool beds.

The physical setting of these ponds also differs from most other southern California vernal pools (Zedler 1987). Vernal pools typically occur on relatively flat mesas, situated in low lying areas between small mounds. This contrasts sharply with the lay of the land on site where few areas are flat. Furthermore, the ponds do not occur in the few flat areas. They occur primarily in drainages which have been dammed and support a low species diversity and high percentage of weed species. We conclude based on vegetation, species composition, and physical setting that these ponds are not vernal pools. However, six of the existing ponds and two former ponds contained Riverside fairy shrimp (*Streptocephalus woottoni*). Although recently the USFWS recorded the Riverside fairy shrimp near El Toro, the occurrence of these shrimp on the site may be an anomaly because the ponds appear to have been artificially created. One possible theory is that cattle rotated between grazing areas with vernal pools in Riverside County and grazing areas on site, transferring fairy shrimp eggs to the ponds. The actual circumstances resulting in their occurrence on site is a matter of speculation and will likely never be known.

DISTURBED

A portion of the site is considered disturbed, which includes roads or other paved areas. Approximately 1.1 acres of disturbed areas occur on site.

PLANTS

A total of 110 plant species, 73 (66 percent) of which are native, were observed during surveys by PSBS (1993; 1994) and SEB. The presence of 39 non-native plant species on the Project site reiterates the disturbed nature of most of the site. A common plant species in much of the site is the cardoon, an artichoke-like plant that grows in areas where soils, especially clay soils, have been highly disturbed and compacted. This aggressive plant species often dominates areas that have been heavily grazed. Undisturbed native vegetation communities on steeper slopes of the site support a typical diversity of plant species common to central Orange County. Overall the plant diversity on site, however, appears to be somewhat limited. Appendix A provides a complete list of all plant species observed.

ANIMALS

A total of 63 animal species were observed during the surveys by PSBS (1993;1994) and SEB. The animal species observed represent a somewhat lower diversity than is usually observed in the western foothill region of the Santa Ana Mountains, probably due to the disturbed nature of the site and the presence of both cattle and man For a complete listing of animal species observed see Appendix B.

INVERTEBRATES

Both the native and non-native plant communities on site probably play host to a wide variety of invertebrate species, especially insects. Invertebrates are important features of an ecosystem because of their role in food chains and as decomposers. Specific surveys for

invertebrates focused on the presence of Riverside fairy shrimp, which were known to occur on site. Hundreds of additional invertebrates are expected to use the site.

VERTEBRATES

Amphibians

No amphibians were observed during site surveys. At least two species, the black-bellied salamander (*Batrachoseps nigriventris*) and California slender salamander (*Batrachoseps attenuatus*), are expected to occur. The disturbed conditions that exist throughout most of the site have likely restricted these species to the steeper slopes where vegetative coverage is most dense.

Reptiles

Four reptiles—the western fence lizard (*Sceloporus occidentalis*), coastal whiptail (*Cnemidophorus tigris multiscutatus*), orangethroat whiptail (*Cnemidophorus hyperythrus beldingi*), and side-blotched lizard (*Uta stansburiana*)—were observed on site. Although the site has many disturbed areas, reptile habitat still occurs throughout the site. Additional lizards and snakes would be expected, especially in the undisturbed portions of Venturan-Diegan transitional coastal sage scrub on the steeper slopes.

Birds

Birds were most abundant and conspicuous (50 species) during the surveys, and undoubtedly exhibit the highest vertebrate diversity. Most of the birds were observed within the Venturan-Diegan transitional coastal sage scrub, southern mixed chaparral, and coast live oak woodland habitats on site. A few of the resident birds which were most abundant on site include California quail (*Callipepla californica*), Anna's hummingbird (*Calypte anna*), mourning dove (*Zenaida macroura*), California towhee (*Pipilo crissalis*), house finch

(*Carpodacus mexicanus*), and lesser goldfinch (*Carduelis psaltria*). Other bird species were observed foraging on the site but probably reside elsewhere including cliff swallows (*Hirundo pyrrhonota*), northern rough-winged swallows (*Stelgidopteryx serripennis*), red-tailed hawks (*Buteo jamaicensis*), and American kestrels (*Falco sparverius*). A barn owl (*Tyto alba*) was observed nesting in the coast live oak woodlands possibly as recently as 1989.

Mammals

Eight mammals were detected on site including the California ground squirrel (*Spermophilus beecheyi*), desert cottontail (*Sylvilagus audubonii*), woodrat (*Neotoma* spp.), coyote (*Canis latrans*), bobcat (*Lynx rufus*), gray fox (*Urocyon cinereoargenteus*), mule deer (*Odocoileus hemionus*), and domestic cattle. Several rodents and additional medium-sized mammals are expected to use the site as well. Some expected but unobserved species include the Virginia opossum (*Didelphus virginiana*), striped skunk (*Mephitis mephitis*), and deer mouse (*Peromyscus maniculatus*). Many of the species which may occur were not observed during the diurnal surveys because they are nocturnal.

CORRIDOR ISSUES AND CONNECTIVITY

This section presents biological resource issues within the broader context of the region, including considerations such as corridors, preserve design, and other regional considerations. Due to the rapid urbanization and associated habitat loss in coastal southern California (in combination with the fact that this region supports such a unique biota), development of reserves that preserve and maintain the natural ecological communities has become an important planning goal.

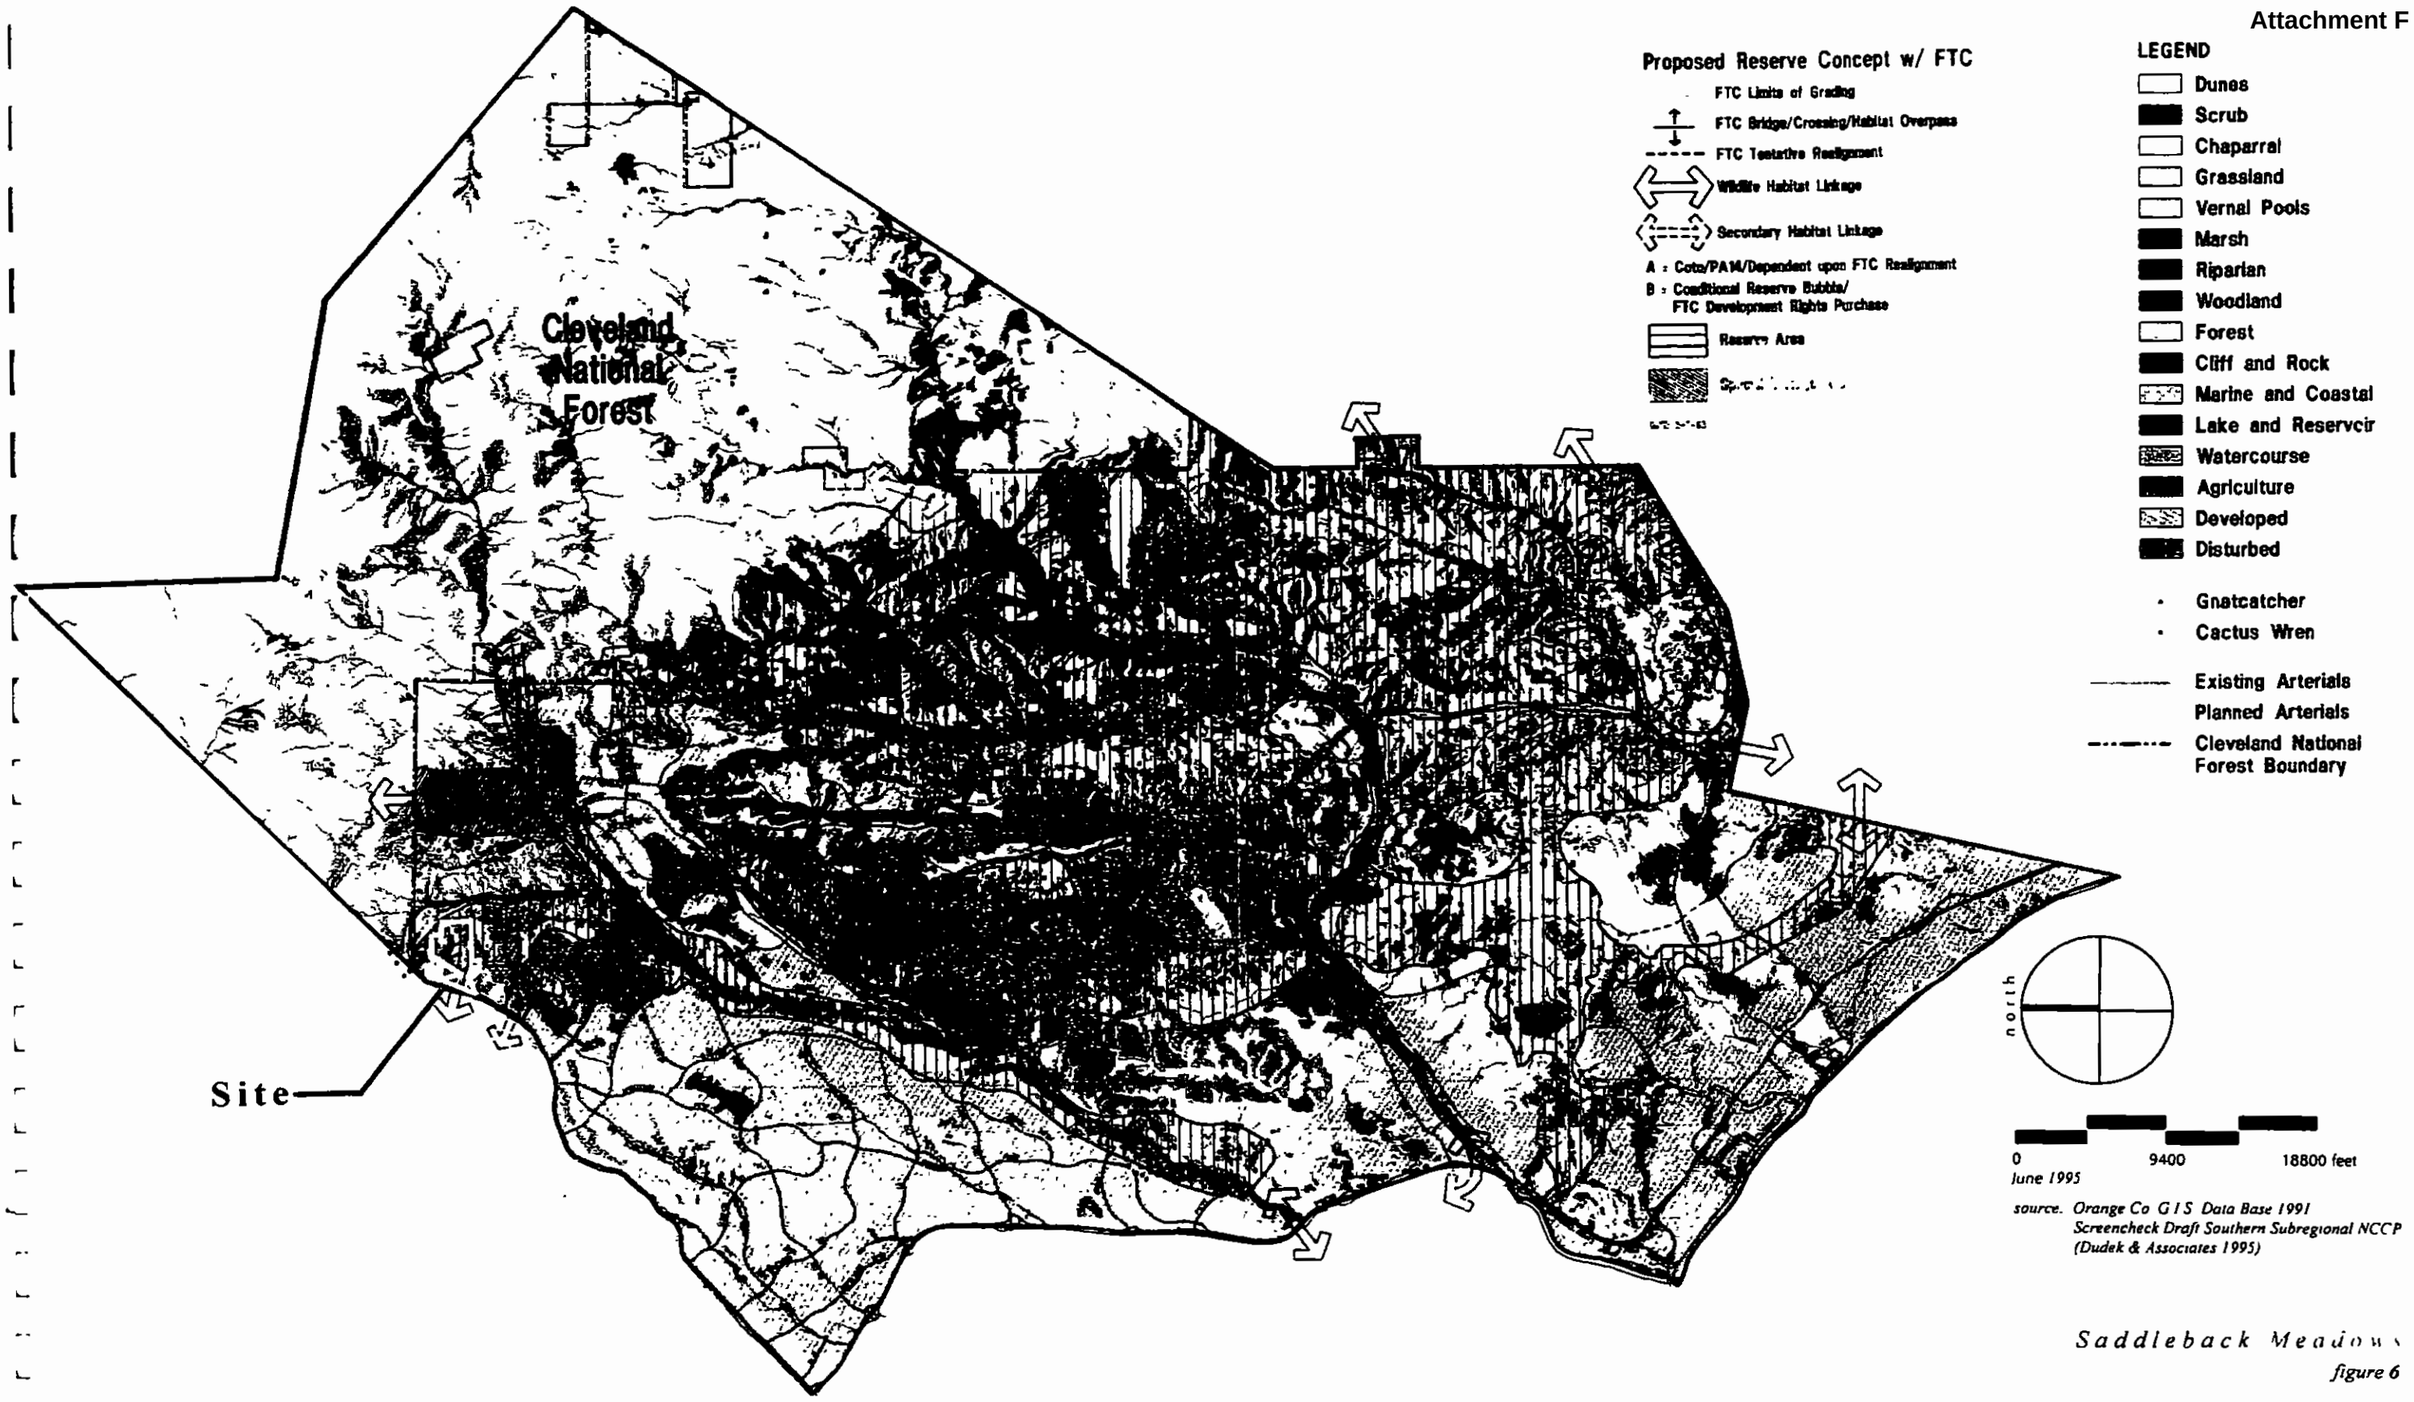
Connectivity between individual reserves is important for maintaining a diversity of species in a reserve system (Harris and Scheck 1991). Where connectivity is lacking, isolated islands of habitat are created. These islands often no longer support the diversity of species that could once

be supported prior to the isolation event. The most prominent threats facing populations in fragmented and isolated habitats are greater vulnerability to local extinction and genetic isolation (inbreeding). Adequate landscape linkages (for example, corridors) between native habitat areas ameliorate the situation by decreasing or eliminating the likelihood of these two threats.

Based on the results of a study in San Diego County for Otay Ranch, Ogden Environmental and Energy Services (Ogden) developed criteria for corridor design in developed areas (Ogden 1992). These criteria state that an ideal corridor has at least 500 feet of vegetative cover with 250 foot native vegetation buffers. Where development is not visible from the corridor (for instance in a deep gully), a narrower buffer would be acceptable. In instances where corridors are less than 500 feet long, the corridor should be no less than 400 feet in total width. At interfaces with developed areas, vegetative or opaque fencing is recommended to reduce visibility of developed areas from the corridor.

As noted earlier, Orange County is developing its NCCP preserve system in accordance with CDFG enrollment. The primary goal of this preserve system is to maintain large blocks of habitat that support viable ecosystems, and to link these large blocks via wildlife corridors. The developed areas in the vicinity of the Project limit the wildlife corridor options. Open space configuration in the vicinity of the Project is a key planning element for the Orange County NCCP preserve area (Figure 6).

Effective wildlife corridors serve all animals, from small mice or lizards up to large deer. Because of the topography and the disturbed nature of the site, and because of the existing open space and development patterns in the Project site's vicinity, the site alone could not serve to fill all of the wildlife corridor needs in the area. Three corridors have been identified in the area (Figure 7) to facilitate movement of wildlife. One would extend through the site (Central Corridor) to facilitate all wildlife except for large mammals. A second corridor would occur to the south (Southern Corridor) of the site to facilitate movement of the coastal California gnatcatcher. And a third corridor (Northern Corridor) would occur to the north of the site to facilitate large mammal movement.



Saddleback Meadows

Saddleback Meadows
figure 7

Vertical Aerial showing adjacency to O'Neill Regional Park, Whiting Ranch Wilderness Park and Cleveland National Forest

prepared by: Sweetwater Environmental Biologists, Inc

The Central Corridor runs from the southern boundary of the Saddleback Meadows property which borders O'Neill Regional Park to Aliso Creek on the western site boundary. It follows a large drainage which demarcates part of the northern boundary of the site until it reaches the western boundary at El Toro Road. The Southern Corridor runs from O'Neill Regional Park, passes the northern end of Oso Reservoir and the Hidden Ridge development through a flat alluvial area currently in use as a nursery, then crosses a ridge and El Toro Road to enter the contiguous open space of Whiting Ranch Wilderness Park and the Edison parcel. The Northern Corridor extends northward from O'Neill Regional Park, along the eastern boundary of Saddleback Meadows. It then proceeds west to cross a portion of the Cleveland National Forest, then runs north/south across El Toro Road and Live Oak Canyon Road where it connects with Whiting Ranch Wilderness Park. All three corridors cross El Toro Road, but only the Central Corridor (on site) will benefit from two existing undercrossings that facilitate some animal movement, although neither one is suitable for large mammals such as mountain lion or mule deer.

The Central Corridor has three important features contributing to its ability to serve as a wildlife corridor: a major drainage through the property, contiguity with O'Neill Regional Park, and existing undercrossings of El Toro Road that facilitate animal movement along the Aliso Creek drainage. The undercrossings consist of several 7-foot diameter corrugated pipes that extend at an angle for approximately 300 feet underneath the road and a second perpendicular undercrossing of a corrugated pipe approximately 10-feet high and 15-feet across. Although the size and shorter length of the larger undercrossing will typically make this a preferred option for most wildlife, access by larger mammals is restricted by fencing and the cement-lined bottom. Preliminary data (Phil Behrens, pers. comm.) suggests that small mammals use the corrugated pipe undercrossings to some extent, and that Aliso Creek is a key wildlife movement corridor from the existing open space east and south of Saddleback Meadows to the Edison property to the west.

Any corridor on site (including the Central Corridor) will not likely serve as a primary corridor for the gnatcatcher. There are no known sightings of gnatcatchers on Saddleback

Meadows. Habitat immediately west of the site is primarily riparian or non-native vegetation. Venturan-Diegan transitional coastal sage scrub habitat is confined to a slope area on the western portion of the site near El Toro Road, along the slopes adjacent to the Central Corridor, and in the southern portion of the site. Therefore, although gnatcatchers at least have the potential to use this corridor, the Central Corridor was deemed most suitable for some birds and most small- to medium-sized mammals.

The Southern Corridor may be the most significant corridor for the gnatcatcher because of the presence of existing Venturan-Diegan transitional coastal sage scrub occupied by the gnatcatcher. The Southern Corridor will cross an area at the northern end of Oso Reservoir that has little native habitat, except in two drainages leading to the reservoir. This corridor could be dramatically enhanced by reconfiguring and revegetating portions of the nursery with native habitats. The ridge that intervenes between El Toro Road and Oso Reservoir supports Venturan-Diegan transitional coastal sage scrub and non-native grassland habitats. Although the eastern side of the intervening ridge line is steep, it is not assumed to prohibit bird movement. There is no undercrossing at El Toro Road, and given the terrain, it will be impractical to construct one; however, because this corridor is likely most important for gnatcatcher movement, road crossings are a secondary issue.

The Northern Corridor, through the Cleveland National Forest, is at a higher elevation than Saddleback Meadows, is steep, and supports mostly chaparral vegetation. Gnatcatchers are expected to make little use of this area due to the physiognomic setting and vegetation; however, there should be no such restriction on mountain lion and other large mammal movements. No undercrossings of El Toro Road occur along this corridor but planned road improvements may present opportunities for the construction of undercrossings.

It is beyond the scope of the Project to establish either the Southern or Northern corridors. However, because the proposed corridor areas are still undeveloped, opportunities still exist through the NCCP process to ensure the three identified corridors can function as a wildlife corridor unit and help meet the goals of the County of Orange's NCCP subregional design.

SENSITIVE RESOURCES

The following is a description of sensitive biological resources found on Saddleback Meadows. Where impacts to these resources occur, mitigation may be required as discussed in the Mitigation Section of this report.

HABITATS

Venturan-Diegan Transitional Coastal Sage Scrub

Venturan-Diegan transitional coastal sage scrub is a sensitive habitat because it supports a number of state and federally listed endangered, threatened, and rare vascular plants as well as several reptile, bird, and mammal species that are federally listed or are candidate species for federal listing. Loss estimates for coastal sage scrub habitat in California range from 36 to 85 percent, but since these estimates were made in 1979 to 1981, additional losses have since accrued (O'Leary 1990). The primary cause for the loss of coastal sage scrub within California have been habitat conversion to agriculture and urban development.

The fragmented nature of much of the Venturan-Diegan transitional coastal sage scrub on site makes it low quality. The highest quality Venturan-Diegan transitional coastal sage scrub occurs on the steep slopes that connect with O'Neill Regional Park in the southeast quadrant of the site. This area supports the highest native plant component and the highest diversity of animal species.

According to the NCCP Evaluation Logic Flow Chart, the Venturan-Diegan transitional coastal sage scrub on the Project site has intermediate value for long-term conservation because although it is not the most dense coastal sage scrub in the region, it is located next to a higher value district (O'Neill Regional Park and Whiting Ranch Regional Park).

Coast Live Oak Woodland

Coast live oak woodland and individual oaks are protected by the tenets of CEQA because of their scarcity, wildlife values, and ability to provide watershed protection. The major factors contributing to the decline of oak woodlands in southern California include livestock grazing, recreational use, and urban and rural developments. The coast live oak woodland on site is of moderate quality because of the extensive grazing which has eliminated the natural understory.

An oak tree inventory was completed by PSBS (PSBS 1994) and updated by SEB (SEB 1995) to document the number of oaks present on site and the number to be impacted by the Project.

Southern Sycamore Riparian Woodland

Southern sycamore riparian woodland is sensitive because it is a riparian habitat. Riparian habitats serve as movement corridors, water sources, shelter/shaded areas, and the unique microclimate supports a variety of wildlife. Many birds and amphibians are completely restricted to riparian habitats and are dependent on them for breeding. Animals also move back and forth across riparian habitats into adjacent upland or wetland habitats. Riparian systems are intimately linked with adjacent upland areas, and many species that are restricted to riparian habitats for breeding use upland areas surrounding riparian habitats for foraging. In addition, several insect and plant species are restricted to riparian habitats.

Riparian communities are protected by the ACOE (Section 404 of the Clean Water Act) and CDFG (Streambed Alteration Agreement) because of their wetland values. Under CEQA, riparian communities are protected because they are declining habitats that support sensitive species and serve in many instances as a wildlife corridors.

Ephemeral Ponds

Although this community by itself is not sensitive, it is recognized as sensitive in this case because it supports the Riverside fairy shrimp, a federally listed endangered species.

Wetlands and Waters of the U.S.

These areas are regulated by the CDFG and the ACOE. On site, Waters of the U.S. occur in manmade stock ponds and intermittent streams that cross several areas of the site. Wetland habitat, under CDFG jurisdiction, is associated with southern sycamore riparian woodland, mule fat scrub, and ephemeral ponds.

SENSITIVE PLANTS

Two sensitive plants, Catalina mariposa lily (*Calochortus catalinae*) and intermediate mariposa lily (*Calochortus weedii* var. *intermedius*), were detected on site (Figure 3).

Catalina mariposa lily

Listing: USFWS: None; CDFG: None; CNPS: List 4, 1-2-3

Distribution: This species is distributed in all coastal counties from Santa Cruz County to San Diego County, except Monterey County.

Habitat(s): The Catalina mariposa lily grows on heavy soils, usually in open grassland or shrubland.

Status On Site: Eight stands were detected by SEB (435 individuals), six of which (428 individuals) were in Venturan-Diegan transitional coastal sage scrub along the southern boundary of the site. The two additional stands (seven individuals) were in Venturan-Diegan transitional coastal sage scrub patches in the northeastern quadrant of the site.

Intermediate mariposa lily

Listing: USFWS: Regionally sensitive; CDFG: None; CNPS: List 1B, 2-2-3

Distribution: This mariposa lily has only been recorded from Los Angeles, Orange, and Riverside counties.

Habitat(s): Dry, rocky slopes are the habitat of this species.

Status On Site: Three stands were detected by SEB totaling 18 individuals. Two stands are in the southwest quadrant, while the remaining stand is in the southeast quadrant.

Since the surveys had adequate coverage to detect potentially occurring sensitive plant species, no additional sensitive plant species are expected to occur on site. The plants which were determined originally to have a potential to occur on site included Palmer's grappling-hook (*Harpogonella palmeri*), many-stemmed dudleya (*Dudleya multicaulus*), and prostrate spineflower (*Chorizanthe procumbens*).

SENSITIVE ANIMALS

Eight sensitive animals were observed during the surveys by PSBS (1993; 1994) and SEB (Figure 3): Riverside fairy shrimp, western spadefoot, coastal whiptail, orangethroat whiptail, Cooper's hawk (*Accipiter cooperii*), cactus wren (*Campylorhynchus brunneicapillus*), loggerhead shrike (*Lanius ludovicianus*), and southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*). No coastal California gnatcatchers occur on site.

Riverside fairy shrimp

Listing: USFWS Endangered

Distribution: Extremely limited distribution in Riverside, Orange, and San Diego counties; and northern Baja California, Mexico. In Orange County, known from two locations, in Riverside County, known only from five vernal pools, in San Diego County, known only from two vernal pool complexes.

Habitat(s): Vernal and ephemeral pool habitats that are relatively deep and have low values for alkalinity and chloride presence. The Riverside fairy shrimp is a warm water species of fairy shrimp, and it hatches at water temperatures of 15 to 17 °C.

Status On Site: Six of the ponds and two recently dried ponds (their dams have been breached) have evidence of Riverside fairy shrimp. These locations represent a significant expansion of the shrimp's typical habitat range.

Western spadefoot

Status: USFWS Regionally sensitive

Distribution: California's Central Valley and San Francisco Bay area south along the coast to northwestern Baja California, Mexico.

Habitat: Mesa tops, valleys, low hills, floodplains, and washes. Southern California habitats include coastal sage scrub, chaparral, and grassland. Important habitat components include temporary pools (which form during winter and spring rains) for breeding and friable soils for burrowing.

Status On Site: During focused surveys, western spadefoot tadpoles were observed in two of the ephemeral ponds on site.

Coastal whiptail

Status: USFWS Regionally sensitive

Distribution: Ventura County south, in cismontane California, to south-central Baja California, Mexico.

Habitat: Open Venturan-Diegan transitional coastal sage scrub, grasslands, chaparral, and woodlands. Frequently found along the edges of dirt roads traversing habitat. Important habitat components include open, sunny areas for basking, plant litter, and an abundance of invertebrate prey, particularly termites (*Reticulitermes* sp.).

Status On Site: A solitary individual was observed by PSBS.

Orangethroat whiptail

Status: USFWS: Regionally sensitive; CDFG CSC

Distribution: Southern Orange County and southern San Bernardino County (Colton), south to the cape of Baja California, Mexico.

Habitat: Venturan-Diegan transitional coastal sage scrub, chaparral, edges of riparian woodlands, and washes. Also found in weedy, disturbed areas adjacent to these habitats. Important habitat requirements include a mosaic of open, sunny areas and shade for thermoregulation, and an abundant invertebrate prey base, particularly termites.

Status On Site: Two individuals were observed by SEB on a slope in the southeast quadrant adjacent to O'Neill Regional Park.

Cooper's hawk

Status: Nesting—CDFG CSC

Distribution: Throughout the continental U.S. excluding Alaska, parts of Montana, and parts of the Dakotas. Winters south to Mexico and Honduras.

Habitat: In San Diego County tends to inhabit lowland riparian areas and oak woodlands in proximity to suitable foraging areas such as scrublands or fields.

Status On Site: One individual was observed by PSBS hunting in grassland on the northern half of the site.

Cactus wren

Status: USFWS Regionally sensitive/CDFG CSC

Distribution: Southern Orange County (San Juan Creek) south through San Diego County into northwestern Baja California, Mexico.

Habitat: Restricted to clumps of prickly-pear (*Opuntia littoralis and O. oricola*) or cholla (*O. prolifera*) growing in Venturan-Diegan transitional coastal sage scrub or along washes.

Status On Site: Ten individuals were observed by PSBS in the southern half of site, with most (seven) occurring on the slopes contiguous with habitat in O'Neill Regional Park.

Loggerhead shrike

Status: CDFG CSC

Distribution: Widespread, but declining, throughout North America. Winters south to Central America.

Habitat: Open habitats including grasslands, scrublands, and ruderal areas with adequate perching locations.

Status On Site: Observed by PSBS in 1989 but not mapped (PSBS 1993).

Southern California rufous-crowned sparrow

Status: USFWS Regionally sensitive/CDFG CSC

Distribution: Ventura County southeast through Los Angeles, Orange, Riverside and San Diego counties to northwestern Baja California, Mexico.

Habitat: Mainly inhabit Venturan-Diegan transitional coastal sage scrub where it occurs on rocky hillsides and in canyons but also may be found in open sage scrub/grassy areas of successional growth (for example, after a fire).

Status On Site: Ten individuals were observed by PSBS on the southern half of the site, mostly (seven) on the slopes of habitat contiguous with O'Neill Regional Park. Two additional individuals occur just off site near the southern half of the site and in the northeast corner.

Several additional animal species may occur on site (see Table 2). The majority of these species have a low to moderate potential for occurring on site. None of the species warrant further surveys because of their low potential for occurrence, they are of a generally low level of sensitivity, and/or adequate mitigation can be accomplished by mitigating for their habitats.

Table 2

SENSITIVE ANIMAL SPECIES WITH THE POTENTIAL FOR OCCURRENCE WITHIN THE SADDLEBACK MEADOWS SITE

SPECIES	STATUS*	POTENTIAL/HABITAT
Invertebrates		
Quino checkerspot *Euphydryas editha quino*	USFWS FE	Low; habitat highly variable, but primarily coastal sage scrub. Food plants (*Plantago* ssp.) present. Focused surveys were conducted but the species was not observed. This species is extremely rare in Orange County.
Reptiles		
San Diego horned lizard *Phrynosoma coronatum blainvillei*	USFWS Regionally sensitive CDFG CSC	High; chaparral, coastal sage scrub, food source (harvester ants [*Pogonomyrmex* sp.]) not seen but probably present. Focused surveys may be needed for detection but are not warranted. Expected but not seen during surveys.
San Diego ringneck snake *Diadophus punctatus similis*	USFWS Regionally sensitive CDFG CSC	Low to moderate; coastal sage scrub, chaparral, oak woodlands. Prefers moist habitats. Focused surveys needed for detection but are not warranted.
Coastal rosy boa	USFWS Regionally sensitive	Low; rocky areas in coastal sage scrub, chaparral, and cactus scrub. Focused surveys needed for detection but are not warranted.
Birds		
Prairie falcon *Falco mexicanus*	CDFG CSC	Low; an uncommon visitor to grasslands and scrublands of Orange County.
Northern harrier *Circus cyaneus*	CDFG CSC	Moderate; habitat includes open areas, such as grasslands, and adjacent habitats. Will have been observed if it consistently uses the site. Nevertheless, this raptor probably occurs in the site vicinity due to the amount of open habitat, especially to the southeast.
Burrowing owl *Speotyto cunicularia*	CDFG CSC	Low; often found in disturbed sites where ground squirrel burrows are present, but will have been observed if present.
Bell's sage sparrow *Amphispiza belli belli*	USFWS Regionally sensitive CDFG CSC	Low; habitat is coastal sage scrub and chaparral, not common and apparently absent from much of Orange County. Will likely have been detected if present.

Table 2 (cont.)

SENSITIVE ANIMAL SPECIES WITH THE POTENTIAL FOR OCCURRENCE WITHIN THE SADDLEBACK MEADOWS SITE

Tricolor blackbird *Agelaius tricolor*	USFWS Regionally sensitive CDFG CSC	Moderate potential as a winter visitor and as a migrant; mostly in grasslands and ephemeral pond habitat.
Mammals		
Pallid bat *Antrozous pallidus pacificus*	CDFG CSC	Moderate; habitat highly variable, could forage throughout the site, but roosting sites are likely elsewhere. Focused surveys needed for detection but not warranted.
Greater western mastiff bat *Eumops perotis californicus*	USFWS Regionally sensitive CDFG CSC	Moderate; could forage in any habitat on site, but roosting sites are likely elsewhere. Focused surveys needed for detection but not warranted.
Dulzura California pocket mouse *Chaetodipus californicus femoralis*	USFWS Regionally sensitive CDFG CSC	Low to moderate; dense chaparral, but occasionally other shrublands Trapping necessary for detection but not warranted.
San Diego desert woodrat *Neotoma lepida intermedia*	USFWS Regionally sensitive CDFG CSC	Moderate; woodrat sign was found, but it could have been dusky-footed woodrat. Habitat is coastal sage scrub and other dry habitats. Trapping necessary for detection but not warranted.

*Explanation of listing/sensitivity can be found in Appendix C

IMPACTS

Two types of impacts will be assessed: direct and indirect. All areas to be modified, including remedial slopes and fuel modification zones will be interpreted as direct impacts. Fuel management zones are also considered direct impacts because most native vegetation will be removed. Both on- and off-site impacts are considered in this analysis.

Indirect impacts are impacts to the biological resources that result from adjacent direct impacts. Though these impacts may not initially be evident, over time they may occur due to the relative proximity of development or disturbance. Examples of indirect impacts include habitat fragmentation, habitat insularization, edge effect, exotic species invasion, lighting, domestic pet intrusion/predation, and increased human intrusion.

DIRECT IMPACTS

HABITATS

Of the 222.2 acres on the Project site, approximately 188.8 acres on site (85 percent) and approximately 17.4 acres off site will be directly impacted by Project development (Figure 8). A total of 33.4 acres (15 percent) of undeveloped land will remain in open space within the site. A summary of the impacts is found in Table 3.

Venturan-Diegan Transitional Coastal Sage Scrub

Approximately 44.2 acres (66 percent) of the Venturan-Diegan transitional coastal sage scrub will be directly impacted on site by the proposed Project, leaving 22.9 acres preserved. An additional 6.1 acres will be impacted off site. Most of these impacts will occur in isolated patches of habitat throughout the central portion of the site and along the fringes of the larger patches on site. All impacts to Venturan-Diegan transitional coastal sage scrub are significant.

Annual grassland	125 3	119.2	95%	6.1	5%	2.4
Agriculture	4.6	4.6	100%	0.0	0%	
Disturbed	1.1	1.1	100%	0.0	0%	2.6
Total	**222.2**	**188.8**	**84%**	**33.4**	**16%**	**17.4**

Mule Fat Scrub and Southern Sycamore Riparian Woodland

Mule fat scrub (2.8 acres [97 percent]) will be impacted where it is associated with three of the ponds and in three intermittent streambeds. Southern sycamore riparian woodland (0.5 acre [100 percent]) will be impacted along the western boundary of the site by remedial grading. Off site, there will be impacts to 2.8 acres of southern sycamore riparian woodland and 1.0 acre of mule fat scrub. These impacts are significant because of the two habitats' values as wildlife habitats and because of their function as wetlands. Impacts to these habitats will require permitting as discussed below.

Coast Live Oak Woodland

A total of 14 acres (97 percent) of coast live oak woodlands (284 individuals) will be impacted by the proposed Project while 0.5 acres (14 individuals) will be preserved. Off site, there will be impacts to 0.6 acre of coast live oak woodlands (5 individuals). Impacts to oak woodlands are significant because of their wildlife values, their function in watershed protection and, in the case of Saddleback Meadows, their function as part of the planned NCCP regional wildlife corridor.

Ephemeral Ponds

The 0.6 acre of impact to manmade stock ponds is significant due to the presence of Riverside fairy shrimp. One ephemeral pond (0.2 acre) would be preserved in open space adjacent to O'Neill Regional Park. In addition, impacts to portions of this habitat will require permitting as discussed below because of its function under ACOE jurisdiction.

Wetlands and Waters of the U.S.

A federal Clean Water Act permit issued by the ACOE will be necessary for direct impacts to 1.65 acres of wetlands (0.84 acre of mule fat scrub and 0.81 acre of the southern sycamore riparian woodland) and 1.78 acres of Waters of the U.S. (intermittent streams and manmade stock ponds). As part of the permitting process, there may be required mitigation measures independent of the requirements of CEQA for impacts to wetlands. Only a portion of the mule fat scrub being impacted was delineated as a wetland (0.84 acre), although the total impact to this community is 2.8 acres. Only a portion of the southern sycamore riparian woodland being impacted was delineated as a wetland (0.81 acre), although the total impact to this community is 3.3 acres (0.5 acre on site and 2.8 acres off site). A Streambed Alteration Agreement with the CDFG will also be required for the 7.7 acres of impacts to wetland habitats (southern sycamore riparian woodland, mule fat scrub, and ephemeral pond). A conceptual wetland mitigation plan for these impacts is presented in Appendix D.

Southern Mixed Chaparral

Approximately 1.8 acres (33 percent) of southern mixed chaparral will be directly impacted on site by the Project. These impacts are not significant because of the small amount of impact and the fact that southern mixed chaparral is not a sensitive habitat.

Agriculture, Annual Grassland, and Disturbed

Approximately 4.6 acres (100 percent) of agriculture, 119.2 acres (95 percent) of annual grassland, and 1.1 acres of disturbed land (100 percent) will also be directly impacted on site. An additional 2.4 acres of annual grassland and 2.6 acres of disturbed will be impacted off site. These impacts are not significant because the habitats are not sensitive.

SENSITIVE PLANTS

All or a portion of seven of the eight stands of Catalina mariposa lily, including approximately 314 (72 percent) of the estimated 435 individuals, will be eliminated by the proposed Project. Approximately 121 individuals of the remaining stand will remain in open space. Impacts to this species are not significant due to the species' relatively low level of sensitivity, the relatively small population size on site, and the relatively broad distribution of this species throughout its range.

One of the three stands of intermediate mariposa lily will be eliminated by the proposed Project. Approximately one of the estimated 18 individuals (5 percent) will be directly impacted. Impacts to this species are adverse but not significant due to the small amount of impact and small size of the total site population and, therefore, low regional significance of the on-site population.

SENSITIVE ANIMALS

Riverside Fairy Shrimp

Impacts to all ponds where fairy shrimp were detected are significant because of the limited distribution of the species and because it is federally listed as endangered.

Western Spadefoot

One of the two ponds where larvae were found will be impacted by the Project. The impact to this species is not significant because of the species low level of sensitivity and because the population on site is not of regional significance due to its small size.

Orangethroat Whiptail, Coastal Whiptail, Cactus Wren, and Southern California Rufous-Crowned Sparrow

The orangethroat whiptail and coastal whiptail prefer the open Venturan-Diegan transitional coastal sage scrub and southern mixed chaparral areas of the site. Two orangethroat whiptails and one coastal whiptail were observed, and the two reptiles are expected to occur throughout appropriate Venturan-Diegan transitional coastal sage scrub habitat on site. Approximately 54 acres of combined Venturan-Diegan transitional coastal sage scrub and chaparral will be directly impacted (including off-site impacts), leaving 26.5 acres in open space on site. Ten cactus wrens and 12 southern California rufous-crowned sparrows are distributed throughout the Venturan-Diegan transitional coastal sage scrub on site and just off site. Approximately 50.3 acres of potential nesting and foraging habitat (Venturan-Diegan transitional coastal sage scrub) will be impacted on and off site, including at least portions of areas occupied by all of the sparrows and at least four pairs of cactus wrens. Impacts to these four species combined are significant but mitigable.

Cooper's Hawk and Loggerhead Shrike

No direct impacts to Cooper's hawk nests are anticipated because no nests were observed during the surveys. Impacts to foraging habitat on site (entire site) are adverse but not significant since it is unlikely that any active nests will be disturbed. The loss of foraging habitat could affect, at most, a portion of one territory of one pair of Cooper's hawks, and this impact is not significant.

Loggerhead shrikes were observed on site by PSBS, but it is unknown how many or whether they were breeding on site. Assuming that they still use the site, the Project impacts will still not be significant because of the low sensitivity of this species.

RAPTOR FORAGING HABITAT

Impacts to all habitats on and off site will total 206.2 acres, while off-site impacts will total 7.0 acres. These impacts will generally add to the loss of raptor foraging areas in the region. This impact is significant cumulatively but mitigable.

POTENTIALLY OCCURRING SPECIES

Given the low sensitivity of the potentially occurring species, their distribution throughout other parts of Orange County, and the low amount of anticipated impacts to their respective habitats, any potential impacts to these species are adverse but not significant. We do not recommend focused surveys for mammals or other species.

299 UNIT SINGLE FAMILY HOUSING ALTERNATIVE

This alternative reduces the impacts and maintains the wildlife corridor across the northeastern corner of the site (Figure 3). There would be significant impacts to all of the

sensitive habitats and species as are impacted under the current plan, but the impact would be greatly reduced and much more open space would remain on site.

CLUSTER/REDUCED DEVELOPMENT FOOTPRINT

This alternative maintains the wildlife corridor across the central ridge of the site (Figure 4). There would be significant impacts to all of the sensitive habitats and species as are impacted under the current plan, but the impact would be greatly reduced and much more open space would remain on site.

MITIGATION

This section presents recommendations to mitigate significant impacts based on current practices in the context of this Project, given the on-site opportunities for preservation and revegetation. Replacement ratios for the various impacted communities will also be discussed. Proposed mitigation measures are based on the requirements of CEQA, which requires mitigation to offset biological impacts which are significant, on the County of Orange's Oak Ordinance, NCCP process guidelines, the federal ESA, and state and federal wetland permitting requirements.

The Project impacts most of the site as a result of Project grading, fuel modification zones, and remedial grading requirements. Additionally, significant remedial grading are also required off site. Mitigation replacement ratios have been defined based on the quality of the habitat and the condition of the habitat used for compensation at the time the parcel is proposed for development.

Impacts to Venturan-Diegan transitional coastal sage scrub habitat will require a mitigation ratio of 1.5:1 because although it is ranked as intermediate value habitat (under the NCCP), in its current condition much of the habitat being impacted is fragmented, is at least partially disturbed, and it does not support the coastal California gnatcatcher. All impacts to mule fat scrub (including the wetland portion) will be mitigated at 1:1 because of the poor quality of the existing habitat and because it is surrounded by agriculture and annual grassland habitats. All southern sycamore riparian woodland (even the wetland portion) will be mitigated at a ratio of 3:1 because of its high habitat quality. Coast live oak woodland habitat will be mitigated at a 1:1 replacement ratio. The minimum number of oaks to be planted is derived from guidelines for individual tree replacement based on the Orange County oak ordinance, which considers the diameter and number of oak trees impacted. Ephemeral pond habitat will need to be replaced at a 2:1 ratio because it supports the Riverside fairy shrimp. Table 4 presents a summary of impacts and mitigation.

Table 4

SUMMARY OF ON- AND OFF-SITE IMPACTS
TO VEGETATION COMMUNITIES AND ASSOCIATED MITIGATION

Habitat Type	Impact Acreage	Mitigation Ratio	Mitigation Acreage
Venturan-Diegan transitional coastal sage scrub*	50 3	1.5:1	75.5
Mule fat scrub	3.8	1:1	3.8
Southern sycamore riparian woodland	3.3	3:1	9.9
Coast live oak woodland	14.6	1:1	14.6
Ephemeral pond	0.6	2:1	1.2

*Mitigation for Venturan-Diegan transitional coastal sage scrub will occur on and off site. See Figure 7 for on-site mitigation areas.

Impacts to the southern mixed chaparral, annual grassland, and agricultural habitats on site do not require mitigation.

VENTURAN-DIEGAN TRANSITIONAL COASTAL SAGE SCRUB

Venturan-Diegan transitional coastal sage scrub will be mitigated by on-site preservation, on-site restoration, and by making a contribution to the NCCP. Based on a 1.5:1 mitigation ratio, the 50.3 acres of impacts to Venturan-Diegan transitional coastal sage scrub will require preservation or creation of 75.5 acres of habitat. On-site preservation of Venturan-Diegan transitional coastal sage scrub totals 22.9 acres in open space within the proposed NCCP corridor; an additional 52.6 acres of Venturan-Diegan transitional coastal sage scrub is therefore required for mitigation through preservation, restoration, or NCCP acquisition. Approximately 40.4 acres of remedial grading areas are proposed to be revegetated with Venturan-Diegan transitional coastal sage scrub. The remaining mitigation requirement will be met by revegetating 6.1 acres of disturbed areas within open space on site with Venturan-Diegan transitional coastal sage scrub and making a financial contribution to the Endowment Fund for the NCCP to be used for programs such as the Adaptive Management Program.

The Venturan-Diegan transitional coastal sage scrub revegetation aspect of the upland mitigation plan can be implemented with one of two options. The first option will entail topsoil salvage and possibly seeding (Table 5). The second option will involve simply seeding of the revegetation areas. Option 1 has the potential to develop into habitat more quickly than Option 2, although the cost of Option 1 is higher than Option 2.

Table 5

VENTURAN-DIEGAN TRANSITIONAL COASTAL SAGE SCRUB HYDROSEED SPECIES

Scientific Name	Common Name
Baccharis sarothroides	Broom baccharis
Gnaphalum californicum	California everlasting
Lotus scoparius	Deerweed
Lupinus bicolor	Lupine
Nasella lepida	Foothill needlegrass
Nasella pulchra	Purple needlegrass
Mimulus aurantiacus	Monkeyflower
Artemisia californica	California sagebrush
Encelia californica	California encelia
Eriogonum fasciculatum	California buckwheat
Opuntia littoralis	Prickly-pear
Opuntia prolifera	Cholla
Salvia mellifera	Black sage
Yucca whipplei	Yucca

Maintenance and technical monitoring events should occur annually in July over a five-year period. Maintenance monitoring will include general maintenance, weed control, pest control, pruning (if necessary), and protection of the revegetation area with adequate fencing. Technical monitoring will involve sampling the habitat to monitor its progress in meeting the success criteria for the revegetation. The primary goal of the monitoring program is to provide quality assurance to oversee the maintenance of the newly created habitat.

Overall supervision of the installation and maintenance contractors and monitoring in the mitigation area will be the responsibility of the restoration specialist or a biologist familiar with native habitat restoration. The restoration specialist will educate all contractors with regard to mitigation goals and requirements.

The Project proponent will be responsible for financing the installation and monitoring of the mitigation sites. In order to ensure the success of mitigation, the Project proponent should enter into a five year secured agreement with the County of Orange to cover the Projected cost to install, monitor, and report on the mitigation Project. This agreement will be in the form of a 100 percent bond.

CONSISTENCY WITH THE 4(d) RULE

Recently, a special rule under Section 4(d) of the federal ESA was finalized which authorizes incidental take of the coastal California gnatcatcher in conjunction with an approved plan under the NCCP. This program was initiated under the NCCP Act of 1991 in an attempt to develop regional open space planning efforts designed to protect native plants and animals and their habitats in regional preserve systems. Since the Final NCCP Plan has not been completed, NCCP planning is currently based on an Interim Plan. The Interim Plan differs from the Final Plan in that the reserve system outlined in the Interim Plan is conceptual. The Final Plan will describe and implement a detailed reserve system that will incorporate results of site-specific open space planning.

An interim habitat loss permit must be approved prior to Project-related loss of coastal sage scrub. To approve an interim habitat loss application, the local agency must make findings based on the information obtained pursuant to Section 4.1.2 of the November 1993 NCCP Process Guidelines. The following paragraphs describe the findings that have been made for Saddleback Meadows.

(1) The proposed habitat loss is consistent with the interim loss criteria in the conservation guidelines and with any subregional process if established by the subregion.

(a) The habitat loss does not cumulatively exceed the 5 percent guideline.

The NCCP Conservation Guidelines have indicated that a 5 percent loss of coastal sage scrub habitat is acceptable within any individual subregion during the preparation of a subregional NCCP or its equivalent. The habitat loss does not cumulatively exceed the 5 percent guideline. The loss of a maximum of approximately 50.3 acres of Venturan-Diegan transitional coastal sage scrub (including 6.1 acres off site) combined with the current losses of coastal sage scrub within the Southern Subregion, will not exceed 5 percent of the existing coastal sage scrub habitat (Table 6).

Table 6

CURRENT LOSSES OF COASTAL SAGE SCRUB
IN ORANGE COUNTY SOUTHERN SUBREGION

Initial 5% Allowable Habitat Loss in Southern Subregion	1,315.75 out of 26,315 total acres
Cumulative Loss to Date	223.27 acres
Remaining Loss Allowed	1,092.48 acres
Remaining Loss After Proposed Project	1,042.18 acres

(b) The habitat loss will not preclude connectivity between areas of high habitat values.

The three-part corridor described in detail earlier is expected to facilitate all wildlife movement in the site vicinity, ultimately enhancing gene pool protection for a high diversity of species within the NCCP preserve system. The primary NCCP target species, the gnatcatcher, will benefit most by preservation and enhancement of the

Southern Corridor through the existing nursery. This is a more direct connection in this area that has existing or restorable Venturan-Diegan transitional coastal sage scrub.

(c) The habitat loss will not preclude or prevent the preparation of the subregional NCCP.

According to the NCCP Evaluation Logic Flow Chart, the Venturan-Diegan transitional coastal sage scrub on the Project site has intermediate value for long-term conservation because although it is not the most dense coastal sage scrub in the region, it is located next to a higher value district (O'Neill Regional Park and Whiting Ranch Regional Park). Saddleback Meadows does not currently support the coastal California gnatcatcher, and Project impacts will not preclude future planning options in the site vicinity where populations of the gnatcatcher are known to occur.

(d) The habitat loss has been minimized and mitigated to the maximum extent practicable in accordance with Section 4.3.

The NCCP Process Guidelines identify several options for mitigating impacts to coastal sage scrub. These options include acquisition of habitat, dedication of land, management agreements, restoration, etc. The dedication and long-term preservation of 22.9 acres of habitat on Saddleback Meadows, revegetation of 46.5 acres of Venturan-Diegan transitional coastal sage scrub on site, and contribution to the Orange County NCCP are consistent with the NCCP Process Guidelines.

(2) The habitat loss will not appreciably reduce the likelihood of the survival and recovery of listed species in the wild.

The loss of Venturan-Diegan transitional coastal sage scrub habitat will not appreciably reduce the likelihood of the survival and recovery of listed species in the

wild because the proposed habitat loss has been mitigated and minimized, and site development will not preclude connectivity between areas of high quality habitat.

(3) The habitat loss is incidental to otherwise lawful activities.

The proposed loss of approximately 50.3 acres of Venturan-Diegan transitional coastal sage scrub (including 6.1 acres off site) will only occur with approval of the necessary development permits.

COAST LIVE OAK WOODLAND

Coast live oak mitigation can be achieved by off-site mitigation or by making a financial contribution to the Endowment Fund for the NCCP to be used for programs such as the Adaptive Management Program.

MULE FAT SCRUB AND SOUTHERN SYCAMORE RIPARIAN WOODLAND

Impacts to mule fat scrub (3.8 acres including the 0.84 acre wetland portion) will need to be mitigated by off-site restoration of 3.8 acres of habitat (1:1 mitigation ratio) (0.84 acre of this will need to be created as wetland). Impacts to southern sycamore riparian woodland (3.3 acres including the 0.81-acre wetland portion) will need to be mitigated by restoration of 9.9 acre (3:1 mitigation ratio). Some of the restoration may be possible within Aliso Creek near the area being impacted, depending on the topography and development after remedial grading. Restoration would involve a combination of planting and seeding of riparian plant species. The remaining mitigation obligation may be met by restoring habitat off site at a 1:1 ratio or possibly by a contribution to the Orange County NCCP.

Impacts to federal jurisdictional wetlands and Waters of the U.S. require a Section 404 permit with the ACOE and a Section 1600 Streambed Alteration Agreement with the CDFG. Applications for these permits have been filed.

RIVERSIDE FAIRY SHRIMP

Because there are no suitable on-site mitigation areas for creating ephemeral pond habitat, the impact to Riverside fairy shrimp will have to be mitigated off site. This would be done by the purchase of Riverside fairy shrimp habitat off site. The exact amount required for mitigation would be determined during consultation with the resource agencies.

ADDITIONAL SENSITIVE SPECIES

No sensitive plant mitigation is required by the Project; however see additional mitigation recommendations below.

Impacts to the orangethroat whiptail, coastal whiptail, southern California rufous-crowned sparrow, and cactus wren are mitigable in the context of Venturan-Diegan transitional coastal sage scrub mitigation. Sufficient habitat will remain on site, when combined with areas to be revegetated, to support these species after Project development.

CORRIDOR ISSUES

The Central Corridor is not being implemented according to the current plan. This is considered a significant unmitigated impact.

ADDITIONAL MITIGATION RECOMMENDATIONS

The following recommendations are proposed to minimize some of the proposed impacts, although some of the impacts will not be mitigated under the current plan.

- Where possible, bulbs of individual Catalina mariposa lily and intermediate mariposa lily that are to be impacted should be removed and transplanted to a suitable habitat with similar soil, slope exposure, etc.

- A barrier adjacent to preserved areas is recommended.

- Lighting within development Projects adjacent to conserved habitat should be selectively placed, shielded, and directed away from that habitat. In addition, lighting from homes abutting conserved habitat should be screened with vegetation, and large spotlight-type lighting that may affect conserved habitat should be prohibited. These lighting restrictions should be incorporated into the Project's CC&Rs.

- Fuel modification zones should contain as many native plant species as possible, and fuel modification zones should blend into each other, with the innermost zone being the most 'landscaped' and the outermost being the most natural.

299 UNIT SINGLE FAMILY HOUSING ALTERNATIVE

Mitigation to below a level of significance for all habitats impacted would be possible by restoration and preservation in open space on site under this alternative. Maintenance of a 200-foot wide wildlife corridor would occur within the northeast corner of the site.

CLUSTER/REDUCED DEVELOPMENT FOOTPRINT

As with the previous alternative, mitigation to below a level of significance for all habitats impacted would be possible by restoration and preservation on site under this alternative. Maintenance of a 200-foot wide wildlife corridor would occur within the central portion of the site.

PLANT SPECIES LIST FOR SADDLEBACK MEADOWS

(* Non-native species)
(† Sensitive species)

SCIENTIFIC NAME**	COMMON NAME
Achnatherum coronatum	needle grass
Adenostoma fasciculatum	chamise
Agave spp.	agave
Amaranthus albus	tumbleweed
Ambrosia acanthicarpa	annual bur-sage
Ambrosia psilostachya	western ragweed
*Anagallis arvensis**	scarlet pimpernel
Anthemis cotula	may weed
Artemisia californica	California sagebrush
Artemisia douglasiana	mugwort
*Arundo donax**	giant reed
*Atriplex semibaccata**	Australian saltbush
*Avena barbata.**	slender wild oat
Baccharis pilularis	coyote brush
Baccharis salicifolia	mule fat
Brickellia californica	brickelbush
*Bromus diandrus**	ripgut grass
*Bromus hordeaceus**	soft chess
Bromus madritensis ssp *rubens**	foxtail chess
Castilleja affinis	indian paintbrush
Calochortus catalinae†	Catalina mariposa lily
Calochortus weedii var. *intermedius*†	intermediate mariposa lily
Ceanothus crassifolius	hoaryleaf ceanothus
*Centaurea melitensis**	tocalote
*Chenopodium murale**	nettle-leaved goosefoot
*Cirsium vulgare**	bull thistle
*Conyza bonariensis**	conyza
*Conyza canadensis**	horseweed
Cordylanthus rigidus	bird's-beak
Cucurbita foetidissima	calabazilla
Cuscuta californica	dodder
*Cynara cardunculus**	cardoon
Datura wrightii	jimson weed
Distichlis spicata	salt grass
Dudleya pulverulenta	chalk live-forever

ANIMAL SPECIES* OBSERVED ON SADDLEBACK MEADOWS
(† Sensitive species)

Scientific Name	Common Name
Invertebrates	
Streptocephalus woottoni†	Riverside fairy shrimp
Reptiles	
Sceloporus occidentalis	Western fence lizard
Uta stansburiana	Side-blotched lizard
Cnemidophorus tigris multiscutatus†	Coastal whiptail
Cnemidophrous hyperythrus beldingi†	Orangethroat whiptail
Birds	
Cathartes aura	Turkey vulture
Accipter cooperii†	Cooper's hawk
Buteo jamaicensis	Red-tailed hawk
Falco sparverius	American kestrel
Callipepla californica	California quail
Zenaida macroura	Mourning dove
Geococcyx californianus	Greater roadrunner
Tyto alba	Barn owl
Archilochus alexandri	Black-chinned hummingbird
Calypte anna	Anna's hummingbird
Calypte costae	Costa's hummingbird
Selasphorus rufus	Rufous hummingbird
Picoides nuttallii	Nuttal's woodpecker
Colaptes auratus	Northern flicker
Sayornis nigricans	Black phoebe
Sayornis saya	Say's phoebe
Contupus sordidulus	Western wood peewee
Hirundo pyrrhanota	Cliff swallow
Stelgidopteryx serripennis	Northern rough-winged swallow
Aphelocoma coerulescens	Scrub jay
Corvus brachyrhynchos	American crow
Corvus corax	Common raven
Thryomanes bewickii	Bewick's wren
Campylorhynchus brunneicapillus†	Cactus wren
Chamaea fasciata	Wrentit
Mimus polyglottos	Northern mockingbird
Toxostoma redivivum	California thrasher
Anthus rubescens	American pipit
Lanius ludovicianus†	Loggerhead shrike
Phainopepla nitens	Phainopepla
Vireo huttoni	Hutton's vireo
Vermivora celata	Orange-crowned warbler
Dendroica coronata	Yellow-rumped warbler
Geothlypis trichas	Common yellowthroat
Pheucticus melanocephalus	Black-headed grosbeak
Guiraca caerulea	Blue grosbeak

APPENDIX B

ANIMAL SPECIES* OBSERVED ON SADDLEBACK MEADOWS (CONT)

(† Sensitive species)

Scientific Name	Common Name
Passerina amoena	Lazuli bunting
Pipilo crissalis	California towhee
Pipilo erythrophthalmus	Rufous-sided towhee
Aimophila ruficeps canescens†	Southern California rufous-crowned sparrow
Melospiza melodia	Song sparrow
Chondestes grammicus	Lark sparrow
Zonotrichia leucophrys	White-crowned sparrow
Junco hyemalis	Dark-eyed junco
Sturnella neglecta	Western meadowlark
Icterus cucullatus	Hooded oriole
Icterus galbula	Northern oriole
Carpodacus mexicanus	House finch
Carduelis tristis	American goldfinch
Carduelis psaltria	Lesser goldfinch
Mammals	
Sylvilagus audubonii	Desert cottontail
Spermophilus beecheyi	California ground squirrel
Thomomys bottae	Botta's pocket gopher
Neotoma sp.	Woodrat
Canis latrans	Coyote
Urocyon cinereoargenteus	Gray fox
Lynx rufus	Bobcat
Odocoileus hemionus	Mule deer

SENSITIVITY CODES

FEDERAL SPECIES DESIGNATIONS

Category

FE	Federal endangered species
FT	Federal threatened species
PE	Species already proposed to be listed as endangered
PT	Species already proposed to be listed as threatened
C1	Enough data on file to support federal listing
RS	Regionally sensitive

Plants only

RS	Regionally sensitive.

Previously considered for listing, but no longer under consideration because (Skinner & Pavlik 1994)

Ca	Extinct.
Cb	Taxonomically invalid.
Cc	Too widespread and/or not threatened.

STATE SPECIES DESIGNATIONS

SE	State listed as endangered (listed as "CE" in Skinner & Pavlik 1994)
ST	State listed as threatened (listed as "CT" in Skinner & Pavlik 1994)
SCE	State candidate for listing as endangered (listed as "CC" in Skinner & Pavlik 1994)
SCT	State candidate for listing as threatened (listed as "CC" in Skinner & Pavlik 1994).
CSC	CDFG "species of special concern."

Plants only

CR	State-listed, rare.
CEQA	CEQA consideration mandatory
CEQA?	CEQA consideration recommended

CALIFORNIA NATIVE PLANT SOCIETY DESIGNATIONS (Skinner & Pavlik 1994)

The CNPS List

List 1	Plants of highest priority
List 1A	Plants presumed extinct in California.
List 1B	Plants rare, threatened or endangered in California and elsewhere.
List 2	Plants rare, threatened or endangered in California, but common elsewhere
List 3	Plants about which we need more information.
List 4	Plants of limited distribution (A watch list).

The R-E-D Code

R (Rarity)	1	Rare, but found in sufficient numbers and distributed widely enough that the potential for extinction or extirpation is low at this time
	2	Occurrence confined to several populations or to one extended population.
	3	Occurrence limited to one or a few highly restricted populations, or present in such numbers that it is seldom reported
E (Endangerment)	1	Not endangered.
	2	Endangered in a portion of its range
	3	Endangered throughout its range
D (Distribution)	1	More or less widespread outside California.
	2	Rare outside California.
	3	Endemic to California.

MANAGEMENT SUMMARY/ABSTRACT

Purpose and Scope: The Presidio Group has produced revised plans to develop Saddleback Meadows in the County of Orange for the purpose of constructing a residential community. The 229.2 acre site will see the construction of 705 manufactured, single-family residential units. EIR 566 will be prepared for the project.

This report has been undertaken for the purpose of inclusion into EIR 566, required for the current project. The report describes all past cultural resource investigation on the Saddleback Meadows property. It further recommends and describes the additional work to be accomplished before implementation of the above mentioned project can occur.

Dates of Investigation: This report was produced between 12 February and 14 March 1997.

Evaluation: Only CA-ORA-710 and CA-ORA-711 have been determined to be important according to Appendix K of the California Environmental Quality Act (Governor's Office of Planning and Research 1995) and significant as defined by the *National Historic Preservation Act* (see below) Although they lie in proposed open space, remedial grading will destroy them and thus data recovery excavation is required The importance/significance of CA-ORA-713, -715, -1437 and -1435H has yet to be established and further work at these sites is necessary.

Undertaking Effects: The revised plans for construction of 705 manufactured, single-family residential units will require extensive grading in preparation for construction. As a result, every cultural resource previously identified on the property will be destroyed The impacts to some of the sites must therefore be mitigated prior to development

Recommendations: CA-ORA-710 and CA-ORA-711 have been determined to be important according to CEQA and significant as defined by the *National Historic Preservation Act* (see below) Although they lie in open space, remedial grading of the proposed open space will destroy the sites. Data recovery excavation of at least 30 one by one meter units at each site must be accomplished. CA-ORA-1437 is the site newly discovered during the previous project (Maxon 1995), no work has been accomplished at the site beyond mapping and recording A surface examination and surface collection and a test excavation consisting of approximately ten, one by one meter units must be accomplished at the site Additional work may become necessary after evaluation CA- ORA-1435H has not yet been evaluated Initial work will entail archival

research and a review of historic aerial photographs. A surface examination and collection and a test excavation consisting of a sufficient number of backhoe trenches (approximately 10-20) must be accomplished on the site. Additional investigation may then become necessary after evaluation All above mentioned investigations must be accomplished prior to the commencement of clearing/grading operations.

No determination of importance/significance has been made for CA-ORA-713 and CA-ORA-715. It is recommended that these sites undergo controlled destruction with the aid of a small, paddlewheel scraper If artifact clusters are discovered, additional excavation may be necessary. This work can be accomplished after grading is underway

All other archaeological sites on the property have been deemed not important/significant and no further work, beyond monitoring of grading is necessary.

Disposition of Data: The material collected during the previous project (Maxon 1995) is being temporarily curated at RMW Paleo Associates, address on title page. The collection will be transferred to a permanent curation facility, specified by the permitting agency and the owners, as soon as possible. All field notes, excavation forms and laboratory documents are on file at RMW Paleo Associates

UNDERTAKING INFORMATION/INTRODUCTION

The Presidio Group has produced revised plans to develop Saddleback Meadows in the County of Orange for the purpose of constructing a residential community

In August 1978, the Orange County Board of Supervisors adopted the "Saddleback Meadows Mobile Home Subdivision" and certified Environmental Impact Report (EIR) 059. This authorized the development of a mobile home park of 617 dwelling units. The plan was never put into effect. In July 1996, The Presidio Group submitted a revised 318 unit Site Development Plan to the County of Orange and circulated EIR 561. In October 1996 the Board of Supervisors denied the 318 unit site development plan and did not certify EIR 561. Currently, The Presidio Group is again planning to revert to the August 1978 plans that have previously been approved and to develop the site for the construction of 705 manufactured, single-family residential units on the 229 2 acre site (see Figure 1 below) EIR 566 will be prepared for this project (Environmental Management Agency 1996.5-7)

A summary of this report will be included in EIR 566, required for the current project The report describes all past cultural resource investigations on the Saddleback Meadows property It further recommends and describes the additional work to be accomplished before implementation of the above mentioned project can occur and that which can be accomplished after grading is underway

The Saddleback Meadows project requires a Section 404 permit Under Section 404, impacts to cultural resources fall under the review of the U S Army Corps of Engineers and must be mitigated to be in compliance with Section 106 of the *National Historic Preservation Act* (NHPA). The NHPA authorizes the maintenance of a *National Register of Historic Places* (NRHP) which facilitates the preservation of properties that meet certain criteria delineated by Section 106 of the NHPA (The Advisory Council on Historic Preservation and the GSA Interagency Training Center 1994.II-26) Those criteria are

> The quality of significance in American history, architecture, archaeology, engineering and culture is present in districts, sites, buildings, structures and objects that possess integrity of location, design, setting, materials, workmanship, feeling and association and

(a) that are associated with events that have made a significant contribution to the broad patterns of our history; or

(b) that are associated with the lives of persons significant in our past; or

(c) that embody the distinctive characteristics of a type, period or method of construction ..; or

(d) that have yielded, or may be likely to yield, information important in prehistory or history

Because the project must be in compliance with Section 106 guidelines, the present study automatically also falls under the provisions of the California Environmental Quality Act (CEQA) as well Appendix K of CEQA requires that if development is unavoidable, significant impacts to important (CEQA definition) archaeological sites must be reduced to a level of insignificance, through avoidance, preservation or excavation According to Appendix K, Section III of CEQA, "...an important archaeological resource" is one which.

A Is associated with an event or person of

1 Recognized significance in California or American history, or

2 Recognized scientific importance in prehistory

B. Can provide information which is both of demonstrable public interest and useful in addressing scientifically consequential and reasonable or archaeological research questions;

C Has a special or particular quality such as oldest, best example, largest, or last surviving example of its kind,

D. Is at least 100 years old and possesses substantial stratigraphic integrity, or

E Involves important research questions that historical research has shown can be answered only with archaeological methods

Recently (September 1992) the *California Register of Historical Resources* (California Register) was created. Its purpose is to identify the state's historical resources and to indicate which properties are to be protected (Office of Historic Preservation 1995 1) The criteria for listing resources on the California Register were expressly developed to be in accordance with previously established criteria developed for listing on the *National Register of Historic Places* (NRHP). A property must be significant at the local, state or national level under the same (with minor variations) criteria as those for the NRHP (Office of Historic Preservation 1995.3) Those criteria are listed on pages one and two of this report

Dillon (1989) has recommended that if subsurface deposits are discovered on any of the present sites, a formal salvage operation must be designed to mitigate any adverse impacts. The project described in this report accomplishes Dillon's recommendations

The revised plans for construction of 705 manufactured, single family residential units will require extensive grading in preparation of construction For this reason, every cultural resource previously identified on the property will be destroyed and impacts must therefore be mitigated prior to development The schedule for completion of the project is unknown

Figure 2 is a portion of the USGS quadrangle map, Santa Ana, California, depicting the general location of the project area. Figure 3 is a portion of the USGS quadrangle map Santiago Peak, California, depicting the specific location of the project area

Ron Bissell served as Principal Investigator for the previous project (Maxon 1995), and will continue in that capacity for any further archaeological investigation Patrick Maxon, the author of this report, served as Field Director for the previous project and will also continue in that capacity

Area shown lies in Township 6S, Range 7W

Scale = 1:24,000

SETTING

Natural: The Saddleback Meadows project area lies in the foothills of the Santa Ana Mountains of Orange County, California Aliso Creek flows southward along its western margin. The property is in Section 4 of Township 6 South, Range 7 West and can be reached via El Toro Road running adjacent to the property, parallel to and west of Aliso Creek Santiago Peak, the highest in the county, is approximately three kilometers northwest of the property

The project area consists of narrow, rugged ridges and rounded knolltops separated by steep sided and narrow canyons. A central east/west canyon drains into Aliso Creek. Elevations range from approximately 1,040 feet where the main drainage empties into Aliso Creek to approximately 1,640 feet along portions of the ridges in the north-western portion of the property

Geologic formations exposed in the Saddleback Meadows study area are the Sespe Formation, the undifferentiated Sespe and Vaqueros Formations, and the Topanga Formation (Raschke 1995) The oldest unit is the late Eocene to early Miocene Sespe Formation and is restricted to the northeastern corner of the property Overlying and interbedded with the Sespe Formation is the early Miocene age undifferentiated Sespe-Vaqueros Formation This unit underlies all except the northeast corner of the Saddleback Meadows property where there appears to be a small exposure of the middle Miocene age (15 million years ago) Topanga Formation. Within the study area there are numerous occurrences of vertebrate fossils in boulders that have apparently eroded from the subsurface These include a variety of large and small fragments of marine mammal bones (Raschke 1995) It is not known if these outcrops were utilized, to any extent, by prehistoric populations.

The climate of the Saddleback Meadows vicinity can be described as mild, uniform and semi arid Temperatures rarely exceed 33 degrees Celsius or drop below five degrees Celsius Rainfall occurs primarily between November and April and averages between 25 and 40 centimeters per year. The current climatic conditions did not prevail during the entire span of time that man has been present in the area. Heusser (1978) suggests that pine forests may have occupied the coastal regions from roughly 10,000 to 6,000 B C.E (Before Common Era). The climate then became warmer and drier, resulting in replacement of the pine forests by oak

woodland and grassland communities. Coastal sage scrub and chaparral communities became pronounced during the few centuries preceding the Common Era (C.E.).

A majority of the property has in recent times been used as a cattle ranch and is therefore now covered predominantly by grasslands including introduced grasses, wild mustard and thistle The slopes and ridges support remnants of the coastal sage scrub community composed of sage, buckwheat, chamise, sumac, prickly pear cactus and other low growing, woody plants A riparian community exists along the Aliso Creek drainage supporting rushes, tules and willows. Mature oaks and sycamores are found in the valleys, drainages and on some of the ridges and knolltops. Hausauer Ranch, along the main drainage emptying into Aliso Creek, is surrounded by introduced eucalyptus trees as well as a large olive grove containing nearly 100 trees.

Several of the ecological communities existing in southern California were readily accessible by the local prehistoric inhabitants of the Saddleback Meadows area, while others were reached only with some difficulty. The following discussion of the plant communities available to the local prehistoric inhabitants is based on Drover and Koerper (1983)

Saltwater Estuary Community and Bay. The estuary and bay communities provided shellfish for the prehistoric peoples . Waterfowl would also have been available, but few plants from the communities were known to have been utilized

Access to the estuary and bay community was relatively easy for persons utilizing the current study area Coastal regions were probably used during the winter months as part of the annual round and direct exploitation by people residing near the current study area could have been accomplished in a day's journey down the Aliso Creek drainage some 20 kilometers to the coast

Beach and Coastal Strand Community: This community, including the beach and intertidal areas, provided a large variety of shellfish and areas for line fishing. Naturally occurring asphaltum occasionally washed ashore and was collected for use as an adhesive Seaweed may have also been collected and used as food

Access to the beach and coastal strand community was also feasible considering the nearness of Saddleback Meadows to the ocean

Marine Community. A wide variety of sea mammals, fish and crustaceans were available in the marine community, but data regarding local prehistoric exploitation of this community is very scant It is known that the Chumash, who lived farther up the California coast, made extensive use of marine community resources during the latter part of archaeological time. Such exploitation in the local area is not well documented. Perhaps this is a reflection of lack of data, rather than an indication that the marine community was not exploited in this area Access to the marine community required some sophisticated technology in the form of watercraft, such as canoes or rafts, as well as fishing and hunting equipment It is unknown if the inhabitants of the Saddleback Meadows area exploited this resource.

Riparian Woodland Community This community exists along streams and around seeps and springs Oaks, alders, willows, sycamores and cottonwoods are common trees associated with this community A large variety of herbs, grasses, cattails and berries grow in the riparian woodland community. Animals and birds attracted by the water and the food resources offered by the vegetation provided ample sustenance for prehistoric and historic peoples. The riparian woodland offers a great variety of easily exploited resources.

The riparian woodland community was found along the local streams and existed throughout the current study area.

Freshwater Marsh Community· The major freshwater marshes near the study area would have been located within the Aliso Creek and Oso Creek flood plain Freshwater marshes resemble the riparian community in terms of the plants and animals they host, but may be surrounded by a greater extent of forest growth. Migratory fowl are attracted to freshwater marshes and would have been an abundant resource during particular seasons of the year.

Access to the freshwater marshes would have been quite easy because they likely existed at various times along Aliso Creek.

Grassland Herbland Community· Located in the lower Aliso Creek valley, around some freshwater marshes and below the steeper foothills of Saddleback Meadows, the grassland herbland community contained a variety of resources Seeds of many annual grasses would have been the primary resource of interest to the prehistoric peoples, but blossoms, greens, fruits, bulbs, the fleshy parts of prickly pear and occasional walnuts were also available, primarily during

the spring. Animals including deer, rabbits, other rodents and quail are associated with this plant community.

Again, access to the grassland herbland community would have required only a short, relatively level walk from the study area.

Oak Woodland. The oak woodland occurs in sheltered valleys where the soil is deep Oak trees can grow to as much as 20 meters in height in such conditions, and are surrounded by grasses and herbs. Acorns were a primary food resource for the native inhabitants, at least during the latter part of the archaeological sequence. Acorns become available in the fall, thus providing a rich resource during the time of year when other plants are far past their peak availability

Access to the oak woodland was very simple since oaks grew in the local drainages of Aliso Creek and could have been exploited with little effort.

Coastal Sage Scrub Community This community consists primarily of shrubs that seldom exceed a height of two meters. Various species of sage, buckwheat, some flowering plants and grasses form the primary vegetation. Seeds are the primary resource of the sage scrub community, but edible stems, stalks, shoots, greens, roots, bulbs and some berries can also be found Rabbits and rodents abound in the sage scrub community The sage scrub community covers the hills around and within the study area The resources of the sage scrub community are primarily available in the spring. During prehistoric times the sage scrub covered a large percentage of the surface, representing a very rich resource

Access to the sage scrub community required only ascending the hills and canyons of the study area.

Chaparral Community: The chaparral community consists of dense brush normally found on rocky slopes, usually at slightly higher elevations than the oak woodland community. Manzanita, chamise, mountain mahogany, scrub oak and ceanothus are typical constituents Seeds, berries, bulbs, shoots and roots are the primary resources available in this community. The chaparral is a primary deer habitat (Moratto 1984)

The chaparral community was located on the higher elevated slopes north of the study area and would have required a day's walk to be reached by prehistoric populations.

Cultural: The current study area is inhabited by a Native American group ethnographically known as the Gabrielino The generally accepted boundary with the Juaneño group to the south is Aliso Creek, flowing directly adjacent to the study area along its western margin (Bean and Smith 1978, Kroeber 1925) It is likely that the study area contains traces of both these cultures.

The names the Native American groups applied to themselves are largely unknown; they are known by the names the Spanish coined as they moved into Native American territories The name "Gabrielino" identifies those people who were under the control of the Spanish Mission San Gabriel, while the name "Juaneño" denotes those people who were under the administration of the Spanish at Mission San Juan Capistrano

The Juaneño and Gabrielino language, as well as that of the Luiseño to the south, was derived from the Takic family, part of the Uto-Aztecan linguistic stock, which can be traced to the Great Basin area (Driver 1969) This language group represents an origin quite different from that of the Chumash to the north and the Ipai and Tipai to the south Their language is derived from the Hokan stock of the Yuman language family originating in the American southwest Linguistic analysis suggests that at one time (probably before 500 B C.E.) the entire southern California coastal region was populated by Hokan speakers who were gradually separated and displaced by Takic speaking immigrants from the Great Basin area The timing and extent of the migrations and their impact on indigenous peoples is not well understood and any data related to it represents a valuable contribution to the understanding of local prehistory

Prehistoric Era· The archaeological heritage of California is quite rich, probably more so than any other North American region north of Mexico However, the archaeology of California is not well known. The native Californians were generally quite peaceful and did not often offer warlike resistance to European settlement. Consequently, they did not gain great notoriety during the settlement period Also, the original Californians were first under the control of the Spanish and then the Mexican governments and only later, after much of their culture had been destroyed by disease and displacement, were they subsumed under the United States government There was only a minor Native American presence remaining in California when it became a United States possession and massive development began For this reason, very little interest in the natives and

their prehistory was initially generated. It was many years later before the size, complexity, and extent of archaeological deposits in the state became apparent.

Homo Sapiens has been present in the New World since perhaps 10,000 to 11,000 years B.C.E. There is some evidence that humans were present long before this date, but it is inconclusive and has not yet been accepted by most archaeologists The earlier sites are all controversial in that they lack definite dateable context and material Such sites can be interpreted in various ways, particularly in relationship to their age The few generally accepted remains indicate a very small, mobile population apparently dependant on hunting of large game animals as the primary subsistence strategy. Other sources were exploited, but the bulk of the traces remaining today are related to game hunting (Chartkoff and Chartkoff 1984, Moratto 1984).

The Chartkoffs identify the earliest portion of the archaeological sequence - to about 9,000 B.C E - as the Paleo-Indian Period (Warren's 1968 San Dieguito Tradition) The surviving material culture of this period consists primarily of large, extremely well made projectile points and large but crude tools such as scrapers and choppers. Encampments were never permanent, based in part on the paucity of significant midden areas that would have degraded to undetectability given the great age, and were probably sited near a major kill. Occupation would have persisted only until the resources of that kill were exhausted. Such an economy, using only a small fraction of the available resources, would not have supported a large population, therefore, it is probable that the Paleo-Indians lived in groups no larger than extended families and that contact with other such groups was infrequent

A general chronology has been developed for the Southern California coastal region by Wallace (1955) for the ensuing periods

The Millingstone Horizon (or Encinitas Tradition, as defined by Wallace (1968)) people (ca 5500-1500 B.C.E.) practiced a mixed hunting and gathering food procurement strategy. Game hunting still played an important role in the economy, but by this time the Native Americans had learned to exploit the hard seed resources of the coastal sage scrub and chaparral ecological communities The rapid extinction of the large mammals that the Paleo-Indian had previously been exploiting necessitated this shift in resource exploitation The principle implements used to process the seeds, manos and metates, appear in large numbers for the first time in this horizon,

and are especially numerous near the end of this tradition Other specialized tools were developed to process the increased resources utilized by Millingstone peoples. Settlement size seems to have increased and an annual round of seasonal migrations may have been practiced as movements coincided with ripening vegetal resources Some formal burials are also evident

The Intermediate Horizon, locally known as the Campbell Tradition (ca 1500 B.C E. to C.E 1000), is characterized by a shift away from primarily vegetable food exploitation to a more maritime subsistence strategy. It is during this time that the mortar and pestle were introduced, enabling acorn processing to begin

In the Late Prehistoric Horizon (or Shoshonean Tradition), groups began to center around trade routes and there was a greater use of food resources with more land and sea mammal hunting to complement collecting The pattern of life in this Late Horizon was more complex More classes of artifacts were being produced and they exhibited a more sophisticated degree of workmanship The recovery of a greater number of small, finely chipped projectile points suggests a greater utilization of the bow and arrow Other items include steatite containers, shell fishhooks, perforated stones, bone tools, personal ornaments, asphalt adhesive and elaborate mortuary customs In addition, the population increased and larger villages evolved (Wallace 1955.223). It is during the Late Prehistoric that the emigrants from the Great basin appeared in the Los Angeles and Orange County area. These peoples were very quick to adopt most of the local traits, because it is difficult to separate the archaeological assemblages of the emigrants from those of the indigenous peoples on the basis of artifact typology alone

The Moratto and Chartkoff chronologies are not the only ones in use and, in fact, are somewhat generalized because they address the entire state of California The latest chronology to appear which has gained local acceptance is that of Koerper and Drover (1983) This chronology is based on extensive work at CA-ORA-119-A, a large multi-component site near the University of California, Irvine The site contained archaeological evidence from the Millingstone to the Historic period. The Koerper and Drover chronology is summarized in Table 1 below

Table 1·

CHRONOLOGY, BASED ON KOERPER AND DROVER (1983)

PERIOD*	TEMPORAL SPAN	MAJOR DIAGNOSTIC TRAITS
Early Man or Paleo-Indian	? to 7,500 B.C.E. +/- ?	1 Lack of grinding implements. 2. Large, well made projectile points.

Characteristics and adaptations:

1 Subsistence through hunting of large Pleistocene game animals.
2 Temporary camps at large kills
3 Group no larger than extended family
4. Widespread. Covered most of North American continent, but no sites known locally.
5. Very small total population.

Milling Stone or Encinitas	7,500 B.C.E +/-? to 1,000 B.C.E. +/- 250	1. Predominance of manos and metates 2 Ornaments made of stone 3 Large and often crude projectile points 4 Cogstones and discoidals 5. Charmstones 6 Some mortars and pestles near the end of the period.

Characteristics and adaptations:

1 Heavy reliance on hunting in early part of period Deer, rabbits and other small game associated with chaparral.
2 In middle to late part of period reliance was on hard seeds associated with chaparral.
3 Coastal groups utilized shellfish and near shore resources.
4 Annual round based on ripening vegetable resources rather than animal migrations This caused increased isolation leading to noticeable differences in culture in much smaller geographic areas
5. Probably about 50 persons in average group.
6 Very little noticeable change in last two thirds of period
7 Colonization of Channel Islands near end of period.

*Both the Chartkoff and Koerper and Drover names are given for the various periods, with the Koerper and Drover names appearing first.

Table 1, continued:

CHRONOLOGY, BASED ON KOERPER AND DROVER (1983)

PERIOD	TEMPORAL SPAN	MAJOR DIAGNOSTIC TRAITS
Intermediate or Campbell	1,000 B C.E +/- 250 to C E 750 +/- 250	1. Bone ornaments 2 Wide use of mortars and pestles along with manos and metates 3 Use of steatite begins. 4 Many discoidals 5 Large projectile points trending to smaller in the last part of the period.
		Characteristics and adaptations: 1 Heavy reliance on acorns as food resource Hard seeds, small animals and coastal resources continue to be used 2 Many more deep water ocean resources utilized. 3 First permanently occupied villages 4. Large increases in local population 5. Atlatl (spear thrower) in use Bow and arrow probably introduced near end of period. 6 Some evidence of trade
Late Prehistoric or Shoshonean	C.E 750 +/- 250 to Spanish contact	1 Shell ornaments. 2 Mortar, pestle, mano and metate use continues 3. Small, finely worked projectile points 4 Wide use of steatite. 5 Some pottery vessels appear near the end of the period.
		Characteristics and adaptations. 1 Increased exploitation of all resources 2 Large populations, some villages had as many as 1,500 persons. 3 Great increase in art objects. 4 Much evidence of trade

Historic Era: Juan Rodriguez Cabrillo sailed along the coast of California in 1542 and, according to available records, stopping only at San Diego and the Channel Islands, was the first European to come into contact with the Gabrielino. The first Europeans to visit the Orange County area arrived in 1769 when Gaspar de Portola led an overland expedition from San Diego to Monterey This expedition of 63 persons passed near the study area, using Arroyo Trabuco as a route to the north (Cramer 1988).

Mission San Gabriel, in Los Angeles County, was founded in September 1771 and all the Native Americans from the Los Angeles plain were persuaded to settle in its vicinity. The first permanent settlement in Orange County came when San Juan Capistrano was selected as the site for a Mission in the spring of 1775. By the early 1820s, all the native Americans from the coastal plains and foothills of what is now Orange County had been settled on Mission lands or on the growing rancho system.

The missions were charged with administering to the Indians within their areas Mission life did give the Indians some skills needed to survive in their rapidly changing world, but the population was decimated by diseases for which they had no immunity After 1810, mission population declined faster than it could be replenished The Mexican Revolution, beginning in 1821, overthrew Spanish control and the new Mexican government had a very different outlook on mission activities. Secularization of the missions, planned under the Spanish was greatly accelerated by the Mexican government. Plans to provide land, training and living quarters for the Indians never developed and the mission lands were soon under the control of a relatively few influential Mexican families. The Mexican-American war ended on 2 February 1848 with the signing of the treaty of Guadalupe Hidalgo. The treaty established California as a United States possession.

The study area was never a part of a Spanish or Mexican land grant The foothill area was not good grazing terrain. Instead, the Santa Ana Mountain area was to be ungranted and for the use of all. The Rancho Canada de los Alisos (Canyon of the Sycamores) abuts a portion of the study area to the west (Morgan 1973). This rancho was granted to José Serrano in 1842 and later expanded to 10,688 acres by Pio Pico (Smith 1977 in Dillon 1989) Present day Lake Forest was part of this grant; the last of Serrano's adobes is still preserved there. The drought of the early

1860s forced Serrano to give up on the rancho. It was broken up into smaller parcels and sold piecemeal, the bulk of the land forming the city of El Toro (now Lake Forest) By the 1880s much of the area had been settled by Anglo-American families. The Hausauer Ranch, within the property boundary, probably dates to the late 1920s and was an active ranch into the 1970s The ranch's main reservoir and olive orchard have been in existence since at least 1939 (Dillon 1989 32)

RESEARCH DESIGN

Theoretical Basis: The theoretical approach of this report is primarily cultural ecological in nature. It is assumed that humans are part of the ecological system in which they exist and patterns of behavior are restricted by ecological constraints. Similarly, human populations have an effect on the environment as well and precipitate ecological change, either intentionally or accidentally (Jochim 1981) This approach applies to prehistoric as well as historic sites

It is thought that Californians from the Middle Archaic Period up to the Pacific Period practiced an annual round adaptation The major habitation camp would be moved periodically as resources ripened. The habitation camp would be surrounded by specialized work stations where resources were collected and initially processed In general, it is thought that the major habitation camps were moved to progressively higher elevations as the year advanced, with a return to near-ocean locations for the winter season. The major habitations were occupied only for a few months each year, but the repeated use may have continued for many generations. By Pacific Period times, storage technology and a broadened resource base allowed settlements to be occupied throughout the year

Pertinent Local Conditions: The Saddleback Meadows area is one of a series of ridges and rounded knolltops bisected by numerous drainages emptying into Aliso Creek The creek makes its way some 20 kilometers southwest into the Pacific Ocean south of present day Laguna Beach The area is ideally suited for exploitation of the range of resources available in the region All could be reached within a day's travel by local inhabitants Aliso, as well as Oso Creek, provided the inhabitants with a reliable, perennial source of water, an easy route leading to the coast and cobbles for lithic tool production.

The little available information indicates that major settlements were located near reliable sources of water, but in areas that commanded a view of the surroundings The area surrounding an encampment or village was used for hunting, resource collecting and initial processing of those resources. Such resources included lithic material for stone tool manufacture, animal resources and vegetable resources (shoots, roots, bulbs, seeds, berries, fibers, nuts, etc.)

Collecting and initial processing of material for chipped lithic tool manufacture leaves evidence in the form of damaged surfaces where material was removed, chipping waste from initial reduction of that material, hammerstones used in the reduction and cores from which viable material had been removed A prehistoric chert quarry (CA-ORA-507 The Hoopaugh site) lying less than one kilometer south of the project area, was studied and recorded by Van Horn (1986) Milling tool production probably relied on the collection of suitable cobbles and would leave no trace Hunting of game animals was an activity pursued in the Saddleback Meadows area. It is a well watered area that in prehistoric time hosted a wide variety of ecological communities Game animals would have been abundant under these conditions and would certainly have been exploited by the prehistoric inhabitants Evidence left by hunting activity may include blinds, lost or broken projectile points and animal bones within the habitation areas

Vegetable resource collecting and initial processing was certainly an activity in the Saddleback Meadows area Evidence for such is the abundance of grinding implements (manos and metates) found at area sites These artifacts found by themselves are evidence of vegetable resource collecting and initial processing. Only with a wide range of other artifact varieties do they constitute evidence of substantial habitation

It is therefore assumed that archaeological sites at Saddleback Meadows will include the possibility of relatively large seasonally occupied village sites located near a reliable water source as well as more numerous specialized use camps Seed collecting and processing stations will be located in more or less level areas in the vicinity of the desired vegetable resources. Chipped lithic tool manufacturing stations will leave traces of chipping waste products and tools such as hammerstones and cores. They will either occur by themselves or within larger site complexes.

PREVIOUS RESEARCH

Early reconnaissance operations were conducted near the present project area that only partially extended onto the Saddleback Meadows property A 1975 reconnaissance by Howard, concerned with the proposed realignment of El Toro Road, included the westernmost edge of the current property, just east of Aliso Creek Howard reported no archaeological sites in the area, even though it is there that CA-ORA-710 and -711 lie.

Tadlock and Tadlock (1978) The first major archaeological investigation on the current project property was undertaken by Tadlock and Tadlock in 1978 The Tadlock's completed a surface examination of the project area - essentially the same boundary as the present project area - and discovered and recorded seven archaeological sites CA-ORA-710, -711, -712, -713, -714, -715 and -716 The sites follow the more level hills and benches of the property's main ridge running from Aliso Creek, near the western property boundary, eastward to the eastern property boundary These sites will be discussed in more detail below.

The Tadlock's recommended that a representative sample of artifacts be collected from the surface of each site as well as from the ridgetop between the sites Test trenches were then to be excavated by backhoe to determine the depth and dimension of the sites (Tadlock and Tadlock 1978:9)

Breece and Padon (1982) In July 1982, William Breece and Beth Padon performed a cultural resource reconnaissance and literature review of the proposed Phase II Foothill Transportation Corridor study. The study encompassed approximately 23 miles of proposed corridor routes from Little San Joaquin Canyon and Irvine Lake to the northwest to Cañada Gobernardo Canyon to the southeast (Breece and Padon 1982:1) The current study area made up only a small portion of this reconnaissance. During the course of the reconnaissance, the authors relocated three of the sites on the current study area: CA-ORA-710, -711, and -713; although CA-ORA-711 was described as containing no artifactual material or midden soil CA-ORA-710 contained chert flakes, a chert core and a possible chopper CA-ORA-713 contained chert flakes and a chert core CA-ORA-712 was also within the reconnaissance area but was not relocated by the researchers (Breece and Padon 1982:31&34)

The authors recommended controlled surface collection and test excavation followed by, if necessary, data recovery excavation at CA-ORA-710 (erroneously identified as -711). CA-ORA-711 was not relocated and was considered destroyed. No further work was deemed necessary (Breece and Padon 1082·33-34) No mention was made as to the recommendations for CA-ORA-713.

Dillon (1989). A cultural resources reconnaissance was undertaken by Brian Dillon in 1989 for Scientific Resource Surveys. Dillon was able to relocate CA-ORA-710, -713, -714, -715 and -716. CA-ORA-711 and -712 were not relocated Dillon surmised that these two sites had been destroyed since they were originally recorded in 1978 (Dillon 1989 48). Dillon also discovered three new sites, now named CA-ORA-1255, -1256 and -1257. The historic Hausauer Ranch was located and described in detail, although not formally recorded. All sites on the property will be discussed in more detail below.

Dillon recommended that each of the sites on the property undergo a comprehensive surface collection and test excavation. Those sites determined to contain a subsurface deposit were to undergo a data recovery excavation that constituted mitigation of adverse impacts (Dillon 1989:92).

Bissell 1984: In October 1984, Ronald Bissell of RMW Paleo Associates discovered a major archaeological site on the grounds of Saint Michael's Priory The site lies on a small knoll above Aliso Creek, adjacent to and immediately north of the current study area The site consisted of a dense scatter of ground and chipped lithic tools, including manos, scrapers, choppers, modified flakes, cores, hammerstones and debitage, in an apparent midden (Bissell 1984 3). The large site is likely to be related to the other sites on the Saddleback Meadows property as it lies only some 200 meters north of CA-ORA-710.

Maxon (1995). The author of the present report performed an archaeological investigation at Saddleback Meadows between September and November 1995 Most previously recorded sites were relocated Some were not relocated. The historic ranch was recorded and a new site was discovered and recorded. Six of the previously recorded sites underwent a surface collection and five of those underwent a test excavation. All sites at Saddleback Meadows are listed in Table 2 below

Table 2· Archaeological Sites at Saddleback Meadows

Site	Recorder	Description	Importance/ Significance
CA-ORA-710	Tadlock & Tadlock 1978	Flakes, scrapers, choppers, hammerstones & manos	Important
CA-ORA-711	Tadlock & Tadlock 1978	Sparse flakes, cores & one chopper	Important
CA-ORA-712	Tadlock & Tadlock 1978	Flakes	Not important
CA-ORA-713	Tadlock & Tadlock 1978	Flakes, scrapers, cores, choppers & manos	Not yet determined
CA-ORA-714	Tadlock & Tadlock 1978	Flakes, cores, some quartz material	Not important
CA-ORA-715	Tadlock & Tadlock 1978	Flakes, cores, scrapers, choppers, hammerstones & manos Sophisticated artifacts exhibiting patination	Not yet determined
CA-ORA-716	Tadlock & Tadlock 1978	Flakes, cores & one chopper	Not important
CA-ORA-1255	Dillon 1989	Metate, core, scraper/spokeshave, blade, flake	Not important
CA-ORA-1256	Dillon 1989	Scraper plane, scraper	Not important
CA-ORA-1257	Dillon 1989	Mano	Not important
CA-ORA-1435H	Knell & Maxon 1995	Ranch complex with olive grove and holding pond	Not yet determined
CA-ORA-1437	Maxon 1995	Groundstone, debitage & thermally modified rock	Not yet determined

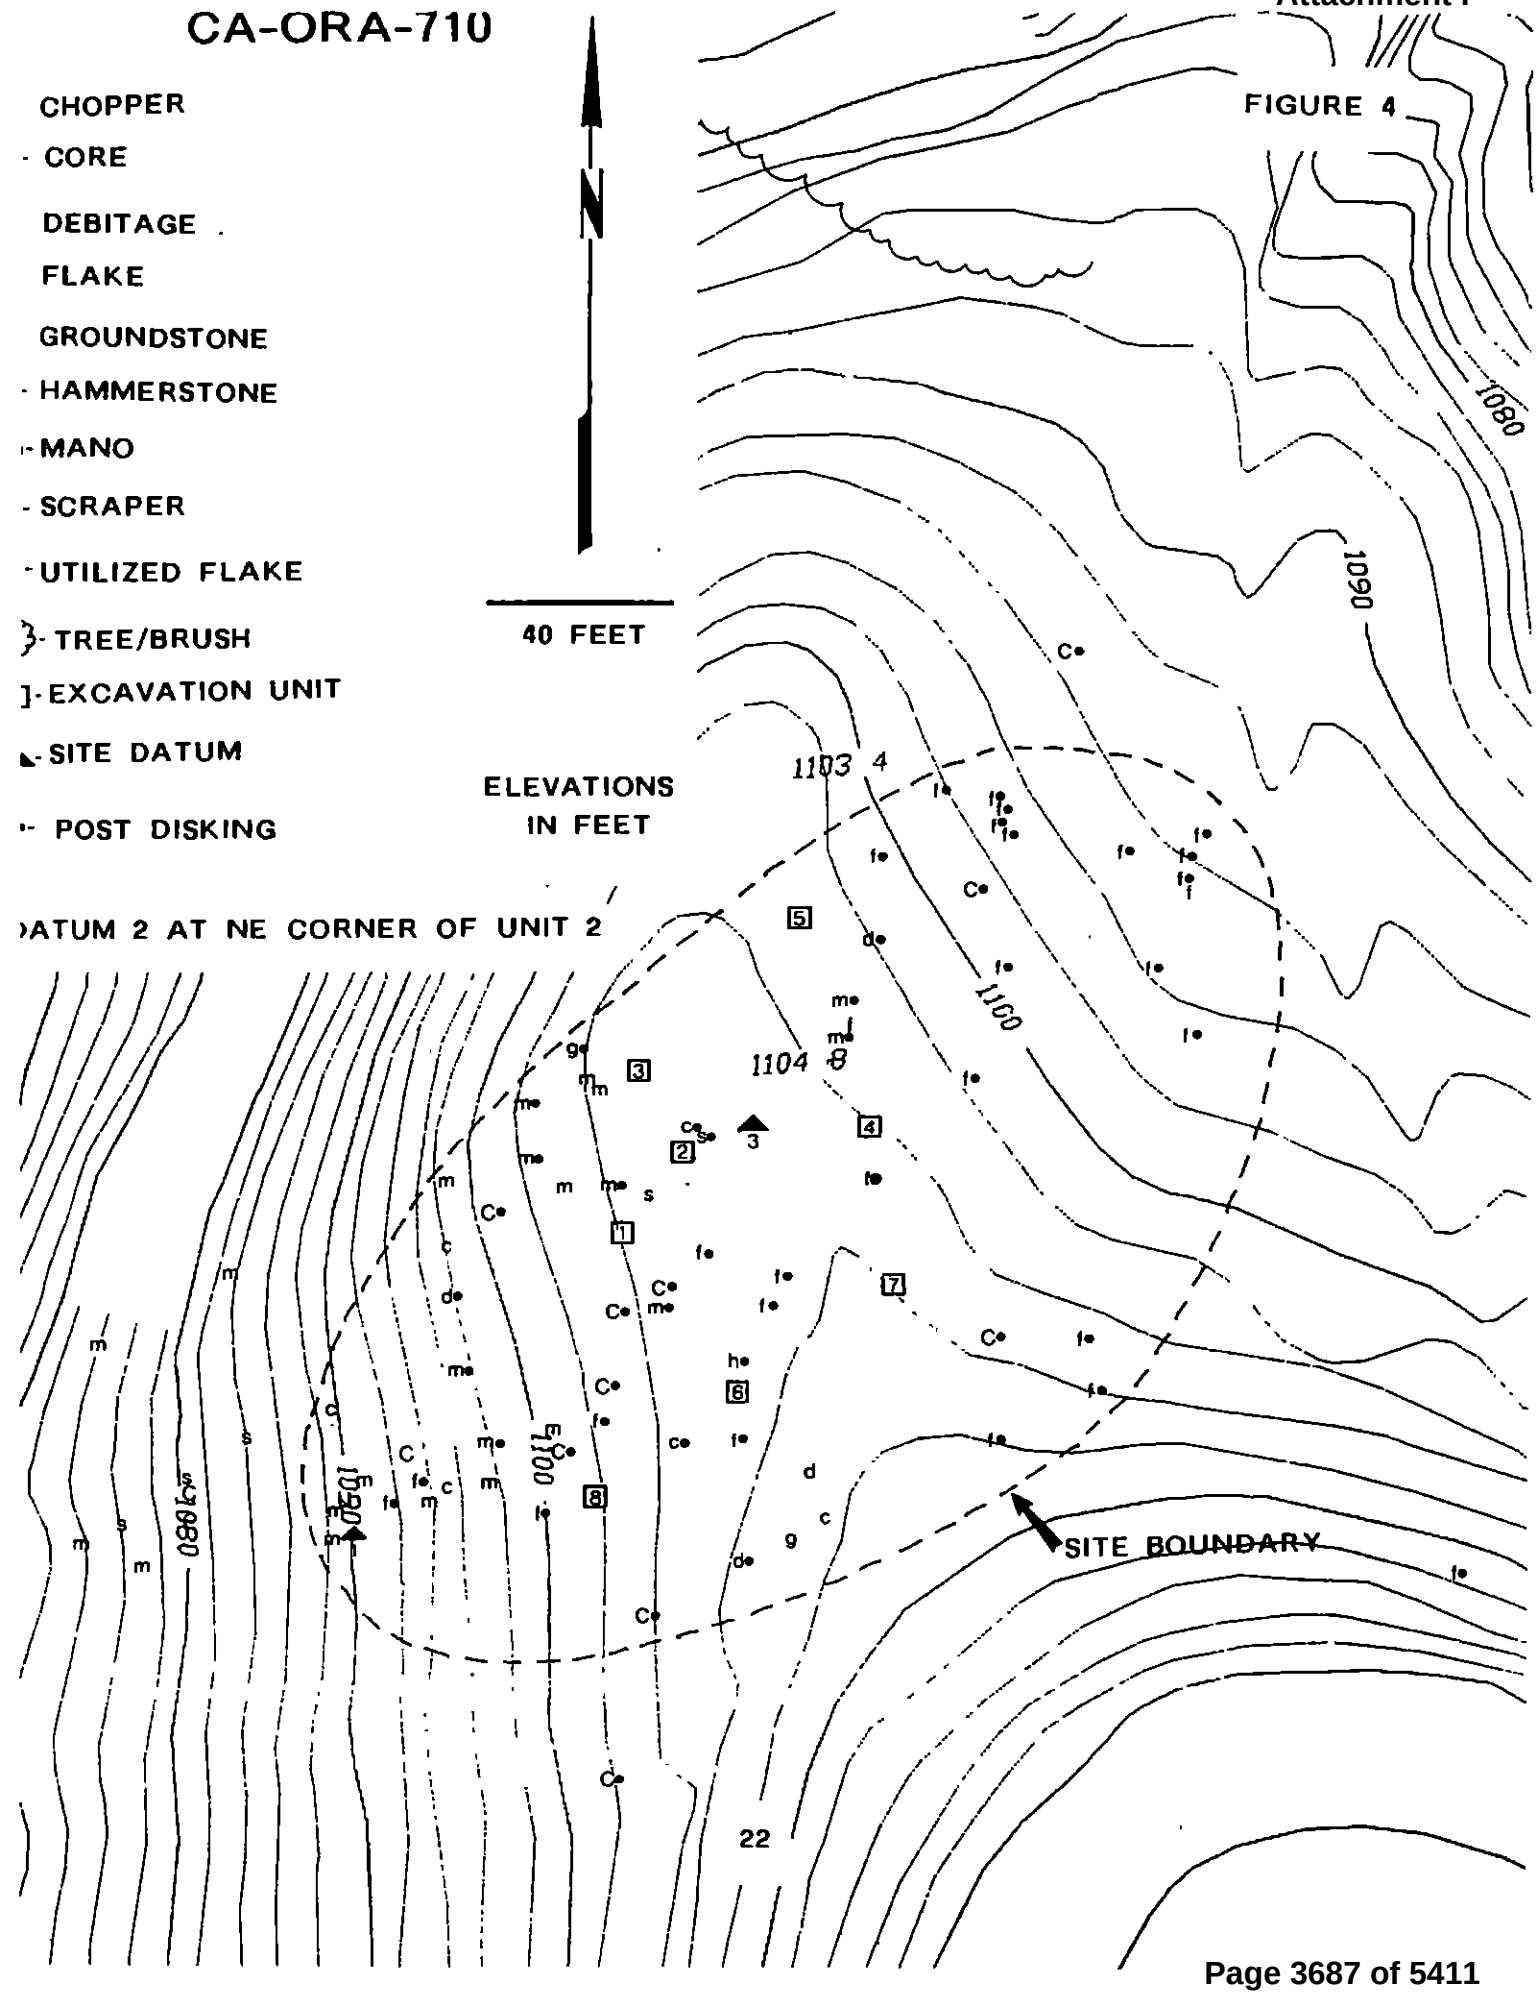
The revised plans for construction of 705 manufactured, single-family residential units will require extensive grading in preparation of construction For this reason, every cultural resource previously identified on the property will be destroyed and impacts must therefore be mitigated prior to development Each of the archaeological sites identified on the property will be discussed in detail below Included will be a summary of work performed and recommendations proposed for each site

CA-ORA-710

The site is located on a relatively flat knoll or terrace, directly east of, adjacent to and 12 meters above Aliso Creek in the northwestern portion of the property (see Figure 4 below) Boundaries of the core of the site are approximately 43 by 55 meters Outcrops of fossiliferous bedrock are evident on the site's surface

CA-ORA-710

FIGURE 4



The original recorders (Tadlock & Tadlock 1978) reported a wide range of artifacts over a rather large area Subsequent archaeologists were not able to see artifacts to that extent Dillon (SRS 1989) discovered a chalcedony core, a chert flake and a burned piece of chert shatter as well as three "truncated" manos, which he apparently collected and removed from the site during his reconnaissance investigation Truncated manos are discussed by Van Horn and Murray (1984). These manos were recovered at CA-ORA-486, along Aliso Creek, just a short distance from site CA-ORA-710 The specimens had been "truncated" or broken off at one end and the rough end pounded smooth They have been associated with the processing of "cacomites" a Spanish term referring to varieties of edible roots, bulbs and corms (bulb-like stems) that are found in the site vicinity

Initial work supervised by the author at the site (Maxon 1995) consisted of a surface examination and surface collection This resulted in the recovery of 26 artifacts including 16 uni- and bifacial manos (one possibly truncated) and mano fragments composed of porphyry, granite and metavolcanics, and chipped stone implements including three choppers, two hammerstones, one core, and four pieces of debitage. Material types include metavolcanics, quartzite and quartz Subsequently, a disk pulled by a small bulldozer was employed to turn up the soil to a depth of approximately ten centimeters, for the purpose of uncovering near surface artifacts This method, after a second surface collection, resulted in the recovery of an additional 56 artifacts including 11 groundstone implements eight manos composed of granite and porphyry, and three metate fragments - two of granite and one quartzite. Chipped stone implements included 12 cores of metavolcanics, chert and quartzite, two hammerstones, two choppers, three scrapers and 25 pieces of debitage made primarily of chert and metavolcanics

Eight one by one meter units were next excavated to determine the spatial extent of the site and verify the existence of a subsurface deposit Fifty-four artifacts were recovered and two of the units produced in situ features. Results of the excavation are summarized in Table 3 below A complete list of artifacts is provided in the artifact catalog in Appendix A

Table 3: CA-ORA-710

Scraper						1	1
Total Level	27	5	8	8	4	2	54

Even though the scope of the test excavation was limited to a small fraction of the total CA-ORA-710 site area, a relatively wide range of tool and material types was recovered. This indicates that a number of activities were performed on the site. Lithic tool production was evidently accomplished on site, based on the total recovery (surface collection and unit excavation) of 19 cores and a variety of waste flakes and other debitage as well as associated hammerstones Scrapers and choppers were used for the processing of vegetable and wood fibers, as well as for working hides and bone The processing of the hard seed resources associated with the coastal sage scrub and chaparral communities is evidenced by the recovery of 33 manos and mano fragments and six metates and metate fragments The sites inhabitants were utilizing a range of material types to fashion tools· chert (31%), metavolcanics (23%), granite (15%), porphyry (11%), quartzite (9%), metasedimentary (7%) and smaller percentages of jasper, sandstone and quartz. Some of the chert may have been heat treated. Van Horn (1986) indicates that some (ca. 5-6%) of the chert at the nearby Hoopaugh site (CA-ORA-507) was heat treated and Dillon (SRS 1989) recovered a piece of burned white chert shatter at CA-ORA-710 Apparently, chert and other silicious materials are "annealed" or made stronger by being heat

treated. The material is heat treated and then slowly cooled to permit the molecular structure to rearrange itself resulting in material that is easier to flake. It has been shown that heat treatment can be used to produce larger flakes (Crabtree & Butler 1964) and thermally altered cores have been recovered at several sites in northern California (Gould 1976, Van Horn 1976). Bordaz (1970) has suggested that the Upper Paleolithic Solutrean points from France were made using thermal modification.

Thermally altered chert can be detected by luster, color change, crazing, potlidding and bleaching (Odell 1979). Van Horn (1986) described the amber chert from CA-ORA-507 as turning red, white and blue after being heated in a barbecue. Some of the chert at CA-ORA-710 shows evidence of being heat treated by a similar change in color and hairline fracturing

Based on the characteristics of the artifacts recovered during the course of the test excavation, it is likely that the site is of Millingstone age. The lack of evidence of the mortar and pestle being used at the site further bolsters this hypothesis The mortar and pestle technology is associated with the later Intermediate period when exploitation of the acorn became widespread

A large portion of the artifacts were recovered from the western portion of the site in Units one through three. Units one and two produced the three in situ features; therefore, it is established that at a minimum, this portion of the site's subsurface remains intact A feature consisting of two slab metates and a core was recovered from the 20-30 centimeter level of Unit 1. Two features were recovered from Unit 2: a mano, core and chopper from the 10-20 centimeter level and a slab metate, three manos and a chopper at the 30-40 centimeter level

It is likely that a substantial subsurface deposit remains relatively undisturbed at the site, therefore, the site is deemed important/significant Preservation of the site is warranted, but not possible based on the current 705 unit plan Data recovery is therefore necessary before ground disturbing activities begin. It is recommended that a data recovery excavation of approximately 30, one by one meter units be accomplished at the site The data recovery excavation should focus on the following research questions.

1 What is the date range of occupation of the site?

2 What activities were accomplished at the site?

3. What was the settlement pattern of the site? Was it used seasonally or occupied year around?
4. Can the chert recovered at the site be associated with the chert quarry (CA-ORA-507) located less than one kilometer from the site?
5. Are truncated manos present on the site that suggest "cacomite" processing (see above)?

CA-ORA-711

The site is located on a low, flat ridge directly east of Aliso Creek and just north of a smaller tributary drainage (see Figure 5 below). The core of the site measures approximately 27 by 30 meters. The original recorders (Tadlock & Tadlock 1978) reported a "sparse distribution of flakes, cores, and one chopper." Dillon (1989) was unable to relocate the site during his reconnaissance

Initial work performed under the supervision of the author (Maxon 1995) consisted of a surface examination and surface collection. This resulted in the recovery of 30 artifacts including 12 uni- and bifacial manos (one or two possibly truncated) of granite, sandstone, metavolcanics and porphyry. Chipped stone implements recovered include two cores, two hammerstones, one uniface, one biface, one scraper plane and 11 pieces of debitage composed of chert, porphyry, metavolcanics and quartzite. Subsequent surface collection during the course of excavation produced 16 additional artifacts including three manos, one metate, four cores, one hammerstone and seven pieces of debitage. Material types included chert, metavolcanics, granite, porphyry and quartzite

Ten 1 x 1 meter excavation units and one feature excavation were then placed in an attempt to delineate the site boundary and verify the existence of a subsurface deposit. One hundred-twelve artifacts, excluding historic or modern items, were recovered from the subsurface including four in situ features Table 4 below summarizes this information

CA-ORA-711

FIGURE 5

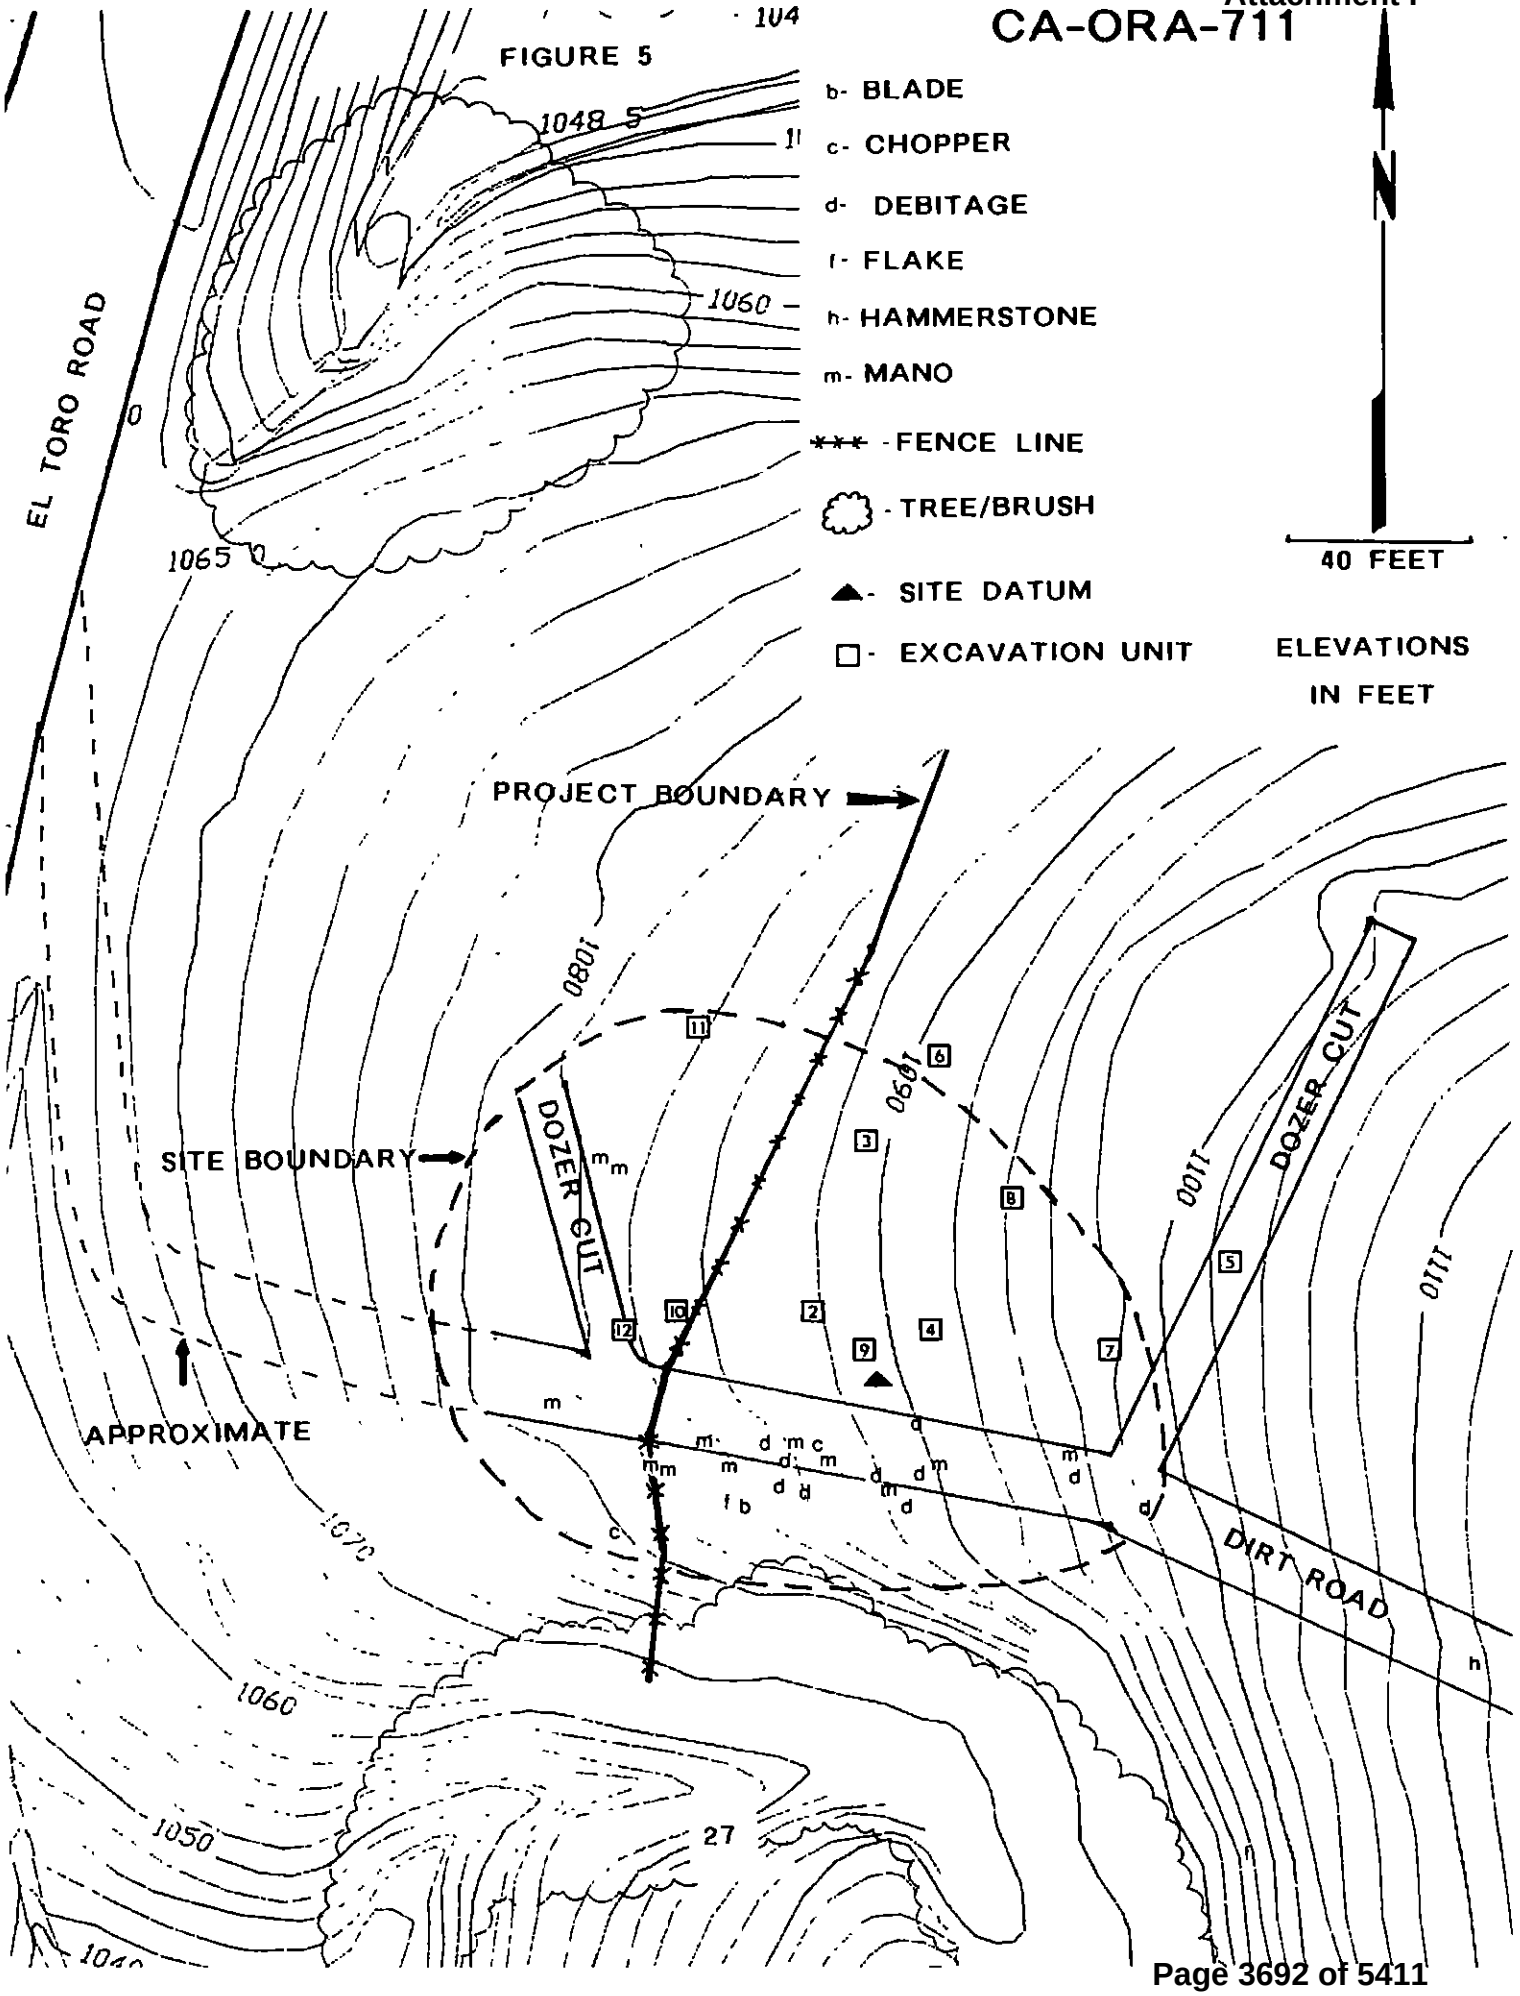

Table 4: CA-ORA-711

Recovered Item	Depth (in centimeters)						Total Items
	0-10	10-20	20-30	30-40	40-50	Feature	
Chopper			2		3		5
Core	1		2		3	1	7
Debitage	25	11	12	4	10	4	66
Hammerstone	1		4		1		6
Mano	2	1	10	1	5	5	24
Metate			1		1	2	4
Total Level	29	12	31	5	23	12	112

As with CA-ORA-710, excavation at CA-ORA-711 was limited to a small fraction of the total site area And similarly, a relatively wide range of tool and material types was recovered This, again, indicates that a number of activities were performed on the site Lithic tool production activities are evidenced by the recovery of 13 cores and a variety of waste flakes and other debitage, as well as associated hammerstones The recovery of 39 manos and mano fragments and five metates and metate fragments is strong evidence that processing of the hard seed resources associated with the coastal sage scrub and chaparral communities was being accomplished Scrapers and choppers were being utilized to process vegetable and wood fibers, as well as for working hides and bone. A single porphyry scraper plane was recovered from the surface of the site, suggesting the possible processing of agave/yucca (Kowta 1969) or other vegetal material (Salls 1985) The sites inhabitants were utilizing a wide range of material types for the manufacture of lithic tools: chert 31%, metavolcanics 25%, granite 17%, quartzite 11%, porphyry 9%, sandstone 5%, and schist 1% Some of the chert recovered may have been heat treated (see discussion of CA-ORA-710 above)

Based on the characteristics of artifacts recovered at CA-ORA-711, as well as the lack of evidence of mortar and pestle technology, it is probable that the site is of Millingstone age

A majority of artifacts recovered from CA-ORA-711 was located in units two, three, four, nine, ten and twelve on both sides of the property boundary fence on the lower, flatter area of the

knoll Units five and six produced no prehistoric artifacts. The existence of in situ features in Units two, nine, ten and twelve suggests an intact subsurface deposit. All of the features contain an assortment of *in situ* lithic tools including manos and metates, hammerstones, cores and debitage CA-ORA-711 is deemed an important/significant site and an intact subsurface deposit remains undisturbed on the site. Preservation of the site is warranted, but not possible based on the current 705 unit plan Data recovery is therefore necessary before ground disturbing activities begin It is recommended that a data recovery excavation of approximately 30 one by one meter units be accomplished at the site. The data recovery excavation should focus on the same research questions that were generated for CA-ORA-710

CA-ORA-712

The site was first recorded by Tadlock and Tadlock (1978) and described as being on a relatively flat hill overlooking CA-ORA-710 and 711 and Aliso Creek It was described as a chipped lithic scatter, heavily damaged by bulldozing. Cultural material could not be relocated by subsequent researchers The site is therefore not important/significant, but the area should be monitored by a qualified archaeologist during mass grading operations If artifacts are discovered, the site can be reevaluated.

CA-ORA-713

The site is located on a ridge between Oso and Aliso Creeks and on the ridge's north facing slopes as well as a relatively flat area at the slopes base (see Figure 6 below) The area measures approximately 150 by 215 meters and could comprise two or more sites The original recorders of the site (Tadlock and Tadlock 1978) reported finding flakes, scrapers, cores, choppers and manos Breece and Padon (1982) reported only three flakes Dillon (SRS 1989) found no "portable artifacts", but discussed a sandstone concretion boulder with a cupule ground into its upper surface

Initial work on the site (Maxon 1995) consisted of a surface examination and surface collection This resulted in the recovery of 14 artifacts including two metavolcanic cores, a quartzite flake, a piece of metavolcanic shatter, a granite chopper, eight uni- and bifacial,

porphyry and granite manos and a granite basin metate fragment The cupule noted by Dillon (SRS 1989) was seen, but the current researchers have serious reservations regarding the cultural nature of the cupule Subsequently, a disk pulled by a small bulldozer was employed to turn up the soil to a depth of ten centimeters to expose near surface artifacts. This method resulted in the recovery of an additional 14 artifacts including three scrapers of metavolcanics and granite, two quartzite cores, three pieces of metavolcanic and quartzite debitage and six manos, uni- and bifacially ground, composed of granite and porphyry

Three one by one meter units were excavated in distinct areas of the large site, two on the ridgetop and one at the base of the slope that yielded the majority of the surface artifacts All three units were sterile - producing no cultural material

Since artifacts were scattered over a large area, a number of unrelated encampments occupied over a period of time may be represented The importance/significance of the site is as yet unknown. It is therefore recommended that controlled grading under the guidance of a qualified archaeologist be accomplished before the commencement of mass grading. Should clusters of artifacts be discovered, additional units could be excavated in those specific areas

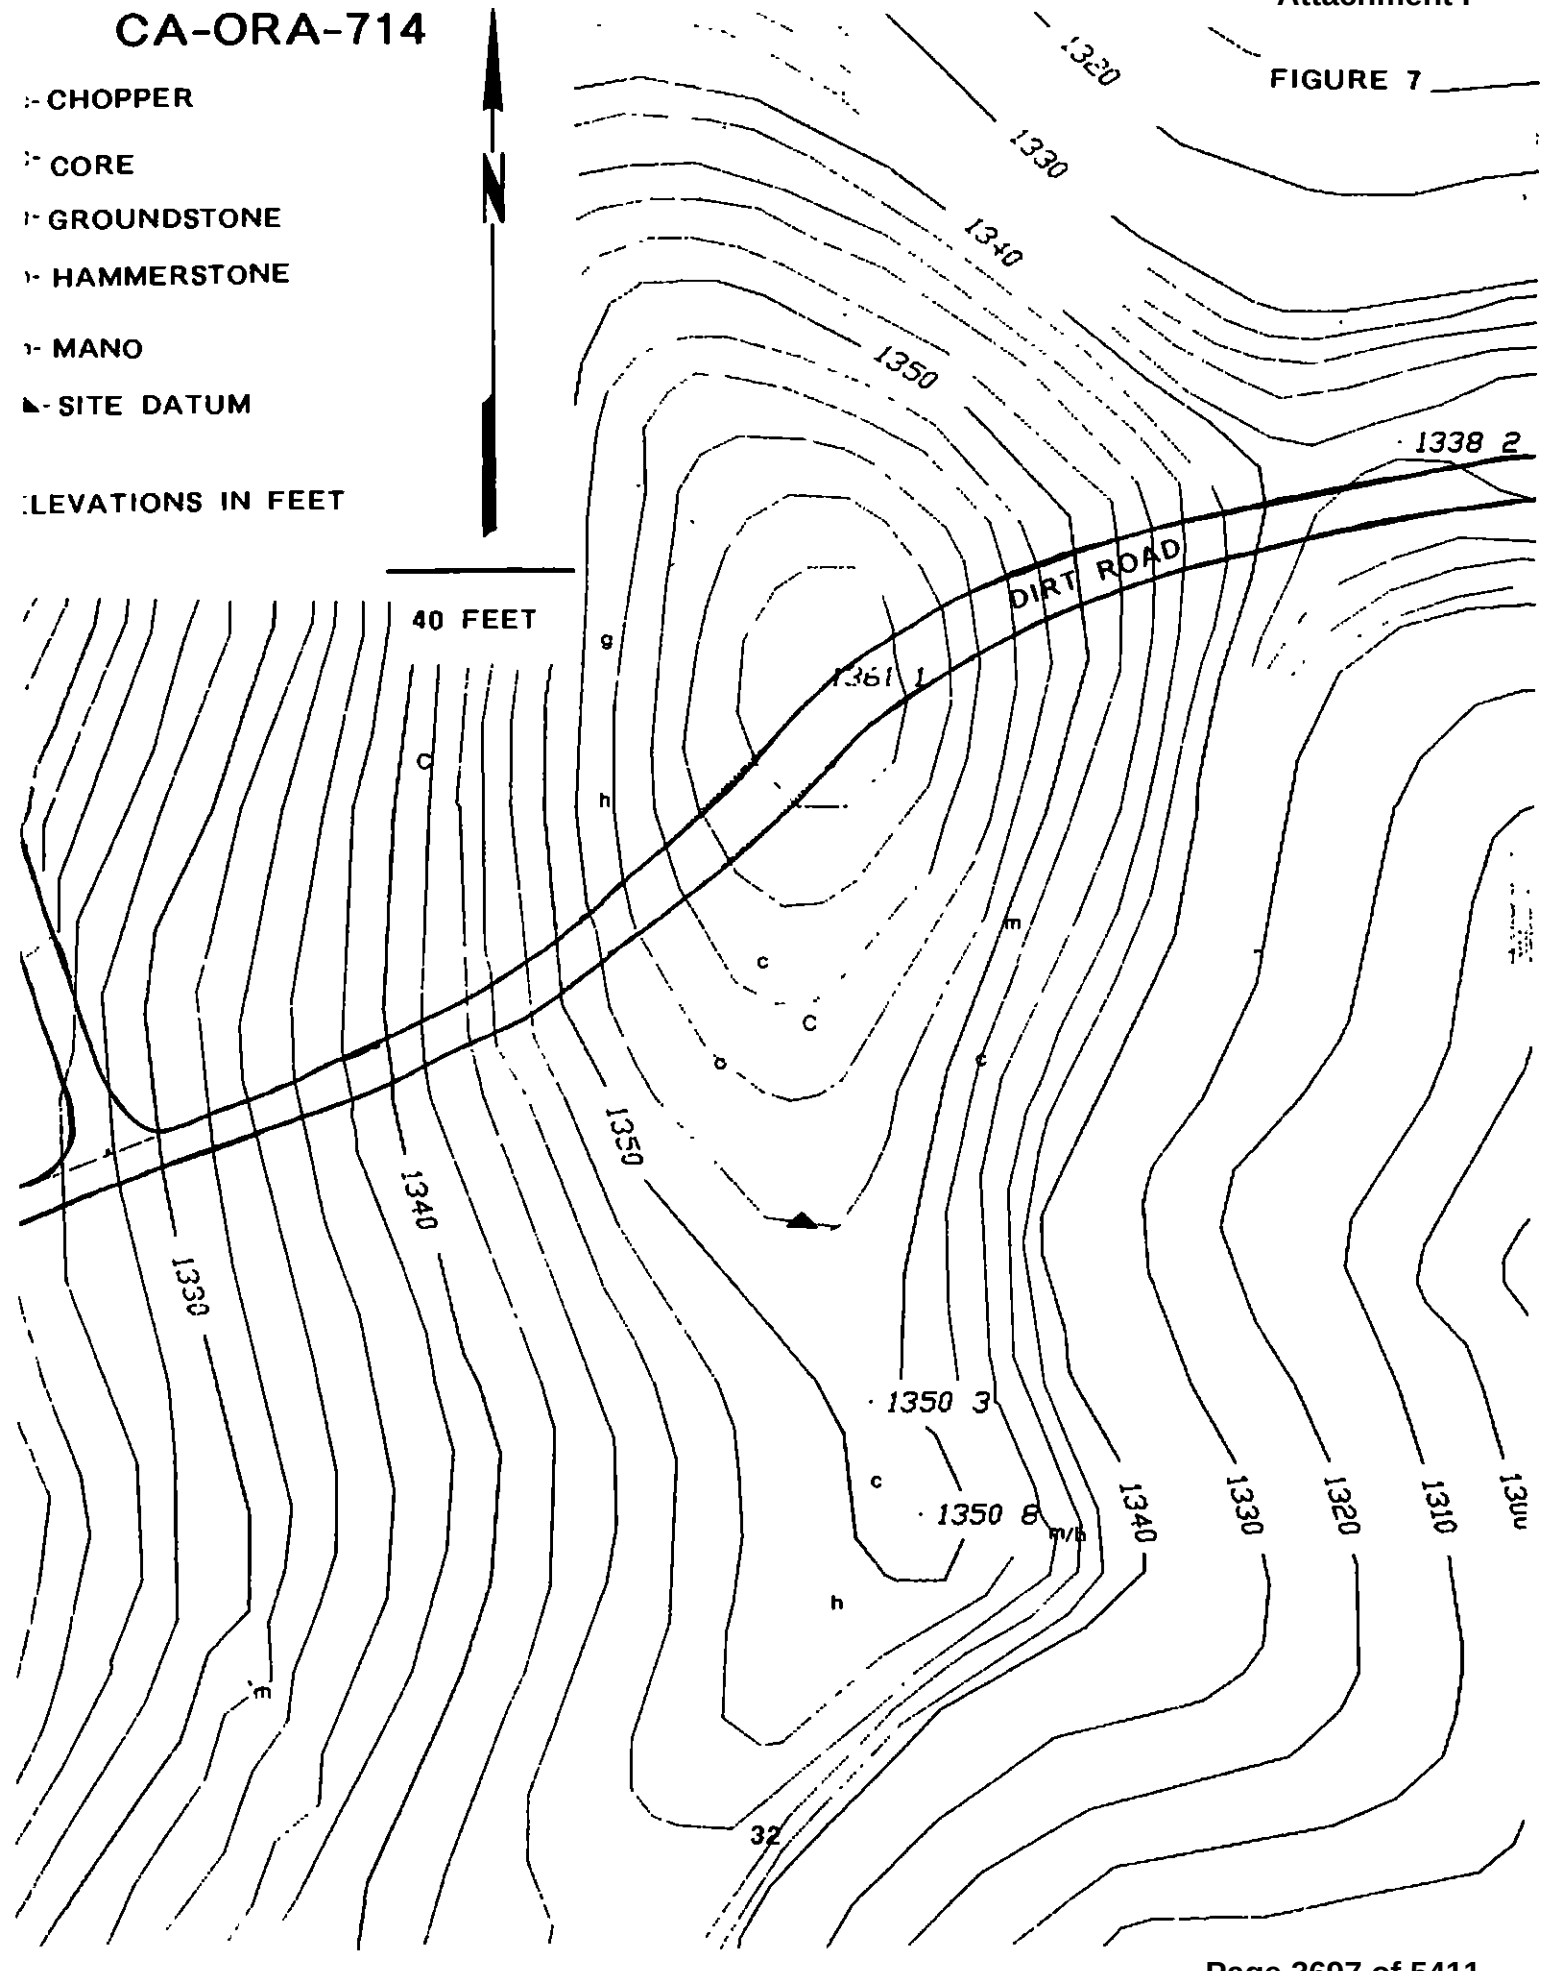
CA-ORA-714

The site is located on a domed hill on the ridge between Oso and Aliso Creeks, west of CA-ORA-713 and just to the south of a steep cliff leading down to a large Oso tributary drainage (see Figure 7 below) Tadlock and Tadlock (1978) called the site a probable quarry containing assayed stones, but Dillon (SRS 1989) reported two artifacts. The presence of bedrock near and at the site's surface eliminates the possibility of extensive subsurface deposits. Bleached cow bones litter the ridgeline indicating either a carcass dumping ground or a carnivore feeding area The site measures some 60 by 30 meters

Work undertaken at this site (Maxon 1995) was essentially a surface examination and surface collection Twelve artifacts were recovered as a result of this procedure including three unmodified hammerstones of metavolcanics and porphyry, two cores of quartz and chert, four choppers of porphyry and metavolcanics and three uni- and bifacial manos of porphyry.

CA-ORA-714

FIGURE 7



No units were excavated on the site because of the presence of bedrock at the surface, which eliminated the possibility of a significant subsurface deposit.

The site was probably a short term encampment, perhaps the result of a single occurrence and because of the presence of exposed bedrock, a subsurface deposit is not expected The site is therefore considered not important/significant and it is recommended that the area be monitored by a qualified archaeologist during mass grading operations. If artifacts are discovered, the site can be reevaluated.

CA-ORA-715

The site is located on a relatively flat, rounded hill comprising the ridge above the headwaters of Oso Creek, overlooking Aliso Creek (see Figure 8 below). Site dimensions are approximately 55 by 65 meters A bulldozer cut in the site area establishes that soils have considerable depth

Initial work on the site (Maxon 1995) consisted of a surface examination and a surface collection Thirty two artifacts were recovered including 13 uni- and bifacially ground manos, four of them fragments, composed of porphyry, sandstone, metavolcanics, quartzite and granite, four choppers of quartzite, metavolcanics, porphyry, and quartz, two bidirectional metavolcanic cores, one metavolcanic anvil, one metavolcanic hammerstone and eleven pieces of debitage of metavolcanics, chert, jasper and quartzite

Subsequently, a disk pulled by a small bulldozer was employed to turn up any subsurface artifacts within ten centimeters of the surface. This procedure resulted in the recovery of nine additional artifacts including two choppers of metavolcanics and quartzite, one quartzite axe, one multidirectional metavolcanic core, two pieces of metavolcanic debitage, one bifacial quartzite mano and two unifacial porphyry mano fragments

Next, four 1 x 1 meter units were excavated to determine if a subsurface deposit existed on the site The existence of a subsurface deposit was not substantiated, because the excavation produced negligible artifacts Those cultural materials recovered could have been deposited via rodent disturbance Table 5 below, summarizes the excavation at CA-ORA-715

The importance/significance of the site is as yet unknown It is therefore recommended that controlled grading under the guidance of a qualified archaeologist be accomplished at the site before the commencement of mass grading. Should clusters of artifacts be discovered, additional units could be excavated in those specific areas.

CA-ORA-716

The site is located on a high hilltop in the northeastern corner of the project area Tadlock and Tadlock (1978) reported finding a negligible number of flakes on the westerly portion of the site and flakes, cores and a redeposited chopper on the central and eastern portion Dillon (SRS 1989), then reports finding just one basalt core at the site area and comments that much of the surface of the site has been graded to and below the surface of bedrock

Relative to the current project, the site, or what is left of it, lies off the property to the west, therefore, no further action is required

CA-ORA-1255

The site lies on the lower drainage of a small knoll creating an upland pond and overlooking a steep-sided drainage (see Figure 9 below) It is approximately 25 by 25 meters in size Dillon (SRS 1989) described the site as lying approximately 50 meters southwest of the pond in a natural amphitheater formed by a series of low, rounded knolls The site was apparently on the backslope of the knoll creating the pond Artifacts recovered by Dillon include one sandstone metate fragment, one core, two flakes and a quartzite prismatic blade

Initial work on the site (Maxon 1995) consisted of a surface examination and surface collection One metavolcanic flake was recovered by this method Subsequently, two 50 by one

CA-ORA-1255

FIGURE 9

FLAKE

- TREE/BRUSH

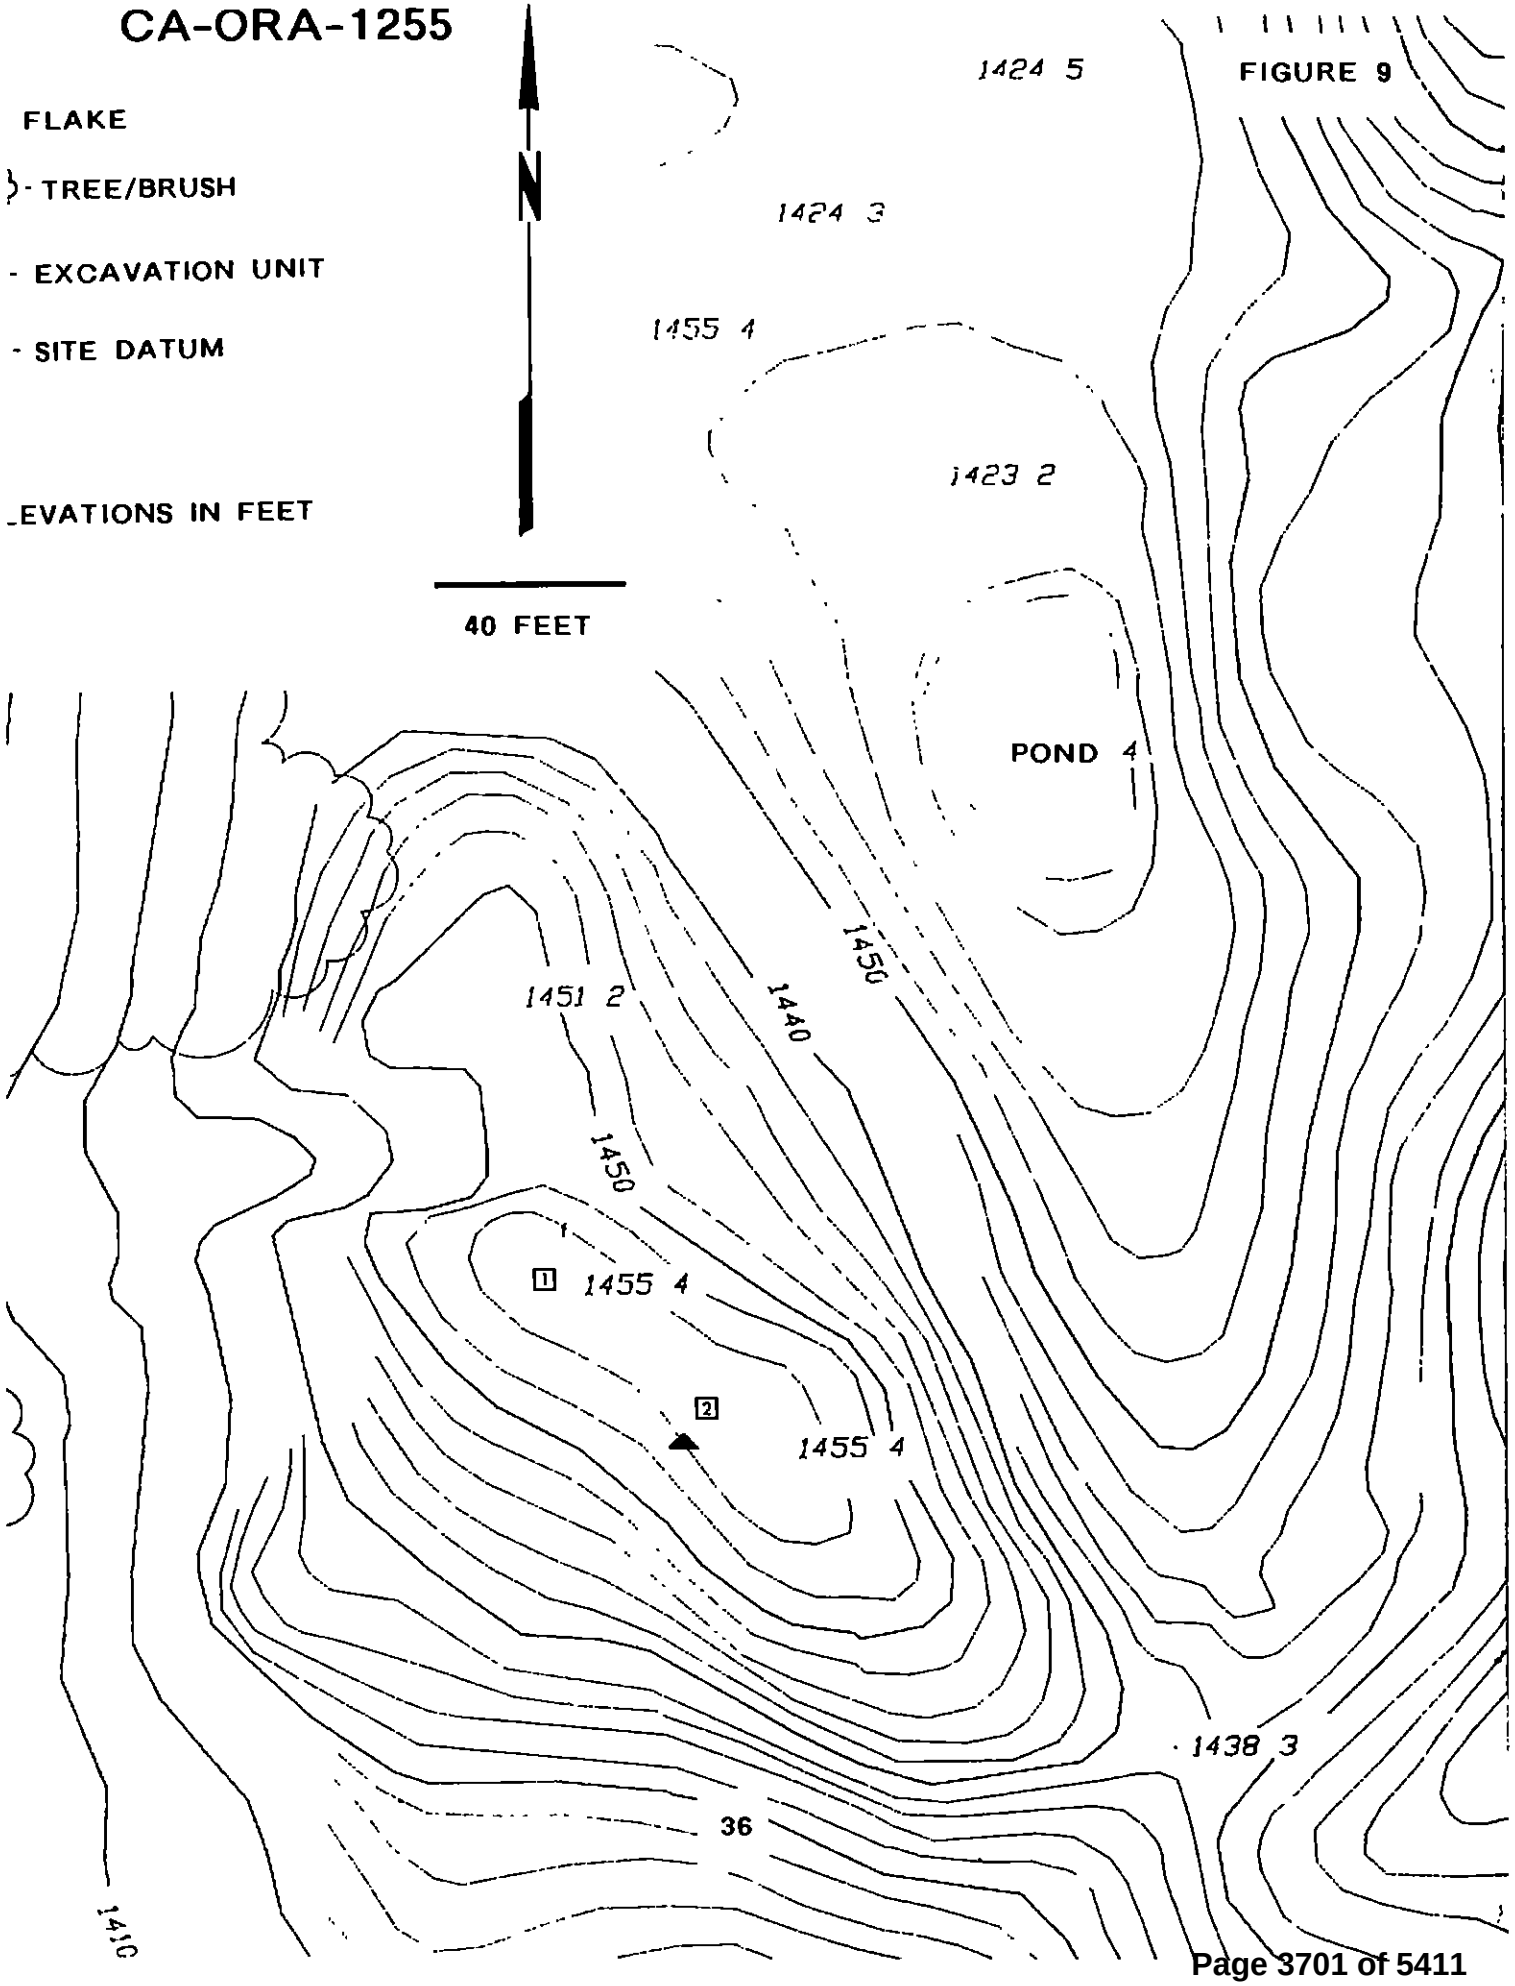
- EXCAVATION UNIT

- SITE DATUM

EVATIONS IN FEET

N

40 FEET



meter units were excavated on the top of the knoll. Unit one was excavated to 20 cm , Unit two to 30 cm The lone artifact recovered was a piece of metavolcanic shatter in the 10-20 cm. level of Unit 2. The units were very shallow, because a very light colored decomposing bedrock sand was encountered at those levels and the units were abandoned

Based on the dearth of cultural materials recovered, the site is deemed not important/significance and no further work is necessary It is recommended, however, that a qualified archaeologist be present to monitor the commencement of clearing/grading. If additional artifacts are recovered, the site can be reevaluated.

CA-ORA-1256

The site lies to the south and downslope from the southwest margin of CA-ORA-715, along a brushy fingerline ridge. Dillon (SRS 1989) first recorded the site and reported finding a large, crude, "early" appearing scraper plane and an andesite core/scraper.

The site was not relocated during the surface examination of the current project and has been likely destroyed The site is not considered important/significant, however, it is recommended that a qualified archaeologist be present to monitor clearing/grading operations If additional artifacts are recovered, the site can be reevaluated.

CA-ORA-1257

The site lies to the west and downslope of a low knoll directly west of Aliso Creek, and north of a steep cliff . Dillon (SRS 1989) recorded the site and reported finding a unifacial granite mano and a sandstone bedrock feature containing two cupules or incipient bedrock mortars He commented that the mano was not truncated like the other three found at CA-ORA-710, but may have been used in conjunction with the bedrock feature for grinding purposes therefore he called it an incipient bedrock mortar

During a prior visit to the site the small boulder containing the purported cupules was seen, and during the current project it was again located The current researchers doubt the cultural nature of the cupules They are in very soft stone and would have been most ineffective as grinding implements

The site was carefully examined for cultural materials during the project (Maxon 1995). No artifacts were seen or recovered. Therefore, the site is considered not important/significant; however, it is recommended that a qualified archaeologist be present during clearing/grading operations. If additional artifacts are recovered, the site can be reevaluated

CA-ORA-1435H (Hausauer Ranch)

The site is located at the bottom of a deep drainage near the center of the property (see Figure 10 below). It is surrounded by dense foliage (oak, eucalyptus and pepper trees) The site is a ranch complex comprised of a residence, barn (collapsed), several out structures and a holding pond surrounded by a large olive grove numbering nearly 100 trees. The ranch buildings are in an advanced state of decay and have additionally been vandalized. The site complex measures approximately 275 by 100 meters.

Work performed on the site (Maxon 1995) included examining the surface of the entire ranch area, mapping and describing all the structures associated with the ranch, and preparing a site recording form.

Because no in depth work has been accomplished on the site, its importance/significance has not yet been determined. It is therefore recommended that a thorough surface collection and excavation of a sufficient number of backhoe trenches (approximately 10-20) be accomplished at the site to provide the data for site evaluation Subsequent work will depend on the results of test excavation of the site Data recovery work may become necessary after evaluation.

CA-ORA-1437

This newly discovered site lies on a rounded knolltop at the northern edge of the property overlooking a small drainage leading south-westward into Aliso Creek (see Figure 11 below). The site is approximately 140 meters northwest of CA-ORA-1255 and measures approximately 20 by 20 meters.

The site was discovered serendipitously (Maxon 1995) as the reconnaissance crew was searching for CA-ORA-1255. Work performed on the site (Maxon 1995) included a surface

40 FEET

examination and the subsequent recording of all identified artifacts by surveyor's transit and stadia radiation methods. Twenty-nine items were identified including mano fragments, metate fragments, cores and flakes The items were not collected, precluding the possibility of further study (material types, measurements, weights) of the artifacts. Finally, an archaeological site recording form was prepared for the site.

Because no in depth work has been accomplished on the site, its importance/significance is not known. It is therefore recommended that a thorough surface collection and unit excavation be accomplished at the site to provide the data for site evaluation. Subsequent work will depend on the results of test excavation of the site

RESPONSE TO COMMENTS

In March 1996, comments to the Draft Environmental Impact Report No. 561 were submitted to Raymond Brantley, Chief of the County of Orange, Environmental and Project Planning Division, by Steve Conkling, a resident of a neighborhood in the vicinity of Saddleback Meadows. Mr. Conkling commented on the entire EIR document, a portion of which concerned the cultural resources research performed at Saddleback Meadows A response to the comments was prepared and sent to Duane Morita of Urban Vision This response is reproduced here Mr. Conkling made some 69 separate comments concerning the EIR document. Those comments were enumerated and any concerning cultural resources (only #s 24 and 64) were responded to.

Comment (#24): "Table 4 states that cultural resources will require EMA approval. However, this table also indicates that a Section 404 permit will be required for the project Under the Section 404 permit, cultural resources should be mitigated to be in compliance with Section 106 of the *National Historic Preservation Act*, and fall under the review of the U S Army Corps of Engineers. The current document does not provide cultural resource mitigation management to this level "

Response: The applicability of completing the project in compliance with Section 106 is discussed in the response to Comment #64 below The statement that "cultural resources should

be mitigated to be in compliance with Section 106" is incorrect. Under Section 106, only the effect of the project on sites determined eligible to be listed in the *National Register of Historic Places* need to be taken into account Sites determined to be ineligible require no additional action.

Comment (#64): "Since the project requires a 404 Permit with the U.S. Army Corps of Engineers (Corps), assessment, testing and data recovery for affected archaeological sites must be conducted in compliance with Section 106 of the *National Historic Preservation Act*. Section 106 requires that the sites be tested for their potential eligibility to the *National Register of Historic Places (National Register)* None of the testing for the EIR was done to these standards "

Response: Throughout the duration of the Saddleback Meadows archaeological study there was no notification that the project required a 404 permit from the Army Corps of Engineers, or that any other Federal involvement in the project was expected Completing the cultural resources study in compliance with Section 106 of the *National Historic Preservation Act* was not warranted Consequently the project was appropriately completed under the *California Environmental Quality Act* (CEQA).

Comment (#64): "The 12 archaeological resources identified in the EIR have not been adequately tested to determine their significance under CEQA."

Response: Eleven prehistoric archaeological sites and one historic site have been recorded within the boundaries of the Saddleback Meadows project area. Three sites (CA-ORA-712, -1256 and -1257) could not be relocated as plotted by previous researchers and no cultural material was found despite a thorough examination of those plotted locations These sites are clearly not important resources.

One site (CA-ORA-716) actually is located just outside the project boundaries and will not be affected by the current project. This site requires no further action relative to the current study

One site (CA-ORA-1435H) lies within the current project area in proposed open space and will not be affected by grading or construction (this has changed because of the new proposed project of 705 manufactured, single-family residential unit development) This site requires no further action unless changes are made to the current plans (those changes to plans have occurred and additional work is necessary).

Six sites (CA-ORA- 710, -711, -713, -714, -715 and -1255) will be affected by the current project (Maxon 1995) and were formally test excavated Test excavation consisted of surface collection and mapping of all visible surface artifacts, and excavation of a sufficient number of one by one meter square excavation units to characterize the nature of any subsurface deposit. These units were excavated using standard archaeological methods Four of these sites (CA-ORA-713, -714, -715 and -1255) are not important since they are highly disturbed and contain no subsurface component. The remaining two sites (CA-ORA-710 and -711) are important since both contain substantial and relatively undisturbed subsurface components

One site (CA-ORA-1437) was discovered during the current project (Maxon 1995) Time constraints prevented testing this site prior to completion of Draft Environmental Impact Report 561 This site requires testing and evaluation prior to development

It is clear from the preceding discussion that eleven of the twelve recorded sites within the project boundaries have been adequately addressed Three are determined to no longer exist, one is actually located outside the current project boundaries, one is located in proposed open space and will not be affected by the project (this has now changed), and six were tested using standard archaeological methods. One site discovered during field work will be test excavated and evaluated prior to the start of grading. The comment that the sites were not adequately tested under CEQA is unfounded

Comment (#64): ". .the sites are not adequately evaluated under a straight CEQA review. The office of Historic Preservation, in 1995, began the *California Register of Historical Places*, based on guidelines very similar to those for Section 106 The sites within the project area have not been evaluated for either *Register* "

Response: The Office of Historic Preservation (OHP) created the *California Register of Historical Resources* which has been adopted as *guidelines* by the Historical Resource Commission In addition, current CEQA Statutes (Public Resource Code 21084.1) state that "an historical resource is a resource listed in, or determined eligible to be listed in, the California Register of Historical Resources (Governor's Office of Planning and Research 1996 51) " However, the *California Register* and the criteria for eligibility have not yet passed through the state legislative process and do not have the weight of formal regulations The legality of requiring evaluation of historical resources for eligibility to be listed in the *California Register*, rather than per the criteria included in Section 21083.2 or Appendix K, is not clear

Regardless, it is our position that the criteria in Appendix K used for evaluation of the archaeological sites to be affected by the proposed project would be sufficient for evaluating these same sites for their eligibility to be listed in the *California Register* Criterion d for eligibility to be listed in the *California Register* states that a historical resource may be listed if "it has yielded or is likely to yield information important in prehistory or history (Office of Historic Preservation 1995 4) " Section III, subsection B of Appendix K of CEQA states that an important archaeological resource is one which "can provide information . useful in addressing scientifically consequential and reasonable or archaeological research questions (Governor's Office of Planning and Research 1996:275) " It is clear that criterion d. for eligibility to be listed in the *California Register* and criterion III, B of Appendix K are similar, and that the evaluation of archaeological sites using section III, B would be nearly identical to an evaluation using criterion d

As stated previously, the project did not require compliance with Section 106 of the *National Historic Preservation Act*

Comment #64: "According to the Office of Historic Preservation (1995), properties are evaluated at 45 years of age, not 100 years."

Response: Citing *Instructions For Recording Historical Resources* (Office of Historic Preservation 1995), Mr. Conkling states that "properties are evaluated at 45 years of age, not 100 years." In reality, the reference cited states that sites to be *recorded* should be at least 45 years

old, but is silent on matters of evaluation All known cultural resources within the project area that are at least 45 years old have been recorded and assigned trinomial designations by the South Central Coastal Archaeological Information Center at the University of California, Los Angeles All sites evaluated for the project are prehistoric sites and far exceed the 45 year criterion The ranch house (CA-ORA-1435H) is not located in an area to be affected by the project (Maxon 1995) as currently planned, and accordingly, was not formally evaluated (this has now changed)

Comment #64: "Yet, no consultation with the Corps has been initiated, and site eligibility assessments have not been completed "

Response: The archaeological investigations were accomplished under CEQA regulations which do not require consultation with the U.S. Army Corps of Engineers

Comment #64: "AM 9-8 is inaccurate and illegal, the Coroner makes the determination of the nature of the Human Remains Also, the Heritage Commission contact information is incorrect

Response: AM 9-8 states that "If human remains of Native American origin are encountered during the project the County Coroner's Office and the Native American Heritage Commission shall be contacted for preservation and protection of the remains." Mr Conkling is correct The proper procedure is that the County Coroner's office is notified whenever human remains are encountered If the Coroner's office determines that the remains are of Native American origin, they have 24 hours in which to notify the Native American Heritage Commission, which in turn will notify the most likely descendant of the deceased Native American

SUMMARY

Archaeological research accomplished at Saddleback Meadows (Maxon 1995) is as follows cultural resource reconnaissance relocated CA-ORA-710, -711, -713, -714, -715, -1255 and -1257, previously recorded on the property, CA-ORA-712, -716 and -1256 were not relocated and are considered destroyed, CA-ORA-1435H, the historic ranch house, was formally recorded; CA-ORA-1437 was discovered during the project

CA-ORA-710, -711, -713, -714, -715 and -1255 were formally test excavated; CA-ORA-1435H did not undergo any testing because it was to be in open space, and was not to be destroyed under the previous 318-unit development; CA-ORA-1437 did not undergo testing because time constraints precluded further work prior to completion of Draft Environmental Impact Report 561. The site was mapped and formally recorded.

RECOMMENDATIONS

CA-ORA-710 and CA-ORA-711 have been determined to be important/significant according to Section 106 of the NHPA and CEQA. Although the sites lie in open space, remedial grading of the proposed open space will destroy them. Data recovery excavation of at least 30 one by one meter units at each site must be accomplished CA-ORA-1437 is the site discovered during the previous project (Maxon 1995); no work has been done as yet A surface examination and surface collection and a test excavation consisting of approximately ten, one by one meter units must be accomplished at the site to characterize the nature of any subsurface deposit. Additional work may become necessary after evaluation. CA- ORA-1435H has not yet been evaluated. Initial work will entail research including archival research and a review of historic aerial photographs. A surface examination and surface collection and a test excavation consisting of a sufficient number of backhoe trenches (approximately 10-20) must then be accomplished at the site Additional investigation may then become necessary after evaluation All above investigations must be accomplished prior to the commencement of clearing/grading operations

No determination of importance/significance has been made for CA-ORA-713 and CA-ORA-715 It is recommended that these sites undergo controlled destruction with the aid of a small,

paddlewheel scraper This work can be accomplished after grading is underway. If artifact clusters are discovered additional excavation may be necessary.

All other archaeological sites on the property have been deemed not important/significant and no further work, beyond monitoring of grading is necessary

APPENDIX A
Artifact Catalog

ARTIFACT CATALOG CODE KEY

All artifacts recovered during the Saddleback Meadows project (Maxon 1995) are listed in the following artifact catalog Entries appear on two successive pages. The first page includes the site number and a unique catalog number assigned to each artifact In addition, the first page also depicts the location of the artifact, the subassemblage, class and type of artifact. The second page repeats the catalog number and includes information on the artifacts material, modifications, presence or absence of cortex and thermal alteration, dimensions, weight and any comments In the interest of space, some column headings have been reduced so that only a partial heading is shown. Those column headings are explained below.

Cat	= Catalog Number
Top 1	= Top depth of level
Bottom 1	= Bottom depth of level
Dup	= Duplicate: Multi-use tools were assigned the same cat number, but recognized as two separate artifacts
No	= Number of modified edges
Cort	= The presence or absence of cortex
Th	= Thermal modification
P	= after each dimension measurement, the P denotes partial measurement if the artifact had been broken

Trinomial	Cat	Location	Top1	Bottom1	Subassemblage	Class	Type

EDUCATION

Master of Arts, Anthropology, Archaeological Emphasis
California State University, Fullerton, California, 1983

Master of Science, Library Science.
California State University, Fullerton, California, 1977.

Bachelor of Arts, Geology and History,
San Diego State University, San Diego, California, 1972

Introduction to Federal Projects and Historic Preservation Law.
Sponsored by the Advisory Council on Historic Preservation and the General Services Administration Training Center, 1989

EMPLOYMENT HISTORY

January 1986, Present. President, RMW Paleontological Associates, Incorporated, 23352 Madero, Suite J, Mission Viejo, California 92691 Duties include Principal Investigator responsibilities for all aspects of Cultural Resources Management projects

April 1983, January 1986. Independent Consultant performing archaeological assignments for clients in California

May 1976, April 1983 Information Specialist and Administrative Services Officer, Leighton and Associates, 1151 Duryea Avenue, Irvine, California 92714. Leighton and Associates is a geotechnical consulting firm.

March 1956, April 1976 United States Army. Rank at retirement was Major of Field Artillery.

CREDENTIALS

Certified by the Society of Professional Archaeologist as a Field Archaeologist

Certified as an Archaeologist by the County of Orange Environmental Management Agency. Also certified by the Counties of Ventura, Los Angeles, Riverside and San Bernardino, Kern, Kings, Fresno, Tulare, Madera and San Diego as well as various municipal agencies

California Community College credentials as Instructor in Anthropology, Library Science and Business Administration and as Chief Administrative Officer and Librarian

Certified as Open Water Scuba Diver by the Professional Association of Diving Instructors.

EXECUTIVE SUMMARY

This report presents the fiscal analysis of the Proposed Project and four development alternatives for Saddleback Meadows. The project site is located in unincorporated Orange County east of Portola Hills.

The Land Use Plans

The Saddleback Meadows project is planned for 222 acres south of the intersection of El Toro Road and Live Oak Canyon Road. Buildout of the Proposed Project will include 705 manufactured single family detached homes, 1.7 acres of neighborhood commercial, local and regional hiking trails and open space. Four development alternatives include residential, trails and open space uses with the following units for each alternative:

Alternative 1 - 150 single family detached units on 20,000 square foot lots
Alternative 2 - 100 single family detached units on 4,000 square foot lots
Alternative 3 - 299 single family detached units on 6,400 square foot lots
Alternative 4 - 140 single family detached units and 178 attached units

Fiscal Impacts

Table A summarizes the projected fiscal impacts to the Orange County General Fund; the County Road Fund; the County Library District; and the Harbor, Beaches and Parks Department at buildout of the five land use plans for Saddleback Meadows.

As shown in Table A, Alternative 3 (299 units) is the only land use plan with recurring annual surpluses projected for all funds. For Alternative 1 (150 units), recurring surpluses are projected for the County General Fund, the Library District and the Harbors, Beaches and Parks Department. Recurring surpluses to the County Road Fund and the Harbors, Beaches and Parks Department are projected for the Proposed Project and Alternative 4 (318 units). Recurring surpluses to the County General Fund and the County Library District for Alternative 2 (100 units).

County General Fund. A recurring annual surplus to the County General Fund is projected for Alternative 1 (150 units), Alternative 2 (100 units) and Alternative 3 (299 units). The County General Fund is projected to have a recurring annual deficit for the Proposed Project and Alternative 4 (318 units).

County Road Fund. Annual recurring surpluses to the County Road Fund are projected for the Proposed Project, Alternative 3 (299 units) and Alternative 4 (318 units). The County Road Fund is projected to have recurring deficits for Alternative 1 (150 units) and Alternative 2 (100 units).

The Presidio Group
County of Orange, "Fiscal Methodolgy and Interim Fiscal Impact Guidelines Workbook", November 1, 1996

20,667

County Library District. At project buildout, the County Library District is projected to have a net recurring surpluses for Alternative 1 (150 units), Alternative 2 (100 units) and Alternative 3 (299 units). The County Library District is projected to have recurring deficits for the Proposed Project (705 units) and Alternative 4 (318 units).

Harbor, Beaches and Parks. County Harbors, Beaches and Parks is estimated to have annual recurring surpluses for the Proposed Project (705 units), Alternative 1 (150 units), Alternative 3 (299 units) and Alternative 4 (318 units). An annual recurring deficit to the Harbor, Beaches and Parks Department is projected for Alternative 2 (100 units).

Fiscal Assumptions

The projected recurring revenue and recurring costs are based on factors from the Orange County Fiscal Methodology and Interim Fiscal Impact Guidelines Workbook, November 1, 1996. Property tax allocation data for the project site was obtained from the Orange County Auditor Controller.

Residential valuations were provided by The Presidio Group as follows:

Proposed Project	$155,000 per unit
Alternative 1	$440,000 per unit
Alternative 2	$260,000 per unit
Alternative 3	$390,000 per unit
Alternative 4	$260,000 per detached unit; $180,000 per attached unit

CHAPTER 1

INTRODUCTION

This report presents the fiscal impacts for the Proposed Project and four land use alternatives for the Saddleback Meadows area, located in unincorporated Orange County. The fiscal impact analysis projects recurring costs and revenues to the Orange County General Fund; the County Road Fund; the County Library District; and the County Harbors, Beaches and Parks Department at buildout of the Proposed Project and four development alternatives.

1.1 Background

The Saddleback Meadows area is about 222.2 acres in size. Figure 1-1 shows the general location of the Saddleback Meadows area within unincorporated Orange County As shown in Figure 1-2, the project site is located approximately one-quarter mile south of the intersection of El Toro Road and Live Oak Canyon Road. Surrounding land uses to the south include the Hidden Hills residential development; the Ranakrishna Monastery; and O'Neil Regional Park. To the west is the residential community of Portola Hills, to the north is Saint Michael's Prep School and Abbey and to the east is existing and planned residential development.

For purposes of this report, the analysis assumes buildout of the five land use plans. The site plan for the Proposed Project is shown in Figure 1-2 and includes 705 manufactured single family detached homes and 1.7 acres of neighborhood commercial uses. Other uses include regional and local trails and natural open space. The four development alternatives include only residential uses, trails and open space.

1.2 Approach

The fiscal analysis is based on data and assumptions from the following sources

FIGURE 1-1
SADDLEBACK MEADOWS
REGIONAL LOCATION MAP

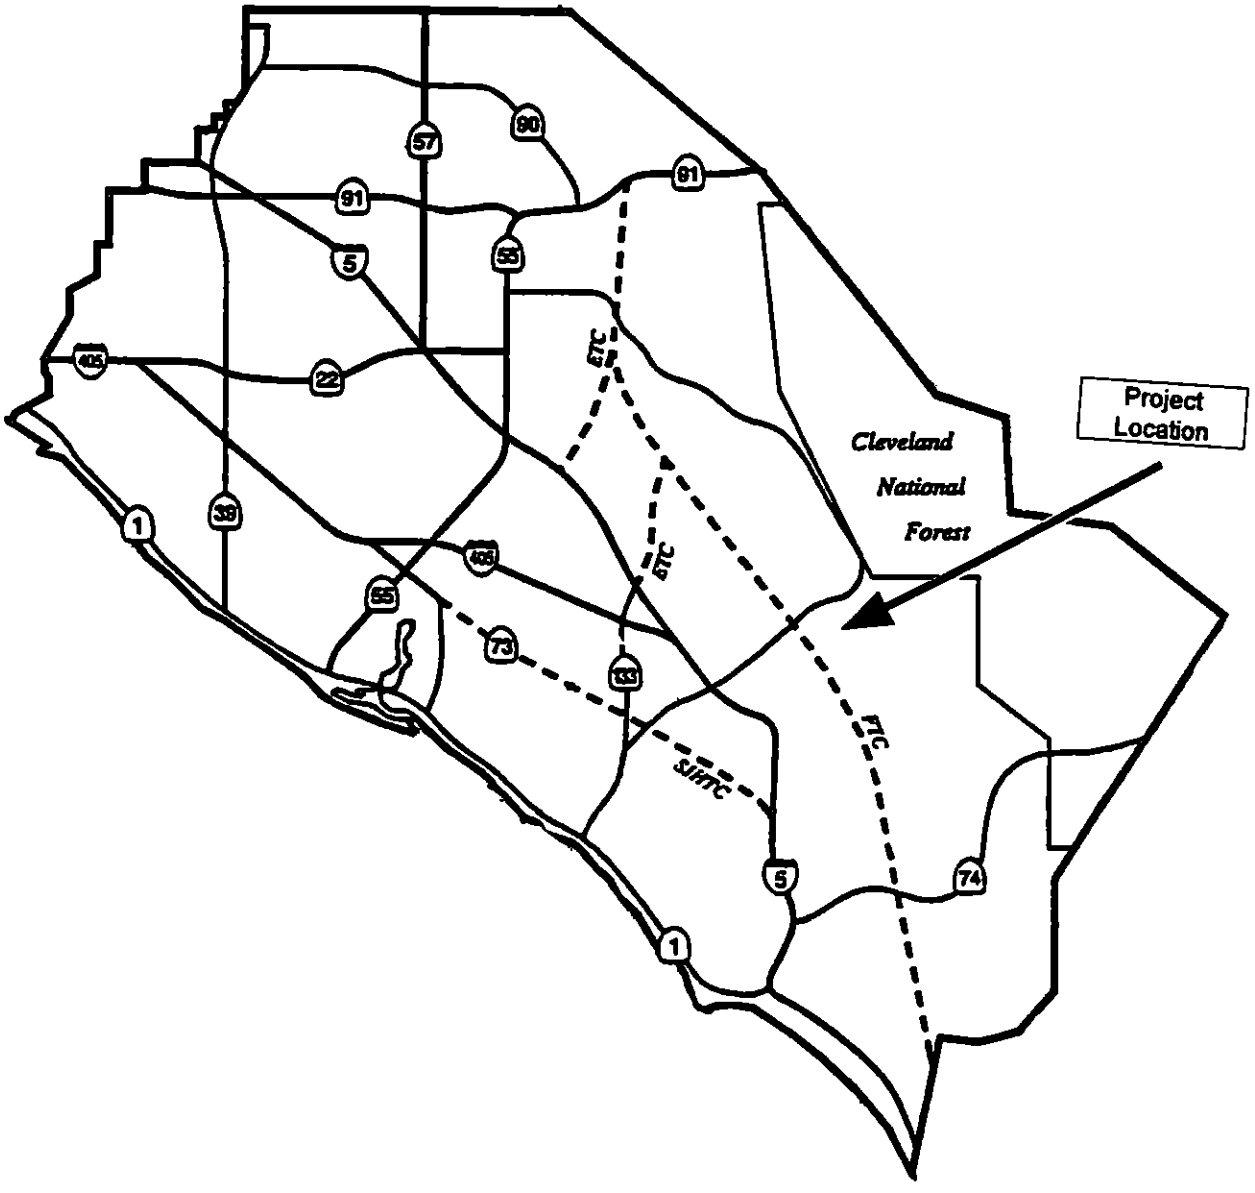

FIGURE 1-2
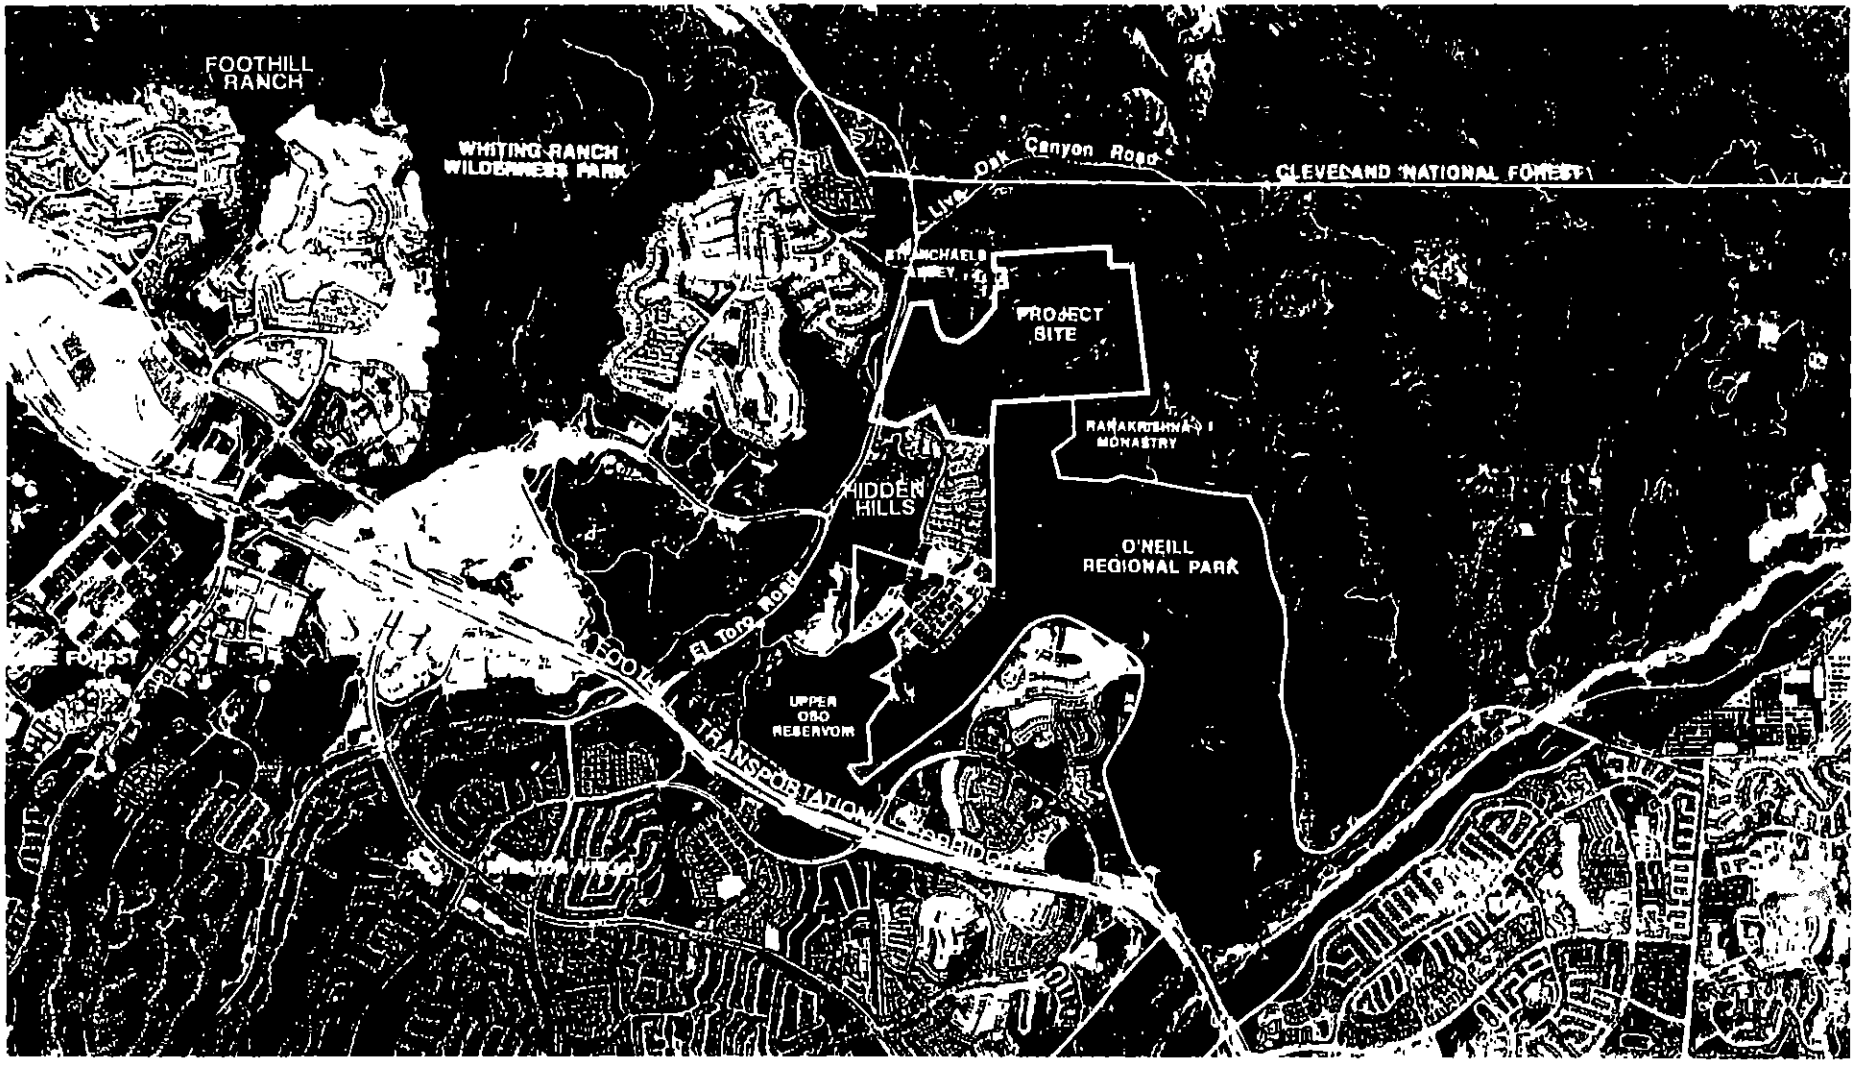
SADDLEBACK MEADOWS
VICINITY MAP



3

- County cost and revenue factors have been derived from the County of Orange Fiscal Methodology and Interim Fiscal Impact Guidelines Workbook prepared by Stanley R. Hoffman Associates, November 1, 1996.
- Project valuation information was provided by The Presidio Group.
- Various assumptions for public works improvements and other infrastructure have been prepared by the project proponent.
- Cost and revenue factors are projected in constant 1997 dollars with no adjustments for possible future inflation.

1.3 Overview

Chapter 2 is a description of the land uses associated with the Saddleback Meadows proposed development plan and four development alternatives. Chapter 3 presents a summary of the fiscal impact analysis resulting from the development plans for Saddleback Meadows. Fiscal impacts are presented for the Orange County General Fund; Road Fund, Library Fund: and Harbors, Beaches and Parks.

Appendix A presents the land use and market factors; revenue factors; and cost factors used for the fiscal analysis.

CHAPTER 2

PROJECT DESCRIPTION

This chapter presents the land use and infrastructure descriptions for the Saddleback Meadows development plans. The project site is about 222.2 acres. The Proposed Project includes residential, neighborhood commercial, trails and open space uses. The four development alternatives include only residential, trails and open space uses.

2.1 Land Uses

Proposed Project. As shown in Table 2-1, a total of 705 manufactured single family detached homes and 18,500 square feet of neighborhood commercial uses are included in the Proposed Project. Overall residential development density is estimated at 11.17 dwelling units per net acre. The average residential lot size is about 3,200 square feet and the average valuation of the residential units is $155,000 per unit. Population associated with the Saddleback Meadows Proposed Project is estimated at 1,692 based on a household size of 2.40 persons per dwelling unit Total employment estimated for the 18,500 square feet of neighborhood commercial uses is 37, which assumes 500 square feet per employee.

Development Alternatives. Four residential development alternatives for the Saddleback Meadows area are also presented in Table 2-1.

Alternative 1 proposes 150 single family detached units on lots averaging 20,000 square feet. The average valuation of the units for Alternative 1 is $440,000 per unit. Estimated population for Alternative 1 is 360.

Alternative 2 includes 100 single family detached units on lots averaging 4,000 square feet. The average valuation of these units is $260,000 per unit. Total population for Alternative 2 is estimated at 240.

Alternative 3 proposes 299 single family detached units on lots averaging 6,400 square feet. Valuation is assumed at $390,000 per unit. Alternative 3 population is estimated at 718.

Local trails lineal miles	0.76	0.76	0.76	0.76	0 76

Source Stanley R Hoffman Associates, Inc.
The Presidio Group

Alternative 4 includes 318 detached and attached residential units. A mix of 140 single family detached units and 178 attached units are proposed for this Alternative. The lots for the single family units will average 4,000 square feet and the attached units will include clusters of twoplexes and fourplexes. The 140 single family detached units are valued at $260,000 per unit and the 178 attached units are valued at $180,000 per unit. The population for Alternative 4 is estimated at 763.

2.2 Infrastructure

Table 2-1 also presents an overview of the infrastructure associated with the Proposed Project and the development alternatives. One signalized intersection is planned for the project entrance and El Toro Road. Other facilities include an estimated 0.21 lineal miles of regional trails and 0.76 lineal miles of local trails, both of which are assumed to be maintained by the County of Orange.

CHAPTER 3

FISCAL ANALYSIS

This chapter presents an analysis of the projected fiscal impacts from the Saddleback Meadows development plans at project buildout. The analysis focuses on the recurring revenues and costs that impact the Orange County General Fund and other funds, including the Orange County Road Fund, Library District and Harbors, Beaches and Parks Department. Projections are presented in constant 1997 dollars.

3.1 County General Fund

Table 3-1 presents the recurring revenues and costs to the Orange County General Fund for the five Saddleback Meadows development plans. A deficit is projected for the Proposed Project and Alternative 4 (318 units). At buildout of the Proposed Project, recurring revenues are projected at $174.1 thousand, while recurring costs are projected at $181.0 thousand. This results in a projected recurring deficit of $7 5 thousand and a revenue/cost ratio of 0.96. A recurring deficit of $6.3 thousand is projected for Alternative 4, based on projected recurring revenues of $99 6 thousand and projected recurring costs of $80.8 thousand. The revenue/cost ratio for Alternative 4 is projected at 0.92.

A surplus to the County General Fund is projected for Alternative 1(150 units), Alternative 2 (100 units) and Alternative 3 (299 units). The largest recurring surplus is projected for Alternative 3 (299 units). This projected surplus of $23.6 thousand is based on recurring revenues of $99.6 thousand and recurring costs of $76.0 thousand. The projected revenue/cost ratio for Alternative 3 is 1.31. A surplus of $16.1 thousand is projected for Alternative 1 based on projected recurring revenues of $54.2 thousand and projected recurring costs of $38.1 thousand. A revenue/cost ratio of 1.42 is projected for Alternative 1. At buildout of Alternative 2 (100 units) a small surplus of $0.5 thousand is projected. This surplus is based on projected recurring revenues of $26.0 thousand and projected recurring costs of $25 4 thousand. The revenue/cost ratio is 1.02.

County of Orange, "Fiscal Methodolgy and Interim Fiscal Impact Guidelines Workbook", November 1, 1996

Recurring Revenues

As Table 3-1 indicates, recurring revenues to the Orange County General Fund include property tax, property transfer tax, sales and use tax, franchise fees, forfeitures/penalties, interest income, motor vehicle in-lieu revenues, other taxes, vehicle code fines and other court fines. The revenues factors utilized in the fiscal analysis are presented in Table A-2 in Appendix A.

Property tax. Revenues accruing to the County General Fund from property tax are projected using an allocation of 5.2 percent of the basic 1 percent property tax levy. The breakdown of the 1 percent property tax levy was obtained from the Orange County Auditor-Controller's Office. The detailed breakdown of the Tax Rate Areas (TRA) is shown Table A-3 in Appendix A. Property tax revenues are based on the assessed valuation of completed development. Residential unit valuations are estimated on a per unit basis and are based on information provided by The Presidio Group.

Property transfer tax. Sales of real property are taxed by the County of Orange at a rate of $1.10 per $1,000 of property value that turns over each year It is assumed that residential and commercial development will change ownership at an average rate of about 5.0 percent, or on the average of once every 20 years. A consideration rate of 90.0 percent is applied to the valuation of the residential property which reflects the amount of turnover valuation that is estimated to be taxed.

Sales and use tax. The County General Fund receives 1.0 percent of all taxable sales that occur within the unincorporated County area. Taxable sales for neighborhood commercial are projected based on $150 per square foot of retail space.

Use tax is distributed to local jurisdictions by the State Board of Equalization to account for retail sales that are not directly tied to a situs based location. Use tax is projected based on a percentage of direct taxable sales generated. The current rate applied to taxable sales in Orange County is 10.7 percent.

Franchise taxes. Franchise fees are estimated at $7.99 per capita and $4.96 per employee based on total budgeted revenues from franchise fees of $1.76 million and a countywide population of 2,748,640 and a countywide employment 1,296,140.

Forfeitures/penalties. Based on 1996/1997 revenues of $2.69 million and the countywide population and employment estimates, revenues from forfeitures/penalties are projected at $0.78 per capita and $0.41 per employee.

Interest income. Interest income is projected at $1.49 per capita and $0.79 per employee based on total County budgeted revenues from this source of $5.11 million and the countywide population and employment estimates.

Motor vehicle in-lieu fees. Based on the State Controller's allocated amount of $99.90 million to Orange County and the County population of 2,748,640, motor vehicle in-lieu fees are estimated at $35.25 per capita.

Other Taxes The County budgeted amount for other taxes is $7.58, resulting in a projected revenue of $2.21 per capita and $1.17 per employee from this source.

Business license revenue Total County revenues from business licenses are estimated at $575.1 thousand. Based on the unincorporated county employment of 35,519, business license revenues are projected at $16.19 per employee.

Vehicle code fines Vehicle code fines are projected using a factor of $1.85 per capita and $0.98 per employee, based on total budgeted revenues of $6.35 million from this source and the total County population and employment estimates.

Other court fines. Based on countywide population and employment estimates and the total budgeted revenues of $888.0 thousand, factors for other court fines are projected at $0.26 per capita and $0.14 per employee.

Recurring Costs

Table 3-1 also presents recurring costs to the County General Fund for the Saddleback Meadows development plans. Recurring costs to the County of Orange General Fund include sheriff's patrol, and other county net operating costs for public protection; health services; community and social services; environmental resources; general government; capital improvements; and insurance reserves and miscellaneous.

Sheriff's patrol. Sheriff protection costs are projected based on the net County cost of $11.13 million and Orange County Projections for unincorporated population of 198,327 and unincorporated employment of 35,519. Based on these estimates the cost factors for sheriff's patrol are projected at $41.14 per capita and $25.53 per employee.

Countywide costs. Countywide costs are associated with functions provided to all residents, and in selected cases all employees, in the County whether they reside in incorporated or unincorporated areas. The net County cost for each countywide service is based on the November 1, 1996 Orange County Fiscal Methodology and Interim Fiscal Impact Guidelines Workbook.

Public protection includes services provided by the District Attorney, Grand Jury, Marshall, Probation, Public Defender, Emergency Management, Institutional Labor, Pedestrian Crossing Guards, Detention Release, Juvenile Justice Commission and Alternative Defense. Costs factors for public protection are $18.90 per capita and $10.02 per employee.

Health services costs are for the Health Care Agency. Health services costs are projected based on a factor of $5.03 per capita.

Community and social services includes services provided by the Community Services Agency, Domestic Violence Programs, Alternate Dispute Resolution, Social Services Agency, Aid to Dependent Families with Children (ADFC), Foster Care, Aid to Refugees, Case Data System and General Relief. Costs for these services are projected based on a factor of $8.83 per capita.

Environmental resources includes services provided by the Local Agency Formation Commission (LAFCO) and the Agricultural Commissioner. Environmental resources costs are projected based on $0.38 per capita and $0.20 per employee.

General government includes the numerous services associated with the operations of the County government. These include Assessor, Auditor-Controller, Board of Supervisors, Clerk of the Board, County Executive Office, Advocacy/Legislation, Protocol Office, County Counsel, Registration and Elections, General Services Agency, Data Systems, Utilities, Human Resources, Clerk-Recorder, Treasurer-Tax Collector, County Clerk and Internal Audit. General government costs are projected based on factors of $12.95 per capita and $6.87 per employee.

Capital Improvements includes minor Capital Projects, Data Systems Development and Real Property Leases. Costs are projected at $1.44 per capita and $0.76 per employee.

Insurance reserves and miscellaneous includes Miscellaneous Costs; Professional Consultants Recovery; Employee Benefits; Employee Retirement; Interest on Notes and Checks; and Provision for Contingencies. Costs for this category are projected based on factors of $14.21 per capita and $7.54 per employee

3.2 County Road Fund

Projected recurring County Road Fund revenues and costs from the Saddleback Meadows development plans are presented in Table 3-2 At buildout, recurring deficits are projected for Alternative 1 (150 units) and Alternative 2 (100 units). A recurring deficit of $2.1 thousand is projected for Alternative 1 based on projected recurring revenues of $2.9 thousand and projected recurring costs of $5 0 thousand. A revenue/costs ratio of 0.57 is projected for Alternative 1. A recurring deficit of $3.1 thousand is projected for Alternative 2 (100 units) based on projected recurring revenues of $1.9 thousand and recurring costs of $5.0 thousand.

Recurring surpluses to the County Road Fund are projected for the Proposed Project, Alternative 4 (318 units) and Alternative 3 (299 units). The largest recurring surplus is projected at buildout of the Proposed Project. A recurring surplus of $8.5 thousand is projected for the Proposed Project based on recurring revenues of $13.5 thousand and recurring costs of $5.0 thousand. A revenue/cost ratio of 2.69 is projected for the Proposed Project. The next largest recurring surplus is projected for Alternative 4 (318 units). The projected surplus for this Alternative is $1.1 thousand based on projected recurring revenues of $6 1 thousand and recurring costs of $5.0 thousand. A revenue/cost ratio of 1.22 is projected for Alternative 4. A recurring surplus of $0.7 thousand is

projected for Alternative 3 (299 units) based on projected recurring revenues of $5.7 thousand and recurring costs of $5.0 thousand. A revenue/cost ratio of 1.14 is projected for Alternative 3.

Recurring Revenues

Recurring revenues to the County Road Fund are projected for state gasoline tax; licenses, permits and franchises; and revenues from the use of money and property. The revenue factors for the County Road Fund are presented in Appendix Table A-2.

State gasoline tax. Orange County receives state gasoline tax from Sections 2104, 2105 and 2106. Based on the Orange County Fiscal Methodology and Interim Fiscal Impact Guidelines Workbook the state gasoline tax revenues are projected at $3.28 per capita for Section 2104, $1.50 per capita for Section 2105 and $2.09 per capita for Section 2106.

Licenses, permits and franchises. The County Road Fund is budgeted to receive total revenues from these sources of $500.6 thousand. Based on the County population of 2,748,640 these revenues are projected at $0.18 per capita.

Use of money and property. These revenues are projected at $0.91 per capita based on total budgeted revenues of $2.49 million and the total County population.

Recurring Costs

No local roads maintenance costs are associated with the Saddleback Meadows development, since all local roads are assumed to be privately maintained through the homeowners association. Annual traffic signal operation costs to the County are estimated at $5,000 per signalized intersection based on the County of Orange Fiscal Methodology and Interim Fiscal Guidelines Workbook.

3.3 County Library District

Table 3-3 presents the projected recurring Library District revenues and costs for the Saddleback Meadows development plans At project buildout, annual recurring deficits

TABLE 3-3
COUNTY OF ORANGE

County of Orange, "Fiscal Methodolgy and Interim Fiscal Impact Guidelines Workbook", November 1, 1996.

are projected for the Proposed Project and Alternative 4 (318 units). The recurring deficit for the Proposed Project is projected at $6.8 thousand based on projected recurring revenues of $19.1 thousand and projected recurring costs of $25.9 thousand. The projected revenue/cost ratio for the Proposed Project is 0.74. Alternative 4 (318 units) is projected to have an annual recurring deficit of $0.6 thousand based on projected recurring revenues of $11.1 thousand and projected costs of $11.7 thousand. The revenue/cost ratio for Alternative 4 is 0.95.

Annual recurring surpluses to the County Library District are projected for Alternative 1 (150 units), Alternative 2 (100 units) and Alternative 3 (299 units) The largest recurring surplus is projected for Alternative 3 (299 units). The projected surplus for Alternative 3 is $6.8 thousand based on projected recurring revenues of $17.8 thousand and projected recurring costs of $11.0 thousand. The revenue/cost ratio for Alternative 3 is a projected 1.61 The next largest recurring surplus is projected for Alternative 1 (150 units). This surplus of $4.4 thousand is based on projected recurring revenues of $10.0 thousand and projected recurring costs of $5.5 thousand. The revenue/cost ratio for Alternative 1 is 1.80. Alternative 2 (100 units) is projected to have a recurring surplus of $0.5 thousand based on recurring revenues of $4.1 thousand and recurring costs of $3.7 thousand. The projected revenue/costs ratio for Alternative 2 is 1.12.

Recurring Reveneus

Annual recurring revenues to the Library District include propert tax; use of money and property, intergovernmental revenues; charges for services; and miscellaneous revenues.

Property tax. The Orange County Library District's share of the basic 1.0 percent property tax levy is 1.3962 percent for the TRA in which the Saddleback Meadows project is located.

Use of money and property. Based on the budgeted amount of $2.14 million and the County Library service population of 1,351,905, this category is projected using a factor of $0.07 per capita.

Intergovernmental revenues. These revenues are estimated to total $491.9 thousand. Based on the Library District service population, intergovernmental revenues are projected at $0.36 per capita.

Charges for services. Based on the Library service population and a budgeted amount of $2.14 million, charges for services are projected based on a factor of $1.58 per capita.

Miscellaneous revenues. These revenues are estimated to total $56.3 thousand. Based on the Library service population, miscellaneous revenues are projected at $0.04 per capita.

Recurring Costs

Current operations and maintenance costs of providing libarary service are calculated in the Orange County Fiscal Methodology and Interim Fiscal Impact Guidelines Workbook at $15.32 per capita.

3.4 County Harbors, Beaches and Parks

The fiscal impacts to the County Harbors, Beaches and Parks Department from the five development plans for Saddleback Meadows are presented in Table 3-4. County Harbors, Beaches and Parks Department is projected to have an annual recurring deficit from Alternative 2 (100 units) and annual recurring surpluses from all other development plan. The annual deficit of $2.9 thousand projected for Alternative 2 is based on projected recurring revenues of $3.3 thousand and annual recurring costs of $6.2 thousand. The revenue/cost ratio for Alternative 2 is projected at 0.54.

The largest recurring surplus to the Harbors, Beaches and Parks Department is projected for Alternative 3 (299 units). The recurring surplus of $8.7 thousand for Alternative 3 is based on projected recurring revenues of $14.9 thousand and projected recurring costs of $6.2 thousand. The projected revenue/cost ratio for Alternative 3 is 2.41. The next largest recurring surplus is projected for the Proposed Project (750 units), at $8.1 thousand. This surplus is based on projected recurring revenues of $14.3 thousand and

projected recurring costs of $6.2 thousand. The revenue/costs ratio is projected at 2.32 for the Proposed Project. Alternatives 1 (150 units) and 4 (318 units) are projected to have similar recuring surpluses of $2.3 thousand and $2.6 thousand, respectively. Recurring revenues for Alternative 1 are projected at $8.4 thousand while recurring revenues for Alternative 4 are projected at $8.8 thousand. The recurring costs are the same for both alternatives, at a projected $6.2 thousand. The projected revenue/cost ratios are 1.37 for Alterantive 1 and 1.42 for Alternative 4.

Recurring Revenues

The only recurring revenue projected for the Harbors, Beaches and Parks Department is property tax. The Department's share of the basic 1.0 percent property tax levy is 1.280 percent, based on the tax rate area in which Saddleback Meadows is located.

Recurring Costs

The only recurring cost to the Department from the development plans for Saddleback Meadows are for maintenance of the regional and local hiking trails. These costs are projected based on a factor of $6,400 per lineal mile.

INTRODUCTION

This report presents the results of a coast live oak (*Quercus agrifolia*) tree inventory of Saddleback Meadows and describes the number of oak trees impacted and preserved by development of 318 detached residential lots and associated facilities on Saddleback Meadows. Saddleback Meadows occurs on 222.2 acres in an unincorporated portion of Orange County, south of El Toro Road and east of the Foothills Transportation Corridor.

METHODS

Previous work by Pacific Southwest Biological Services' (PSBS) original tree inventory from 1989 (PSBS 1994) was reviewed by Deborah Pudoff and Scott Taylor of Sweetwater Environmental Biologists, Inc. (SEB) on October 20, 1995. Trees that were missing from the PSBS map but were in PSBS' inventory were located and added. SEB also added trees that PSBS did not include in its inventory. Tree heights were visually estimated, and each tree was assigned a qualitative assessment number (Appendix A, numbers 360 through 380). The additional trees were not tagged.

Based on the remedial grading line, the number of trees within the remedial grading zone were compiled, and these trees are considered impacted. The number of trees outside the remedial grading zone were also compiled, and these trees are considered preserved.

RESULTS

The PSBS oak tree inventory (PSBS 1994) states that 289 trees were inventoried Actually, it appears that 279 trees were inventoried along with two scrub oaks (for a total of 281). Only 276 trees appear on the PSBS oak tree maps. We found that four of the trees were left off of the map (tag numbers 125, 126, 228, and 238), and PSBS included one scrub oak on the map (tag number 244) but not the other scrub oak (tag number 85). Two-hundred seventy-six mapped trees including one mapped scrub oak, plus four omitted trees and one omitted scrub oak equals 281 plants inventoried. SEB mapped the missing trees, added two new trees (numbers 379 and 380), and deleted two trees that appear to have fallen into a ravine for a total of 279 trees (Figure 1–map pocket). In the southern portion of the site, 19 oak trees were counted and have been included on the attached map (Figure 1, numbers 360 through 378).

As an aside, most of the trees that were tagged by PSBS no longer retain the tags, and some no longer retain even the nails. Many of the remaining tags were very mangled, and bark is growing around them. In most cases we believe that the trees have grown to a point where the tags were pushed out. In other cases the nail only penetrated the bark, and the bark has fallen off.

A total of 140 oak trees (approximately 47 percent) occur within the remedial grading zone and are considered impacted. A total of 158 oak trees (approximately 53 percent) occur outside the remedial grading zone and are considered preserved (Figure 1 and Appendix A).

I. INTRODUCTION

A. PROJECT LOCATION

Tract 10692 is located in the County of Orange South of Santiago Canyon Road and East of El Toro Road. (See Figure One).

B. STUDY PURPOSE

The purpose of this study is to determine the drainage facilities necessary for Tract 10692 (Saddleback Meadows).

C. PROJECT STAFF

Hunsaker & Associates, Inc. engineering staff involved in this study include:

Doug Snyder, R.C.E., Principal
Gary Martin, R.C.E.
G. Eshaghi

Hunsaker & Associates, Inc.

DISCUSSION

The hydrology calculations submitted with this report for Tract 10692 is done per the 1986 O.C.E.M.A. Hydrology manual.

Tract 10692 is a proposed residential development known as Saddleback Meadows.

Total of 318 single family residential lots with the average lot size of 7500 square feet. The hydrology map for proposed condition in the back of this report depicts the storm drain alignments and catch basin locations. Node numbers are used to correlate the computer printouts to the development plan. All catch basins in the sump condition were sized to pickup the 100 year storm event.

The hydrology analysis for Tract 10692 (Saddleback Meadows) has been divided into five different files plus an existing 100 years storm event analysis of total tract area.

The hydrology map for existing condition in the back of this report is only for the purpose of comparing areas tributary at each point for Tract 10692 under developed and undeveloped stage and is not the actual discharge flow comparison nor total discharge tributary at each point.

I. INTRODUCTION

This Addendum to certified subsequent EIR (SEIR 566) has been prepared to evaluate the environmental effects associated with a contingency plan for 299 single-family dwelling units, as proposed by the applicant for the 222.2-acre Saddleback Meadows project site. This revised project has been developed by the applicant, based upon direction given at the December 3, 1997 Orange County Planning Commission public hearing and identified comments during the public review period and is referred to as the proposed project within this addendum. The Area Plan and Site Development Permit application had been submitted to implement the direction given to County Staff by the Board of Supervisors per their motion of June 2, 1998 (Agenda item #S86A) which directs County Staff to immediately begin processing General Plan Amendment, Specific Plan Amendment, Zone Change, Area Plan, Tentative Tract Map applications and any other required plan/application for the 299-Lot Development Plan, in accordance with the conceptual terms of a settlement agreement regarding the potential purchase of the Saddleback Meadows property as described at the June 2, 1998 Board of Supervisors hearing. This Addendum evaluates the environmental effects associated with this project and is based on Final SEIR 566, which was certified by the Planning Commission on December 3, 1997 and affirmed by the Orange County Board of Supervisors on January 27, 1998.

The currently proposed contingency plan for 299 residential units was examined previously for this site in the form of alternatives, contained in Final EIR 561 and Certified Final EIR 566, although with slightly differing site plans. The alternatives contained in the appendix of this document are Alternatives 4, 8 and 9 which were previously evaluated. The contingency plan results from an extended evaluation by the applicant to address environmental concerns previously analyzed by reconfiguring the proposed project density, land use and location.

The Addendum is based on certified SEIR (EIR 566) which was prepared to evaluate 705 manufactured homes (referred herein as the "approved project") and evaluates the currently proposed 299 unit project, which includes strategically designed landform grading and landscaping to screen and filter views of the proposed development area from surrounding land uses. This has been accomplished by shortening cul-de-sac street lengths and eliminating residential lots in order to allow space for landform berming and contour grading, designed to substantially reduce views of the development area from both Saint Michael's Abbey and the Ramakrishna Monastery. In addition, the majority of the development area is now located south of the primary on-site spine road, creating a single loaded collector street through the majority of the project site. The proposed project represents a substantial reduction in density and associated environmental effects, in comparison to the 705-unit previously approved project evaluated in certified SEIR 566.

The following design features have been incorporated into the proposed contingency plan for 299 single-family dwelling units:

- 299 single-family lots with conventional housing.

- Contour grading that emphasizes and extends existing landforms working in concert with landscaping to screen and filter views of the development.

- Berming at selected locations to blend with natural terrain features while providing screening and buffering views into the project site from The Ramakrishna Monastery, St. Michael's Abbey and the Hidden Ridge community.

- Site planning techniques that minimize rows of backyards along highly visible edges, incorporating slopes, landscape zones, and landforms between homes and surrounding land uses.

- Community-wide landscaping that provides visual enhancement through perimeter and interior plantings, providing filtered views of the proposed development area from the surrounding areas.

The scope of this Initial Study will be to analyze the contingency plan in comparison with the previously approved project. Final SEIR 566 was certified as final and adequate on January 27, 1998.

The CEQA Guidelines (Cal. Code of Regulations §15000 et seq.) authorize the use of an Addendum for the purpose of determining whether a previously prepared EIR can be used for a project (CEQA Guidelines §15063(c)(7)). This document will analyze each topical area for disclosure of any new or more severe impacts based on the proposed project, not previously anticipated.

Section 21166 of the California Environmental Quality Act (CEQA, Pub. Res. Code §21000, et seq.) sets the standard to determine whether another EIR should be prepared when a previous EIR has been prepared. Section 21166 states:

> "When an environmental impact report has been prepared for a project pursuant to this division, no subsequent or supplemental environmental impact report shall be required by the lead agency or by any responsible agency, unless one or more of the following events occurs:
>
> (a) Substantial changes are proposed in the project which will require major revisions of the environmental impact report.
>
> (b) Substantial changes occur with respect to the circumstances under which the project is being undertaken which will require major revisions in the environmental impact report.
>
> (c) New information, which was not known and could not have been known at the time the environmental impact report was certified as complete, becomes available."

Section 21166 is further explained in the CEQA Guidelines at §15162, in the following language;

"(a) When an EIR has been certified or a negative declaration adopted for a project, no subsequent EIR shall be prepared for that project unless the lead agency determines, on the basis of substantial evidence in the light of the whole record, one or more of the following.

(1) Substantial changes are proposed in the project which will require major revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;

(2) Substantial changes occur with respect to the circumstances under which the project is undertaken, which will require major revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

(3) New information of substantial importance which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the Negative Declaration was adopted, shows any of the following:

(A) The project will have one or more significant effects not discussed in the previous EIR or negative declaration;

(B) Significant effects previously examined will be substantially more severe than shown in the previous EIR;

(C) Mitigation Measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or

(D) Mitigation Measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

(b) If changes to a project or its circumstances occur or new information becomes available after adoption of a negative declaration, the lead agency shall prepare a subsequent EIR if required under subsection (a). otherwise, the lead agency shall determine whether to prepare a subsequent negative declaration, an addendum, or no further documentation.

(c) If the project was approved prior to the occurrence of the conditions described in the subsection (a), a subsequent EIR or negative declaration shall be prepared by the public agency which grants the next discretionary approval for the project. In this situation no other Responsible Agency shall grant an approval for the project until the subsequent EIR has been certified or subsequent negative declaration adopted.

(d) A subsequent EIR or negative declaration shall be given the same notice and public review as required under Section 15087 or Section 15072. A Subsequent EIR or negative declaration shall state where the previous document is available and can be reviewed."

The key to sections 21166 and 15162 is to determine if any circumstances have changed dramatically enough to justify repeating a substantial portion of the environmental documentation process. If conditions do not justify a new or supplemental EIR, but minor additional or technical changes (such as traffic updates) are appropriate to keep the document current and useful, an agency may prepare an Addendum (CEQA Guidelines §15164).

Based upon the foregoing information, it was determined that preparation of an Addendum is the appropriate CEQA document to provide project specific analysis and to provide clarification and minor changes to Final SEIR 566. This document is prepared under the authority of §15164 of the California Environmental Quality Act (CEQA) since only minor technical changes or additions are necessary to make previously certified Final SEIR 566 adequate under CEQA.

Additionally, this Addendum does not raise important new issues about the significant effects on the environment. There is no substantial evidence that the project, as mitigated by the mitigation measures required within the Final SEIR 566 would have a significant adverse effect on the environment (§15070).

Finally, Final SEIR 566 was certified for the development of the previously proposed project in connection with earlier approvals. The certification of an EIR is a recognition of the continuing utility of the document for subsequent development approval within the scope of the original approval.

The §21166 test provides evidence under state law on the question of whether a new environmental document is necessary. This test is a tangible one, and does not challenge the age of a document, only provides the criteria to test its continuing accuracy and utility.

II. PROJECT DESCRIPTION

1. Location

The project site is situated on 222.2 acres of vacant land located on the easterly side of El Toro Road, approximately ½-mile south of the intersection of Santiago Canyon Road/El Toro Road and Live Oak Canyon Road, in east-central unincorporated Orange County. The incorporated cities of Mission Viejo and Lake Forest lie approximately three (3) miles to the south and southwest, with the Cleveland National Forest boundary located approximately ½-mile north of the project site. Aliso Creek is located adjacent to the northwest portion of the project site. in addition, a small strip of County owned land is located between the project site and El Toro Road (Please refer to Exhibit 1, Regional Location Map and Exhibit 2, Vicinity Map).

2. Background

The following chronology identifies key dates in the projects' history.

SADDLEBACK MEADOWS PROJECT CHRONOLOGY

DATE	PROJECT RELATED EVENT
August 8, 1978	- The Orange County Board of Supervisors adopted GPA 78-1, Item 4, the "Saddleback Meadows Mobile Home Subdivision" which granted a change in the Land Use Element designation for the site from 5.4 Other Open Space to 1.22 Medium Low Density Residential and 2.1 Local Commercial. Maximum number set at 617 dwelling units. Triggering mechanism to revert land use designation to original after 2 years commenced. EIR 059 certified.
February 6, 1979	- Board adopted Site Plan conditions as requirements for implementing the subject amendment. Draft EIR 059, which was the CEQA documentation for the site plan, identified major grading impacts as project related impacts; these impacts were also shown on grading plans for Tentative Tract Map TT10692, prepared for the project.
March 7, 1979	- Zone change application, Tentative Tract Map and Addendum requests submitted to County for a maximum of 617 mobile home units and a neighborhood convenience commercial center on the project site.
March 29, 1979	- Determination of requirement for an EIR transmitted to applicant by Environmental Services Division (ESD).
June 5, 1979	- Appeal of EIR requirement by Cliff Russell, representing Worthington/McNiff.

June 11, 1979 - The Orange County Planning Commission denied the appeal. Supplemental EIR required for proposed 617 unit tentative tract map.

June 25, 1979 - Zone Change 79-24 submitted to County. The project proposed at the time consisted of 617 units.

December 13, 1979 - TT10692 approved by the Planning Commission with recommendation that Zone Change ZC79-24 be approved by Board of Supervisors for 705-unit residential.

January 9, 1980 - Saddleback Meadows properties placed in the PC "Planned Community" District and adopted by Board of Supervisors, Ordinance Number 3177. Final EIR 203 certified.

October 28, 1981 - Two year extension of time to record to expire December 12, 1983 approved by the Subdivision Committee.

December 7, 1981 - Appeal to deny two year extension of time affirmed by Planning Commission. One year extension of time to record to expire December 12, 1982 granted by Planning Commission.

November 17, 1982 - An additional one year extension of time to record to expire December 12, 1983 approved by Subdivision Committee.

July 13, 1983 - Saddleback Meadows Planned Community District Regulations amended by Planning Commission and adopted by Board of Supervisors, Ordinance Number 3398 (ZC82-63P).

October 26, 1983 - Third one year extension of time to record approved.

June 13, 1984 - Saddleback Meadows Planned Community District Regulations amended by Planning Commission and adopted by Board of Supervisors, Ordinance 3486 (ZC84-3P) to allow manufactured housing in PC.

October 24, 1984 - 589-day stay of time in which to record a final tract map approved by Subdivision Committee. Expiration date extended to July 24, 1986.

July 24, 1986 - Water district could not provide sewer service; recordation not allowed until sewer capacity available.

September 21, 1988 - Execution between Southmark and the Trabuco Canyon Water District of "Agreement for Designing Construction of Master Plan Facilities, Tract No. 10692";

September 21, 1988 - Execution between Southmark and the Trabuco Canyon Water District as a document entitled "Agreement for Construction of On-site Water and Sewer Facilities, Tract No. 10692";

December 16, 1988 - Tract Map 10692 recorded.

February, 1989	-	Payment of $973,528.58, purchase of sewer treatment capacity rights in Trabuco Canyon Water District's Chiquita Wastewater System Facilities by predecessor to Applicant;
1989	-	Payment by predecessor to applicant to the Trabuco Canyon Water District in the amount of $904,475.00 for capital improvement charges based on the Equivalent Density Units of Recorded Tract No. 10692;
December 10, 1991	-	Foothill/Trabuco Specific Plan approved and Final EIR 531 certified by Orange County Board of Supervisors. The Specific Plan incorporated the Saddleback Meadows Planned Community Regulations as the Bridlewood Residential District.
April, 1994	-	Grading Permit Application GA940031 submitted for Phase I, Grading (98.3 acres) of the site.
August, 1994	-	Environmental Impact Report Determination Letter issued by County.
August 11, 1994	-	Letter of Appeal filed with County, appealing EIR requirement.
November, 1994	-	Appeal Hearing postponed to January 7, 1995.
January 31, 1995	-	Applicant withdraws appeal. Planning Commission directs applicant to develop a more compatible project in response to public testimony, staff concerns, and Planning Commission's direction.
July 27, 1995	-	Revised Zone Change and Area Plan, 318-unit Site Development Plan and Tentative Tract Map submitted to County of Orange.
August 11, 1995	-	Notice of Preparation circulated for EIR 561
October 17, 1995	-	Screencheck Draft EIR 561 submitted to OCPDS for review.
July 30, 1996	-	After five public Planning Commission hearings, the Planning Commission was unable to reach a decision and make a recommendation to the Board of Supervisors. The Commissioners voted four times on varying lot yields ranging from 318 down to 260 units. However, a majority of the commissioners were in agreement on the general development envelope as depicted by Staff recommended Alternative 8 for 299 units. The Commission did, however, recommend certification of the EIR document. The Planning Commission recommended moving the project along to the Board of Supervisors for its consideration.
August 2, 1996	-	The applicant appeals Planning Commission action of July 30, 1996 because the Commission's inaction on making recommendation to the Board of Supervisors on the substantive issues of the Zone Change and Area Plan was procedurally a de-facto project denial.

September 10, 1996 - Applicant submits Alternative 9 (318 lots) to County staff and requests that the alternative be considered by the Board of Supervisors as a plan which better addresses the concerns and issues raised by the public and the Planning Commission at the last public hearing.

October 2, 1996 - Saddleback Valley Unified School District Board approves Mitigation Agreement for Saddleback Meadows based on the 318 unit project.

October 22, 1996 - Board of Supervisors public hearing on appeal of Planning Commission Action. The Board denied the Appeal. The Supervisors then motion to approve a project with a density cap of 100 lots (Draft EIR alternative No. 4). The motion did not carry and the Board directs staff to report back to the Board by November 5th, regarding the process to initiate a reversion to acreage on the Saddleback Meadows property, (i.e. remove the existing Recorded Final Tract Map).

November 5, 1996 - Board of Supervisors hear County staff's report concerning the reversion to acreage procedure. The motion to initiate the reversion to acreage does not carry. Supervisor Saltarelli requests staff to inquire about the potential acquisition of the Saddleback Meadows property for public purposes. The Board does not certify the EIR No. 561.

November 8, 1996 - Applicant receives transmittal from County expressing the desire to explore possible full or partial acquisition of the Saddleback Meadows property.

November 18, 1996 to March 7, 1996 - Applicant works with County staff and representatives of the community and the Foothill Trabuco Review Board to explore the possibility of negotiating a reduced development project in conjunction with a partial acquisition of the property.

December 3, 1996 - County accepts Grading application for Tract 10692 (for 705 units). Assigned Grading Application Number GA960048.

December 16, 1996 - County determines that a Subsequent EIR is required to evaluate the effects of the grading application.

December 24, 1996 - County circulates Notice of Preparation (NOP) of a Draft Subsequent Environmental Impact Report (#566) related to the Grading Application GA960048, for Tract Map 10692.

February 6, 1997 - County re-circulates NOP document for SEIR #566.

May 30, 1997 - Applicant submits application for Use Permit to allow construction of a temporary project identification/future construction sign on the Saddleback Meadows property.

September 9, 1997	-	Planning Commission denies Use Permit for sign.
September 19, 1997	-	Applicant appeals Use Permit denial to Board of Supervisors.
December 3, 1997	-	Planning Commission certifies Final Subsequent EIR 566.
December 9, 1997	-	Board of Supervisors denies applicants appeal and affirms Planning Commission's denial of Use Permit for a site sign on Saddleback Meadows.
February 9, 1998	-	St. Michael's Abbey transmits an offer to California Quartet for a partial purchase of Saddleback Meadows through their legal representative.
February 24, 1998	-	Board of Supervisors hearing upholding certification of Final Subsequent EIR 566. Supervisor Spitzer to provide Board with an update regarding potential settlement negotiations with Applicant regarding pending litigation against the County, within 45 days (April 14, 1998).
March 6, 1998 to August 1998	-	First in a series of settlement negotiation meetings involving St. Michael's Abbey, the Ramakrishna Monastery, California Quartet, and the County. CQ agrees to study a series of reduced development alternatives in conjunction with partial acquisition.
June 2, 1998	-	Board of Supervisors Hearing. Supervisor Spitzer presents status report on Saddleback Meadows project with direction to County Counsel and Planning & Development Services Department staff to prepare for consideration by the Board a settlement agreement containing the following "Conceptual" terms: 1) $1.5 million in appropriated County funds (Strawberry Field funds) will be utilized to acquire an interest in the subject property with the understanding that it is to be used only in conjunction with $10.5 million from St. Michael's Abbey to purchase the entire property with escrow to close on or before October 29, 1998 with language that if the "Strawberry Field funds" are not available for this proposal that it will not trigger the development option until the Board has had an opportunity to explore alternative funding and that County's contribution of $1.5 million shall be reimbursed in the event the property is used for a purchase which derives financial benefit; 2) request that all litigation by St. Michael's Abbey and/or California Quartet will be tolled; 3) County staff will immediately begin processing general plan, specific plan, zone change, area plan, tentative tract map applications and any other required plan/application for the 299-lot development plan to be considered for approval if the acquisition is not completed by October 29, 1998; and 4) request that California Quartet cease processing any permits related to the 705-unit manufactured home subdivision until October 30, 1998.

June 12, 1998 - Letter of intent regarding purchase and sale of Saddleback Meadows property to CQ from St. Michael's Abbey. Abbey indicates that as part of the terms, they would be allowed to develop the property.

June 15, 1998 - CQ formally requests County cease processing of the grading plan check application based on Recorded Tract Map 10692 (705 units), in accordance with the conceptual terms of the settlement agreement referenced in the Board of Supervisors motion of June 2, 1998.

June 22, 1998 - Area Plan and Zone Change application for the 299-unit "Contingency Plan" submitted to County.

June 23, 1998 - Board of Supervisors' Hearing – Supervisor Spitzer's update on Saddleback Meadows.

3. Project Description

The project proposes the construction of 299 single-family detached dwelling units (the proposed project). The average lot size for this project is approximately 6,672 s.f., with a minimum lot size of 5,000 s.f. Access to the project would be provided via a gate guarded private street off El Toro Road immediately south of the existing Aliso Creek/Trail under-crossing structure. An emergency only access connects with Valley Vista Way. All habitable structures are proposed to be protected by automatic fire sprinkler systems. The project site is approximately 222.2 acres in size. Total open space exceeds approximately 70%.

The project acreage (222.2 acres) does not include the adjacent off-site water tank site. A water tank with a maximum capacity of 1.4 million gallons, and associated access road, are proposed off-site adjacent to the northeast corner of the project site to provide water service to the proposed project. The proposed water tank site was previously dedicated to the Trabuco Canyon Water District when the existing Final Tract Map was recorded (Tract No. 10692). The water tank will be approximately 30-feet tall, 100 to 110-feet in diameter, and will be bermed, landscaped, and painted a complimentary color to the surrounding setting. A total of approximately 8 acres of off-site area would be affected as a result of project implementation to accommodate slope area, access roads, related remedial grading, the water tank, and County of Orange fuel modification requirements.

On-site circulation is proposed with a system of private streets consisting of a primary spine street (56-foot r.o.w.) and a series of cul-de-sacs (41-, 45-, and 52-foot r.o.w.). An encroachment easement is required from the County of Orange to accommodate the project access road where it traverses County owned property along the western-most boundary of the site.

The project has been designed to minimize impact on the existing landform. The homes have been located on the relatively level areas in a broad crescent shape flowing along the southern and eastern sides of the site, while the steep terrain of the central canyon area has been left as open space. Development is kept off the eastern

and northern major ridgelines bordering the property. A primary design consideration in establishing the rural-like character of Saddleback Meadows is presenting a landscape enveloped community when viewed from the surrounding areas and from within the development. In response to this design intent and the interests of St. Michael's Abbey, the Ramakrishna Monastery and the neighboring Hidden Ridge community, specific grading techniques, site planning, and landscape elements will be incorporated within the project. The intent of these features will be to enhance the views of Saddleback Meadows from the surrounding areas.

Design features such as landform grading, resource enhancement, and recreation/open space components are summarized as follows:

- Landform grading along the northern side of the primary spine road, and the majority of the southern development edge, designed to screen off-site views of the development area.
- A wildlife movement corridor system designed to accommodate primary wildlife movement through a 400 foot wide east-west corridor (not counting 50' wide buffer zones on either side of the corridor).
- Preservation of the southerly ephemeral pond.
- A ±90-acre extension of O'Neill Regional Park that may include a trail head/pocket park and ridge top lookout park as possible amenities.
- A hiking trail connecting the Aliso Creek Riding/Hiking Trail and the Live Oak Hiking Trail to the trail staging area and O'Neill Regional Park.
- Relocation of residential lots adjacent to the wildlife corridor and St. Michael's Abbey.
- Preservation of the oak woodland associated with the east-west wildlife movement corridor.
- Revegetation of the wildlife movement corridors with native plant materials.
- Elimination of side yard slope retaining walls.
- The elimination of a commercial use.
- Approximately 68.6 acres of Restricted Scenic Preservation Easement (open space).

Implementation of the proposed project would require grading totaling approximately 8.6 million cubic yards. The above outlined features of the proposed project would result in an incremental reduction in impacts to biological resources, traffic, noise, air quality, aesthetics, recreation, as compared to the approved project for a 705-unit manufactured housing project. In addition, the proposed project incorporates the most recent position of the resource agencies (U.S. Fish and Wildlife Service, California Department of Fish and Game, and the Army Corps of Engineers) pertaining to the location and width of the on-site wildlife movement corridor.

The proposed project site plan is shown in Exhibit 3, with the contour grading concept shown in Exhibit 5 and the landscape and revegetation plan shown in Exhibit 6 in this document. The proposed project land uses are summarized in the following table.

Proposed 299-Lot Project
Land Use Summary

ON-SITE	ACREAGE	% OF SITE
Residential Lots	45.8	21%
Streets (private)	17.8	8%
Regional Park	90.0	41%
Restricted Scenic Preservation Easement	68.6	30%
Subtotal	222.2	100%

The 299-unit project proposes a total of 158.6 acres or 71% of on-site open space, approximately 30.47 acres more than the approved project.

Orange County General Plan

The project site is subject to policies contained in Land Use Element, Circulation Element, Housing Element, Public Services and Facilities Element, Noise Element, Recreation and Safety Element of the Orange County General Plan.

Land Use Element

The Orange County General Plan Land Use Element (Adopted June 1982), designates the Saddleback Meadows project site as 1B (Suburban Residential - 0.5 to 18 du/ac). The Community Profile, which is not a part of the General Plan, designates the site as 1.2 low density residential (0.5 to 2.0 du/ac.)

Housing Element

The Orange County General Plan Housing Element was adopted September 13, 1993 and is a comprehensive statement of broad and specific policies to facilitate development of housing in the County. The project site is located in Regional Statistical Area (RSA) 43-C. RSA 43-C had a 1995 population of 190,700 with a year 2000 population projection of 212,700 (2.3 percent growth). RSA 43-C had a 1995 jobs to housing ratio of 3.80, the highest in the County.

In 1979, the County adopted the Inclusionary Housing Program (IHP), which required developers to provide 25 percent of all new dwellings within the affordable category (i.e., 120 percent or less of median income). In 1983, the IHP was replaced by the Housing Opportunities Program (HOP), which phased out mandatory requirements over a three-year period in favor of voluntary compliance with affordable housing objectives encouraged by County incentives and market forces. Adoption of the HOP did not rescind prior approvals of mandatory affordable housing requirements placed on projects as conditions of approval under the IHP.

A total of 26,907 mandatory affordable units have been required to date as part of General Plan amendments or zone changes. The vast majority of these (24,268) are found within planned communities, with the remainder scattered in conventionally-zoned parcels.

The previously approved and recorded Final Tract Map 10692 was required in the IHP/HOP to provide 66 2/3 percent of total construction as affordable housing (mobile homes). Since it was an original Condition of Approval, this requirement still applies to the project even though the County-mandated affordable housing requirements have since been rescinded.

Foothill-Trabuco Specific Plan

In December 1991, the Foothill-Trabuco Specific Plan was adopted by the County Board of Supervisors, and replaced the Foothill-Trabuco Feature Plan. This action converted the then policy level Foothill-Trabuco Feature Plan into a regulatory-zoning level Specific Plan The Specific Plan sets forth goals, policies, land use district regulations, development guidelines, and implementation programs designed to preserve the area's rural character and to guide future development in Foothill-Trabuco area.

To facilitate planning efforts, three (3) individual planning areas were created within the overall Specific Plan Area: 1) Upper Aliso Planning Area; 2) Trabuco Canyon Planning Area, and 3) Plano Trabuco Planning Area. The project site is located within the Upper Aliso Planning Area and is designated, the "Bridlewood Residential District".

While the Foothill-Trabuco Specific Plan was adopted with the intent of guiding future land use within the Specific Plan area, its approval post-dated that of Tract Map 10692 by some 12 years. Accordingly, the current project, originally approved in 1979, is effectively exempt from the provisions of the Foothill-Trabuco Specific Plan.

The following passages are excerpted from the Land Use Regulations section of the Specific Plan:

> *As long as the site is developed in accordance with the existing Saddleback Meadows Planned Community zoning (Zone Change 84-3P) and Recorded Tract 10692, the project site shall be exempt from all of the Regulations and Guidelines included in this Specific Plan other than those provided for by this District.* (Emphasis added)
>
> *The Bridlewood Residential District is established to recognize the existing zoning and tract map approvals for the Bridlewood (Saddleback Meadows) property which permit the development of 705 manufactured homes on the site. While the Board of Supervisors does not believe that these approvals are consistent with the Goals and Objectives of the Specific Plan, the property owner has recently declared bankruptcy. A legal stay precludes the Board of supervisors from taking any action related to the property that would affect its*

value. However, the provisions of this District require that the Specific Plan be amended to determine an appropriate density cap and District Regulations for the property in the event that it cannot be developed in a manner which is consistent with the approved zoning and tract map (Foothill-Trabuco Specific Plan p. III-20).

Aliso Creek Corridor Specific Plan

The Aliso Creek Corridor Specific Plan (concept) was adopted in July 1978 and outlines open space and recreational policies and programs for Aliso Creek and proximal surrounding areas, from it's headwaters in the Cleveland National Forest to its outlet into the Pacific Ocean at Laguna Beach. The goals of the Aliso Creek Corridor Specific Plan area as follows:

- The preservation of the natural character of the Aliso Creek Corridor from the forest to the sea, including the creek course and banks, irreplaceable resources and environmental features.

- The utilization of the Aliso Creek Corridor as an organizer for various systems including, but not limited to, recreation, circulation, public service and development.

- The provision of opportunities to provide for alternative means of transportation and recreation within the Aliso Creek Corridor utilizing bicycle, pedestrian, and equestrian trails, while minimizing conflicts with vehicular traffic along and across the corridor.

- The utilization of the Aliso Creek Corridor as a regional recreation/open space amenity providing a variety of recreation opportunities.

- Provision of a well-organized program designed to implement the Aliso Creek Corridor Specific Plan.

The project site is partially located within the Aliso Creek Corridor Specific Plan, with the Specific Plan's boundary formed by the Aliso Creek watershed limits. The site is located within Planning Unit 5 and more specifically Sub-area 33. Sub-area 33 is designated for open space and recreation land uses. In addition, the Concept Plan shows a regional bike trail on-site.

Zoning

The entire project site is currently zoned "S"-Foothill-Trabuco Specific Plan with "SR"-Sign Restriction overlay district. The Bridlewood/Saddleback Meadows Residential District was established within the Foothill-Trabuco Specific Plan, adopted December, 1991, to recognize the existing zoning and tract map approvals for the Bridlewood/Saddleback Meadows property. A zone change (ZC98-3) will be required to

amend the Foothill-Trabuco Specific Plan ("Bridlewood Residential District") (Specific Plan Amendment), Page III-20 (Section III.D.3.0 through 3.4). Although not a project-specific requirement, the County of Orange would be required to implement a General Plan Amendment to modify project-related affordable housing requirements no longer in effect. Once Zone Change 98-3 is adopted, the proposed project would be in substantial compliance with the Foothill-Trabuco Specific Plan.

III. ANALYSIS OF IMPACTS/MITIGATION:

The impact analysis contained in this Addendum compares project level and cumulative impacts of the previously approved project for 705 manufactured homes to the currently proposed project for 299 units for Saddleback Meadows. This section does not contain the full body of text from Certified SEIR 566, however, incorporates those sections by reference which are not duplicated herein in order to avoid redundancy.

1. LAND USE AND PLANNING ANALYSIS

PROJECT IMPACTS

Land Use Compatibility

The approved project for 705 units would construct manufactured single-family detached dwelling units, streets, slopes and associated infrastructure on the currently vacant project site. Minimum lot size for the approved project would be about 2,630 sf., which is smaller than the 3,000 sf. and 5,000 sf. required for the neighboring Portola Hills and Hidden Ridge single family detached residential communities, respectively. Both Hidden Ridge and Portola Hills also have attached residential units. A comparison of surrounding project gross densities is shown in EIR 566, Table 5 of Section 3. The approved project has a higher gross density than surrounding area projects.

O'Neill Regional Park is located adjacent to and directly south of the project site. The portion of the park adjacent to the site is primarily devoted to wilderness activities. As a result, implementation of the previous and proposed project would not be compatible with existing and planned park uses.

The Ramakrishna Monastery is also located adjacent to the southern boundary of the project site. This religious facility is occupied by seven resident monks and serves a limited number of visitors. Due to the contemplative purposes for which this facility exists, the previous and proposed project would not be compatible with the Ramakrishna Monastery.

Scattered estate density residential land uses are located adjacent to the eastern and northern project boundaries, although they would be physically separated from the project site by an intervening major ridgeline. These surrounding areas contain minimum one and 2.5-acre lots, and would not be considered compatible with the previous or proposed projects.

St. Michael's Abbey is located north of the project site and functions as a religious and educational facility. Introduction of the approved project adjacent to the Abbey would result in a land use incompatibility. The incompatibility between development and the Ramakrishna Monastery and St. Michael's Abbey is partially offset by some natural open space buffering and topographic landscape screening.

The proposed project does provide additional buffering through site design, with landform berming and contour grading, working in concert with landscaping to further screen and filter views of the development edges. A major design feature of the proposed project for 299 units is the single loaded primary spine road (residential development south of the spine road and landform grading to the north), which is intended to screen off-site views of the on-site development area. Landform grading and limited use of loffel walls are proposed to minimize the views of the development area from off-site locations. In addition, the proposed project would provide for a wildlife movement corridor system, which would effectively apportion the development into three residential enclaves. Additional single-family residential dwellings were located within the north central portion of the project site in the approved project, as compared to the proposed project, which has undisturbed open space in the same area.

The discussion on pages 4-1 through 4-13 of Certified Final SEIR 566 remains appropriate for this project. The reader is also directed to pages 4-1 to 4-17 of Final EIR 561. The proposed project would be in conformance with the Orange County General Plan, Foothill Trabuco Specific Plan and zoning, through the implementation of appropriate mitigation measures.

No significant unavoidable adverse impacts to land use would occur with implementation of the proposed project beyond those previously identified and addressed in Certified Final Subsequent EIR 566 for which a Statement of Overriding Considerations was adopted.

Orange County General Plan

Land Use Element

After approval of General Plan Amendment and Zone Change, the proposed project will be in conformance with all elements of the County General Plan, including the Land Use Element, Noise Element, Transportation Element, Housing Element, Growth Management Element, Safety Element, Public Services and Facilities Element, Recreation Element, and Resource Element.

Housing Element

The approved project would have supplied 705 manufactured single-family residential dwelling units into RSA 43-C, a jobs-rich, housing-poor area. This would have provided a significant addition to the County's stock of affordable housing units. This is noteworthy because the project was conditionally approved in 1979 with a 66 2/3

percent affordable housing requirement in accordance with the County's Inclusionary Housing Program (IHP). Although this mandate has since been rescinded, the original affordable housing requirements are still attached to Final Recorded Tract Map 10692. As per the Conditions of Approval originally placed on Tentative Tract 10692, a total of 470 lots are to be sold in the affordable range. This figure is further broken down as follows: 188 low/ moderate, and 282 Medium I, as defined by the County. The proposed project would not provide affordable housing stock to the County's housing stock.

Foothill-Trabuco Specific Plan

The approved project is inconsistent with many of the goals, objectives, and policies of the Foothill-Trabuco Specific Plan which generally calls for the preservation of the rural character and natural habitat of the Foothill-Trabuco area. The current proposal for 299 units is more consistent with the provisions of the plan. The proposed site has been designated "Bridlewood Residential District" by and was made a part of the Specific Plan. Accordingly, the project is exempt from provisions of the Specific Plan. The Specific Plan reads as follows:

> *The Bridlewood (Saddleback Meadows), Lyon Ranch (Saddleback Community Church), Santiago Ranch and Zadeh properties currently have approved or recorded tract maps in effect. Except in the event that proposed development on these individual properties cannot be found consistent with previous approvals, the subject properties shall be exempt from all of the Regulations and Guidelines included in this Specific Plan and shall be subject to the zoning in effect at the time of . . . project approval.*

Although the Saddleback Meadows area is deemed exempt from the goals, objectives and policies of the Foothill-Trabuco Specific Plan, there are certain features of the project which attempt to satisfy community amenities and standards for development. Specifically, these include the incorporation of riding, hiking and bicycle trails, and eight private park sites.

The previously proposed project conflicts with the Foothill-Trabuco Specific Plan specifically with regard to the preservation of a regionally contiguous wildlife corridor. Furthermore, the Specific Plan states that the type of homes previously proposed (manufactured homes) would be incompatible with site topography and biological resources. The Specific Plan reads as follows:

> *It is recognized that the Specific Plan Area, due to its steep terrain and sensitive biological resources, is inappropriate for the provision of affordable housing. The provision of (high density) affordable housing conflicts with the goals and objectives of the Specific Plan which include maintaining the rural character of the area, providing a buffer between urban development and the Cleveland National Forest and preserving significant biological resources and natural landforms.*

The Saddleback Meadows "Rural Character Statement" establishes the community design concept of the project. It responds to the project team's intent for a rural community theme and character and to design considerations expressed by Saint Michael's Abbey, Hidden Ridge residential community, and the Ramakrishna Monastery. Further, it is used as a guideline for community design and as a "tool of measure" to be used by the Planning commissioners during the review of the Use Permit. The Saddleback Meadows community will incorporate community wide design elements and features reflective of the rural character. A primary design consideration in establishing the rural character of Saddleback Meadows is presenting a landscaped enveloped community when viewed from the surrounding areas and from within. This is accomplished through creative contour grading, berming at select and appropriate locations, creative site planning techniques, and an aesthetic community wide landscape.

Aliso Creek Corridor Specific Plan

The previous and the proposed project do incorporate regional riding and hiking trail connections into the design, however, conflict with several other aspects of the Aliso Creek Corridor Specific Plan. The proposed project does not warrant the need to channelize Aliso Creek along El Toro Road as the previous 705-unit project does. The approved project (705 units) is in direct conflict with the Natural Communities Conservation Planning Program (NCCP) in that it would further disturb a sensitive wildlife habitat area and inhibit the movement of wildlife through the area. However, the proposed project would not preclude the viable movement of small and medium size mammals and birds, because of the incorporation of a wildlife movement corridor into the design of the project.

Zoning

The previous and proposed projects are in conformance with County zoning standards. No conflicts would result.

Impact Significance Criteria

The effects of a project on existing or planned land uses are considered to be significant if the proposed project conflicts with one or more of the following:

A. Conflicts with General Plan land use or zoning designations or policies;

B. Conflicts with existing or planned land uses on-site or adjacent to the project site, e.g., disrupts the physical arrangement of an established community or causes development within or adjacent to open space preserved for habitat value;

C. Results in conversion of prime agricultural land to non-agricultural uses, or impairs the productivity of prime agricultural land;

D. Causes significant urban growth.

These criteria are derived from the County PDS/Environmental Analysis Checklist.

SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the approved proposed project, would result in significant land use compatibility impacts to O'Neill Regional Park, the Ramakrishna Monastery St. Michael's Abbey, and surrounding residential communities. The project would also conflict with policies of the Aliso Creek Corridor Specific Plan.

CUMULATIVE IMPACTS

Implementation of the approved or proposed project, in conjunction with the identified related projects, would result in additional urban intensity within and adjacent to the Foothill-Trabuco Specific Plan area.

MITIGATION MEASURES

Standard County Conditions and Mitigation Measures

SC 1-1 Prior to the issuance of any building permits for residential construction, the developer shall comply with Board of Supervisors Resolution 82-1368 (Buyer Notification Program) which requires the developer to prepare a map denoting the existing and proposed land uses, arterial highways, and public facilities within the surrounding area for the approval of the Manager, PDS/Current Planning Services Division. The map content, display, and distribution shall be in accordance with the Buyer Notification Program guidelines approved by the Board of Supervisors and available at the Development Processing Center.

SC 1-2 Prior to the issuance of any certificates of use and occupancy, the developer shall provide evidence to the Manager, PDS/Building Inspection Services Division, that the Department of Real Estate has been notified that the project area is within the boundaries of a Community Facilities District (CFD), and will be subject to special taxes for public facilities and/or services.

Land Use Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	No	No change in regional or local conditions occurred which exceed the thresholds established in Certified SEIR 566.
Changes in impact thresholds?	No	The impact thresholds established in Certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	Yes	The proposed project consists of 299 units on 160 acres (1.9 du/ac), compared to 705 units on 191 acres (3.7 du/ac) for the approved project., and it includes 62.2 acres of open space, compared to 31 acres for the approved project. The proposed project also provides more recreational amenities (a passive park and trailhead staging area) and a wildlife movement corridor system.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	Although the proposed project will continue to have a significant impact on land use compatibility, no new adverse impacts will occur.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

2. SOILS AND GEOLOGY ANALYSIS

PROJECT IMPACTS

Grading

Implementation of the approved project for 705 manufactured homes would require the following grading actions:

- Multiple cuts and fills (2.6 million cubic yards of conventional grading) to achieve planned elevations and profiles, and associated access roadways.
- Remedial grading (8.9 million cubic yards) to stabilize the proposed slopes by means of buttresses, shear keys, and stabilization fills;

- Removal (clean out) of all or major portions of the graben materials and softer alluvium and colluvium under most of the variable thickness fills;

- Installation of appropriate subdrain systems within natural drainage courses and within stability fills prior to fill placement;

- Adequate foundation and slab subgrade conditioning for the proposed development, including overexcavation, capping and measures related to expansive soils;

- Achieving suitable surface gradients, to preclude ponding anywhere on-site and to control water run-off via paved/closed drainage devices.

Implementation of the proposed remedial grading features, including removals/cleaners, buttress construction, subdrain systems, and temporary stockpiling are not anticipated to result in any impact to the stability of adjacent properties.

Based on average daily grading of 30,000 cubic yards/day, total proposed project-related grading (8.9 million cubic yards) would require approximately 10 months to complete. All preliminary grading would be completed in one continuous phase.

Geotechnical Conditions

The document entitled "Geotechnical Environmental Impact Report for Draft EIR No. 566 for Final Tract Map 10692 Saddleback Meadows Development" concludes that the site is geotechnically suitable for the previous and proposed project. This conclusion is based on the following conditions:

1. On-site bedrock and large landslide blocks have low settlement potential.

2. There is sufficient low to non-expansive materials to generate select fills

3. On-site liquefaction is not expected.

4. Bedrock can be excavated; no blasting is anticipated.

5. Grading east of the Abbey property will produce fill in the gully area which will stabilize slopes on the Abbey property.

6. No known active faults are present at the site and surface rupture during earthquakes is not expected.

7. Planned remedial grading will reduce the potential for earthquake-induced landsliding.

8. The site does not lie within the 100-year flood zone.

9. Subsidence at the site due to fluid withdrawal should not occur since no major ground water aquifers or petroleum reservoirs are known to underlie the site.

10. Site grading will reduce the potential for surficial erosion and the consequential siltation of nearby Aliso Creek.

The geotechnical report contained in Certified Final SEIR 566 also describes several unfavorable geotechnical conditions that could compromise the site's ability to support the project. Mitigation measures are recommended however, to correct these conditions and ensure that future development would be adequately and safely supported. The geotechnical report identifies the following conditions as being unfavorable: presence of unstable landslides, occurrence of some moderately to highly expansive soils and bedrock units, and presence of adverse bedding conditions and the presence of some perched ground water.

These unfavorable conditions can be mitigated by implementing corrective grading concepts, such as the construction of buttresses and shear keys, placement of expansive materials in deep fills, buttressing of cut slopes where necessary, construction of canyon subdrains and back drains to minimize or eliminate the affects of ground water, removal of compressible materials and replacement with compacted fill, and construction of large buttress cuts in segments to reduce the possibility of backcut failure.

In comparison, implementation of the proposed project for 299 units would require approximately 2.1 million cubic yards of cut and fill conventional grading and 6.8 million cubic yards of remedial grading (remove and replace) for a total grading quantity of 8.9 million cubic yards. The required grading for the proposed project would require 2.6 million cubic yards less than that required to implement of the proposed project. Grading quantities incrementally decreased under the proposed project as a result of the reduced earthwork required to create the landform grading along the visually prominent project edges. A supplemental geotechnical evaluation of the proposed project is included in Appendix A of this document. The supplemental investigation for the proposed project was conducted on June 22, 1998 by G.A. Nicoll and Associates, Inc. The purpose of the study was to evaluate the proposed project and its impact on the site conditions, to revise the previous geotechnical cross sections to reflect the new grades, to conduct stability analyses and to provide other additional geotechnical data to supplement the previous Geotechnical investigation of November, 1995.

The remedial grading required for the proposed project (299 lots) is significantly reduced from the 705-unit grading concept for the original entitled plan. The total remedial grading quantity for the proposed project is approximately 6.8 million cubic yards compared to the approved project with 8.9 million cubic yards. The study concluded that the site is developable.

Much of the general discussion on pages 4-13 through 4-33 of SEIR 566 and in Appendix D (Geotechnical Evaluation) of the Certified SEIR remain appropriate for the

proposed project Prior to implementation of mitigation measures, grading would result in significant impact related to slope stability, landslides, mudslides, subsidence and erosion. Review by County geotechnical experts, implementation of the proposed remedial grading features, including removals/cleaners, buttress construction, subsurface systems, and temporary stockpiling, would not result in any impact to the stability of adjacent properties. An average daily grading quantity of 30,000 cubic yards/day (total grading 8.9 million cubic yards) would require approximately 300 days (10 months) to complete grading operations.

The proposed project will eliminate an existing geotechnical hazard by remediating the existing deep seated ancient and surficial landslides on the property.

No significant unavoidable adverse impacts to soil and geology would occur with implementation of the proposed project.

Impact Significance Criteria

Earth resource impacts resulting from the proposed project could be considered significant if it causes any of the following impacts:

A. Changes in the geologic substructure or unstable earth conditions.

B. Exposures of people of property to geological hazards like landslides, mudslides, ground failure or similar hazards.

C. Substantial disruptions, displacements, compaction or overcovering of the soil.
D. Substantial increase in wide erosion of soils.

E. Changes in siltation, deposition or erosion that may modify the channel of a river or stream, or the bed of any bay, inlet or lake.

SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the proposed project, prior to the application of mitigation measures would result in significant impacts related to slope stability, landslides, mudslides, subsidence and erosion.

CUMULATIVE IMPACTS

Geotechnical impacts are not considered on a cumulative basis.

MITIGATION MEASURES

Project Design Features

PDF 2-1 A comprehensive remedial grading mitigation plan has been designed to stabilize the project site, in accordance with OCPDS requirements. The plan is depicted in Exhibit 19 of SEIR 566, p. 4-26, included in Appendix D of SEIR 566 and proposes measures including shear keys, buttresses, removals/recompaction to reduce hazards associated with landslides, erosion and subsidence.

Standard County Conditions and Mitigation Measures

SC 2-2 Prior to the issuance of a grading permit, the applicant shall submit a geotechnical report to the Manager, PDS/Subdivision and Grading Services Division for approval. The report shall include the information and be in a form as required by the Grading Manual.

SC 2-3 Prior to the issuance of any grading permits, the Manager, PDS/Subdivision and Grading Services Division, shall determine if the proposed grading complies with the grading illustrated in the plans approved by the decision-maker with regard to grading concepts, slope heights, slope ratios, and pad elevations and configuration. Significant deviations shall be reviewed by the decision-maker for a finding of substantial conformance. Failure to achieve such a finding will require processing a revised application per Orange County Zoning Code Section 7-9-139 and 7-9-150.

SC 2-4 Prior to the issuance of the first grading permit, for projects located immediately adjacent to or including portions of regional parks, significant open space corridors, or other environmentally sensitive areas, the project proponent shall provide evidence acceptable to the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PFRD/Harbors Beaches & Parks Division, that graded areas will be compatible with natural land characteristics of the adjacent open space areas including techniques to enhance a smooth and gradual transition, urban edge treatment plans and incorporating view enhancement through architectural and design techniques.

SC 2-5 Prior to the issuance of any grading permit, off-site grading and/or drainage shall be conducted in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-6 Prior to the issuance of a grading permit, substantial compliance with the following shall be certified by a registered engineer in a manner meeting

the approval of the Manager, PDS/Subdivision and Grading Services Division:

- Fill soils shall be placed in layers that are less than 8 inches thick and moisture-conditioned generally 1- to 2-percent above optimum moisture content. The existing diatomaceous soils should be moisture-conditioned to 125-percent of optimum moisture content.

- For preliminary earthwork computations, the following shrinkage/bulking factors are recommended for the on-site material (these do not include handling losses): Bedrock - 5% bulking; slopewash - 5% shrinkage; and Other Soils - 15% shrinkage. Grading plans shall include an area where finish grades can be raised or lowered to accommodate changes in actual material quantities.

- Dewatering shall be achieved using sumps and pumps located strategically within the excavated area. However, the excavation shall be carefully observed; if the conditions warrant, supplementary dewatering provisions shall be made. It is the responsibility of the contractor to provide an adequate dewatering system during construction.

Seismic

SC 2-7 Conformance with the Uniform Building Code and Orange County codes will insure that seismic considerations are incorporated into the structural designs. All recommendations of the geotechnical report shall be incorporated and utilized in the final construction plans for the parcels in a manner meeting the approval of the Manager, PDS/Building Permit Services Division. Larger buildings, structures with extraordinary architectural configurations, or those of tilt-up construction may require seismic analysis.

SC 2-8 The seismic exposure of the site shall be considered in the design of the proposed structures in a manner meeting the approval of the Manager, PDS/Building Permit Services Division.

SC 2-9 Geologic inspections shall be required during site grading for each parcel to confirm the absence of major faults in the local area in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-10 Prior to the issuance of any grading permits, if review of the grading plan for this property by the Manager, PDS/Subdivision and Grading Services Division, indicates significant deviation from the proposed grading

illustrated on the approved tentative tract map, specifically with regard to slope heights, slope ratios, and pad elevations and configuration, the plan shall be reviewed by the Subdivision Committee for a finding of substantial conformance. Failure to achieve such a finding will require processing a revised tentative tract map; or, if a final tract/parcel map has been recorded, a new tentative tract/parcel map or a site development permit application per Orange County Zoning Code Section 7-9-139 and 7-9-150. Additionally, a new environmental assessment and determination is required.

SC 2-11 Prior to the issuance of any grading permit, if determined necessary by the Manager, PDS/Subdivision and Grading Services Division, a letter of consent, in a form approved by the Manager, PDS/Subdivision and Grading Services Division, suitable for recording, shall be obtained from the affected property owners for off-site grading and/or drainage. The owner/applicant shall record said letters of consent for off-site drainage and/or cross-lot drainage prior to recordation of the tract/parcel map or prior to the issuance of any grading permit, whichever comes first.

SC 2-12 Prior to the issuance of any preliminary grading permits, the subdivider shall request that the Vector Control District initiate the survey process of the tract/parcel map site to determine if vector control measures are necessary. If warranted, such measures shall be conducted by the developer in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-13 Prior to issuance of grading permits, a Water Quality Management Plan (WQMP) shall be submitted to and approved by the Manager, PDS/Subdivision and Grading Services Division. The WQMP shall identify, at a minimum, the application and incorporation of those routine structural and non-structural BMPs outlined in the Countywide NPDES Drainage Area Management Plan (DAMP) Appendix G detailing implementation of BMPs not dependent on specific land uses, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-14 Prior to the issuance of any grading or building permits, whichever comes first, the applicant shall provide, in accordance with criteria supply by EMA, a "Hazardous Materials Assessment" and a "Disclosure Statement" covering the property (both fee and easement) which will be offered for dedication to the County of Orange, for review and approval by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PFRD/Monitoring Programs Division.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

Grading

AM 2-15 Multiple cuts and fills (approximately 2.1 million cubic yards) to achieve planned elevations and profiles, and associated access roadways shall be required.

AM 2-16 Remedial grading (approximately 6.8 million cubic yards) to stabilize the proposed slopes by means of buttresses, shear keys, and stabilization fills shall be required. Back cut failure guidelines shall be provided to the Grading Services Division prior to issuance of grading permits.

AM 2-17 Removal (clean out) of all or major portions of the graben materials and softer alluvium and colluvium under most of the variable thickness fills shall be required.

AM 2-18 Installation of appropriate subdrain systems within natural drainage courses and within stability fills prior to fill placement shall be required.

AM 2-19 Adequate foundation and slab subgrade conditioning for the proposed development, including over excavation, capping and measures related to expansive soils shall be required.

AM 2-20 Achieving suitable surface gradients to preclude ponding anywhere on-site and to control water run-off via paved/closed drainage devices shall be required.

Compaction

AM 2-21 Wherever structural fills are to be placed, the upper 6 to 8 inches of the exposed subgrade (after stripping and/or over excavation/clean-out) shall first be scarified and reworked. In general, the dry density of the in-situ (native) material shall be at least 85 percent of maximum. In the event that lower densities are determined by field testing to exist, the depth of over excavation will be determined on-site, given due consideration to the geology of the exposed material, as well as its relative location. It is at present expected that typical depths of over excavation will be on the order of 4 to 5 feet.

AM 2-22 Fill shall be placed in lifts of 6 to 8 inches (loose) in thickness. Rocks exceeding 4 inches in maximum dimension are best not incorporated

within the upper fill zone (say 3 feet) where foundations and most utility systems are expected to be housed.

AM 2-23 In all fill areas where active gradients are steeper than 5:1 (horizontal:vertical), those surfaces shall be prepared to receive fill by excavating standard keyways and benches in a stair-step configuration.

AM 2-24 Any loosening of reworked or in-place (native material, consequent to weathering and/or passage of construction traffic, shall be made competent.

AM 2-25 Temporary fills, typically associated with access ramps built to accommodate grading equipment shall be subject to removal when their use is discontinued.

AM 2-26 The depths of excavation shall be subject to on-site monitoring by the Soil Engineer, normally during the actual removal operations. Any surface or subsurface obstructions, or questionable material encountered during grading, shall be brought immediately to the attention of the Soil Engineer, for his determination as to proper exposure, removal and/or processing as directed.

Material Selection

AM 2-27 After the site has been stripped of any debris, vegetation and organic soils, such exposed on-site shall be considered satisfactory for reuse in the construction of on-site fills, provided the organic content does not exceed 3% by volume. It is recommended that highly expansive soils not be placed within the upper 4 to 5 feet thick zone underlying final pad and street grades. More importantly, no such soil is to be placed (as backfill) within a horizontal distance equal to the wall height immediately behind retaining walls.

AM 2-28 Any objectionable material, as determined by the Soil Engineer, shall be subject to relocation in deeper fill areas or removal off-site.

AM 2-29 All borrow sites shall be approved by the Soil Engineer/Geologist prior to on-site delivery. This will permit the timely allocation of such available materials for use on the project site.

Compaction Requirements

AM 2-30 Reworking/compaction shall include water addition or drying-out as needed, to bring the soils close to their optimum moisture content. All such reworked soils, placed as structural fills, shall be densified to achieve at least 90 percent relative compaction with reference to the laboratory

compaction standard. The optimum moisture content and maximum dry density, for each identified soil type, will be determined in the laboratory in accordance with ASTM Test Designation D1557.

Shrinkage/Subsidence

AM 2-31 For preliminary earthwork computations, an approximate (overall) shrinkage factor of 12 percent shall be required, for the existing site soils. The above value does not include allowance for stripping nor handling losses.

AM 2-32 Subsidence shall be assumed as 3/4 to 1-1/2 inches for grading design purposes.

Excavating Conditions

AM 2-33 Excavation of on-site soils shall be accomplished with standard heavy duty earthmoving or trenching equipment. Some hard cemented sandstone beds were encountered during the field exploration on portions of the site and some minor, isolated blasting may be required to remove these hard materials. If they are not rippable with conventional heavy duty earth moving equipment.

AM 2-34 Heavy seepage was encountered, as indicated on the Boring Logs, at multiple elevations. Consequently, considerable water can be expected within planned excavations, typically reaching maximum discharge within 2 to 5 days after exposure. Additional nuisance water (seepage) is foreseen in nearly all major cuts decreasing in volume with time, and being less at higher site elevations as well as in cuts made late in the year. All nuisance water shall be accommodated in accordance with County requirements.

Expansion Potential

AM 2-35 On-site materials are considered to be moderately expansive, generally. Soils of high and low expansivity are expected to comprise less than 25% of the overall pad areas. The expansivity of the actual soils placed within structural areas shall be verified during grading, prior to construction.

Utility Trenching

AM 2-36 The typical walls of temporary construction trenches shall stand nearly vertical, with only minor sloughing, provided the total depth does not exceed 4 to 5 feet. Shoring of excavation walls and/of flattening of side slopes may be required, if greater depths are necessary.

AM 2-37 Trenches shall be located so as not to impair the bearing capacity nor settlement under planned foundations. As a guide, trenches shall be aligned perpendicular to foundations, and the Structural Engineer so informed to modify the foundation at the crossing, as needed. All other trenches shall observe a lateral off-set equal to their total depth.

AM 2-38 Existing soils shall be utilized for trench backfill, provided they are essentially free of organic materials and oversized materials (rock, gravel, etc. in excess of 1-inch maximum size, unless within an approved soil matrix). Alternately, select granular materials (sand equivalent of 30 or greater) may be imported as backfill. Compaction should be accomplished entirely by mechanical means, subject to on-site assessment during pipeline installation.

Surface Drainage

AM 2-39 Positive surface gradients shall be provided away from slope tops per approved grading plans and adjacent to the future buildings, so as to direct surface water run-off away from structural areas and toward suitable discharge facilities.

Sulphate Content

AM 2-40 The soils sulphate content shall be ascertained during the concluding stages of rough grading, and the type of cement to be used determined at that time.

Grading Control

AM 2-41 All grading and earthwork shall be subject to on-going testing and observation by the applicants geotechnical consultant, including engineers, engineering geologists and/or technicians.

Slabs-on-Grade

AM 2-42 Concrete slabs shall be founded on approved (reworked) in-place soils and/or on properly compacted fill. The subgrade shall be proof-rolled just prior to construction to provide a firm, unyielding surface, especially if the surface has been disturbed by the passage of time and/or exposure to construction traffic.

AM 2-43 Floor slabs shall be at least 4 inches thick. The Finished Floor Level should be at least 6 inches above highest adjacent exterior grade. Joints shall be provided.

AM 2-44 If flooring that would be affected by moisture is to be used, the slab shall be underlain by 2 inches of sand, with a 10-mil plastic sheet between the sand and the subgrade.

AM 2-45 Precautions in respect to expansive soils shall be taken.

Foundations

AM 2-46 The proposed structures shall be supported on conventional spread footings, supported into approved compacted fill and/or reworked native material.

Long Term Settlement

AM 2-47 The grading concept, as presently proposed, includes several areas where deep fill will result, exceeding 50 feet in depth. These soil masses may experience significant, but considered normal, settlements, with time, of 4 to 6 inches or more. Such downward movements can be tolerated by most improvements, provided these occur at a reasonably uniform rate and rather evenly over a well distributed area. However, the degrees and rates of settlement shall be analyzed during the final design phase.

Phasing of Earthwork

AM 2-48 Unstable Ground
Initial stability evaluations have determined that several natural slopes subject to grading are inherently unstable. Removals, therefore, shall be planned and carried out with care in order to minimize deep-seated, in-construction failures. Typically, statistically about 10 percent of back cuts for buttresses have the potential to fail during grading. Extra care, the use of segmented back-cuts, along with allowances for schedule and budget contingencies will further minimize the potential for back-cut failure during construction.

AM 2-49 Required Clean-Out Work
Prior to improving the gross stability of hillsides, clean-out work will be necessary along their lowest (toe) elevations. Whereas such selective removals are essential prior to placement of additional fill, this process can trigger undesired slippage if proper care is not taken. Therefore, selective unloading of the slide mass shall be required before stabilization can effectively begin.

AM 2-50 Slide Unloading
Where existing slope faces are marginally safe in their present condition, the higher portions of each such slide shall require removals toward the top, prior to clean-out, and subsequent loading at the toe.

Soils and Geology Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	No	No change in regional or local conditions occurred which exceed the thresholds established in Certified SEIR 566.
Changes in impact thresholds?	No	The impact thresholds established in Certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	Yes	The proposed project will result in 8.9 million cubic yards of total grading, compared to 11.5 million cubic yards of total grading for the approved project. Grading for the proposed project will take 10 months to complete compared to 18 months for the approved project. The proposed project will also result in 31 acres of less disturbance area.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	Although the proposed project will continue to have a significant impact on landform/topography, no new adverse impacts will occur.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

3. WATER/HYDROLOGY ANALYSIS

PROJECT IMPACTS

Implementation of the previous and proposed project will result in the introduction of impervious surfaces (streets, driveways, residential units) and will result in a decrease in the area available for stormwater percolation and a subsequent increase in stormflow runoff. Implementation of the approved project would result in substantially more landform modification than the current proposal for 299 units therefore, redirecting drainage throughout the site.

Post development drainage is proposed to be accommodated through a series of storm drains, catch basins and inlet/outlet structures designed to accommodate a 100 year storm event. The proposed storm drain facilities parallel to El Toro Road will join the existing dual 96-inch diameter CSP storm drain which currently crosses underneath El

Toro Road. The proposed Orange County Flood Control District facility J01 storm drain plans were approved and signed by the County of Orange on November 16, 1988. The storm drain facilities consist of extending the dual 96-inch CSP storm drain to connect with an open channel riprap facility and a 14-foot by 12-foot reinforced concrete box culvert (RCB) that will run underneath the proposed entry road to Saddleback Meadows.

The on-site private storm drain improvement plans were approved and signed by the County of Orange on November 15, 1988. All of the proposed storm drain system is to be constructed of reinforced concrete pipe (RCP) ranging in size from 18 inches to 48 inches. All hydraulic calculations and the related hydrology have been previously approved by the County of Orange. Minor updating of the hydrology might be needed in the future depending on input from the County during review of the 40-scale rough grading plans. Proposed drainage facilities are shown in the following table.

PROPOSED DRAINAGE FACILITY SUMMARY

Storm Drain	Size	Q25 cfs (Discharge	Q_{100} cfs (Discharge)	Outlet Location / Connector
A	27-48 inch	277	300	Aliso Creek
B	18-24 inch	68.2	--	Line "A"
E	30 inch	48.5	--	Line "A"
H	27 inch	41.2	--	Line "A"

Water Quality

On-site surface and groundwater quality has not been evaluated from an analytical constituent standpoint due to: 1) its location at the headwaters of Aliso Creek and Oso Creek, 2) the undeveloped nature of the project site and upstream areas, and 3) the lack of pollutant generation sources. Ongoing livestock grazing activities have resulted in continued contamination of the on-site watering ponds with cattle manure. All organic material will be removed during grading operations.

Discharge of increased and concentrated runoff volumes into on-site natural drainage courses would result in increased erosion and associated sedimentation, primarily due to the unstable condition of drainage course banks.

Urban runoff associated with proposed on-site streets, driveways and manufactured slopes would be directly discharged into on-site drainage courses ultimately discharged to Aliso and Oso Creeks and the Pacific Ocean. Urban runoff constitutes would typically include oil, grease, cleaning products, herbicides, pesticides and fertilizers. Project urban runoff would be subject to an National Pollutant Discharge Elimination System (NPDES) Construction Stormwater Discharge Permit, issued by Regional Water

Quality Control Board (RWQCB). In addition, the proposed project is subject to the County's NPDES requirements.

Project related post-development urban runoff would incrementally impact the ability of Aliso Creek to recover from its currently impaired designation.

In comparison, the proposed project for 299 units would generate substantially reduced storm water runoff volumes and similar domestic water supply requirements, as compared to the approved project. Due to the enhanced habitat restoration and landform/contour grading provided with this alternative, temporary irrigation related water supply impacts are expected to be greater than the approved project with long term domestic supply impacts substantially less than the approved project. In addition, the proposed project would require less alteration of on-site natural drainages than the approved project, incrementally reducing the potential for increased urban runoff impacts.

Much of the discussion on pages 4-33 through 4-43 of SEIR 566 and Appendix E (Hydrology Study) in the Technical Appendices of Certified SEIR 566 remain appropriate for this alternative. Twelve (12) standard conditions/mitigation measures requiring compliance with the Master Plan of Drainage, NPDES, erosion control strategies, construction of site drainage systems and compliance with county and state water quality management standards will result in no significant effects to water/hydrology under this alternative.

Impact Significance Criteria

An impact is considered significant if:

A. There will be substantial and adverse increased inundation, sedimentation and/or damage from water forces to the subject property or downstream areas; the project will adversely affect the collection and conveyance of runoff and sediment. The design hydrologic standard is the 100 year storm event with an 85 percent (85%) confidence level.

B. Runoff from the completed project area would adversely impact the designated beneficial uses in the runoff receiving watershed, or would substantially impact Public Agency effects to improve any currently recognized conditions of water quality impairment.

SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the approved project would increase on-site storm flows by 17-54% over existing Q_{100} levels. Discharge of urban runoff, discharge of post development runoff into on-site natural drainage courses would result in increased erosion and sedimentation. Urban runoff would be directly discharged into on-site natural drainage

courses, resulting in impacts to downstream water quality in Aliso Creek and ultimately the Pacific Ocean.

CUMULATIVE IMPACTS

Implementation of the approved or the proposed project, in conjunction with related projects located within the watershed of both Aliso Creek and Oso Creek, would result in increased flows and increased urban runoff, ultimately discharging into the Pacific Ocean. Cumulative impacts to Oso Creek would also effect surface flows and water quality in San Juan Creek. These related projects are located within several jurisdictions, including the County of Orange, the Cities of Mission Viejo, Lake Forest, Aliso Viejo, Laguna Niguel, San Juan Capistrano, Dana Point and Laguna Beach, and Doheney State Park.

MITIGATION MEASURES

Project Design Features

PDF 3-1 A master drainage concept has been incorporated into the project design to mitigate hydrology impacts to existing OCPDS requirements and standards. The master drainage concept, shown in Exhibit 22 of SEIR 566, p. 4-40, and contained in its entirety in Appendix L of SEIR 566, proposes a series of storm drains, catch basins, inlet/outlet structures, energy dissipators and slope drains to control project drainage.

Standard County Conditions and Mitigation Measures

SC 3-2 Prior to the issuance of any grading permits the applicant shall, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division:

a. Prepare a drainage study determining the effect the proposed development and associated drainage patterns will have on existing drainage facilities.

b. Mitigate either by on-site retardation or by providing improvements appropriately to impacted existing drainage facilities.

SC 3-3 Prior to the issuance of any grading permits the applicant shall, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division:

a. Design and convey construction funds for surface drainage improvements; and

b. Design all necessary storm drain facilities extending to a satisfactory point of disposal for the proper control and disposal of storm runoff; and

c. Dedicate the associated easements to the County of Orange, if determined necessary.

SC 3-4 Prior to the issuance of any certificates of use and occupancy, said improvements shall be constructed in a manner meeting the approval of the Manager, PFRD/Construction Division.

SC 3-5 Prior to the issuance of any grading permit, and if determined necessary by the Manager, PDS/Subdivision and Grading Services Division, a letter of consent, in a form approved by the Manager, PDS/Subdivision and Grading Services Division, suitable for recording, shall be obtained from the upstream and/or downstream property owners permitting drainage diversions and/or unnatural concentrations.

SC 3-6 Prior to issuance of any building permits, the applicant shall participate in the applicable Master Plan of Drainage in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division, including payment of fees and the construction of the necessary facilities.

SC 3-7 Potential for the proposed project to impact the site's hydrology shall be reduced to a level of insignificance through engineering design and construction techniques incorporated into the project in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

Water Quality

SC 3-8 Prior to issuance of building permits, or grading permits, whichever come first, permit applicant shall submit for approval of the Manager, PDS/Subdivision and Grading Services Division, a Water Quality Management Plan (WQMP) specifically identifying Best Management Practices (BMPs) that will be used on-site to control predictable pollutant runoff. This WQMP shall identify at a minimum the routine structural and non-structural measures specified in the Countywide NPDES Drainage Area Management Plan (DAMP) Appendix which details implementation of the BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, lessee, etc.); and, shall reference the location(s) of structural BMPs.

SC 3-9 Prior to the issuance of precise grading permits or building permits, whichever comes first, the applicant shall submit and obtain approval from

the Manager, PDS/Subdivision and Grading Services Division, of a Water Quality Management Plan (WQMP) specifically identifying Best Management Practices (BMPs) that will be used on-site to control predictable pollutant runoff. This WQMP shall identify, at a minimum, the routine, structural and non-structural measures specified in the Countywide NPDES Drainage Area Management Plan (DAMP) Appendix which details implementation of BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association shall reference the location(s) of structural BMPs.

Flood Plain Elevation

SC 3-10 Prior to issuance of any grading permits, the applicant shall submit evidence to the Manager, PDS/Subdivision and Grading Services Division, that the applicant has obtained coverage under the NPDES statewide General Stormwater Permit from the State Water Resources Control Board.

Easements

SC 3-11 Prior to the issuance of any certificates of use and occupancy, the applicant shall not grant any easements over any property subject to a requirement of dedication or irrevocable offer to the County of Orange or the Orange County Flood Control District, unless such easements are expressly made subordinate to the easements to be offered for dedication to the County. Prior to granting any of said easements, the subdivider shall furnish a copy of the proposed easement to the Manager, PDS/Subdivision and Grading Services Division, for review and approval. Further, a copy of the approved easement shall be furnished to the Manager, PDS/Building Inspection Services Division, prior to the issuance of any certificate of use and occupancy.

Water/Hydrology Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	No	No change in regional or local conditions occurred which exceed the thresholds established in Certified SEIR 566.
Changes in impact thresholds?	No	The impact thresholds established in certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	Yes	The proposed project will generate 160 acres of surface storm water runoff compared to 191 acres for the approved project. The proposed project will also result in less alteration of on-site natural drainages reducing potential for increased urban runoff.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	The conclusion of no unavoidably adverse water/hydrology impacts reached in Certified SEIR 566 remains appropriate for the proposed project.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

4. TRANSPORTATION AND CIRCULATION ANALYSIS

PROJECT IMPACTS

Project access will be off of El Toro Road; an emergency only access at Valley Vista Way will also be provided. The entry street will be designed as a Collector roadway with a curb-to-curb width of 58 feet at its intersection with El Toro Road. This provides for two 12-foot exiting lanes and two 12-foot entering lanes with a 10-foot median. The Collector cross-section should be maintained for approximately 160 feet where it could then be transitioned to a standard 40-foot wide curb-to-curb width Collector roadway. The entry street will be designed with a traffic signal and a southbound left-turn pocket and northbound right-turn lane.

Traffic Impact Modeling

The current modeling source for traffic projections in the study area is the Orange County Transportation Analysis Model (OCTAM), Version 2.5, South County Subarea (SCTM). The Year 2000 and 2020 daily forecasts were projected to include the project, therefore, Year 2000 and 2020 traffic conditions without the project involved subtracting project volumes from the SCTM model volumes.

The Year 2000 and 2020 peak hour forecasts were developed using the previously described daily forecasts, along with peak hour traffic count data collected at each analysis location. Future baseline ADT volumes are shown in SEIR 566. The approved project is projected to generate approximately 6,220 trip-ends per day with 345 vehicles per hour during the AM peak hour and 635 vehicles per hour during the PM peak hour.

Trip Distribution/Assignment

Trip distribution represents the directional orientation of traffic to and from the project site. Trip distribution is heavily influenced by the geographical location of the site, the proximity to the regional freeway system, existing/future residential development, other commercial and community facilities. The directional orientation of traffic was determined by evaluating existing and proposed land uses within the community and the Master Plan of Arterial Highways (MPAH).

Existing plus project intersection ICU/LOS is shown in the following table.

EXISTING PLUS PROJECT ICU/LOS

Intersection	PEAK HOUR ICU		PEAK HOUR LOS	
	AM	PM	AM	PM
Santiago Canyon Road (NS) at:				
• Modjeska Canyon Road (EW)	0.87	0.61	D	B
• Ridgeline Road (EW)	0.82	0.60	D	A
El Toro Road (NS) at:				
• Live Oak Canyon Road (EW)	0.78	0.49	C	A
• Ridgeline Road (EW)	0.68	0.62	B	B
• Project Entrance (EW)	0.62	0.57	B	A
• Valley Vista Way (EW)	0.64	0.59	B	A
• Glenn Ranch Road (EW)	0.57	0.69	A	B
Saddleback Ranch Road (NS) at:				
• Glenn Ranch Road (EW)	0.32	0.33	A	A
Marguerite Parkway (NS) at:				
• El Toro Road (EW)	0.34	0.49	A	A
Portola Parkway (NS) at:				
• Glenn Ranch Road (EW)	0.57	0.46	A	A
• Foothill Transportation Corridor (EW)	0.40	0.58	A	A
• El Toro Road (EW)	0.41	0.50	A	A

Trip distribution for this study has been based upon near-term conditions, based upon those highway facilities which are in place. This assignment of traffic from the site to the adjoining roadway system has been based upon the site's trip generation, trip distribution and proposed arterial highway and local street systems. The Projected ADT volumes along El Toro Road in the vicinity of the site do not exceed 30,000 vehicles per day. The projected ADT's along El Toro Road between the Foothill Transportation Corridor (SR-241) and Live Oak Canyon Road are well within the Level of Service "C" volumes for a Primary (four-lane divided) Arterial highway facility.

As shown in the above table, intersections in the vicinity of the site for the previous and proposed project would continue to operate at Level of Service "D" or better during peak hours. A traffic signal is projected to be warranted at the intersection of El Toro Road/Project Entrance for existing plus project traffic conditions.

Year 2000 intersection ICU/LOS projections with and without the project and with and without improvements are shown in Table 15 of the SEIR 566. As shown in that table, all intersections will operate at LOS D or better, except for the intersection of Portola Parkway at Foothill Transportation Corridor, which will operate at LOS E during morning peak hours for the with project/without improvements scenario. A traffic signal would be warranted at the intersection of Santiago Canyon Road at Modjeska Canyon Road for the Year 2000 without project traffic conditions.

Year 2020 intersection ICU/LOS projections with and without the project and with and without improvements are shown in Table 15a of the SEIR 566. As shown in Table 15a several intersections would operate at unacceptable levels of service in Year 2020 without improvements in place. With project improvements in place, all intersections would operate at acceptable levels of service. Improvements would include the ultimate widening of El Toro Road and Santiago Canyon Road to four through travel lanes (two in each direction).

Santiago Canyon Road Analysis

Pursuant to the County of Orange Growth Management Plan (GMP), segments of Santiago Canyon Road are required to function at a Level of Service "C" Capacity improvements along Santiago Canyon Road will be required in conjunction with future growth to achieve Level of Service "C". The Santiago Canyon Road Major Thoroughfare and Bridge Fee Program has been designed to provide up to $34 million in improvements to Santiago Canyon Road from Chapman Avenue to Live Oak Canyon Road. However, the March, 1994 Project Report for improvements to Santiago Canyon Road indicates that the total cost of improvements is approximately $52.3 million for a "limited project" scenario. To address the difference between the ultimate cost of $52.3 million and the fee program allocation of $34 million, the project must provide an additional contribution beyond the payment of normal fees based upon its traffic share. Santiago Canyon Road Project Share Analysis is shown in the following table.

SANTIAGO CANYON ROAD PROJECT SHARE ANALYSIS

Volume Component	Roadway Segment					
	Live Oak Cyn. Rd. to Ridgeline Rd.		Ridgeline Rd. to Modjeska Cyn. Rd.		North of Modjeska Cyn. Rd.	
	AM	PM	AM	PM	AM	PM
Existing Volume (two way)	1,478	1,276	1,640	1,441	1,650	1,375
Project Volume (two way)						
-Residential	40	49	38	49	40	49
-Commercial	3	13	4	10	2	7
Project Increases						
-Residential	2.7%	3.8%	2.2%	3.4%	2.4%	3.6%
-Commercial	0.2%	1.0%	0.2%	0.7%	0.1%	0.5%

In comparison, estimated average daily traffic generation volumes associated with the proposed project for 299 units would be approximately 3,820 trips per day, 2,400 ADT

less than the proposed project. In addition, AM/PM peak hour volumes would be reduced to approximately 42% of the approved project ADT. The resulting impacts to existing level of service values would be substantially less than identified in the Final SEIR for the proposed project.

The proposed 299-unit project will not have a commercial land use component, therefore, it will not have traffic associated with such use.

The discussion on pages 4-44 through 4-83 of SEIR 566 and Appendix F (Traffic Report) of the Certified Final EIR of the Technical Appendices remain appropriate for this project. Because of its reduction in traffic impacts from the recorded tract map and imposition of (41) Project Design Features (PDFs), Standard Conditions (SCs) and additional Mitigation Measures (AMS), the proposed project would not result in any additional negative impacts. Implementation of the proposed project would result in the same improvements to El Toro Road through the existing Road Fee programs, similar to the proposed project.

No significant unavoidable adverse traffic and circulation impacts would occur with the proposed project, following implementation of outlined mitigation measures.

Impact Significance Criteria

The impact evaluation in this analysis focuses on intersection capacity, and uses peak hour intersection capacity utilization (ICU) values to express level of service (LOS). For the year 2010 evaluation, the GMP requires an evaluation of intersections where the project impact is greater than one percent. Satisfactory intersection operation is expressed as LOS D or better (ICU values from 0.00 to 0.90). Therefore, a significant circulation impact would occur if the project caused any intersection to exceed LOS D.

SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Under existing plus project intersection ICU/LOS conditions, the surrounding circulation would continue to operate at acceptable levels of service. The appropriate tables are contained in the Certified SEIR 566.

Year 2000 intersection conditions, without mitigation measures, would exceed Level of Service "D" significance criteria at the following intersections:

- Santiago Canyon Road at Modjeska Canyon/ Ridgeline Road
- Portola Parkway at Foothill Transportation Corridor
- El Toro Road at Live Oak Canyon Road/Glenn Ranch Road
- Portola Parkway at Glenn Ranch Road

Year 2020 intersection conditions, without mitigation measures, would exceed Level of Service "D" significance criteria at the following intersections:

- Santiago Canyon Road at Modjeska Canyon Road

- Santiago Canyon Road at Ridgeline Road
- El Toro Road at Live Oak Canyon Road
- El Toro Road at Ridgeline Road
- El Toro Road at Project Entrance
- El Toro Road at Glenn Ranch Road
- El Toro Road at Valley Vista Way
- Saddleback Ranch Road at Glenn Ranch Road
- Marguerite Parkway at El Toro Road
- Portola Parkway at Glenn Ranch Road
- Portola Parkway at Foothill Transportation Corridor
- Portola Parkway at El Toro Road

CUMULATIVE IMPACTS

The OCTAM/SCTM Year 2000/2020 model accounts for all cumulative projects within the region which could affect future traffic conditions. Refer to Section 4.4.3 for a complete analysis of cumulative impacts.

MITIGATION MEASURES

Project Design Features

Primary project access will be off of El Toro Road with an emergency access at Valley Vista Way.

PDF 4-1 The on-site circulation system will accommodate project related traffic generation, including design of the entry street as a Collector roadway with a curb-to-curb width of 58 feet at its intersection with El Toro Road. This provides for two 12-foot exiting lanes and two 12-foot entering lanes with a 10-foot median. The entry's cross-section shall be maintained for approximately 160 feet where it could then be transitioned to a standard 40-foot wide curb-to-curb width Collector roadway. Secondary emergency only access will be provided via a gated connection to existing Valley Vista Way. Minimum fire access roadway width of 28 feet shall be required.

PDF 4-2 The entry street will be designed with a traffic signal and a southbound left-turn pocket and northbound right-turn lane. The applicant shall provide a cash deposit for the design and construction of the traffic signal.

PDF 4-3 All weather access to the proposed water tank shall be provided by the applicant. This access shall be designed with a minimum 28 foot width and a maximum grade of 10%.

Standard County Conditions and Mitigation Measures

SC 4-4 Prior to the issuance of any building permits, the applicant shall participate in design, construction, and/or financing of the cost of a traffic signal in the project vicinity in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 4-5 Prior to the issuance of building permits, the applicant shall pay fees for the Major Thoroughfare and Bridge Fee Programs listed below, in a manner meeting the approval of the Manager, PFRD/Programs Division.

a. Foothill Circulation Phasing Program

b. Prior to recordation of a final tract map, the subdivider shall enter into an agreement with the County of Orange for participation in a fee program (if adopted by the Board of Supervisors) for implementation of the Foothill/Eastern Transportation Corridor. Said agreement shall provide that:

1. The fee shall be $158.00 per trip end times the County standard trip end generation rate for the type of development proposed, times the number of units (footage) proposed, or the fee payable under the program, whichever is less.

2. Subdivider's obligation to pay fees would arise only after the County establishes the fee program, prior to issuance of building permits.

3. Subdivider's obligation to pay the fee would be extinguished if the fee program were not established within three (3) years of the date of issuance of the first building permit for subject development.

4. Subdivider shall furnish surety bond, letter of credit, money or such other security approved by the Director, PFRDD, to assure payment of the fees related to subject development.

5. This condition shall be void if a trial court of competent jurisdiction, in a final judgement, or an appellate court, if the matter is appealed, sets aside a condition imposed by the County which was substantially the same as said condition.

c. El Toro Road

d. Santiago Canyon Road

SC 4-6 Building permit issuance shall be phased in accordance with the Foothill Circulation Phasing Plan (FCPP) Development Phasing Plan, and shall also be subject to any other Board of Supervisors approved growth management phasing plan pertaining to the timely provision of public services and facilities.

SC 4-7 Building permit issuance shall be phased in accordance with any Board of Supervisors approved Growth Management Phasing Plan pertaining to the timely provision of public services and facilities.

SC 4-8 Prior to the issuance of any grading permits, adequate sight distance shall be provided at all street intersections per Standard Plan 1117, in a manner meeting the approval of the Manager, PFRD/Programs Division. This includes any necessary revisions to the plan such as removing slopes or other encroachments from the limited use area.

SC 4-9 Prior to the issuance of any certificates of use and occupancy, the developer shall construct the approved internal circulation improvements in a manner meeting the approval of the Manager, PFRD/Construction Division. Further, a copy of the approved plans shall be furnished to the Manager, Building Inspection Services, prior to the issuance of any certificates of use and occupancy.

SC 4-10 When monuments exist which control the location of subdivisions, streets or highways, or provide survey control, the monuments shall be located and referenced prior to any street construction or relocation, and shall be reset after construction as required by Section 8771 of the Business and Professions Code, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 4-11 Prior to issuance of a building permit, the applicant shall pay a cash fair share contribution for the design and construction of improving Santiago Canyon Road from Live Oak Canyon Road to Jamboree Road, in a manner meeting the approval of the Manager, PFRD/Programs Division. In addition, the applicant shall participate in the Santiago Canyon Road Safety Improvement Program.

SC 4-12 Prior to issuance of a building permit, the applicant shall design and construct roadway improvements for El Toro Road including a deceleration lane and a left turn pocket into the project entrance based on a 60 mph minimum design speed in a manner meeting the approval of the Manager, PFRD/Programs Division.

SC 4-13 Prior to issuance of a building permit, the applicant shall provide a cash deposit for the difference in cost of designing and constructing the roadway improvements condition.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations in a manner meeting the approval of the Manager, Transportation Planning.

AM 4-14 El Toro Road lane improvements needed at the Project Entrance to serve Year 2000 and 2020 conditions shall be completed in conjunction with development.

AM 4-15 Traffic signing/striping shall be implemented in conjunction with detailed construction plans for the project. Verification of adequate parking shall be analyzed for the project site in conjunction with approval of the site plan.

AM 4-16 The project shall participate in existing road fee programs, including the Foothill/Eastern Transportation Corridor Fee Programs, Foothill Circulation Phasing Program (FCPP), El Toro Road Fee Program and the Santiago Road Fee Program. Both existing traffic patterns and SCTM traffic projections for Years 2000 and 2020 indicate the attraction of Glenn Ranch Road, Portola Parkway, and the Foothill Transportation Corridor (SR-241) for increased traffic volumes in the project study area. North of the Foothill Transportation Corridor, El Toro Road can accommodate projected traffic volumes with the proposed project on four travel lanes divided by a raised or striped median.

Transportation/Circulation Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	No	No change in regional or local conditions occurred which exceed the thresholds established in Certified SEIR 566.
Changes in impact thresholds?	No	The impact thresholds established in Certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	Yes	The proposed project will generate 3,820 ADT (Average Daily Trips), 2,400 ADT less than the approved project with 6,220 ADT.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	The conclusion of no unavoidably adverse transportation/circulation impacts reached in Certified SEIR 566 remains appropriate for the proposed project.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

5. AIR QUALITY ANALYSIS

PROJECT IMPACTS

The analysis methodology utilizes procedures outlined in the SCAQMD 1993 "CEQA Air Quality Handbook" where appropriate. In areas where more site-specific information was available beyond the default values recommended in the handbook, they were used to supplement the SCAQMD-suggested input parameters.

Vehicular emissions were calculated using the SCAQMD "MAAQI" computer model. Microscale emissions impacts were calculated using one generic run of the CALINE4 computer model adjusted for site-specific traffic volumes, travel speeds and emission data for intersections near Saddleback Meadows potentially affected by project-related traffic.

Many air quality impacts from dispersed mobile sources, i.e., the dominant pollution generators in the basin, often occur hours later and miles away after photochemical processes have converted primary exhaust pollutants into secondary contaminants

such as ozone. The incremental regional air quality impact of an individual source is generally immeasurably small.

In comparison, implementation of the proposed project for 299 units would result in a reduction in vehicular generated emissions as compared to the previously approved project, and incrementally reduced impacts to regional air quality. Temporary short-term emissions associated with grading and construction operations would decrease slightly over those associated with the previously project, as a result of the reduced grading requirements associated with the landform grading.

All of the discussion on pages 4-83 through 4-101 and Appendix G (Air Quality Assessment) of the SEIR 566 remain adequate for this alternative.

As with any large project located within the South Coast Air Basin, a non-attainment area, not projected to reach attainment until 2010 or later. The proposed project would result in unavoidable adverse cumulative air quality impacts.

Significance Impact Criteria

Criteria for determining the potential significance of new air quality impacts are based on Federal, state and local pollution standards/regulations. Impacts are considered potentially significant if project emissions meet any of the following criteria:

A. If the project is capable of an increase in daily emissions that exceeds the following SCAQMD recommended threshold criteria:

SCAQMD RECOMMENDED SIGNIFICANCE THRESHOLD CRITERIA

Pollutant	Operational Emissions	Construction Emissions
Reactive Organic Gases (ROG)	55 lbs/day	75 lbs/day
Carbon Monoxide (CO)	550 lbs/day	550 lbs/day
Suspended Particulates (PM_{10})	150 lbs/day	150 lbs/day
Nitrogen Oxides (NO_x)	55 lbs/day	100 lbs/day
Sulphur Oxides (SO_x)	150 lbs/day	150 lbs/day

B. If project emissions increase ambient carbon monoxide levels from below the NAAQS/CAAQS to above these standards.

C. If project emissions result in the accedence of any State, Federal or local ambient standards.

These thresholds do not take into account several important considerations, namely:

1. Emission levels from one large project may exceed thresholds while those from numerous smaller projects with identical emissions might not, even though the regional impact is the same.

2. Large developments have a greater opportunity to effectively implement TCMs because of a greater potential participant pool in trip/VMT diversion programs.

3. Project-related emissions and their regional impact may already have been incorporated into regional growth projections.

4. Emissions generated in or near El Toro have essentially the same regional air quality impact if they were released in a nearby community. If the anticipated demand for residential use is not met at Saddleback Meadows but in some other community, the no-project alternative will have basically the same regional air quality impact.

Additional indicators should be used as screening criteria to evaluate the need for further analysis with respect to air quality. Whenever possible, the project should be evaluated in a quantitative analysis; otherwise a qualitative analysis is appropriate. The additional indicators are as follows:

- Project could interfere with the attainment of the federal or state ambient air quality standards by either violating or contributing to an existing or projected air quality violation;

- Project could result in population increases within the regional statistical area which would be in excess of that projected in the AQMP;

- Project could generate vehicle trips that cause a CO hot spot;

- Project might have the potential to create or be subjected to objectionable odors;

- Project could have hazardous materials on site and could result in an accidental release of air toxic emissions;

- Project could emit an air toxic contaminant regulated by District rules or that is on a federal or state air toxic list;

- Project could involve disposal of hazardous waste;

- Project could be occupied by sensitive receptors near a facility that emits air toxics or near CO hot spots;

- Project could emit carcinogenic air contaminants that could pose a cancer risk.

Project-Related Sources of Potential Impact

Intensification of land uses in Orange County potentially impacts ambient air quality on two scales of motion. As cars drive throughout Southern California, the small incremental contribution to the basin air pollution burden from any single vehicle is added to that from several million other vehicles. The impact from this project, even if it generates a significant number of new vehicle trips, is very small on a regional scale. Basin-wide air quality impacts are, therefore, addressed in terms of project compatibility with regional air quality plans. If any given project or plan has been properly incorporated into basin-wide growth projections which are the basis for regional air quality/transportation planning, then the basin-wide impact of any proposed development is presumed, by definition, to be less than significant.

Locally, changes in the location of any collection of automotive sources, or changes in the number of vehicles or travel speeds may impact the microscale air quality around any given development site. Traffic increases not only contribute air pollutants in direct proportion to their cumulative percentage of traffic volume growth, but they may slow all existing traffic to slower, more inefficient travel speeds. The development traffic/air quality impact is thus potentially compounded.

Temporary construction activity emissions will occur during project buildout. Such emissions include on-site generation of dust and equipment exhaust, and off-site emissions from construction employee commuting and/or trucks delivering building materials. Because of their temporary nature, air quality impacts from construction have often been considered as individually less than significant. Also, construction activity emissions are difficult to quantify, since the exact type and amount of equipment that will be used or the acreage that may be disturbed on any given day in the future is not known with any reasonable certainty. The emphasis in environmental documents relative to construction activity emission impacts has therefore been to minimize the emissions as fully as possible through comprehensive mitigation even if the precise amount of emissions can not be precisely quantified.

Historical use of agricultural pesticides or herbicides on the project site may have left residues within the soil that may be lofted during site development. Such concern, however, are more common for cultivated fields where DDT or other chlorinated compounds were used than for open rangeland such as the project site.

Construction workers, and to some extent the public at large, could also be exposed to any spores, viruses or other materials in the soil released during site grading. Grading activities are not likely to create any unacceptable health impacts from biological organisms in that organisms such as Valley Fever are not endemic to the El Toro area. Thousands of acres of Orange County have been tilled for many years or graded for new development with minimal evidence of any health impacts from soil-borne pathogens.

Construction Activity Impacts

Dust is normally the primary concern during construction of new buildings and infrastructure. Because such emissions are not amenable to collection and discharge through a controlled source, they are called "fugitive emissions". Emission rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). Because of such variations, regulatory agencies use one universal factor based on the area disturbed assuming that all other input parameters into emission rate prediction fall into mid-range average values.

The PM-10 fraction of fugitive dust emissions are predicted to be around 55 pounds per day per acre disturbed in the absence of any dust control measures being applied. Mandatory measures required by South Coast AQMD Rule 403 (Fugitive Dust) are generally assumed to reduce this rate by 50%. Average daily PM-10 emissions during site grading and other disturbance are stated in the SCAQMD Handbook to be 26.4 pounds/ acre. Enhanced dust control procedures such as continual soil wetting, use of supplemental binders, early paving, etc. can theoretically achieve a 90% PM-10 control efficiency, or around 5.3 pounds per day per acre.

With "normal" dust control procedures, daily PM-10 emissions during construction of any individual project would exceed the SCAQMD emissions significance threshold of 150 pounds per day if more than 5.7 acres (150 lb □ 26.4 lb/acre = 5.7 acres) were under simultaneous disturbance. With assumed maximum achievable dust control, up to 28.4 acres (150 □ 5.7 = 28.4) could be under simultaneous disturbance.

The proposed project would be mass graded in one phase, with a total area of disturbance of 211 acres. Project development would exceed the PM-10 emissions significance threshold if a very substantial fraction of the project area were under simultaneous construction. It is highly doubtful, however, that heavy equipment operations will cover more than 25 acres because it would take an armada of equipment moving furiously to cover that much ground on any given day. It is possible, however, that more than 5.7 acres may be under simultaneous disturbance as the significance threshold for standard dust abatement. Enhanced dust control procedures thus need to be implemented during construction. With an effective dust control program implemented during construction, PM-10 impacts can be maintained at a less-than-significant level.

In addition to the fine particulates that remain suspended in the air semi-indefinitely, soil disturbance during construction may release considerable amounts of larger particles that have short atmospheric residence times. These larger particulates are generally inert silicates that are readily filtered out in the upper respiratory tract. They therefore have no adverse health effects. They may, however, create a soiling nuisance as they settle out on parked cars, landscaping foliage or other horizontal surfaces. Clouds of such dust may also locally impair visibility. Soiling nuisance at St. Michael's Abbey

during daytime on-shore flow or in Hidden Hills during nocturnal drainage winds is therefore a possible concern that further prompts the use of efficient dust control.

It is through these larger particulates that the public is aware of a dust problem in a construction area rather than through PM-10. Because such large particles are more readily lofted by turbulence during strong winds, extra dust control or cessation of soil disturbance activities is recommended when wind speeds exceed a heavy particulate lofting threshold of around 25 mph.

Construction also entails use of internal combustion engines to power on-road trucks and off-road mobile, semi-mobile and semi-stationary equipment. Such sources are mainly diesel-powered and are poorly regulated in terms of allowable emission levels. Off-road sources are sometimes not well maintained because there is no regulatory mechanism to enforce efficient combustion as there is for on-road sources. The SCAQMD has calculated the total area under construction that would cause the significance thresholds to be exceeded from construction-related equipment combustion emissions. For single family residences, the threshold is 1.3 million square feet of gross floor area (SCAQMD Handbook, Table 6-2). For 705 units even at 2,630 square feet per unit, total improved footage from simultaneous construction of the entire project will be less than the stated threshold. With the use of a comprehensive dust control program, construction activity air quality impacts in the project vicinity can be maintained at less than significant levels.

Construction activities are concentrated at the construction site, but they also spill over into the adjacent community. Spill-over may be physical spillage, or it may be from off-site congestion effects. Vehicles may track dirt off-site, lane closures may create congestion on public roadways and construction worker vehicles and supply trucks may compete with the general public for sometimes inadequate roadway capacity. Trucks may be left idling near off-site sensitive receptors while waiting to load or unload. Each of these small impacts nevertheless may be cumulatively significant when spread over several years of project area buildout. As with the on-site impacts, a heightened level of impact mitigation will need to be utilized to maintain an overall tolerable level of impact from site activity construction. Housekeeping and construction activity management procedures are identified in the impact mitigation discussion relative to "spill-over" minimization.

Mobile Source Impacts

The bulk of the proposed project's impact will derive from the approximately 5,410 daily trips that will be generated at full site buildout. At a typical trip length of around 9 miles per trip, project implementation would add around 50,000 vehicle miles traveled (VMT) to the basin-wide mobile source emissions burden.

The emissions associated with project buildout can be readily calculated using the SCAQMD's MAAQI computer model. Emissions from project-related travel were calculated for a buildout year of 1997 as the earliest likely project completion year. The

results of these calculations are summarized in the following table. The computer output from the emissions model is contained in Appendix G of this document.

PROJECT-RELATED OPERATIONAL EMISSIONS (POUNDS/DAY)

Land Use	CO	ROG	NO_x	SO_x	PM-10
750 D.U. (Mfg. Housing	1311.8	107.7	149.0	10.3	15.2
20 KSF Commercial	397.3	34.0	43.1	3.2	5.1
Total	1709.1	141.7	192.1	13.5	20.3
SCAQMD	550.0				
Proj. Share of Threshold	311%	55.0	55.0	150.0	150.0
		258%	349%	9%	14%

Source: MAAQI Computer Model (output in Appendix)

- Assuming a 1998 buildout.

- Stationary source emissions are slightly over predicted because project size was artificially modified upward to force MAAQI model trip projections to match the project traffic study forecasts.

Mobile Source Emissions

As shown in Table 19, mobile source emissions for the three primary exhaust pollutants (ROG, CO and NO_x) exceed the SCAQMD significance threshold by a wide margin. This conclusion is generally consistent with the SCAQMD Handbook ... which, in Table 6-2, states that single family residential projects of 166 units or more may have a significant environmental impact. Although the SCAQMD Air Quality Handbook states strongly that such emission levels will have a significant impact on the environment, that finding is not necessarily binding. The SCAQMD is only an advisory agency on this project, such that the Lead Agency must evaluate whether there will actually be a measurable degradation of the regional air quality environment resulting from project implementation. While the proposed project would cause the suggested AQMD emissions threshold to be exceeded by a wide margin, several considerations may mitigate against considering the resulting air quality impact as individually significant as follows:

1. Similar emissions would result from development of the same project in an adjacent jurisdiction or elsewhere in Orange County.

2. The project is consistent with growth assumptions that were used for regional emissions forecasts in the AQMP. The AQMP forecasts regional

attainment of the federal ozone standard by 2010 as long as the rate of predicted regional growth is not exceeded. The Saddleback Meadows project is only a minute part of predicted Orange County growth.

3. The transportation infrastructure is in place to efficiently service the site with good access to multiple transportation modes.

4. The project is located near the Foothill Transportation Corridor that provides good linkage between the Orange County concentrated employment centers and the project site.

The above considerations would allow for the Lead Agency to find that the air quality impact is individually less than significant despite the considerable emissions magnitude. If the emissions total alone were to be judged as sufficient evidence for a finding of significance, then the above considerations should be incorporated into a statement of overriding consideration.

Relative to a finding of (in)significance for the mobile source emissions, it should also be noted that the calculations do not take into account mandatory conversion of the basin travel fleet to methanol or a similar "clean" fuel. Clean fuel market penetration is mandated to be 25 percent by 1997 and then rise steadily into the early 21st Century. Zero emissions vehicle (ZEV) availability is also currently mandated under state law by the end of this decade with accelerated market penetration expected in the first decade of the next century. The assumption of 100 percent use of gasoline and diesel fuel in the analysis thus overstates project regional air quality impacts. However, independent of any reason to reduce the stated burden, traffic from all future growth will contribute significantly to the sub-regional and regional air pollution burden, and, therefore, creates a cumulatively significant air quality impact, regardless of project size. This is a function of growth and the dependence upon the single occupant fossil-fueled vehicle as the primary means of transportation. All growth delays the ultimate attainment of regional clean air standards. This project, within a loose definition of "cumulative projects", would contribute to that impediment to clean air. Regardless of any finding of individual impact significance, the proposed Saddleback Meadows development should be identified as having a cumulatively significant air quality impact.

Because vehicular sources from all combined growth will contribute so substantially to regional emissions total, it correspondingly represents a significant opportunity to reduce that contribution. A reasonable reduction percentage through the implementation of an aggressive transportation system management (TSM) will achieve a measurable reduction when applied to such a large baseline emissions level. If the air quality impact from mobile source emissions is to be maintained at an acceptable level, a viable TSM program is an imperative strategy toward achieving that end.

Orange County has been extensively involved in trip/VMT reduction programs through the trip reduction ordinances (TRO) and various geographically focused transportation management programs. Several countywide programs that monitor city and county

response to AQMP TCMs have shown that the county collectively has exceeded the 1994 trip reduction target of the 1991 AQMP when the county is allocated its fair share of the basin-wide reduction target. While progress toward reducing the dependence on the single occupant vehicle (SOV) is slow, continued progress toward higher average vehicle ridership (AVR) is to be expected during the Saddleback Meadows buildout time frame.

While regional mobile source emissions do not have a very direct impact on local El Toro air quality, the incremental addition of growth-related traffic over a wide area may change microscale air quality distributions. To determine whether future traffic changes will create an adverse air quality impact, a microscale air quality analysis was performed for the traffic analysis grid around the project site. A screening procedure based on the California line source roadway dispersion model CALINE4 was run for a number of traffic scenarios to evaluate any changes due to changes in patterns of growth anticipated as part of the Saddleback Meadows development.

The model combines the results of the traffic analysis with very restrictive dispersion conditions in order to generate a worst-case impact assessment. Carbon monoxide (CO) was used as an indicator of any "hot spot" potential because CO, unlike regional pollutants such as ozone, is directly related to source activity immediately adjacent to the receptor (a primary, unreacted pollutant impact). Calculations were made for an hourly exposure in the immediate vicinity of 10 roadway intersections where baseline traffic volumes were calculated in the traffic analysis.

The results of the microscale impact analysis are summarized in the following table. The values in the following table must be added to any non-local background CO distribution. If one assumes that the maximum level measured near the El Toro and Jeronimo Roads intersection is the regional background, and that the worst-case, one-hour level of 6 ppm observed in 1995 occurs at the exact same hour as any worst-case project impact, then it would take a local contribution of 14 ppm to threaten the one-hour California CO standard of 20 ppm. Microscale hourly CO levels, both without and with the proposed project are forecast to be below the 14 ppm threshold. Combined CO concentrations will thus remain below the California 1-hour CO standard of 20 ppm, and far below the federal standard of 35 ppm.

MICROSCALE AIR QUALITY IMPACT ANALYSIS

(Hourly CO concentration [ppm] above non-local background at edge of each indicated intersection).

Source: Screening Procedure based upon CALINE4 Model; Caltrans Air Quality Technical Analysis Notes (AQTAN), 1988.

Project-related CO contributions are seen in Table 20 to range from 0.0 to 1.9 ppm. The only increase exceeding 1 ppm occurs at El Toro Road and Ridgeline, where a change in level of service increases queuing times for all vehicles. The average increase at all intersections is 0.2 ppm compared to the most stringent standard of 20 ppm (1.0 percent average change). There are not now, nor will there be with the project, any microscale air pollution "hot spots" at any project area intersections.

Increased area-wide traffic and associated congestion is offset by continued improvements in vehicular CO emissions per average vehicle. Future (2020) CO levels with the proposed project and with anticipated intersection improvements are generally less than in 1997. At no intersection are 2020 "with project" levels greater than in 1997 by no more than 1.0 ppm. SCAQMD Rule 1303 identifies a CO increment of less than 5 percent of the hourly standard of 20 ppm, i.e., 1.0 ppm, to be a de minimis increment requiring no further impact analysis. The findings of the microscale impact assessment are therefore that CO levels under theoretical worst-case conditions do not exceed clean air standards and the Saddleback meadows traffic will add an insignificant amount to the total CO exposure. Microscale impacts are less than significant.

SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the previous and proposed project prior to the application of mitigation measures would result in significant impacts to short term dust (PM-10) generation, and operational emissions. Potentially significant impacts were identified during construction from dust (PM-10) generated by surface disturbance and from construction equipment operations. Operational emissions will be in excess of thresholds of significance for regionally significant pollutants as identified by the South Coast AQMD. As a minimum, vehicular emissions from project-related traffic should be identified as having a cumulatively significant air quality impact.

CUMULATIVE IMPACTS

Cumulative impacts are evaluated in Section 4.5.3 of SEIR 566. Regardless of any finding of individual impact significance, the proposed project would have an unavoidable adverse cumulative impact on air quality because of the site's location within the South Coast Air Basin.

MITIGATION MEASURES

A number of mitigations, as related to the project, are already incorporated into rules, regulations or ordinances. They are included in the following list of mitigation measures in that compliance mitigates a potentially adverse impact. They are not discretionary measures, however, which a developer can implement or the County of Orange can additionally require since compliance is already assumed in the impact analysis.

Project Design Features

No air quality PDF's have been proposed.

Standard Conditions and Mitigation Measures

SC 5-1 Grading and excavation shall be halted during periods of high winds meeting the approval of the Manager, PDS/Subdivision and Grading Services Division. According to AQP Measure F-4, high winds are defined

as 25 mph or greater. This level occurs only under unusually extreme conditions, such as Santa Ana wind conditions. Notations in the above format, included with other notations on the front sheet of grading plans, will be considered as adequate evidence of compliance with this condition.

SC 5-2 Prior to issuance of grading permits, the project applicant shall demonstrate measures to ensure compliance with SCAQMD Rule 403, and shall identify the dust suppression measures, such as regular watering, which shall be implemented to reduce emissions during construction and grading in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division. This will help reduce the short-term impacts from particles which could result in nuisances that are prohibited by Rule 403.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provision of existing codes and regulations:

AM 5-3 As previously noted, no credit was taken for mobile source emissions reductions either from technology improvements (reformulated gasoline, alternative fuels and/or electric cars), nor from transportation behavior modification in response to programs such as South Coast AQMD Reg. XV or by the trip reduction programs. These programs will mitigate the identified significant growth-related cumulative air quality impact to some extent. Because the projected effectiveness of such programs and because the time frame for technology development is uncertain, the degree of possible mitigation can not be quantified with certainty. Similarly, the buildout date for Saddleback Meadows will depend on economic forces that can not be predicted. The following discussion structures the recommended mitigation as comprehensively as possible, but quantification of mitigation effectiveness is speculative at currently known levels of detail.

AM 5-4 Contractors will comply with SCAQMD Rule 403.

AM 5-5 Contractors will utilize measures to prevent dirt from being tracked, washed, blown or otherwise conveyed onto paved roadways, and will wash or sweep the construction access points at El Toro Road on a routine basis on a frequency specified by the County of Orange as well as whenever dirt is visible more than 50 feet from the access point independent of the routine clean-up schedule.

AM 5-6 Trucks hauling dirt on public roads to and from the site will be covered or will maintain a six inch differential between the maximum height of any

hauled material and the top of the haul trailer. Haul truck drivers will water the load prior to leaving the site to prevent soil loss during transport.

AM 5-7 Construction management procedures required by the County of Orange and other jurisdictions shall be implemented. Contractor personnel responsible for supervision and the appropriate actions to be taken for the following measures shall be identified:

- Cessation of activities during a Stage-2 smog episode. Call 1-800-242-4022 for the daily forecast.
- Truck routes and schedules for receipt of materials shall be coordinated with County of Orange staff.
- Where feasible, on-road vehicles and off-road equipment shall be turned off and subsequently restarted if the anticipated duration of idling is expected to exceed five (5) minutes.

AM 5-8 Graded surfaces used for off-road parking, materials lay-down or awaiting future construction shall be stabilized for dust control as needed. Frequently accessed unpaved areas shall be paved as early as possible to minimize dirt trackout to public rights of way.

AM 5-9 Equipment will be maintained in proper tune to prevent visible soot from reducing light transmission through the exhaust stack exit by more than 20 percent for more than three (3) minutes per hour and use low-sulfur fuel as required by SCAQMD regulation.

Flag persons and appropriate traffic control devices will be used as needed to minimize construction activity interference with off-site traffic.

AM 5-11 Implementation of the above measures is expected to maintain construction activity air quality impacts at less than significant levels.

Operational Activities:

- Traffic flow at the project access will be maintained at acceptable levels of service through mitigation measures identified in the project traffic study.
- 220v electric power for future use to charge electric-powered vehicles will be made available in homeowner garages.

AM 5-12 Emissions calculations and the corresponding ambient air quality impact assessment for project-related construction and Saddleback Meadows operations presumed compliance with SCAQMD rules regarding dust

control. The potential for additional emissions reduction beyond the mandatory requirements of existing rules and regulations was evaluated based on Appendix 11 of the SCAQMD Air Quality Handbook which quantifies reduction potential of a variety of project construction and operation emissions control measures.

Dust emissions can be controlled from their 50 percent control assumed for Rule 403 compliance by an additional 50-80 percent of the uncontrolled fraction. The net effective dust control level is therefore 75-90 percent.

Unless the entire project site is under simultaneous massive grading, attaining the optimum level of dust control will maintain dust impacts at less than significant levels. Operational emissions reduction from mobile sources of 5 percent of their non-TCM implementation level can not reduce the substantial emission level to less than the SCAQMD advisory level significance thresholds. A number of secondary considerations were identified, however, that would either allow for a finding of an individually less than significant air quality impact.

Air Quality Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	Yes	The proposed project will result in reduced vehicular generated emissions, thus decreasing regional air quality impacts.
Changes in impact thresholds?	No	The impact thresholds established in Certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	Yes	The proposed project will result in a lower 299 du based emission generation. The proposed project will also have less short-term impacts associated with 8.9 million cubic yards of total grading compared to 11.5 million cubic yards for the approved project.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	Although the proposed project will continue to have a significant impact on air quality, no new adverse impacts will occur.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

6. NOISE ANALYSIS

PROJECT IMPACTS

Three noise concerns are typically identified with land use intensification such as that of the previous or proposed project. Construction activities, especially heavy equipment, will create short-term noise increases near the project site. Upon completion, project-related traffic will cause an incremental increase in area-wide noise levels throughout the El Toro area. Since, however, the number of trips generated by this small housing project is limited, the impact of ambient noise on the project site, rather than project traffic noise impacts on the rest of the community, is the important noise environment concern.

Construction Noise Impacts

Temporary construction noise impacts will vary markedly because the noise strength of construction equipment ranges widely as a function of the equipment used and its activity level. Short-term construction noise impacts tend to occur in discrete phases dominated initially by site clearing and grading, then by foundation construction, and finally for finish construction. The earth-moving (grading) activities are anticipated to be the noisiest sources during construction with equipment noise ranging from 75 to 90 dB(A) at 50 feet from the source.

Spherically radiating point sources of noise emissions are atmospherically attenuated by a factor of 6 dB per doubling of distance. The quieter construction noise sources will, therefore, drop below 60 dB by about 300 feet from the source while the loudest sources might still be detectable above the local background beyond 1,000' from the construction area. With hilly topography in the project vicinity, the terrain shielding effects will limit the "noise envelope" around each construction site to considerably less than its theoretical maximum.

Construction noise sources are not strictly relatable to a noise standard because they occur only during selected times and the source strength varies sharply with time. The penalty associated with noise disturbance during quiet hours and the nuisance factor accompanying such disturbance usually leads to time limits on grading activities imposed as conditions on grading permits. The weekday (including Saturday) hours from 7 a.m. to 8 p.m. are the times allowed in the Orange County Noise Ordinance for construction or grading. Division 6 (Sec. 4-6-1, et seq.) of the County Code also contains standard requirements related to the distance separation between construction activities and any occupied dwellings. EMA's "Standard Condition for Approval" N10 requires:

1. All powered equipment operating within 1,000 feet of a dwelling must have a properly operating and maintained muffler.

2. Stockpiling and staging activities must be located as far as practicable from dwellings.

Construction activities in areas of noise-sensitive biotic habitats such as coastal sage scrub containing gnatcatchers may affect bird behavior. Little actual evidence of noise effects on gnatcatchers has been documented, but many wildlife management agencies believe such effects exist. In San Diego County, a standard of 60 dB Leq (one hour average) derived from studies on least Bells Vireo has been applied to gnatcatchers. Use of this standard ignores the fact that a large number of successful breeding pairs have been found directly under the take-off end of major airport runways or next to freeways where peak hourly noise levels reach almost 80 dB. Many San Diego County grading projects have nevertheless been conditioned to avoid the breeding season for possibly noise-sensitive birds, or to erect temporary berms or other buffers to reduce avian noise exposure if seasonal avoidance is not practical.

Development-Related Vehicular Noise Impacts

Long term noise concerns from the increased urbanization of the project area center primarily on mobile source emissions surrounding the project site. These concerns were addressed using the California specific vehicle noise curves (CALVENO) in the federal highway noise prediction model (FHWA-RD-77-108) in a computerized version of the model developed by Caltrans. The model calculates the Leq noise level for a particular reference set of input conditions, and then makes a series of adjustments for site-specific traffic volumes, distances, speeds, or noise barriers.

Project-related traffic may incrementally contribute to the noise exposure of off-site receiver locations. Of the 3780 daily project-generated trips, 75% will travel southwestward on El Toro Road, while the other 25% will turn right at El Toro Road to travel inland. At each subsequent turning opportunity, fractions of each traffic stream will split into different directions and thus dilute any off-site project traffic noise impact. The CNEL at 100 feet from area roadways for various scenarios is shown in the following table.

As shown in the following table, Valley Vista Way and Glenn Ranch Road would experience noise increases exceeding 2 dB noise level increases of 1 dB or greater are considered distinguishable. However, as shown in the table on page 59, the 65 dB CNEL contour will remain within 50 feet of the roadway centerline when project traffic noise is superimposed upon existing noise levels. This offsets any degree of noise impact occurring on these roadways. It should also be noted that in areas of concentrated traffic, such as at the project area, the high noise levels already experienced will substantially mask most project noise contribution. The project is too limited in scope to create a discernible change in off-site traffic noise levels. Noise impact on the ambient acoustic environment is judged to be less than significant.

N/A = no data available Source: FHWA-RD-77-108 (Calveno mod.)

The roadway that could affect project on-site noise exposure is El Toro Road. At the maximally exposed lot at around 400 feet from El Toro Road, the traffic noise level will be 63.5 dB CNEL at area buildout. Inclusion of a 60 dB CNEL aircraft contribution increases the noise exposure to 65.0 dB CNEL at the nearest property line. This just meets the County exterior noise standards and requires no extensive noise mitigation. This calculation assumes a semi-infinite line of sight to El Toro Road. Terrain irregularities will reduce the actual noise exposure to well below the worst-case maximum. There, is, therefore, no required exterior noise mitigation because of adequate setback from El Toro Road.

Mitigation in the form of exterior to interior noise attenuation will be required to meet the 45 dB CNEL interior standard for all units within the development since a 62 dB CNEL aircraft noise contour will cover the site as long as El Toro MCAS operations occur. Meeting the interior standard requires the option to close the window. Such ability, in turn, requires that there is supplemental mechanical ventilation to replace the natural draft eliminated by such closure. For new homes in inland valleys of Orange County, air conditioning is normally a standard feature meeting this requirement.

Noise reduction of 20 dB is normally attainable with closed windows, which will reduce any aircraft-related CNEL from 62 to 42 dB. As previously noted, however, CNEL is not the best predictor of noise annoyance due to single event phenomena such as individual overflights. Measured peak noise levels from helicopter operations were 86.5 dB in the center of the project site. A comparable level would likely occur from El Toro jet aircraft operations. A 20 dB attenuation would create a 65+ dB single event level that may be annoying to occupants even with windows closed. Most new developments within the fringes of the El Toro noise impact envelope thus have been built with acoustically enhanced windows.

Use of windows rated with a sound transmission class (STC) of 25 or better is recommended to reduce noise annoyance potential from single events. Such windows reduce single event noise, reduce vibration response (rattle) to aircraft noise often found in single-pane windows and are more energy efficient.

Residential activities may affect adjacent noise-sensitive land uses such as contemplative religious facilities. These facilities are, however, already exposed to single event aircraft noise that is much louder than a distant barking dog, lawnmower or auto horn associated with project residential use. The combination of irregular terrain, distance buffering and normally quiet residential activities are not expected to create a significant noise impact on any adjacent abbey or monastery uses.

In comparison, the proposed project for 299 units still has a number of noise sensitive land uses located in the vicinity of the project site including, St. Michael's Abbey, Ramakrishna Monastery, O'Neill Regional Park and residential land uses. Since the site currently contains no noise generating uses, development of 299 single-family residential dwelling units would result in an increase in noise levels emanating from the project site. This change in noise levels, would be less than the noise expected to be generated by the approved project and could be perceived to be intrusive to surrounding land uses. Noise impacts to St. Michael's Abbey would be incrementally reduced under the proposed project, as compared to the approved project, as a result of relocation of the lots in close proximity to the Abbey on the north side of the spine road and the intervening topography that would be created by the landform grading. The proposed project extends the limits of the upper portion spine road further to the west than the approved project, resulting in residential lots being located within 600 feet of the eastern Abbey property boundary. These noise impacts would be offset by the buffering effects of the landform grading proposed to screen views of the site from surrounding land uses. Impacts to the Ramakrishna Monastery, adjacent residential land uses and O'Neill Regional Park would be substantially reduced in comparison to those created by the approved project.

All of the discussion on pages 4-101 through 4-118 of Certified SEIR 566 and Appendix H (Acoustical Analysis) remain appropriate for the proposed project. The 14 mitigation measures in Certified SEIR 566 remain adequate to effectively attenuate noise impacts.

No significant unavoidable adverse impacts to noise would occur with implementation of the proposed project.

Impact Significance Criteria

According to CEQA guidelines, a significant noise impact is one that substantially increases the ambient noise levels for adjoining or nearby sensitive receptors. For purposes of community noise assessment, changes in noise levels of three dB or greater are typically identified as significant, while changes of less than one dB are not discernable. In the one dB to three dB range, residents sensitive to noise may perceive a slight change.

Transportation related noise standards have been established for noise sensitive land use areas (e.g., residences, schools, hospitals, churches, etc.) in the Orange County Noise Element. These standards are 65 dB CNEL for exterior noise sensitive areas and 45 dB CNEL for interior areas.

Thus, a noise impact will be considered potentially significant if the project results in a noise level increase of greater than three dB, and if that increase, or a lesser increase, causes the County noise standard of 65 dB CNEL to be exceeded.

A significant noise impact would occur if residential units are located within the MCAS El Toro 65 dB CNEL contour or higher.

SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the proposed project would result in short-term construction related impacts to adjacent land uses including: 1) St. Michael's Abbey; 2) Ramakrishna Monastery; 3) Hidden Hills Planned Community.

No on-site or off-site significant noise impacts would occur since 1) on-site residential lots would not be affected by 65 CNEL plus noise levels, 2) off-site roadway CNEL levels would not increase by more than 2 dB at 100 feet from the roadway centerline, and 3) the project site is outside of the MCAS 65 dB CNEL contour.

CUMULATIVE IMPACTS

Cumulative noise impacts are evaluated in Section 4.6.3 of the EIR.

MITIGATION MEASURES

Project Design Features

No PDF mitigation measures are proposed.

Standard County Conditions and Mitigation Measures

SC 6-1 All residential lots and dwellings shall be sound attenuated against present and projected noise which shall be the sum of all noise impacting the project so as not to exceed a composite interior standard of 45 dBA CNEL all habitable rooms and a source specific exterior standard of 65 DBA CNEL in outdoor living areas. Evidence prepared by a County-certified acoustical consultant, that these standards will be satisfied in a manner consistent with Zoning Code Section 7-9-137.5, shall be submitted as follows:

a. Prior to the issuance of grading permits, as determined by the Manager, PDS/ Building Permit Services Division, the applicant shall submit an acoustical analysis report to the Manager, PDS/Building Permits Services Division, for approval. The report shall describe in detail the exterior noise environment and preliminary mitigation measures. Acoustical design features to achieve interior noise standards may be included in the report, in which case it may also satisfy "B" below.

b. Prior to the issuance of any building permits for residential construction, the applicant shall submit an acoustical analysis report describing the acoustical design features of the structures required to satisfy the exterior and interior noise standards to the Manager, PDS/Building Permits Services Division, for approval along with satisfactory evidenced which indicates that the sound attenuation measures specified in the approved acoustical report have been incorporated into the design of the project.

c. Prior to the issuance of any building permits, the applicant shall show all freestanding acoustical barriers on the project's plot plan illustrating height, location and construction in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 6-2 Prior to the issuance of grading permits, as determined by the Manager, PDS/Building Permits Services Division, an acoustical analysis report shall be submitted to the Manager, PDS/Building Permits Services Division, for approval. The report shall describe in detail the exterior noise environment and preliminary mitigation measures. Acoustical design features to achieve interior noise standards may be included in the report in which case it may also satisfy SC 6-3 below.

SC 6-3 Prior to the issuance of any building permits for residential construction, an acoustical analysis report describing the acoustical design features of the structures required to satisfy the exterior and interior noise standards shall be submitted for review and approval to the Manager, PDS/Building Permits Services Division, along with satisfactory evidence which indicates that the sound attenuation measures specified in the approved acoustical report have been incorporated into the design of the project.

SC 6-4 Prior to the issuance of any building permits, all freestanding acoustical barriers must be shown on the project's plot plan illustrating height, location and construction in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 6-5 Prior to the issuance of any certificates of use and occupancy, the developer shall produce evidence acceptable to the Manager, PDS/Building Inspection Services Division, that information stating this property is subject to the overflight, sight, and sound of aircraft operating from (El Toro Marine Corps Air Station) has been provided to the Department of Real Estate of the State of California for inclusion into the Final Subdivision Public Report.

SC 6-6 Prior to the issuance of any certificates of use and occupancy, the applicant shall post aircraft noise impact notification signs in all sales

offices associated with new residential development located within an aircraft 63 dB CNEL contour. The number and location of said signs shall be as approved by the Manager, PDS/Building Permits Services Division.

SC 6-7 Prior to the issuance of any building permit, an aviation easement over this property shall be offered for dedication to the County of Orange in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 6-8 Prior to the sale, lease or rental of any structure or portion thereof, the applicant/owner shall provide to each prospective purchaser, lessee, or tenant a notice and statement of acknowledgment that the property is subject to overflight, sight, and sound of aircraft operating from (El Toro Marine Corps Air Station). The form and method of distribution of said notice and statement of acknowledgment shall be as approved by the Manager, PDS/Building Permits Services Division.

A. Prior to the issuance of any grading permits, the proponent shall produce evidence acceptable to the Manager, Building Permit, that:

(1) all construction vehicles or equipment, fixed or mobile, operated within 1000 feet of a dwelling shall be equipped with properly operating and maintained mufflers.
(2) All operations shall comply with Orange County "Codified Ordinance Division 6 (Noise Control); and
(3) Stockpiling and/or vehicle staging areas shall be located as far as practicable from dwellings.

B. Notations in the above format, appropriately numbered and included with other notations on the front sheet of grading plans, will be considered as adequate evidence of compliance with this requirement.

SC 6-9 Prior to issuance of any grading permits, the project proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division that excavation, grading and other construction-related activities shall be restricted to daytime hours as promulgated in the County's Codified Ordinance Division 6 (Noise Control).

SC 6-10 Prior to issuance of any grading permits, the project proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division that all construction equipment, stationary or mobile, shall be equipped with properly operating and maintained mufflers.

SC 6-11 Prior to the issuance of any grading permits, the project proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division, that:

a) All construction vehicles or equipment, fixed or mobile, operated within 1,000-feet of a dwelling shall be equipped with properly operating and maintained mufflers.

b) All operations shall comply with Orange County Codified Ordinance Division 6 (Noise Control).

c) Stockpiling and/or vehicle staging areas shall be located as far as practicable from dwellings.

Notations in the above format, appropriately identified and included with other notations on the front sheet of grading plans, will be considered as adequate evidence of compliance with this condition.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations, in manner meeting approval of the Manager, PDS/Building Permits Services Division.

AM 6-12 Prior to the issuance of building permits, all operative windows exceeding 6 sq.ft. of glazing shall be rated SR=25 or greater.

Noise Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	No	No change in regional or local conditions occurred which exceed the thresholds established in Certified SEIR 566.
Changes in impact thresholds?	No	The impact thresholds established in Certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	Yes	The proposed project will result in less noise impact associated with 3,820 ADT related noise generation compared to 6,220 ADT related noise generation. The proposed project will also result in reduced noise impacts to St. Michael's Abbey, Ramakrishna Monastery, adjacent residential land uses and O'Neill Regional Park.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	The conclusion of no unavoidably adverse noise impacts reached in Certified SEIR 566 remains appropriate for the proposed project.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

7. BIOLOGICAL RESOURCES ANALYSIS

PROJECT IMPACTS

Vegetation communities

Implementation of the approved project for 705 manufactured homes results in the direct removal of 191.4 acres (86 percent) of on-site and 19.8 acres of off-site vegetation as shown in the following table. A total of 30.8 acres (14 percent) of undeveloped land would remain in open space.

IMPACTED VEGETATION (ACRES) SUMMARY

Habitat	Existing	On-site Impacts	Percent Impact (%)	Preserved On-site	Percent Impact (%)	Off-site Impacts	Total
• Venturan-Diegan Transitional Coastal Sage Scrub (disturbed and undisturbed)	67.1	44.2	66	22.9	34	6.1	50.3
• Southern Mixed Chaparral	5.4	1.8	33	3.6	67	1.9	3.7
• Coast Live Oak Woodland (acreage/individuals)	14.5/29	14.0/28	97	0.5/14	3	0.6/5	14.6
• Southern Sycamore Riparian Woodland	6	4	100	0.0	0	2.8	3.3
• Mulefat Scrub	0.5	0.5	97	0.1	3	1.0	3.8
• Ephemeral Pond	2.9	2.8	75	0.2	25	0	0.6
• Annual Grassland	0.8	0.6	97	3.5	3	4.8	126.0
• Agriculture	125.3	121.8	100	0.0	0		
• Disturbed	4.6	4.6	100	0.0	0	2.6	3.7
	1.1	1.1					
TOTAL	222.2	191.4	84	30.8	16	19.8	211.19

Venturan-Diegan Transition Coastal Sage Scrub/NCCP

For the approved project, a total of 50.3 acres of coastal sage scrub would be impacted by implementation of the proposed project. The Natural Communities Conservation Planning (NCCP) program Southern Subregions is currently in preparation and is anticipated to be completed in late 1997 or early 1998. The USFWS/CDFG have developed interim loss procedures for coastal sage scrub habitat, which may occur during preparation of the subregional NCCP. Under the requirements of the Interim Take 4(d) Rule and guidelines, up to 5% of the coastal sage scrub habitat may be impacted during preparation of the southern subregional NCCP. In addition, the following NCCP findings must be made prior to coastal sage scrub impacts:

1) The proposed habitat loss is consistent with the interim loss criteria in the Conservation Guidelines.

   a) The habitat loss does not cumulatively exceed the five percent guideline for loss of CSS within a subregion.
   b) The habitat loss will not preclude connectivity between areas of high habitat values.
   c) The habitat loss will not preclude or prevent the preparation of the subregional NCCP.
   d) The habitat loss has been minimized and mitigated to the maximum extent practicable, in accordance with the Interim Mitigation Criteria of the NCCP Process Guidelines.

2) The habitat loss will not appreciably reduce the likelihood of the survival and recovery of listed species in the wild.

3) The habitat loss is incidental to otherwise lawful activity.

Implementation of the approved project would not result in the cumulative exceedance of the five percent loss of coastal sage scrub in the southern subregion. When added to the current total loss to date of 296 acres (authorized and pending), and 274 acres recorded from non-NCCP authorized projects, the maximum loss of 50.3 acres associated with this project would bring the total loss to 620 acres, which is about 2.4% of the 26,315 acres of coastal sage scrub in the Southern Subregional NCCP program area.[1]

Impacts to the following habitats occur with implementation of the approved project for 705 manufactured homes:

Southern Mixed Chaparral

Approximately 1.8 acres (33 percent) of southern mixed chaparral would be directly impacted on-site by the approved project, and an additional 1.9 acres would be impacted off-site. These impacts are not considered to be significant because of the small amount of impact and the fact that southern mixed chaparral is not considered a sensitive habitat.

Mulefat Scrub and Southern Sycamore Riparian Woodland

Mulefat scrub (3.8 acres) would be impacted where it is associated with three of the ephemeral ponds and in three intermittent streambeds, and southern sycamore riparian woodland (3.3 acres) would be impacted by remedial grading along the western boundary of the site. These impacts would be significant because of the two habitats' values as wildlife habitats and because of their function as wetlands or Waters of the United States. Impacts to these habitats would require permitting as discussed below.

Coast Live Oak Woodland

A total of 14.6 acres (97 percent) of coast live oak woodlands (312 individuals) would be impacted by the approved project, while 0.5 acres (14 individuals) will be preserved. Impacts to oak woodlands are considered significant because of their wildlife values, their function in watershed protection and, in the case of the project site, their function as part of the planned NCCP regional wildlife corridor.

Ephemeral Ponds

0.6 acres of the existing ephemeral ponds would be impacted as a result of project implementation. The 0.6 acres of impact to ephemeral ponds is significant due to the presence of Riverside fairy shrimp. In addition, impacts to portions of this habitat would require permitting as discussed below because of its function as a Waters of the United States.

Agriculture and Annual Grassland

Approximately 4.6 acres (100 percent) of agriculture, 121.79 acres (97 percent) of annual grassland, and 1.1 acres of disturbed land (100 percent) will also be impacted. An additional 4.8 acres of annual grassland and 2.6 acres of disturbed land will be impacted off-site. These impacts are not considered significant because the habitats are not sensitive.

Wetlands and Waters of the United States

Implementation of the approved project would result in impacts to jurisdictional Wetlands/Waters of the United States, as regulated by the U.S. Army Corps of Engineers, summarized in the following table.

IMPACTED WETLANDS/WATERS OF THE UNITED STATES

Type of Habitat	Acres
Wetlands (0.84 ac Mulefat/0.81 ac Sycamore Woodland)	1.65
Non-Wetlands Waters of the U.S. (Intermittent Streams and Man-Made Stock Ponds)	1.78
Total	**3.43**

A Federal Clean Water Act section 404 individual permit issued by the U.S. Army Corps of Engineers would be necessary for direct impacts to 1.65 acres of wetlands (0.84 acre of mulefat scrub and 0.81 acre of southern sycamore riparian woodland) and 1.78 acres of Waters of the United States (intermittent streams and ephemeral ponds). As part of the permitting process, there may be required mitigation measures independent of the requirements of CEQA for impacts to wetlands. Only a portion of the mule fat scrub being impacted was delineated as a wetland (0.84 acres), although the total impact to this community is 3.8 acres. Only a portion of the southern sycamore riparian woodland being impacted was delineated as a wetland (0.81 acres), though the total impact to this community is 3.3 acres (0.5 acres on-site and 2.8 acres off-site). A Streambed Alteration Agreement with CDFG will also be required for the 8.1 acres of impacts to wetland habitats (southern sycamore riparian woodland, mule fat scrub, and ephemeral pond).

Sensitive Plants

Seven of the eight stands of Catalina mariposa lily, including approximately 314 (72 percent) of the estimated 435 individuals, would be eliminated by the approved project. Approximately 121 individuals of the remaining stand would remain in open space. Impacts to this species are not considered to be significant due to its relatively low level of sensitivity, the relatively small population size on-site, and the relatively board distribution of this species throughout its range.

Two of the three stands of intermediate mariposa lily would be totally impacted by the approved project. Only one of the estimated 18 individuals (5 percent) would be directly impacted. Impacts to this species are considered to be adverse but not significant due to the small size of the total site population and, therefore, low regional significance of the on-site population.

Sensitive Animals

The following sensitive animals would be impacted by the approved project for 705 manufactured homes:

Riverside Fairy Shrimp

Impacts to all ponds where fairy shrimp were detected are significant because of the limited distribution of the species, and because it is federally-listed as endangered.

Western Spadefoot Toad

One of the two ponds where larvae were found will be impacted by the approved project. The impact to this species is not significant because of the species low level of sensitivity and because the population on-site is not of regional significance due to its small size.

Orangethroat Whiptail, Coastal Whiptail, Coastal Cactus Wren, and Southern California Rufous-Crowned Sparrow

The orangethroat whiptail and coastal whiptail prefer the open coastal sage scrub and southern mixed chaparral areas of the site. Two orangethroat whiptails and one coastal whiptail were observed, although many more are expected. Approximately 54.0 acres of combined coastal sage scrub and chaparral would be directly impacted (including off-site impacts), leaving 26.5 acres in open space. Ten coastal cactus wrens and twelve southern California rufous-crowned sparrows are distributed throughout the coastal sage scrub on-site and just off-site. Approximately 50.3 acres of potential nesting and foraging habitat (coastal sage scrub) would be impacted on and off-site, including at least portions of areas occupied by all twelve pairs of sparrows and at least six pairs of coastal cactus wrens. Impacts to these four species combined are considered significant but mitigable.

Cooper's Hawk

No direct impacts to known Cooper's hawk nesting habitat are anticipated, because no nests were observed during the surveys. Impacts to foraging habitat on-site are considered adverse but not significant since it is unlikely that any active nests would be disturbed. Should Cooper's hawks breed on the site, the loss of foraging habitat could affect, at most, a portion of one territory of one pair of Cooper's hawks, and this impact would not be considered significant.

Loggerhead shrikes were observed on-site, but it is unknown how many or whether they were breeding on-site. Assuming that they still use the site, the project impacts will still not be significant because of the low sensitivity of this species.

Coastal California Gnatcatcher

Previous field surveys (1993/1994) have determined that on-site coastal sage scrub habitat is not occupied by coastal California gnatcatchers, although current 1997 gnatcatcher surveys have not been completed to USFWS presence/absence protocol. As such, on-site coastal sage scrub habitats must be considered occupied by coastal California gnatcatcher until proven otherwise.

Raptor Foraging Habitat

Impacts to all habitats on-site would total 206.2 acres, while off-site impacts would total 7.0 acres. These impacts would generally add to the loss of raptor foraging areas in the region. However, because of the disturbed nature of most of the present habitat and the restoration of oak woodland and project slopes, sufficient habitat would remain so that these impacts are not considered significant.

Potentially Occurring Species

A list of potentially occurring mammals and additional species are shown in SEIR 566. Additional focused surveys (that is, small mammal trapping) would be required to determine the status of potentially occurring sensitive mammal species on-site. Given the low sensitivity of the potentially occurring species, their distribution throughout other parts of Orange County, and the low amount of anticipated impacts to their respective habitats, these impacts are considered to be adverse but not significant.

Wildlife Movement

Implementation of the approved project would directly impact wildlife movement through the project site, as it does not contain any design features which seek to facilitate wildlife movement. It can not be assumed that wildlife would be able to move through the project site as currently designed. The project, as currently

proposed, may hinder or preclude the preparation of the southern subregional preserve, due to restricted wildlife movement.

The following analysis has been prepared for the current proposal for 299 units:

In comparison, the proposed project for 299 units has been designed in response to the Chairman of the Planning Commission and comments received on the Draft EIR from State and Federal resource agencies and the public pertaining to the location and dimension of the proposed on-site wildlife movement corridor. The biological issues of concern were analyzed for an update of the impacts and for inclusion in the Addendum PA980103 which is the proposed project. The results of the analysis are categorized as, corridor analysis, vegetation impacts, oak tree impacts, and sensitive species impacts. This analysis is based on the Alternative 4 – 299 Lots Development Plan Concept map (February 10, 1998).

Corridor Analysis

The study concludes that an "ideal" corridor provides at least 500 feet of vegetative cover with 250-foot native vegetation buffers. A narrower buffer would be acceptable if development is not visible from the corridor. For corridors of less than 500 feet long, the corridor should not be less than 400 feet in total width. Vegetative or opaque fencing was recommended where there is an interface with the developed areas to reduce visibility.

The wildlife corridor through Saddleback Meadows under the proposed project would traverse the southern and eastern site boundary next to O'Neill Regional Park, then cross through the site in the northern half. It is planned on a west-facing slope on the west side of an existing saddle that is approximately 1,540 feet in elevation above sea level. The narrowest point of the corridor is where it crosses through a 'pinch point' between residential development blocks.

The corridor pinch point for the proposed project is 400 feet wide with 50-foot setbacks on each side and approximately 800 feet long. Most of this pinch point falls within the remedial grading zone, except for a patch approximately 300-feet long and 200-feet wide at the eastern end of the corridor that would remain undisturbed. A 50-foot wide spine road for the development would cross the corridor at grade. The middle strip of the graded portion of the corridor, approximately 200-feet wide, would be restored to native vegetation. The next 200 feet out (100 feet on each side) would be within the non-irrigated fuel modification zone. The outer 100 feet (50 feet on each side) would be landscaped as an irrigated fuel modification zone.

Overall, positive and negative aspects of the corridor's design and revegetation plans for this project's mitigation will increase the viability of the wildlife connectivity through Saddleback Meadows. The corridor, as planned in this alternative, is expected to be wide enough for wildlife movement. Topography on either side of the corridor is conducive to wildlife movement because it coincides with an area of natural canyon

topography. The revegetation within the corridor is expected to provide the necessary cover for wildlife to add to the corridor's viability. The 50-foot wide spine road crossing the corridor is not expected to inhibit wildlife due to the low traffic levels anticipated for this road. This wildlife corridor is expected to function adequately.

Vegetation Impacts

Impacts due to this proposed project would be similar to those for the approved project. The proposed project would impact approximately 160.0 acres of the site, leaving 62.2 acres in undisturbed open space (see following table).

Approximately 45.8 acres of Venturan-Diegan transitional coastal sage scrub (including 2.5 acres off-site), 5.7 acres of coast live oak woodland (175 individual oaks), 0.21 acre of southern sycamore riparian woodland, and 2.01 acres of mule fat scrub will be impacted by the proposed project. In addition, all but two of the manmade stock ponds (0.6 acre) supporting the Riverside fairy shrimp will be directly impacted. One of the preserved ponds is just west of the former ranch while the other is in the southeast corner of the site near O'Neill Canyon. All of the above impacts are significant according to the California Environmental Quality Act. A federal Clean Water Act permit issued by the U.S. Army Corps of Engineers will be necessary for direct impacts to 3.1 acres of wetlands (2.01 acre of mule fat scrub and 0.21 acre of southern sycamore riparian woodland and 0.88 acre of Waters of the U.S. (intermittent streams [0.28 acre] and manmade stock ponds [0.6 acre]). A streambed alteration agreement with the California Department of Fish and Game will also be required for the 2.62 acres of impacts to wetland vegetation.

Oak Tree Impacts

Based on the recent oak tree inventory (SEB 1995), total of 175 oak trees (approximately 59 percent) occur within the remedial grading zone and are considered impacted. A total of 123 oak trees (approximately 41 percent) occur outside the remedial grading zone and are considered preserved.

Sensitive Species Impacts

Eight stands of Catalina mariposa lily and three stands of intermediate mariposa lily fall completely or partially within the impact area of the proposed project. Two stands of Catalina mariposa lily and one stand of intermediate mariposa lily will likely remain to some degree despite the impact. An estimated 259 of the 435 individuals of Catalina mariposa lily will likely be lost, leaving an estimate 176 individuals in two stands in open space or within the non-irrigated fuel modification zones. These impacts are not significant because of the low level of sensitivity of the plant, its generally wide distribution in southern California, and the relatively small population size on site. Two stands of intermediate mariposa lily (9 individuals) will be graded, while one stands (9 individuals) are within the non-irrigated fuel modification zone and are assumed to

remain. This impact is not significant because of the small size of the on-site population.

The orangethroat whiptail, coastal whiptail, at least five cactus wren territories, and at least 10 southern California rufous-crowned sparrow territories would be affected by the loss of 45.8 acres of Venturan-Diegan transitional coastal sage scrub. The western spadefoot occurs on the property in at least two ponds, one of which would be impacted by the proposed project. These impacts are significant but mitigable considered the low level of sensitivity of these observed. Impacts to Cooper's hawks will, therefore, be limited to foraging habitat and are not significant. The 0.6 acre of impacts to manmade stock ponds will impact the Riverside fairy shrimp, and this impact is considered significant.

In accordance with the NCCP, the loss of 45.8 acres of Venturan-Diegan transitional coastal sage scrub due to the project is less than the allowable 5 percent of the total coastal sage scrub in the subregion. According to the NCCP Evaluation Logic Flow Chart, the coastal sage scrub on the project site has intermediate value for long-term conservation because although it is not the most dense coastal sage scrub in the region, it is located next to a higher value district (O'Neill Regional Park).

Saddleback Meadows Proposed Project – 299 Units
Existing Vegetation and Project Impacts

Habitat	Existing Acreage	On-Site Impacts	Percent	Preserved On-Site	Percent	Off-Site Impact
Venturan-Diegan transitional coastal sage scrub (disturbed and undisturbed)	67.1	43.3	65%	23.8	35%	2.5
Coast Live Oak Woodland (acreage/individuals)	14.5/298	5.7/175	39%/ 59%	8.8/123	61% 41%	0.0
Southern Mixed Chaparral	5.4	3.3	61%	2.1	39%	1.25
Southern Sycamore Riparian Woodland	0.5	0.2	40%	0.3	60%	0.01
Mule fat scrub	2.9	2.0	69%	0.9	31%	0.0
Ephemeral Pond	0.8	0.6	75%	0.2	25%	0.0
Annual Grassland	126.4	101.8	81%	24.6	19%	3.0
Agriculture	4.6	3.1	67%	1.5	33%	0.0
TOTAL	**222.2**	**160.0**	**72%**	**62.2**	**28%**	**6.76**

Much of the discussion on pages 4-118 through 4-154 of SEIR 566 and Appendices I, J and K (Biological Assessment, Pak Tree Report and Pond Mitigation Plan) remain appropriate for the proposed project. Imposition of the 14 mitigation measures in the SEIR will mitigate most biological impacts. However, incremental decreases in impacts to coastal sage scrub, oak woodland, ephemeral ponds and the Riverside fairy shrimp would remain significant under this alternative following mitigation.

Impact Significance Criteria

The impact significance criteria listed below, are based on a combination of the following: the Natural Community Conservation Planning (NCCP) information from the County of Orange, including acreages of habitat types proposed to be included in the Southern Subregion reserves; significance criteria, adopted regulations and stated policies of the California Department of Fish and Game, California Resources Agency, U.S. Army Corps of Engineers, and the U.S. Department of the Interior Fish and Wildlife Service.

The criteria listed below have been developed with the knowledge of the habitat resources on the project site. They have been focused to address the project site, including the context of this site within the NCCP Southern Subregion.

The project will have a potentially significant effect if it results in one of the following:

- For the federally listed coastal California gnatcatcher, other NCCP "target and identified species," coastal sage scrub (CSS) habitat, and wildlife movement corridors, the project would impair the ability of the Lead Agency (the County of Orange) to prepare an effective subregional NCCP consistent with the requirements of the Special 4(d) Rule for the coastal California gnatcatcher, FESA Section 10, and the NCCP Planning guidelines.

  The California Resources Agency and Department of Fish and Game have stated their intent to declare that significant impacts for individual projects addressed by a NCCP should be evaluated and determined based on the above standard (consistency with the subregional NCCP). Once a subregional NCCP has been approved by State and Federal agencies, a project whose CSS impacts have been addressed by the approved NCCP should be considered to be mitigated to below a level of significant effect.

- For other species of limited distribution in a subregion, or otherwise of high sensitivity; a) loss of habitat such that the potential benefits of any current or expected process to maintain viable levels of the species, through study, listing or a proposal to list the species would be diminished by a loss of the habitat at this time; b) the loss would be a non-recoverable loss during a time when the species and its habitat are undergoing a rapid decline; or c) loss of a consequential portion of a known population in the subregion.

- Project implementation results in notable net loss of a biotic community that is subject to local, State and/or Federal regulations (e.g., riparian communities) or that is otherwise of very limited occurrence in the subregion (e.g., oak woodland and native grassland).

- Project implementation results in the direct impairment of wildlife movement on a local or regional scale.

SIGNIFICANT IMPACTS OF PROJECT PRIOR TO MITIGATION

Implementation of the proposed project, prior to application of outlined mitigation measures, would result in significant impacts to the following resources:

Sensitive Vegetation

Approved project implementation would result in the direct impact to : 1) 50.3 acres of Venturan-Diegan transitional coastal sage scrub; 2) 14.6 acres of coast live oak woodland; 3) 5.0 acres of southern sycamore riparian woodland; 4) 3.8 acres if mulefat scrub; and 5) 0.6 acres of ephemeral pond.

Sensitive Animals

Implementation of the approved project would result in direct impacts to the Riverside fairy shrimp, a Federal endangered species. In addition, impacts to the orange-throated whiptail, western spadefoot toad, coastal whiptail, coastal cactus wren, and Southern California rufous-crowned sparrow, cooper's hawk, and loggerhead shrike will also result. Based on the absence of a current (1997) coastal California gnatcather survey conducted to USFWS presence/absence survey protocol requirements, impacts to coastal California gnatcatchers must be considered significant until proven otherwise by future surveys.

Wildlife Movement

Implementation of the approved project for 705 units would conflict with existing wildlife movement corridors, as depicted in the Foothill-Trabuco Specific Plan, Exhibit 52 of SEIR 566, p. 4-132, and is identified in Section 4.7.1 of SEIR 566.

CUMULATIVE IMPACTS

Contributions to Cumulatively Significant Impacts

Considered alone, many impacts associated with implementation of a single project may not meet the criteria of significance, either because project implementation impacts a relatively small area or because the resources impacted are only moderately sensitive; many candidates for federal listing fall under this category. However, when considered in the context of past and ongoing development of the region, a single project's impacts can be seen as a contribution to cumulatively significant effects.

In light of the fact that the Southern Subregional NCCP preserve has not been finalized, cumulative impacts to coastal sage scrub habitat are considered significant.

- Implementation of the proposed project in conjunction with other projects would result in cumulative impacts to oak woodland and sycamore riparian habitat.

- Implementation of the proposed project would contribute to cumulatively significant impacts to wildlife movement in the vicinity of the proposed project.

- Implementation of the proposed project would contribute significant impacts to the coastal California gnatcatcher, until such time as future field surveys, conducted to 1997 USFWS presence/absence protocol, demonstrates that on-site coastal sage scrub habitat is not occupied by California gnatcatchers.

- Implementation of the proposed project would contribute to cumulatively significant impacts to Riverside fairy shrimp.

- Implementation of the proposed project would contribute to cumulatively significant impacts to coast live oak and southern sycamore/riparian woodland.

- Implementation of the proposed project would contribute to cumulatively significant impacts the completion of the NCCP Southern Subregional reserve.

MITIGATION MEASURES

Conceptual Mitigation Program

The following conceptual mitigation program has been developed based upon input from the USFWS and CDFG during the scoping and public review processes for EIR 561 and EIR 566.

Impacts to Venturan-Diegan transitional coastal sage scrub habitat will require a mitigation ratio of 1.5:1 because although it is ranked as intermediate value habitat (under the NCCP), in its current condition much of the habitat being impacted is fragmented, is at least partially disturbed, and it may not support the coastal California gnatcatcher. According to the NCCP Evaluation Logic Flow Chart, the coastal sage scrub on the project site is considered intermediate value for long-term conservation because although it is not the most dense coastal sage scrub in the region, it is located next to a higher value district (O'Neill Regional Park). Impacts to mulefat scrub will be mitigated at 1:1 because of the poor quality of the existing habitat, and because it is surrounded by agriculture and annual grassland habitats. Southern sycamore riparian woodland will be mitigated at a ratio of 3:1 because of its high habitat quality. Oak woodland habitat will be mitigated at a ratio of 1:1, due to its moderate habitat values. Ephemeral pond habitat will also need to be replaced at a 2:1 ratio. Refer to the following table for a summary of the biological mitigation requirements.

CONCEPTUAL BIOLOGICAL MITIGATION PLAN REQUIREMENTS
APPROVED PROJECT (705 UNITS)

Habitat	Sensitive Habitat Impact Acreage	Mitigation Ratio	Mitigation Acreage
Venturan-Diegan Coastal Sage Scrub	50.3	1.5:1	75.5 Acres
Mulefat Scrub	3.8	1:1	3.8 Acres
Southern Sycamore Riparian Woodland	3.3	3:1	9.9 Acres
Oak Woodland	14.6	1:1	14.6 Acres
Ephemeral Pond	0.6	2:1	1.2 Acres
Total	**72.6**		**105.0 Acres**

The biological resource mitigation measure outlined above and summarized in Table 30 of Certified SEIR 566, cannot be implemented on-site for the approved project and must be implemented off-site, however, the proposed 299-unit project will allow for most if not all mitigation to occur on-site. Specific standard county conditions and mitigation measures have been developed to ensure that a comprehensive biological resources mitigation program is devised and approved by the County of Orange, in conjunction with USFWS and CDFG prior to the issuance of grading permits.

Project Design Features

No PDFs proposed.

Standard County Conditions and Mitigation Measures

SC 7-1 Pursuant to Section 711.4 of the Fish and Game Code, the applicant shall comply with the requirements of AB 3158, prior to the filing of the Notice of Determination for the project, in a manner meeting the approval of the Manager, PDS/Environmental and Project Planning Services Division.

SC 7-2 Prior to the issuance of any grading permits, the applicant shall obtain a Streambed Alteration Agreement covering the affected water courses and wetland areas within the proposed project area from the California Department of Fish and Game. A 1603 Streambed Application has been submitted to CDFG. All Streambed alteration activities shall be carried out in accord with the requirements of an approved Streambed Alteration Agreement.

SC 7-3 Prior to the issuance of any grading permits, the applicant shall obtain the necessary individual or nationwide permit (pursuant to Section 404 of the Federal Clean Water Act) covering all affected wetland areas from the U.S. Army Corps of Engineers, Los Angeles District. All wetland areas shall be subject to the specifications of the 404 permit as determined by the Corps of Engineers. A copy of the 404 permit shall be submitted with the first grading permit application for the proposed project to the Manager, PDS/Subdivision and Grading Services Division.

SC 7-4 Prior to the issuance of a grading permit, as required by participation in the Natural Community Conservation Planning/Coastal Sage Scrub (NCCP) agreement signed by the County on May 1, 1992, the project applicant shall provide an accounting summary, in acres or portions thereof, of coastal sage scrub scheduled to be impacted by removal through grading in a manner meeting the approval of the Administrator, Planning & Zoning. (See Section 4.7.3.)

SC 7-5 Prior to the issuance of a grading permit, the applicant shall provide proof that the appropriate Federal approvals required for impacts to Coastal Sage Scrub have been obtained from the U.S. Fish and Wildlife Service, in a manner meeting the approval of the Administrator, Planning & Zoning and Manager, PDS/Grading Services Division, in consultation with the Administrator, Planning & Zoning.

SC 7-6 Notwithstanding the tentative map, no grading shall occur within the Natural Community Conservation Plan (NCCP) enrolled area except as in a manner meeting the approval of the Administrator, Planning and Zoning.

SC 7-7 Prior to the issuance of any grading permit, approval of any activity that involves removal of any native vegetation from subject site including clearing, grubbing, mowing, discing, trenching, grading, fuel modification, or other related construction-related activities, the applicant shall obtain written proof from the U.S. Fish and Wildlife Service that said activity complies with the Federal Endangered Species Act. This evidence shall be submitted to the Manager, PDS/Subdivision and Grading Services Division, for review and approval, in consultation with the Administrator, Planning and Zoning.

SC 7-8 Prior to the issuance of grading permits the applicant shall submit a landscape and tree preservation plan to the Manager, PFRD/Harbors Beaches and Parks Division, for review and approval in accordance with the following guidelines:

A. To the maximum extent feasible, all existing native and exotic trees and other significant vegetation shall be preserved in conjunction with any development activity.

B. A tree preservation plan shall be prepared by a landscape architect for all development projects which identifies the location, size and species of all trees having a trunk diameter of 5 inches or greater (measured at four and one-half feet above ground level) and shrubs having a trunk or branch diameter of 3 inches or greater. The plan shall show which plants are proposed for removal and where transplanted and/or replacement plants will be located. Tree preservation plans shall be approved prior to issuance of grading permits, or where grading permits are not required, prior to issuance of building permits.

C. Trees removed in accordance with an approved tree preservation plan shall be replaced by a combination of transplanting to another location on the subject property and/or replacement by a combination of 1 and 15-gallon plants at a minimum ratio of 5:1. The following sliding scale shall also be used for trees to determine if more than the minimum number of replacement trees are required.

Tree Replacement Scale

Trunk Diameter (inches) of Tree Removed At 4½ Feet Above Ground Level	Total Number of Replacement
5 to 11	5 (1-15 gal / 4-1 gal)
12 to 17	7 (1-15 gal / 6-1 gal)
18 to 23	10 (2-15 gal / 8-1 gal)
24 to 35	12 (2-15 gal / 10-1 gal

Any oak exceeding 35 inches in diameter should be preserved, transplanted or replaced in accordance with the provisions outlined in Section E of the mitigation measure. In the event that all required replacement trees will not fit on the property, increase in container size will be considered in conjunction with reductions in replacement quality.

D. Significant shrubs removed in accordance with an approved tree preservation plan should be replaced by a combination of transplanting to another location on the subject property and/or replacement by 5-gallon plants at a minimum ration of 3:1.

E. All other plants not specified in Guidelines C and D above that are removed in accordance with an approved tree preservation plan should be either transplanted to another location on the subject property or replaced by 15-gallon plants for trees and 5-gallon plants for shrubs at a minimum ration of 1:1. The two 35" + oak trees impacted by project implementation, will be mitigated by an enhanced replacement ratio (5-15 gal/10-1 gal) to

the satisfaction of the Manager, PFRD/Harbors Beaches and Parks Division.

F. All transplanting of trees shall be performed by an experienced nursery or other landscape contractor, who shall care for the trees for at least six months after transplanting.

G. Prior to issuance of final certificates of use and occupancy, all transplanted or replacement trees and shrubs shall be installed in accordance with the tree preservation plan.

H. Oak trees shall not be subjected to increased runoff from irrigation systems, impermeable surfaces, storm drain discharge, etc.

I. Natural drainage courses and natural grades in proximity of, and providing seasonal irrigation to oak trees shall not be altered.

J. Grading, placement of fill, storage of building materials and heavy equipment, structural development, and hardscape (e.g., roads, sidewalks, patio slabs and pool decks) shall be prohibited within the drip line (outer edge of branches) of any tree. During grading and construction operations, all trees shall be temporarily fenced off with chain link fencing to protect such areas.

K. Use of pre-emergent weed killers shall be prohibited within 10 feet of the drip line of any individual tree and within any natural drainage course which seasonally irrigates trees.

L. Use of soil sterilizes shall be prohibited because they kill everything in the soil.

SC 7-9 Specify areas/lots to be dedicated or irrevocably offered to the County in fee or easement for landscape maintenance purposes, scenic or resource preservation purposes or resource replacement shall be landscaped, equipped for irrigation, and improved in accordance with an approved plan as stated below:

a) Preliminary Plan -An agreement shall be entered into and financial security posed guaranteeing landscape improvements and the maintenance thereof based on a preliminary landscape plan showing major plant material and uses, with a cost estimate for the landscape improvements. The preliminary plan and cost estimates shall be reviewed and approved by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PFR/Harbors Beaches and Parks Division. Said plan shall take into account the previously approved landscape plan for AP 95-7, the EMA Standard Plans for landscape areas,

adopted plant palette guides, applicable scenic and Specific Plan requirements, Water Conservation Measures contained in Board Resolution 90-487 (Water Conservation Measures), and Board Resolution 90-1341 (Water Conservation Implementation Plan).

b) Detailed Plan - Prior to the issuance of any building permit(s), a detailed landscape plan shall be submitted to and approved by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PFR/Harbors Beaches and Parks Division. Detailed plans shall show the detailed irrigation and landscaping design.

c) Installation Certification - Prior to the issuance of final certificates of use and occupancy and the release of the financial security guaranteeing the landscape improvements, said improvements shall be installed and shall be certified by a licensed landscape architect or licensed landscape contractor, as required, as having been installed in accordance with the approved detailed plans. Said certification, including an irrigation management report for each landscape irrigation system, and any other required implementation report determined applicable, shall be furnished in writing to the Manager, PFR/Construction Division, and the Manager, PDS/Building Inspection Services Division, prior to the issuance of any certificates of use and occupancy.

SC 7-10 Prior to the issuance of precise grading permits, landscaping for privately maintained areas shall be designed in accordance with a plan. The plan shall be certified by a licensed landscape architect or a licensed landscape contractor, as required, as taking into account approved preliminary landscape plan (if any), EMA Standard Plans, area plan 95-7, scenic corridor and Specific Plan requirements, Grading and Excavation Code erosion control requirements, Subdivision Code, Zoning Code, and conditions of approval, Water Conservation Measures contained in Board Resolution 90-487 (Water Conservation Measures) and Board Resolution 90-1341 (Water Conservation Implementation Plan). Said plan shall be reviewed by the future homeowners association and be reviewed and approved by the Manager, PDS/Subdivision and Grading Services Division.

SC 7-11 Prior to the issuance of grading permits, the applicant shall provide additional evidence that the on-site coastal sage scrub habitat is not occupied by California gnatcatchers, in accordance with current USFWS protocol (7 in season/9 out of season pass surveys) to the satisfaction of the USFWS and the Administrator, Planning and Zoning. Should occupied coastal sage scrub habitat be identified on-site by the surveys consultation shall be initiated with the USFWS, and a coastal sage scrub/gnatcatcher

mitigation plan shall be developed to the satisfaction of the USFWS and the Administrator, Planning and Zoning prior to the issuance of grading permits.

SC 7-12 Prior to the issuance of grading permits, the applicant shall provide assurances to the satisfaction of the County NCCP coordinator and the Administrator, Planning and Zoning, that the proposed project will participate in the NCCP planning process and not preclude the finalization of the Southern Subregional reserve component of the NCCP.

SC 7-13 Prior to the issuance of grading permits, the applicant shall prepare a relocation and establishment mitigation plan, designed to mitigate impacts to Riverside fairy shrimp/pond habitat, wetlands, and southern sycamore woodland, to the satisfaction of the Administrator, Planning and Zoning, in consultation with USFWS and CDFG. Mitigation shall consider on-site as well as off-site mitigation options, as well as, established fee programs.

Additional Mitigation Recommendations

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations in a manner acceptable to the Manager, Environmental and Project Planning Services Division, in consultation with the Manager, PFRD/Harbors Beaches & Parks Division.

AM 7-14 The following recommendations are proposed to further minimize some of the proposed impacts.

- Where possible, bulbs of individual Catalina Mariposa Lily and Intermediate Mariposa Lily that are to be impacted shall be dug up and transplanted to a suitable habitat with similar soil, slope exposure, etc.

- Lighting within development projects adjacent to conserved habitat should be selectively placed, shielded, and directed away from that habitat. In addition, lighting from homes abutting conserved habitat should be screened with vegetation, and large spotlight-type lighting that may affect conserved habitat should be prohibited. These lighting restrictions should be incorporated into the project's CC&Rs.

Biological Resources Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	No	No change in regional or local conditions occurred which exceed the thresholds established in Certified SEIR 566.
Changes in impact thresholds?	No	The impact thresholds established in Certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	Yes	The proposed project will result in 160.0 acres of impact on-site (included in this overall impact area, the proposed project will result in disturbance to 45.8 acres Venturan-Diegan transitional coastal sage scrub; 5.7 acres coast live oak woodland; 0.21 acre southern sycamore riparian woodland; and 2.01 acres of mule fat scrub) compared to 191 acres of impact for the approved project (included in this overall impact area, the proposed project will result in disturbance to 50.3 acres Venturan-Diegan transitional coastal sage scrub; 14.6 acres coast live oak woodland). The project will also result in reduced impact to on-site plant communities/habitats, and it will consist of dual wildlife movement corridor.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	Although the proposed project will continue to have a significant impact on biological resources, no new adverse impacts will occur.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

8. AESTHETICS ANALYSIS

PROJECT IMPACTS

Substantial alteration of the existing on-site aesthetic visual resources will occur with the development of the approved project (705 units). Viewshed impacts will be primarily due to substantial direct and remedial site grading and the subsequent construction of 705 manufactured single family residences on site. Grading volumes are estimated to

total approximately 11.5 million cubic yards (2.6 million cubic yards of conventional and 8.9 million cubic yards of remedial). Significant change to existing landforms, due to the substantial cut and fill required to create flat buildable pad areas from the steep rolling terrain on site, will generate permanent alteration of the natural topography and have an associated aesthetic impact on the site's viewshed. Visual impact is not limited to topographic alteration, but will also include loss of a portion of an oak woodland, on-site ponds, and annual grasslands. Approximately 211.12 acres of the site (191.4 on-site and 19.8 off-site) will be altered or disturbed by project development. 14% of the site will remain in undisturbed open space.

In addition, site development will change the surrounding property's viewshed of the site from essentially undisturbed natural rolling rangeland and oak woodland to an urban environment. Although approximately 14% of the site will be retained in natural open space, the predominant view will be of man-made slopes, roads, manufactured single family residences, and planted landscaping. This impact is permanent and unavoidable with site development.

The approved project proposes development of 705 manufactured residential units on minimum 2,630 square foot pads. This intensity and scale of development could be perceived as aesthetically objectionable by nearby residents.

Another potential impact of site development is glare from night lighting of project streets and residences. The site currently generates no night lighting. As a result, adjacent land uses experience a more natural night sky and view of the site. Glare from night lighting may impact the ability to view stars and the visual aesthetic resource of a naturally lit environment.

Potential impacts to visual and aesthetic site resources have been evaluated from the following specific locations listed below. Exhibits 60 - 62 in the SEIR 566, pp. 4-165-166, show computer generated post development views and cross-sections from the following locations:

Saint Michael's Abbey and School - Located northwest and adjacent to the project site. Views of the project site from the main abbey compound are generally screened by intervening buildings on the abbey property, mature vegetation and topography (see Exhibit 61 of SEIR 566, p. 4-166). Proposed residences would be located approximately 300 feet from existing Abbey facility. A significant portion of the proposed development will be visible however, from other parts of the abbey grounds including the pool, recreation field and "Stations of the Cross" knoll. Views of the project from these various locations on the abbey grounds are considered potentially significant. Glare from night lighting will directly impact this property due to its proximity and its lower elevation from the project site allowing street and residence lighting to shine directly down on the abbey property.

Ramakrishna Monastery - The Ramakrishna Monastery has occupied this location directly adjacent to the southeast portion of the project site since 1946. Normally, the

monastery is occupied by seven resident monks and an occasional small number of short term visitors. Due to the contemplative purposes for which this facility exists, potential visual impact of site development may be particularly intrusive to monastery residents. Existing on site vegetation near the main monastery buildings and revegetation and common area landscaping of the project's graded slopes may provide additional screening of the site from the monastery property. Nevertheless, it appears that complete site screening will not be possible due to the project site's higher elevation and its proximity to the monastery grounds. Therefore, even with extensive project site landscaping a significant number of residences will remain visible from the monastery, particularly the shrine trail surrounding the monastery property.

Night lighting glare may also have a significant aesthetic impact on monastery residents from both street and normal residence lighting. Resident monks have indicated that night lighting glare from recently constructed residential development in the vicinity has already negatively impacted the quality of life at their facility.

A church and two dwellings are located immediately north of the Ramakrishna Monastery, and would be impacted to the same degree as the outlying areas of the monastery.

O'Neill Regional Park - Residential elevations and man-made slopes located near the south project property line will be visible to the public from the Live Oak Trail within O'Neill Regional Park. The trail view points are located over ½ mile approximately 2,900 feet from the project boundary. Though project views will be far enough away so that elevation details are not apparent, the mere visual presence of a large number of homes from a wilderness hiking trail is considered a significant aesthetic impact.

Portola Hills - Portola Hills is a 2,200 unit planned community located directly west of the project site, across El Toro Road at a similar elevation. Views of the project site will be extensive as indicated in the viewshed analysis, and will encompass the entire proposed project and off site water tank (see Exhibit 60 of SEIR 566, p. 4-165). Due to Portola Hills' elevation, mitigation of potential visual impacts to a level of insignificance is not possible.

Portola Hills residents night views of the site are currently of a dark naturally lit area. Subsequent project buildout will change their view of natural open space to a view of an artificially lighted urban hillside development. As with all aesthetic impacts, some individuals may find this night lighting change to be a negative impact, while others may consider night lighting when viewed from a higher elevation to be aesthetically pleasing.

Hidden Hills - Hidden Hills is located directly adjacent to the southwest portion of the project site. Viewshed analysis indicates that residents of this tract will have significant uphill view of residences constructed along the southern boundary of the proposed project (see Exhibit 62 of SEIR 566, p. 4-167). This visual impact is considered potentially significant because of the close proximity of the proposed project to existing residences built at a lower elevation. This proximity between the two tracts may

generate a feeling to existing residents that Saddleback Meadow homes are looming over their Hidden Hills tract, creating a sense of crowding and associated loss of privacy.

El Toro Road - The proposed project will be visible to motorists on El Toro Road and to bicyclists, equestrians and hikers utilizing the regional trail located parallel to El Toro Road and Aliso Creek west of the project site.

Live Oak Canyon Road - A small portion of the upper portions of the project will be visible from the intersection of Live Oak Canyon Road and Harris Truck Trail. Views of the project site from Live Oak Canyon Road north of the site are partially screened by intervening topography.

In comparison, the proposed project for 299 units, as with the approved project, would substantially alter the existing topography and visual character of the project site. The land form/contour grading, berming, and wildlife corridor system included in the proposed project would help to break up the long linear massing of housing which would result with implementation of the proposed project and create areas of housing separated by 150 to 500 foot stretches of open space. Open space corridors within the design of the proposed project are larger and more significant than those of the approved project. In addition, overall aesthetic impacts to surrounding land uses would be reduced under the proposed project, as compared to the approved project, due to the extensive use of landform grading along the visually prominent portions of the development edge. Further, the approved project illustrated "soldiering" or "linear" design techniques which did not allow any relief for landscape elements.

Visual impacts to St. Michael's Abbey would be substantially reduced under this project as compared to the proposed project due to the relocation of residential lots north of the on-site spine road, extensive landform grading and implementation of a trail head/staging area. Also, the proposed project has no development in the near foreground view from St. Michael's Abbey. View impacts of the project site from the Ramakrishna Monastery would be reduced as compared with the approved project by implementation of the berming/contour grading, the wildlife corridor system and associated open space areas, and through the elimination of several loffel walls which would reduce the height and intensity of adjacent manufactured slopes. The wildlife corridor would replace manufactured slope, housing and associated lighting with natural and revegetated open space. In addition, the proposed project incorporates manufactured knolls strategically placed to assist in the screening of proposed development. The landscape concept will work in concert with the landform grading and berming to further help screen and filter the project from view. Furthermore, specialized grading proposed under this project to preserve the highest quality on-site ephemeral pond would create substantially less manufactured slope adjacent to the Monastery. (Refer to Exhibits 6 to 8 of this document for computer modeled visual analysis).

Most of the discussion on pages 4-154 through 4-173 of Certified SEIR 566 remain appropriate for the proposed project. The 19 mitigation measures in the SEIR will reduce most impacts to below a level of significance. However, significant viewshed impacts to the Ramakrishna Monastery and O'Neill Regional Park would remain significant under the proposed project.

Impact Significance Criteria

The determination of whether an aesthetic impact is significant or not is subjective, and there is no universally adopted standard or set of criteria for this issue. The impact significance criteria listed below are based on the CEQA Guidelines, Appendix G, and the Foothill Trabuco Specific Plan Development and Design Guidelines.

The project will have a potentially significant aesthetic impact if it results in one of the following:

- Degradation of, or significant interference with, the public's enjoyment of the site's existing visual resources (from designated public open space or public roads).
- Substantial alteration of the site's natural character, including extensive removal/changes or fill of slopes, canyons, rock outcroppings and/or vegetation.
- Impacts visual resources of "Major Ridgelines/Major Rock Outcroppings" as identified in the Foothill-Trabuco Specific Plan.
- Elimination of a unique geologic or physical landform feature.
- Areas where the elevation change along the length of a graded slope meets or exceeds 100 feet.
- Areas where the depth of cut or fill meets or exceeds 50 feet.
- Elimination or modification of a significant landform feature that is part of a larger, contiguous, unmodified off-site landform feature.

SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the proposed project, prior to application of mitigation measures, would result in significant impacts to the following surrounding land uses:

- O'Neill Regional Park
- Ramakrishna Monastery
- St. Michael's Abbey

These significant impacts would be related to the following visible project features: 1) grading, including cut and fill slopes; 2) proposed residences 3) drainage improvements; 4) native vegetation removal; and 5) night lighting.

CUMULATIVE IMPACTS

The proposed Saddleback Meadows project would result in the encroachment of large scale residential development into a rural transition area that is currently undeveloped. The project will contribute to the cumulative impacts to existing rural and natural open space, and to a continuing urbanization of foothill areas in South Orange County.

MITIGATION MEASURES

Project Design Features

PDF 8-1 All public utilities shall be situated underground.

PDF 8-2 Where feasible, drainage devices (terrace drains, benches, and intervening terraces) shall be bermed and placed in swales.

PDF 8-3 Concrete drainage swales and other similar drainage infrastructure shall be tinted with an appropriate earth tone to assist in concealing them from surrounding view.

PDF 8-4 The water tank shall be bermed, landscaped and painted to blend with the surrounding environment.

Standard County Conditions and Mitigation Measures

SC 8-5 Prior to the issuance of any building permits, an agreement shall be entered into and financial security posted guaranteeing landscape improvements and the maintenance thereof based upon a detailed landscape plan showing landscape design and irrigation with a cost estimate for the landscape improvements approved by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PFRD/Harbors Beaches & Parks Division. Said plan shall take into account previously approved landscape plan(s), PFRDD Standard Plans for landscape areas, adopted plant palette guides, applicable scenic and specific plan requirements, water conservation measures contained in Board Resolutions 90-487 (Water Conservation Measures), and 90-1341 (Water Conservation Implementation Plan).

SC 8-6 Prior to the issuance of preliminary grading permits, landscaping for privately maintained areas shall be designed in accordance with a plan certified by a licensed landscape architect or a licensed landscape contractor, as required, as taking into account approved preliminary

landscape plan(s), PFRDD Standard Plans, area plan 95-7 scenic corridor and Specific Plan requirements, Grading and Excavation Code erosion control requirements, Subdivision Code, Zoning Code, and conditions of approval, Water Conservation Measures contained in Board Resolutions 90-487 (Water Conservation Measures) and 90-1341 (Water Conservation Implementation Plan). Said plan shall be reviewed and approved by Manager, PDS/Building Permits Services Division, Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PFRD/Harbors Beaches & Parks Division, and Manager, PDS/ Environmental and Projects Planning Services Division.

SC 8-7 Prior to the issuance of certificates of use and occupancy and release of financial security, applicant shall install the approved landscaping and irrigation system and shall have a licensed landscape architect or licensed landscape contractor, as applicable, certify that it was installed in accordance with the certified plan. Said certification, including an irrigation management report for each landscape irrigation system, and any other implementation report determined applicable, shall be furnished in writing to the Manager, Building Inspection Services, prior to the issuance of any certificates of use and occupancy.

SC 8-8 Prior to issuance of any building permit, the applicant shall demonstrate that all exterior lighting has been designed and located so that all direct rays are confined to the property in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations:

AM 8-9 Prior to issuance of any grading permit, the project proponent shall provide evidence to the Manager, PDS/Subdivision and Grading Services Division indicating that graded areas will be compatible with natural landform characteristics to the greatest extent possible. Criteria to achieve the desired effect shall include:

a) Recontouring the existing landforms to provide a smooth and gradual transition between graded slopes and existing grade while preserving the basic topographic character of the site.

b) Variation and combination of slopes 2:1, 3:1 and 4:1 to create a more natural character wherever possible within the graded areas.

c) Attempting to balance cut and fill within the overall project area to eliminate off-site and import/export related grading operations.

d) Obscuring slope drainage structures with a variety of plant materials.

e) Preservation of visual opportunities from hillsides by providing for panoramic views from selected locations (e.g., view corridors, sensitive landscape placement).

AM 8-10 Manufactured slopes shall be replanted with vegetation native to the site to blend the new topography with existing natural on site vegetation, immediately following precise grading operations.

AM 8-11 Fuel modification areas shall be planted with fire resistant vegetation.

AM 8-12 Use of the California Sycamore or other species similar to trees currently existing on-site shall be used in appropriate common area and street landscape locations where feasible.

AM 8-13 Common area landscaping and habitat transition zones shall utilize the FTSP recommended plant palette (Appendix H) when selecting plant material.

AM 8-14 Slope landscaping shall occur as soon as feasible after grading and be maintained by the applicant until a homeowners association has been organized and assumes long term maintenance responsibility.

Light and Glare

AM 8-15 Prior to issuance of any certificate of use and/or occupancy, the potentially adverse impact of night lighting on surrounding land use shall be mitigated to the satisfaction of the Manager, PDS/Subdivision and Grading Services Division by the following measures:

a) Street lights shall only be installed at intersections and as required to insure public safety.

b) Low intensity halogen street lamps shall be used.

b) Street lights shall be shielded to direct the light beam downward and to avoid direct glare into open space areas and adjacent property.

Aesthetics Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	No	No change in regional or local conditions occurred which exceed the thresholds established in Certified SEIR 566.
Changes in impact thresholds?	No	The impact thresholds established in Certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	Yes	The proposed project will result in reduced grading related aesthetic impacts, and it will also include major landform screening.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	Although the proposed project will continue to have a significant impact on aesthetics, no new adverse impacts will occur.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

9. CULTURAL / SCIENTIFIC RESOURCES ANALYSIS

PROJECT IMPACTS

Archaeology

A number of the known archeological sites on the subject property were initially found to contain a high density of artifact deposits which for the most part have been removed by previous site researchers. Some of these sites may still contain significant deposits below ground. Without mitigation, potentially culturally significant sites may be destroyed by project development. The recommended course of action for these potentially significant sites is to collect the visible surface artifacts, disk the site to determine if there are significant artifact deposits below current grade, and then if warranted excavate up to 12 one meter by one meter excavation units to determine the extent and cultural significance of the site. Depending on the significance of the find, the site can either be preserved in place, artifacts collected and cataloged, or no further action taken if the site proves unimportant.

CA-ORA-710: The site is located on a relatively flat knoll or terrace, directly east of, adjacent to and 40 feet above Aliso Creek in the northwestern portion of the property. Boundaries of the site are approximately 165 x 245 feet.

The original recorders (Tadlock & Tadlock 1978) reported a wide range of artifacts over a rather large area. Subsequent archaeologists were not able to locate artifacts to that extent. Dillon (SRS 1989) discovered a chalcedony core, a chert flake and a burned piece of C\chert shatter as well as three "truncated" manos, which he apparently collected and removed from the site during his reconnaissance investigation. Truncated manos are discussed by Van Horn and Murray (1984). These manos were recovered at CA-ORA-486, along Aliso Creek, just a short distance away from site CA-ORA-710. The specimens had been "truncated" or broken off at one end and the rough end pounded smooth. They have been associated with the processing of "cacomites": a Spanish term referring to varieties of edible roots, bulbs and corms (bulb-like stems) that are found in the site vicinity.

Work consisted of a surface examination and surface collection. This resulted in the recovery of 26 artifacts including 16 uni- and bifacial manos (one possibly truncated) and mano fragments composed of porphyry, granite and metavolcanics, and chipped stone implements including three choppers, two hammerstones, one core, and four pieces of debitage. Material types here include metavolcanics, quartzite and quartz. subsequently, a disker pulled by a small bulldozer was employed to turn up the soil to a depth of three to five inches, with the purpose of uncovering near surface artifacts. This method, after a second surface collection, resulted in the recovery of an additional 56 artifacts including 11 groundstone implements; eight manos composed of granite (4) and porphyry (4), and three metate fragments - two of granite and one quartzite. chipped stone implements included 12 cores of metavolcanics, chert and quartzite; two hammerstones; two choppers; three scrapers and 25 pieces of debitage made primarily of chert and metavolcanics.

Eight 1 x 1 meter units were next excavated to determine the spatial extent of the site and verify the existence of a subsurface deposit. Fifty-eight artifacts were recovered and two of the units produced in situ features.

The sites inhabitants were utilizing a range of material types to fashion tools: chert (31%), metavolcanics (23%), granite (15%), porphyry (11%), quartzite (9%), metasedimentary (7%) and smaller percentages of jasper, sandstone and quartz. Some of the chert may have been heat treated.

Based on the characteristics of the artifacts recovered during the course of the test excavation, it is likely that the site is of Millingstone age. The lack of evidence of the mortar and pestle being used at the site further bolsters this hypothesis. The mortar and pestle technology is associated with the later Intermediate period when exploitation of the acorn became widespread.

A large portion of the artifacts were recovered from the western portion of the site in Units 1 through 3. Units 1 and 2 produced the three in situ features; therefore, it is established that this portion of the site's subsurface remains intact.

It is likely that a substantial subsurface deposit remains relatively undisturbed at the site; therefore, the site is deemed important and further data recovery is warranted during ground disturbing activities.

CA-ORA-711: The site is located on a low, flat ridge directly east of Aliso Creek and just north of a smaller tributary drainage. It measures approximately 170 x 170 feet. The original recorders (Tadlock & Tadlock 1978) reported a "sparse distribution of flakes, cores, and one chopper." Dillon (1989) was unable to relocate the site during his reconnaissance.

Work performed consisted of a surface examination and surface collection. This resulted in the recovery of 30 artifacts including 12 uni- and bifacial manos (one or two possibly truncated) of granite, sandstone, metavolcanics and porphyry. Chipped stone implements recovered include two cores, two hammerstones, one uniface, one biface, one scraper plane and 11 pieces of debitage composed of chert, porphyry, metavolcanics and quartzite. Subsequently surface collection during the course of excavation produced 16 additional artifacts including three manos, one metate, four cores, one hammerstone and seven pieces of debitage. Material types included chert, metavolcanics, granite, porphyry and quartzite.

As with CA-ORA-710, excavation at CA-ORA-711 was limited to a small fraction of the total site area. And similarly, a relatively wide range of tool and material types was recovered. This, again, indicates that a number of activities were probably performed on the site. Lithic tool production activities are evidenced by the recovery of 13 cores and a variety of waste flakes and other debitage, as well as associated hammerstones. The recovery of 39 manos and mano fragments and five metates and metate fragments is strong evidence that processing of the hard seed resources associated with the coastal sage scrub and chaparral communities was being accomplished. Scrapers and choppers were being utilized to process vegetable and wood fibers, as well as for working hides and bone.

CA-ORA-712: The site was described by Tadlock and Tadlock (1978) as being on a relatively flat hill overlooking CA-ORA-710 and 711 and Aliso Creek. It was described as a chipped lithic scatter, heavily damaged by bulldozing. Cultural material could not be relocated by subsequent researchers. The site is therefore not important, but the area should be monitored by a qualified archaeologist during mass grading operations.

CA-ORA-713: The site is located on a ridge between Oso and Aliso Creeks and on the ridge's north facing slopes as well as a relatively flat area at the slopes base. The area measures approximately 500 x 700 feet and could comprise two or more sites.

The original recorders of the site (Tadlock and Tadlock 1978) reported finding flakes, scrapers, cores, choppers and manos. Breece and Padon (1982) reported only three flakes. Dillon (SRS 1989) found no "portable artifacts", but discussed a sandstone concretion boulder with a cupulae ground into its upper surface.

Work on the site during the current project consisted of a surface examination and surface collection. This resulted in the recovery of 14 artifacts including two metavolcanic cores, a quartzite flake, a piece of metavolcanic shatter, a granite chopper, eight uni- and bifacial, porphyry and granite manos and a granite basin metate fragment. The cupulae noted by Dillon (SRS 1989) was seen, but the current researchers have serious reservations regarding the cultural nature of the cupulae. Subsequently, a disker pulled by a small bulldozer was employed to turn up the soil to a depth of 3-5 inches to expose near surface artifacts. This method resulted in the recovery of an additional 14 artifacts including three scrapers of metavolcanics (2) and granite, two quartzite cores, three pieces of metavolcanic (2) and quartzite debitage and six manos, uni- and bifacilly ground, composed of granite (4) and porphyry.

Since artifacts were scattered over a large area, a number of unrelated encampments occupied over a period of time may be represented. It is therefore recommended that controlled grading under the guidance of a qualified archaeologist be accomplished before the commencement of mass grading. Should clusters of artifacts be discovered, additional units could be excavated in those specific areas.

CA-ORA-714: The site is located on a domed hill on the ridge between Oso and Aliso Creeks, west of CA-ORA-713 and just to the south of a steep cliff leading down to a large Oso tributary drainage. Tadlock and Tadlock (1978) called the site a probably quarry containing assayed stones and Dillon (SRS 1989) only reported two artifacts. The presence of bedrock near and at the site's surface eliminated the possibility of extensive subsurface deposits. Bleached cow bones litter the ridgeline indicating either a carcass dumping ground or a carnivore feeding area. The site measures some 200 x 90 feet.

Work undertaken at this site was essentially surface examination and surface collection. Twelve artifacts were recovered as a result of this procedure including three unmodified hammerstones of metavolcanics (2) and porphyry, two cores of quartz and chert, four choppers of porphyry (3) and metavolcanics and three uni- and bifacial manos of porphyry.

The site was probably a short term encampment, perhaps the result of a single occurrent and because of the presence of exposed bedrock, a subsurface deposit is not expected.

CA-ORA-715: The site is located on a relatively flat, rounded hill comprising the ridge above the headwaters of Oso Creek, overlooking Aliso Creek. The site measures approximately 180 x 210 feet. A bulldozer cut in the site area establishes that soils have considerable depth.

Work on the site consisted of a surface examination and a surface collection. Thirty two artifacts were recovered including 13 uni- and bifacially ground manos, four of them fragments, composed of porphyry (8), sandstone (2), metavolcanics, quartzite and granite, four choppers of quartzite, metavolcanics, porphyry, and quartz, two bidirectional metavolcanic cores, one metavolcanic anvil, one metavolcanic hammerstone and eleven pieces of debitage of metavolcanics (5), chert (4), jasper and quartzite.

Although few artifacts were recovered from the subsurface, the relatively large number of artifacts recovered during the surface collection indicates that prehistoric activity did take place at the site. The presence of groundstone implements suggests the processing of hard seed resources associated with the area's coastal sage scrub and chaparral. Choppers were used to process vegetable and wood fibers, as well as for working hides and bone. Lithic tool production and/or maintenance is evidenced by the recovery of cores, debitage and associated hammerstones. Material types represented at the site included metavolcanics 33%, porphyry 24%, chert 18%, quartzite 13%, and small percentages of sandstone, quartz, jasper and granite.

CA-ORA-716: The site is located on a high hilltop in the northeastern corner of the project area. Tadlock and Tadlock (1978) reported finding a negligible number of flakes on the westerly portion of the site and flakes, cores and a redeposited chopper on the central and eastern portion. Dillon (SRS 1989), then reports finding just one basalt core at the site area and comments that much of the surface of the site has been graded to and below the surface of bedrock.

Relative to the current project, the site, or what is left of it, lies off the property to the west; therefore, no further action is required.

CA-ORA-1255: The site lies on the lower drainage of a small knoll creating an upland pond and overlooking a steep-sided drainage. It is approximately 80 x 80 feet in size. Dillon (SRS 1989) described the site as lying approximately 50 meters southwest of the pond in a natural amphitheater formed by a series of low, rounded knolls. Artifacts recovered by Dillon include one sandstone metate fragment, one core, two flakes and quartzite prismatic blade.

Previous work on the site consisted of a surface examination and surface collection. One metavolcanic flake was recovered by this method. Subsequently, two .50 x 1 meter units were excavated on the top of the knoll. Unit 1 was excavated to 20 cm, Unit 2 to 30 cm. The lone artifact recovered was a piece of metavolcanic shatter in the 10-20 cm level of Unit 2. The units were very shallow because a very light colored decomposing bedrock sand was encountered at those levels and the units were abandoned.

CA-ORA-1256: The site lies to the south and downslope from the southwest margin of CA-ORA-715, along a brushy fingerline ridge. Site dimensions are approximately 100 x 16 feet. Dillon (SRS 1989) first recorded the site and reported finding a large, crude,

"early" appearing scraper plane and an and site core/scraper. Dillon's photographs leave some doubt as to the cultural nature of the objects.

CA-ORA-1257: The site lies to the west and downslope of a low knoll directly west of Aliso Creek, and north of a steep cliff. Dillon (SRS 1989) recorded the site and reported finding a unifacial granite mano and a sandstone bedrock feature containing two cupules or incipient bedrock mortars. He commented that the mano was not truncated like the other three found at CA-ORA-710, but may have been used in conjunction with the bedrock feature for grinding purposes: therefore he called it an incipient bedrock mortar.

During a prior visit to the site the small boulder containing the purported cupules was seen, and during the current project it was again located.

CA-ORA-1435H (Hausauer Ranch): The site is located at the bottom of a deep drainage in the center of the property. It is surrounded by dense foliage (oak, eucalyptus and pepper trees). The site is a ranch complex comprised of the remnants of a residence, a small barn (collapsed), several out structures, a holding pond and a large olive grove numbering nearly 100 trees. The ranch buildings are in an advanced state of decay and have additionally been vandalized. The site complex measures approximately 900 x 330 feet.

CA-ORA-1437: This newly discovered site lies on a rounded knolltop at the northern edge of the property overlooking a small drainage leading south-westward into Aliso Creek. The site is approximately 450 feet northwest of CA-ORA-1255 and measures ca. 60 x 60 feet.

The site was discovered serendipitously as the reconnaissance crew was searching for CA-ORA-1255. Work performed on the site included a surface examination and the subsequent recording of all identified artifacts. Twenty-nine items were identified including mano fragments, metate fragments, cores and flakes. The items were not collected, precluding the possibility of further study (material types, measurements, weights) of the artifacts. Finally, an archaeological site record was prepared for the site.

Paleontology

The rock units underlying the project site have a history of fossil production dating from the 1930's and represent a significant scientific resource. The most abundant concentration of fossils appear to be located in the Topanga and undifferentiated Sespe Vaqueros Formations. Initial project site investigation has uncovered numerous fossil concentrations at various locations within the Sespe-Vaqueros Formation on the subject property. The Topanga Formation has yielded numerous occurrences of vertebrate fossils in boulders which have apparently eroded from higher elevation. One of these boulders contains a portion of a baleen whale skull and another contains what appears to be the skeleton of a large toothed whale. Based on the abundance of observed fossils currently exposed on site, it is anticipated that project grading and construction

will unearth additional fossil concentrations which may be destroyed without adequate precaution to document, recover and preserve what is found.

History

The remains of a ranch house and out buildings are located in an area that will be directly impacted by the approved project.

In comparison, the proposed project for 299 units would result in incrementally less disturbance to the project site, as compared to the proposed project, and would not impact potential on-site cultural and scientific resources. CA-ORA-710 has been recorded in the vicinity of the knoll adjacent to the Abbey property, and would be preserved under this project.

All of the discussion on pages 4-173 through 4-192 of SEIR 566 and Appendix L (Cultural Resources Assessment) remain adequate for this alternative. Imposition of the 21 mitigation measures in the SEIR, including PDFs, SCs and AMs will ensure that all project impact are reduced to below a level of significance.

No significant unavoidable adverse impacts to cultural scientific resources would occur with implementation of the proposed project.

Impact Significance Criteria

If the project may cause damage to an important archaeological resource, the project may have a significant effect on the environment. For the purposes of CEQA, an "important archaeological resource" is one that:

- Is associated with an event or person of: 1) recognized significance in California or American History, or 2) recognized scientific importance in history.
- Can provide information which is both of demonstratable public interest and useful in addressing scientifically consequential and reasonable or archaeological research questions.
- Has a special or particular quality such as oldest, best example, largest, or last surviving example of its kind.
- Is at least 100 years old and possesses substantial stratigraphic integrity.
- Involves important research questions that historical research has shown can be answered only with archaeological methods.

SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Archaeology

Both the previous and proposed project may have significant impacts on the following archaeological sites: CA-ORA-710, CA-ORA-713, CA-ORA-715 and CA-ORA-1435H unless adequate safeguards are taken to document and recover any artifacts found at these locations. All other archeological sites have been determined to be not important.

Paleontology

Disturbance of potential paleontological resources may occur with project development without adequate mitigation.

History

Project implementation will directly impact CA-ORA-1435H, which may be considered significant.

CUMULATIVE IMPACTS

Archaeology

Cultural archeological resources are non-renewable in character. Once disturbed or destroyed, they can never be recovered. Cumulative impact to archeological and culture resources stems from their irreplaceable loss due to site development. The recommended mitigation measures will reduce the potential impact of site development, particularly to the known archeological sites on the subject property. Complete mitigation of the potential effects of site development on cultural resources is not fully possible however, because other archeological sites often remain hidden until project grading activities uncover them.

Paleontology

Fossils recovered at other locations from the rock formations underlying the project site have contributed to the understanding of the regions geologic and evolutionary history. Fossils are unique and irreplaceable scientific resources which can be lost forever unless adequate mitigation measures are taken to ensure their recovery and preservation.

Historical

No significant impact is anticipated.

MITIGATION MEASURES

Standard County Conditions and Mitigation Measures

Archaeology

SC 9-1 Prior to the issuance of any grading permit, a County-certified archaeologist shall be retained by the applicant to complete a literature and records search for recorded sites and previous surveys. In addition, a field survey shall be conducted by a County-certified archaeologist unless the entire proposed project site has been documented as previously surveyed in a manner which meets the approval of the Manager, PFRD/Harbors Beaches and Parks Division. A report of the literature and records search and the field survey shall be submitted to and approved by the Manager, PFRD/Harbors Beaches and Parks Division. Mitigation measures may be required depending upon the recommendations of this report. This mitigation measure has been completed as part of the Draft EIR.

SC 9-2 Prior to issuance of any grading permit, a county-certified archaeologist shall be retained by the applicant to perform a subsurface test level investigation and surface collection as appropriate. The test level report evaluating the site shall include discussion of significance (depth, nature, conditions and extent of the resources), final mitigation recommendations and cost estimates and shall be approved by the Manager, PFRD/Harbors Beaches and Parks Division. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis.

SC 9-3 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified archaeologist has been retained to conduct pregrade salvage excavation of the archaeological resources in the permit area. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis. A final report of the salvage operation shall submitted to and approved by the Manager, PFRD/Harbors Beaches and Parks Division, prior to any grading.

SC 9-4 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified archaeologist has been retained, shall be present at the pregrading conference, shall establish procedures for archaeological resource surveillance, and shall establish, in cooperation with the project developer, procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of the artifacts as appropriate. If the archaeological resources are found to be significant, the archaeological observer shall determine appropriate

actions, in cooperation with the project developer, for exploration and/or salvage. The archaeologist shall submit a follow-up report to the Manager, PFRD/Harbors Beaches and Parks Division, which shall include the period of inspection, an analysis of any artifacts found and the present repository of the artifacts. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis. These actions, as well as final mitigation and disposition of the resources, shall be subject to the approval of the Manager, PFRD/Harbors Beaches and Parks Division.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provision of existing codes and regulations in a manner acceptable to the Manager, PFRD/Harbors Beaches and Parks Division Facilities.

AM 9-5 Prior to site grading the project site shall be examined by a qualified archeologist, all potential archeological sites identified, and surface collection and documentation of artifacts be conducted.

AM 9-6 As indicated by the project archeologist, sites warranting further study shall be disced to ascertain the extent and significance of the deposit. If the project archeologist determines that a site is potentially of cultural worth, then additional excavation in a manner determined by the project archeologist shall occur prior to further grading or construction activities at these locations.

AM 9-7 During initial grading, the project site shall be monitored by a qualified archeologist who shall have the authority to order a temporary cessation of grading activities and take appropriate action to preserve any culturally significant materials if uncovered.

AM 9-8 If human remains of Native American origin are encountered during the project the County Coroner's Office and the Native American Heritage Commission shall be contacted for preservation and protection of the remains.

Paleontology

SC 9-9 Prior to the issuance of any grading permit, a County-certified paleontologist shall be retained by the applicant to complete a literature and records search for recorded sites and previous surveys. In addition, a field survey shall be conducted by a County-certified paleontologist unless the entire proposed project site has been documented as previously surveyed in a manner which meets the approval of the Manager, PFRD/Harbors Beaches and Parks Division. A report of the literature and records search and field survey shall be submitted to and approved by the

Manager, PFRD/Harbors Beaches and Parks Division, Future mitigation shall depend upon the recommendations of the report. This mitigation measure has been completed.

SC 9-10 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified paleontologist has been retained by the applicant to conduct pregrade salvage and prepare a catalogue of the exposed resources. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis. The paleontologist shall submit a follow-up report for approval by the Manager, PFRD/Harbors Beaches and Parks Division, for review and approval, which shall include methodology, an analysis of artifacts found, a catalogue of artifacts, and their present repository. This mitigation measure has been completed.

SC 9-11 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified paleontologist has been retained to observe grading activities and salvage and catalogue fossils as necessary. The paleontologist shall be present at the pregrading conference, shall establish procedures for paleontological resource surveillance, and shall establish, in cooperation with the project developer, procedures for temporarily halting or redirecting work to permit sampling, identification, and evaluation of the fossils. If major paleontological resources are discovered, the paleontologist shall determine appropriate actions, in cooperation with the project developer, which ensure proper exploration and/or salvage. Excavated finds shall be offered to the County of Orange, or its designee, on a first-refusal basis. The paleontologist shall submit a follow-up report for approval by the Manager, PFRD/Harbors Beaches and Parks Division, which shall include the period of inspection, a catalogue and analysis of the fossils found, and present repository of the fossils. These actions, as well as final mitigation and disposition of the resources, shall be subject to approval by the Manager, PFRD/Harbors Beaches and Parks Division.

Additional Mitigation Measures

AM 9-12 A qualified paleontologist shall be retained to perform periodic inspections of excavations and, if necessary, salvage exposed fossils. The frequency of inspections will depend on the rate of excavation, the materials being excavated, and the abundance of fossils. Initially, monitoring shall be on a full time basis in all excavations because of the high potential for the discovery of fossils in all the rock units present in the study area.

AM 9-13 The paleontologist shall be allowed to divert or direct grading in the area of an exposed fossil to facilitate evaluation and if necessary, salvage.

AM 9-14 To recover small fossils, it will be necessary to collect sediment samples from promising horizons discovered during grading monitoring for processing through fine mesh screens. Once the samples have been screened, they will be examined microscopically for small fossils.

AM 9-15 Fossils shall be prepared to the point of identification and catalogued before they are donated to their final repository.

AM 9-16 All fossils collected should be donated the County of Orange's designated repository.

AM 9-17 A report detailing the results of these efforts, listing the fossils collected, and naming the repository shall be submitted to the lead agency at the completion of the project.

Historical Resources

SC 9-18 Prior to issuance of a grading permit, project applicant shall provide written evidence to Manager, PFRD/Harbors Beaches and Parks Division that an historian has been retained by the applicant to implement final mitigation measures. A final report shall be submitted to and approved by the Manager, PFRD/Harbors Beaches & Parks Division prior to any alteration of the historical site area.

SC 9-19 Development adjacent to a place, structure, or object of historic significance shall be designed so that permitted uses and architectural design will protect the visual setting of the historic site. Such design shall be submitted to and approved by the Manager, PFRD/Harbors Beaches & Parks Division prior to any alteration of the historical site area.

Cultural/Scientific Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	No	No change in regional or local conditions occurred which exceed the thresholds established in Certified SEIR 566.
Changes in impact thresholds?	No	The impact thresholds established in Certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	Yes	The proposed project will result in preservation of CA-ORA-710 and historic ranch house.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	Although the proposed project will continue to have a significant impact on cultural resources, no new adverse impacts will occur.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

10. RECREATION ANALYSIS

PROJECT IMPACTS

A primary goal in the County's Recreation Element is to provide adequate local park sites to meet the recreation needs of existing and future residents and preserve the natural resources within unincorporated Orange County. To comply with this goal the County acquires park land by requiring residential developers to provide a minimum of 2.5 net useable acres for every prospective 1,000 residents. Based on the projected population, local park requirements would total approximately 4.0 acres. The nearest facility containing playground equipment is the Portola Hills Elementary School located approximately 3/4 of a mile west of the site. Playground equipment is also found near the entrance to O'Neill Park located over two miles southeast of the subject property.

Mitigation of project-related local park impacts may be provided by the payment of local park fees as required by the Orange County Department of Harbors, Beaches and Parks. County regulations permit the payment of fees in lieu of actual on site park construction, allowing for the construction and maintenance of local parks at other more appropriate locations.

Although the approved 705-unit project is not proposing to improve the view park site and connecting trail, the project is proposing the construction of other regional recreational facilities which may mitigate this omission. As previously indicated, the applicant will be providing on site relocation and connection to the Aliso Creek Regional Riding and Hiking Trail. Provision of these recreational trail improvements in conjunction with required park fees, will provide mitigation for the lack of on-site park facilities.

In comparison, the proposed project for 299 units would provide for enhanced recreational amenities as compared to the approved project including access to existing and proposed trails, and an interpretive trail head park / staging area, and an passive ridge top lookout park as possible amenities associated with a ±90-acre extension of O'Neill Regional Park. The proposed project would achieve the goals outlined in the Recreation Element of the Foothill/Trabuco Specific Plan.

Much of the discussion on pages 4-192 through 4-199 of DEIR 566 remains appropriate for the proposed project. The SEIR includes 15 mitigation measures relating to recreation, which require the applicant to provide trail connections and develop the view/lookout park.

No significant unavoidable adverse impacts to recreation would occur with implementation of the proposed project.

Impact Significance Criteria

The effects of a project on recreation are considered to be significant if the project will result in the following:

- The demand generated by the project meets or exceeds the capacity of existing park lands, bicycle trails and hiking trails, or otherwise requires their expansion or requires the construction of major new facilities.
- The project will cause permanent removal or relocation of existing recreational trails, parks or other facilities in the area.
- The project would be in conflict with existing or planned recreational uses in the project area of effect.

SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the proposed project, prior to mitigation, would result in significant impacts to existing local public park demand. This impact however will be reduced by the provision of in-lieu fees.

CUMULATIVE IMPACTS

The proposed project will increase area population by approximately 1,000 persons which will contribute to the cumulative impact on local and regional recreational

facilities. This potential impact is considered incidental given the overall increase of recreational facilities to be provided by other regional development and is not considered significant.

MITIGATION MEASURES

Project Design Features

PDF 10-1 The Live Oak and Aliso Creek riding and hiking trail shall be located on the Project Site as shown in Exhibit 7 and Exhibit 63 of SEIR 566, pp. 3-11 and 4-200).

PDF 10-2 Live Oak Canyon Trail shall be constructed on-site, ultimately connecting O'Neil Regional Park to the Aliso Creek riding and hiking trail, as shown in Exhibit 7, Site Plan, of SEIR 566, p. 3-11.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations:

AM 10-5 Prior to first building occupancy, the applicant shall pay all park mitigation fees as required by the Department Manager, PFRD/Harbors Beaches & Parks Division.

AM 10-6 Prior to final building occupancy the applicant shall dedicate and construct all required regional trail connections and improvements as approved and required by the Department Manager, PFRD/Harbors Beaches & Parks Division.

Recreation Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	No	No change in regional or local conditions occurred which exceed the thresholds established in Certified SEIR 566.
Changes in impact thresholds?	No	The impact thresholds established in Certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	No	No changes in significant impacts occurred.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	Although the proposed project will continue to have a significant impact on recreation, no new adverse impacts will occur.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

11. HAZARDS ANALYSIS

PROJECT IMPACTS

The proposed project site is located in a high fire hazard area, and as a result, all future development would be subject to risk during wildfires. The circulation system proposed by the proposed project provides for similar emergency access as the approved project, with 224 units served off of a single means of access. It should be noted that the proposed project proposes a single loaded primary spine road on-site, which would reduce fire hazards to proposed residents by allowing for direct access to major on-site wildland areas and allowing for additional non combustible areas adjacent to residential areas. The location of the proposed project hiking trail is proposed to travel through the primary east-west wildlife movement corridor, which could result in an increase in human/wildlife interaction hazards.

All of the discussion on pages 4-199 through 4-208 of Certified SEIR 566 remain appropriate for the proposed project. Because of the inclusion of nine (9) PDFs and (21) SCs, as well as the design features of the project, potential hazard impacts are reduced to below a level of significance.

No significant unavoidable adverse impacts to hazards would occur with the proposed project.

Impact Significance Criteria

The risks posed to public health and safety are considered to be significant if the project will result in the following:

- Provision of insufficient fire protection measures, and/or design plans inconsistent with the Development/Open Space policies of the LUP (Land Use Plan, Chapter 3M, I-3.35).

- The placement of habitable structures within 1,000 feet of a landfill boundary without monitoring gas migration to the satisfaction of the Local Enforcement Agency (LEA), as specified in Title 14, CC&R 17783.5.

- Exposure of humans to radio frequency (RF) energy that exceeds the standards and guidelines established by the American National Standards Institute (ANSI) or National Council on Radiation Protection and Measurements (NCRP). The Ansi standards are set in the *American National Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz* (ANSI 1992), and are similar to the NCRP maximum personal exposure limits.

SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Wildfire

Due to topography, biology, and weather conditions the project site is located in area classified as a "Special Fire Protection Area" by the Orange County Fire Authority. To help mitigate property damage and risk to project residents in the event of a wildfire in the project vicinity, a number design measures would be incorporated into this project.

First the project site will implement a comprehensive fuel modification program in accordance with County standards. Typically fuel modification consists of a twenty-foot setback zone (Zone A), a minimum of fifty foot irrigated zone (Zone B), with an additional minimum of one hundred feet (100') of brush thinning zone (Zones C and D). Exhibits 64 and 65 of SEIR 566, pp. 4-208-209, illustrate these standards. Manufactured slope and remedial grading areas will be replanted with native low fuel plant species to further reduce the fire risk.

The site is also located ½ mile east of the Portola Hills Fire Station and less than a 30-second flight time from the upper Oso Reservoir, which will be used by OCFA helicopters, and a ten minute flight time to the site from the helicopter station at Fullerton Airport. (Helicopter dispatch is only included in dispatch to Wildland fires not structural fires on-site.) Therefore, during wildfire suppression operations, emergency response times to the subject property are expedite. To ensure fire fighter access to

wilderness areas surrounding the site, individual lots around the project perimeter will provide a recorded unobstructed fire access easement through these properties ensuring adequate emergency access to all portions of the project's perimeter. Finally project construction will use alternative fire resistant materials and methods including concrete tile roofs, closed eaves and soffits, double paned/dual glazed windows, and noncombustible exterior building facing. Wet and dry utilities will be located on opposite sides of the street to minimize lane closures during maintenance periods.

Emergency Access

Due to site constraints, only one primary access roadway can be provided to the eastern portion of the site. The provision of only one main access road is of concern since this roadway could become obstructed and impassible in emergency situations creating an impact to public safety. As indicated on the site plan, primary project access is provided from El Toro Road by the main spine road extending the length of the site, with secondary access via Valley Vista Way in the Hidden Hills tract south of the project site. This roadway design leaves a majority of the proposed lots with one single access point east of Valley Vista Way. In the event that this east access point is blocked or impassible in an emergency situation, residents and emergency personnel have no other all weather access alternatives. As indicated by the OCFA, mitigation of this restricted access may be provided by the proposed fire mitigation features and by providing internal fire sprinklers for the single access lots in the proposed project.

Wildlife Interaction

Conflict between wildlife and project residents and pets is an associated project risk due to the proximity of wild areas to the subject site. As more residential development occurs at the interface with wilderness areas, the potential for increased contact with dangerous wild animals increases. In the past, when development encroached into previously undeveloped areas, the wildlife would move on to new more remote foraging ranges. Unfortunately, due to developmental encroachment which now encircles the remaining wilderness areas, the ability for animals to relocate to new grounds is limited. A number of animal species, particularly coyotes and raccoons have proved particularly adaptable to human presence, foraging and hunting in proximity to residential housing tracts.

CUMULATIVE IMPACTS

Implementation of the proposed project will add to the cumulative encroachment of residential tract development into existing remaining rural and wilderness areas, further reducing the natural foraging habitat area available to area wildlife and increasing the opportunities for human/animal conflict within the interface zone between the built manmade and natural environments.

Project construction within extreme fire risk areas adds to the potential cumulative impact of increased fire frequency and increased property and human loss due to fire events.

MITIGATION MEASURES

PDF 11-1 Implement a comprehensive fuel modification program in accordance with Section 27 of Appendix II-A of the 1994 Uniform Fire Code as adopted by County Ordinance 3954 (the Wildland Urban Interface Task Force report was not adopted and is not enforced by the OCFA). Exhibits 9 and 64 of SEIR 566, pp. 3-13 and 4-208, illustrate the fuel modification zones and, although adequately described, it should be noted that the distances are horizontal measurements rather than vertical and, therefore, may actually be larger zones as measured vertically up or down a slope (based on topography).

PDF 11-2 Incorporate the use of native, low fuel plant species into the landscape plan for both manufactured slope areas and remedial grading areas where appropriate as approved by the OCFA.

PDF 11-3 Provide for the construction of a water tank off site to ensure adequate on site water supply and OCFA fire flow requirements. The minimum fireflow requirements for this project of 1500 gpm for a minimum of 2 hours at 20 psi residual pressure. This flow must be available 24 hours per day .

PDF 11-4 Wet and dry utilities shall be constructed on opposite sides of the project streets to minimize land closure during maintenance periods.

PDF 11-5 Residential structures shall be constructed of fire-resistant material, including but not limited to, "Class A roof assemblies", closed eaves and offsets, double paned or dual glazed windows. The exterior walls of structures will be constructed of " 1-hour fire resistant materials" and all structures will have fire sprinklers.

PDF 11-6 All residential structures shall be required to have automatic interior fire sprinkler systems.

PDF 11-7 The interface area between residential lots and open space areas within the project boundary shall be wrought iron fenced to minimize intrusion of wildlife into the built portions of the project site.

Standard County Conditions and Mitigation Measures

SC 11-8 Prior to the issuance of any preliminary grading permits, applicant shall request that the Manager, HCA/Environmental Health, determine if vector control measures are necessary. If warranted, such measures shall be conducted by the developer in a manner meeting the approval of the Manager, HCA/Environmental Health.

SC 11-9 Prior to the issuance of any building permits for combustible construction, a letter and plan from the developer shall be submitted stating that water for fire fighting purposes and an all weather fire access road shall be in place before any combustible materials are placed on the site. Said letter shall be approved by the Fire Chief prior to the issuance of any building permits.

SC 11-10 Prior to the issuance of any building permits on those lots determined applicable by the Fire Chief, plans for an automatic fire sprinkler system shall be submitted to and approved by the Fire Chief prior to installation. This system shall be operational prior to the issuance of a certificate of use and occupancy.

SC 11-11 Prior to the issuance of any building permits, the applicant shall submit a detailed letter of intended use for each building to the Fire Chief for review and approval.

SC 11-12 Prior to the issuance of any grading permits, preliminary plans for all street and courts, public or private, shall be submitted to and approved by the Fire Chief. The plans shall include the plan view, sectional view, and indicate the width of the street or court measured flow line to flow line. All proposed fire apparatus turnarounds shall be clearly marked.

SC 11-13 Prior to the issuance of any certificates of use and occupancy, street improvement plans with fire lanes shown shall be submitted to and approved by the Fire Chief. The plans shall indicate the locations of red curbing and signage, and provide a drawing of the proposed signage with the height, stroke and color of lettering and the contrasting background color.

SC 11-14 Prior to the issuance of any grading permits, construction details for any emergency access gate shall be submitted to and approved by the Fire Chief. Contact the Orange County Fire Department at (714)744-6623 for a copy of the "Guidelines for Fire Department Emergency Access".

SC 11-15 Prior to the issuance of any grading permits, a fuel modification plan and program shall be submitted and approved by the Fire Chief in consultation with the Manger, Environmental and Project Planning Services Division. The Planning and Development Section shall be contacted at 744-0403 for requirements to be met and clearance of this condition. The plan shall indicate the proposed means of achieving an acceptable level of risk to structures by vegetation, include the method (mechanical or hand labor) for removal of flammable vegetation and provide for the planting of drought tolerant fire resistant plants.

SC 11-16 Prior to the issuance of any building permits, the developer shall have completed, under the supervision of the Fire Chief, that portion of the approved fuel modification plan determined to be necessary by the Fire Chief before the introduction of any combustible construction material into the project area.

SC 11-17 Prior to the issuance of any certificates of use and occupancy, the remaining fuel modification shall be installed and completed under the supervision of the Fire Chief. Further, the installed fuel modification shall be established to a degree meeting the approval of the Fire Chief.

Hazards Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	No	No change in regional or local conditions occurred which exceed the thresholds established in Certified SEIR 566.
Changes in impact thresholds?	No	The impact thresholds established in Certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	No	No changes in significant impacts occurred.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	The conclusion of no unavoidably adverse hazard impacts reached in Certified SEIR 566 remains appropriate for the proposed project.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

12. PUBLIC SERVICES ANALYSIS

PROJECT IMPACTS

Sheriff

The Orange County Sheriff's Department has indicated that it can provide adequate police service to the project area. The new response time varies with the location of the deputies at the time of the call, and range from five (5) to fifteen (15) minutes. Based on

an officer/population ratio of 2:1000, three additional officers would be required by the project.

Fire

The approved project proposes 705 manufactured single family residential dwelling units on 222.23 acres of land that is classified as a High Fire Hazard Severity Zone by the OCFA. A 1.4 million-gallon water tank will be constructed in the northeast corner of the project site. This tank will be able to meet the water demand and fire flow requirements for the project (860,000 gallon water supply/540,000 gallon fire flow).

The previous and proposed project is a residential community with two points of access (spine road at El Toro Road and Valley Vista Way). Valley Vista Way is proposed as an emergency access only. Portions of the project above Valley Vista Way would be served by only one access, El Toro Road. Emergency medical response to areas above Valley Vista Way could be delayed, if the main spine road is blocked or made impassable.

Education

Implementation of the previous and proposed project would add additional students to an already overcrowded system. Project-related student generation is shown in Table 33.

PROJECT-RELATED STUDENT GENERATION

Grade	Units	Student Generation Factor	Student Generation
K-6	299	0.340/du	102
7-8	299	0.065/du	19
9-12	299	0.160 du	48
Total			169

As shown, 169 K-12 students would be generated at buildout of the approved project.

Library

Implementation of the previous and proposed project would result in additional demand for library services in the project area.

The local branches of the Orange County Public Library System will be able to serve the needs of the project's residents. The system has established the following standards for service:

- .2 square feet of library space per capita;
- 1.3 volumes per capita.

Based on an average of 2.57 persons per dwelling unit countywide, the proposed project will increase population by 768 persons using the above figures. Development of the proposed project will require approximately 154 square feet of additional library space and approximately 998 additional volumes. Currently, according to the County, most Orange County public libraries are within current service guidelines. However, due to County budget constraints, branch libraries vary their hours and reduce services to cut spending. The County also requires participation in the County's Development Fee Program for Libraries. Currently the fee is set at $185.00 per dwelling unit.

Solid Waste

The project will have trash and recycling collection services provided by Waste Management of Orange County (WMOC). WMOC will provide storage containers for refuse collection and recycling bins for recyclable materials. Refuse is collected once a week and recyclable materials will be collected every other week. Currently WMOC charges $13.96 per dwelling unit per month. WOC estimates an average of 65 pounds of refuse per month per household unit in unincorporated Orange County. The following table shows the estimated solid waste generation for the proposed project.

PROJECT-RELATED SOLID WASTE GENERATION

Land Use	# of Units	Generation Factor	Monthly		Annual	
			Lbs.	Tons	Lbs.	Tons
Single Family Residential	299	65 lbs/du/mo	19,435	9.72	233,220	116.6

Refuse will be transported by the County run Integrated Waste Management Department to one of two (2) County owned landfills. They are Prima Deshecha, a 1500 acre facility in San Juan Capistrano and the Frank Bowerman landfill, a 725 acre facility in Irvine. The Integrated Waste Management Department of Orange County runs five (5) landfills in Orange County, which the County indicates will have available landfill capacity for 50 years.

Recyclable materials are transported to Sunset Environmental in Irvine for processing.

The demand for public services and utilities by the proposed project for 299 units would be reduced as compared to the approved project (705 units), due to a substantial

decrease in the number of proposed residential lots and associated residents. No unavoidable adverse impacts to public services and utilities would result.

All of the discussion on pages 4-209 through 4-222 of Certified SEIR 566 remain appropriate for the provision of public services, including sheriff, fire, schools, library and solid waste. Because of the ten (10) PDFs and eighteen (18) SCs, no unavoidable impacts will be generated with the proposed project.

No significant unavoidable adverse impacts to public services would occur with the proposed project.

Impact Significance Criteria

The effects of the project on public services is considered significant if the project will result in the following:

- The demand for school facilities, police and fire protection, library services, or solid waste facilities meets or exceeds their capacity.

SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Sheriff

The project will have no significant impact on the Orange County Sheriff's Departments ability to provide adequate police services.

Fire

Due to topography, vegetation and climatic conditions, the project site is located in an area classified as a "Special Fire Protection Area" by the OCFA.

Because much of the project would be served by a single access road, the OCFA has expressed concern that public safety could be compromised should this road become blocked or impassable.

Education

Implementation of the proposed project would result in the generation of about 168 additional students into the currently overcrowded Saddleback Valley Unified School District.

Library

The project will not have a significant impact on the Orange County Public Library System's ability to provide services.

Solid Waste

WMOC would be able to provide refuse collection and Integrated Waste management does have landfill space available. There are no significant impacts from the project.

CUMULATIVE IMPACTS

Sheriff

Anticipated countywide growth combined with the project impacts would have a cumulative impact on Sheriff Department services over time.

Fire

The anticipated countywide growth in combination with the project impacts would have a cumulative impact on fire and emergency services in Orange County.

Education

District-wide growth in combination with project-related impacts would result in cumulative impacts to the Saddleback Valley Unified School District.

Library

This project in combination with regional growth would have a cumulative impact on the Orange County Public Library System.

Solid Waste

The Integrated Waste Management Department indicates that landfill space is available for the next 50 years and the project will not have a significant impact on landfill capacity; however, regional development will have a cumulative impact on available landfill space.

MITIGATION MEASURES

Project Design Features

Sheriff

SC 11-8 Prior to the issuance of any preliminary grading permits, applicant shall request that the Manager, HCA/Environmental Health, determine if vector control measures are necessary. If warranted, such measures shall be conducted by the developer in a manner meeting the approval of the Manager, HCA/Environmental Health.

SC 11-9 Prior to the issuance of any building permits for combustible construction, a letter and plan from the developer shall be submitted stating that water for fire fighting purposes and an all weather fire access road shall be in place before any combustible materials are placed on the site. Said letter shall be approved by the Fire Chief prior to the issuance of any building permits.

SC 11-10 Prior to the issuance of any building permits on those lots determined applicable by the Fire Chief, plans for an automatic fire sprinkler system shall be submitted to and approved by the Fire Chief prior to installation. This system shall be operational prior to the issuance of a certificate of use and occupancy.

SC 11-11 Prior to the issuance of any building permits, the applicant shall submit a detailed letter of intended use for each building to the Fire Chief for review and approval.

SC 11-12 Prior to the issuance of any grading permits, preliminary plans for all street and courts, public or private, shall be submitted to and approved by the Fire Chief. The plans shall include the plan view, sectional view, and indicate the width of the street or court measured flow line to flow line. All proposed fire apparatus turnarounds shall be clearly marked.

SC 11-13 Prior to the issuance of any certificates of use and occupancy, street improvement plans with fire lanes shown shall be submitted to and approved by the Fire Chief. The plans shall indicate the locations of red curbing and signage, and provide a drawing of the proposed signage with the height, stroke and color of lettering and the contrasting background color.

SC 11-14 Prior to the issuance of any grading permits, construction details for any emergency access gate shall be submitted to and approved by the Fire Chief. Contact the Orange County Fire Department at (714)744-6623 for a copy of the "Guidelines for Fire Department Emergency Access".

SC 11-15 Prior to the issuance of any grading permits, a fuel modification plan and program shall be submitted and approved by the Fire Chief in consultation with the Manger, Environmental and Project Planning Services Division. The Planning and Development Section shall be contacted at 744-0403 for requirements to be met and clearance of this condition. The plan shall indicate the proposed means of achieving an acceptable level of risk to structures by vegetation, include the method (mechanical or hand labor) for removal of flammable vegetation and provide for the planting of drought tolerant fire resistant plants.

SC 11-16 Prior to the issuance of any building permits, the developer shall have completed, under the supervision of the Fire Chief, that portion of the approved fuel modification plan determined to be necessary by the Fire Chief before the introduction of any combustible construction material into the project area.

SC 11-17 Prior to the issuance of any certificates of use and occupancy, the remaining fuel modification shall be installed and completed under the supervision of the Fire Chief. Further, the installed fuel modification shall be established to a degree meeting the approval of the Fire Chief.

Public Services Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	No	No change in regional or local conditions occurred which exceed the thresholds established in Certified SEIR 566.
Changes in impact thresholds?	No	The impact thresholds established in Certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	Yes	The 299-unit proposed project will result in less demand for fire, police and school services compared to the previous 705-unit project.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	The conclusion of no unavoidably adverse public services impacts reached in Certified SEIR 566 remains appropriate for the proposed project.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

13. UTILITIES & SERVICE SYSTEMS ANALYSIS

PROJECT IMPACTS

Water

The Trabuco Canyon Water District (TCWD) has indicated that the project's water needs can be met. Water demands were estimated using current Orange County Fire

Authority criteria plus current TCWD standard guidelines. TCWD has established the average annual water demand at 450 gallons per dwelling unit (du) per day for residential land uses. The following table shows the project-related water demand.

PROJECT-RELATED WATER DEMAND

Land Use	# of Units	Generation Factor	Gallons Per Day
Single-Family Residential	299	450 gal/du/day	134,550
Irrigation	51.0 ac	2.5 af/ac/yr	127,500
Total			**262,050**

Water for irrigation has been estimated to require 2.5 acre feet per acre, per year (af/ac/yr). Maximum day demand has been calculated using TCWD's 2.0 multiplier for residential and 2.5 multiplier for irrigation uses.

Since the project will have a single water source it is classified as a "stand alone" zoned water distribution system. Proposed service zones for the project are:

Zone 0	Existing systems at point of connection 865-feet to 1065 feet.
Zone 1	Elevation 1,085 feet to 1,200 feet.
Zone 2	Elevation 1,200 feet to 1,400 feet.
Zone 3	Elevation 1,400 feet to 1,510 feet.

Because of the elevation gain at the project site a booster pump station near the main water line connection is necessary to pump water to a reservoir located just outside the property's northeast tract boundary at pad elevation 1,590 feet. The water tank site was dedicated to TCWD when Tract Map 10692 recorded. In addition, a $904,425 capital improvement charge was paid to the Trabuco Canyon Water District when Tract Map 10692 recorded in 1988. TCWD will construct the water tank concurrent with project development.

Wastewater

TCWD indicates that the project's waste water needs can be met. Most of the project will be served by an 8-inch line which will gravity flow beneath the collector street into the TCWD's 15-inch line in El Toro Road. The remaining lots in the southwest corner of the project will connect to the 8-inch line in Valley Vista Way and gravity flow into the 15-inch line in El Toro Road.

TCWD has established a discharge factor of 90 gallons per person with 3 persons per unit. The following table shows the estimated project-related sewage discharge flow.

PROJECT-RELATED WASTEWATER GENERATION

Land Use	# of Lots	Discharge Factor (90 gal/pp @ 3 persons/unit)	Discharge Gallons (per day)
Single Family Residential	299	270 gal/day	80,730

The existing TCWD 15-inch line serving the project has reserved capacity for the project in the amount of approximately 200,000 gallons per day. In addition, substantial sewer capacity fees amounting to $973,528.58 was paid to Trabuco Canyon Water District when the Tract Map 10692 recorded in 1988.

Electricity

SCE indicates that the electrical loads of the project are within parameters of the overall projected load growth which SCE is planning to meet. Unless the demand for electrical generating capacity exceeds SCE's estimates, and provided that there are no unexpected outages to major sources of electrical supply, SCE expects to meet the demand for electricity from the project site. SCE's estimates for residential electrical consumption are based on a figure of 700 kilowatt (kwh) hours per dwelling unit (du) per month. The following table shows the monthly and yearly project related electrical consumption.

PROJECT-RELATED ELECTRICAL CONSUMPTION

Land Use	Number of Units	Generation Factor	Monthly kwh of Electricity	Annual kwh of Electricity
Single-Family Residential	299	700 kwh/month	209,300	2,511,600

Natural Gas

SCG indicates that the project's natural gas needs can be met without major system expansion.

Gas consumption has been estimated by SCG at 1,095 therms per year per single family dwelling unit. The following table shows annual project-related natural gas consumption.

PROJECT-RELATED NATURAL GAS CONSUMPTION

Land Use	No. of Lots	Generation Factor	Therms Per Year
Single Family Residential	299	1,095 Therms/du/yr	327,405

Note: 1 Therm = 100 cu.ft. of natural gas

Cable

Cox Communications has indicated that it can provide cable service to the area. There will be no charge to the applicant or homeowners to have cable TV services provided to the project site.

Communications

Pacific Bell has indicated that it can provide telephone service to the area. There will be no charge to the applicant or homeowners to have telephone services provided to the project site.

Summary

In comparison, Demand for utilities and service systems would be substantially reduced under the proposed project for 299 units, as compared to the previous proposed project, since a substantially reduced number of residential units are proposed. All of the discussion on pages 4-223 through 4-235 of Certified SEIR 566 remain appropriate for the proposed project regarding utilities and service systems, and the provision of water, wastewater, electricity, natural gas, cable and communications. Because of ten (10) PDFs and eight (8) SCs, no unavoidable impacts would occur under proposed project, in these service areas.

Impact Significance Criteria

The effects of a project on utilities and service systems is considered to be significant if the project will result in the following:

- The demand generated by the project meets or exceeds the capacity of existing, or otherwise requires their expansion, or requires the construction of major new facilities.
- The project's demands for fuel or energy meet or exceed existing supplies, or otherwise cause supply and/or capacity constraints.
- The project's demands exceed the capacity of existing utility systems, or otherwise require the expansion or construction of major new facilities.

- The project causes significant disruption of service.

SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Water

Project implementation would not result in significant impacts on TCWD's ability to provide water service. Due to the elevation change between the water line connection and the reservoir, a booster pump station will be required to provide adequate water supply for the site.

Wastewater

The project will have no significant impacts on TCWD's ability to provide wastewater service to the area.

Electricity

The project will have no significant impacts on SCE's ability to supply electricity to the area.

Natural Gas

The project will have no significant impacts on SCG's ability to provide natural gas service to the area.

Cable

The project will have no significant impact on Cox Communications ability to supply cable TV service to the area.

Communications

The project will have no significant impact on Pacific Bell's ability to supply telephone service to the area.

CUMULATIVE IMPACTS

Water

The cumulative impacts of the project are not significant. The project falls within the plans of the TCWD for long range growth.

Wastewater

The cumulative impacts of the project are not significant. The project falls within the plans of the TCWD for long range growth.

Electricity

The cumulative impacts of the project are not significant. The project falls within the plans of SCE for long range growth.

Natural Gas

The cumulative impacts of the project are not significant. The project falls within the plans of SCG for long range growth.

Cable

This project along with other proposed projects would not have a cumulative impact on Cox Communication's ability to provide services to the area.

Communications

This project along with other proposed projects would not have a cumulative impact on Pacific Bell's ability to provide service to the area.

MITIGATION MEASURES

Project Design Features

Water

PDF 13-1 The new booster pump station shall be paid for by the applicant and designed and function according to TCWD's guidelines and standards.

PDF 13-2 Operational capacities and pressure parameters for design of the booster pump station (approved by OCFA) shall be determined at design stage and should incorporate but not be limited to the following requirements:

- It shall meet the maximum day demand for the "stand alone" zones of Saddleback Meadows with an operating time of 24 hours and without its largest unit in service.
- It shall be designed with a back-up generator for the booster pump, as well as fuel and maintenance provisions.
- It shall incorporate the typical 3 or 4 pump system with an alternating state sequence.
- It shall pump from TCWD's El Toro Road zone (1,165 feet HWL) to the storage facility (reservoir) proposed.

- It shall have the ability to refill the proposed reservoir, if it were empty, within 72 hours while also providing for maximum day demands on the water system during that time.

PDF 13-3 Water conservation measures to be implemented consist of water-conserving features in the design and construction of residential homes and uses, plus use of drought-tolerant plant materials in the slope and streetscape plantings. Proposed water conservation measures also include:

- Supply line pressure: Water pressure greater than 50 pounds per square inch (psi) reduced to 50 psi or less by means of pressure-reducing valves.
- Ultra-low-flush toilets: 1.5 gallon-per-flush toilets installed in all new construction.
- Landscape with low-water-using plants wherever feasible.
- Grouping of plants of similar water use to reduce over-irrigation of low-water-using plants.
- Extensive use of mulch as top cover to improve water-holding capacity of the soil.
- Installation of efficient irrigation systems that minimize runoff and evaporation, and maximize the amount of water reaching plant roots. Drip irrigation, soil moisture sensors, and automatic irrigation systems are proposed methods of increasing irrigation efficiency.

PDF 13-4 All design and landscape features shall comply with TCWD's guidelines and standards.

Wastewater

PDF 13-5 All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Electricity

PDF 13-6 All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Natural Gas

PDF 13-7 All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Cable

PDF 13-8 All utilities shall be installed by Cox Cable in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Communications

PDF 13-9 All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

Standard County Conditions and Mitigation Measures

Water

SC 13-10 Prior to the issuance of any building permit(s), the applicant shall provide a report to the Manager, PDS/Building Permits Services Division, indicating that plans showing the location of all proposed reclaimed water lines used to irrigate open spaces, parks, and other landscaped areas, have been submitted to and approved by the Trabuco Canyon Water District.

SC 13-11 Prior to the issuance of building permits, water conservation measures shall be incorporated into the development design plans and which shall be submitted for approval to the Trabuco Canyon Water District.

Wastewater

SC 13-12 Prior to the issuance of a certificate of use and occupancy, sewer lines, connections, and structures shall be installed in a manner meeting the approval of the Manager, HCA/Environmental Health.

A. All waste water facilities and line shall be constructed and maintained to meet TCWD standards and requirements.

B. All sewer lines shall be underground facilities.

C. The project shall comply with all State of California Health and Safety Codes.

Electricity

SC 13-13 Prior to the issuance of a building permit, project proponent shall consult with the local gas and electric companies regarding feasible energy conservation features that should be included in the design of the proposed project. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 13-14 Prior to the issuance of a building permit, the project proponent shall incorporate passive or natural heating and cooling opportunities in the design of the proposed project including but not limited to the following: solar energy use; thermal insulation; tinted or solar reflective glass; orientation to sunlight; use of deciduous trees in landscaping; installation of roof fans; utilize fluorescent lighting, switches and thermostat, utilize time-controlled lighting; and, utilize AC units with 100% outdoor air economize. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

Natural Gas

SC 13-15 The applicant shall provide for all lines and mains necessary to provide natural gas to the project.

SC 13-16 The applicant shall obtain all required permits and follow all SCG, State and County regulations and requirements regarding natural gas service.

Cable

No standard condition requirements.

Communications

SC 13-17 Applicant shall comply with the requirements of the California Public Utilities Commission and Pacific Bell Telephone Company for the provision of telephone service.

Utilities & Service Systems Summary Findings

	Yes/No	Status/Comment
Changes in regional or local conditions?	No	No change in regional or local conditions occurred which exceed the thresholds established in Certified SEIR 566.
Changes in impact thresholds?	No	The impact thresholds established in Certified SEIR 566 remain adequate.
Changes in mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate for the proposed project.
Changes in significant impacts?	Yes	The 299-unit proposed project will result in less demand for water, wastewater, electricity, natural gas and communication services compared to the previous 705-unit project.
Changes in cumulative impacts?	No	The assessment of cumulative impacts within Certified SEIR 566 remain adequate for the proposed project.
New significant adverse impacts?	No	The conclusion of no unavoidably adverse utilities and service systems impacts reached in Certified SEIR 566 remains appropriate for the proposed project.
Additional mitigation required?	No	The mitigation measures within Certified SEIR 566, including PDFs, SCs, & AMs, remain adequate in scope for the proposed project. No additional mitigation measures are required.

14. FINDINGS:

1. AB 3158 FEE EXEMPTION: Find that pursuant to Section 711.4 of the California Fish and Game Code, this project is exempt from payment of required fees as it has been determined that the required fees have been paid.

2. The proposed project will be beneficial in achieving both long-term and short-term goals; it will provide both employment opportunities as well as additional housing opportunities for the future.

3. The impacts associated with implementation of the proposed project would be substantially less than those associated with implementation of the previously approved project evaluated in Certified SEIR 566 for biological resources, public services, traffic, air quality, cultural resources, aesthetics and recreation, with all of the other environmental factors expected to experience similar impacts. Impacts considered significant, unavoidable and adverse for the proposed project, as identified in Certified SEIR 566, would remain as such, with the

exception of aesthetic impacts to St. Michael's Abbey and the Ramakrishna Monastery, which would be greatly reduced through the use of landform grading in conjunction with landscaping, as well as the elimination of residential lots north of the on-site spine road. No additional significant adverse effects would occur as a result of implementation of the proposed project beyond those identified for the proposed project in Certified SEIR 566. Additional mitigation measures have not been proposed or required.

4. Find that the project as proposed will not have any adverse effects or impacts on humans or otherwise.

5. Find that Final SEIR, which was certified in January 27, 1998, satisfies the requirements of CEQA for this project.

15. DETERMINATION:

I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because Final SEIR 566, certified December 3, 1997 has been prepared, with mitigation measures which will ensure that any project related impacts will be mitigated to a level of insignificance.

AREA PLAN 98-2
SADDLEBACK MEADOWS
CONTINGENCY PLAN- 299 LOTS

BACKGROUND

This plan has 299 single-family detached dwelling units and originated from the "Staff recommended" 299-Lot Alternative (a.k.a. Alternative 8 in EIR No. 561 and presented as Alternative 4 in the recently certified SEIR No. 566). However, this Area Plan submittal is nearly *identical* to a plan (referred to as "Alternative 9") submitted for consideration before the Board of Supervisors on October 22, 1996 The differences between Alternative 9 and the proposed "Contingency Plan - 299 Lots" can be summarized as follows: 1) A reduction in density from 318 lots, to 299 lots, 2) Significant buffering and landform berming has been added along the project edge adjacent to the Ramakrishna Monastery, 3) The need for three extensive "loffel walls" near the project edge adjacent to the Ramakrishna Monastery have been eliminated, and 4) The majority of side-yard retaining walls throughout the project have been eliminated. The intent of this alternative Area Plan, as was its predecessor, Alternative 9, is to provide a project that directly responds to the view impact concerns expressed by St. Michael's Abbey, the Ramakrishna Monastery, the Hidden Ridge Community, and to a lesser degree, Portola Hills This Area Plan also incorporates community-wide design concepts, elements and features reflective of a "*rural-like*" character within the context and constraints of the site and the developer's objectives These design elements and features were also first presented at the July 30, 1996 Planning Commission Hearing, in a document entitled "Saddleback Meadows Rural Character Statement", a copy of which has been included in this document.

DESCRIPTION

The average lot size for this project is approximately 6,672 s.f, with a minimum lot size of 5,000 s.f.. Access to the project would be provided via a gate guarded private street off El Toro Road immediately south of the existing Aliso Creek/Trail under-crossing structure An emergency only access connects with Valley Vista Way. All habitable structures are proposed to be protected by automatic fire sprinkler systems The project site is approximately 222.2 acres in size. Total open space exceeds approximately 70%

The project acreage (222.2 acres) does not include the adjacent off-site water tank site. A water tank with a maximum capacity of 1.4 million gallons, and associated access road, are proposed off-site adjacent to the northeast corner of the project site to provide water service to the proposed project The proposed water tank site was previously dedicated to the Trabuco Canyon Water District when the existing Final Tract Map was recorded (Tract No. 10692). The water tank will be approximately 30-feet tall, 100 to 110-feet in diameter, and will be bermed,

landscaped, and painted a complimentary color to the surrounding setting. A total of approximately 8 acres of off-site area would be affected as a result of project implementation to accommodate slope area, access roads, related remedial grading, the water tank, and County of Orange fuel modification requirements

Onsite circulation is proposed with a system of private streets consisting of a primary spine street (56-foot r.o.w.) and a series of cul-de-sacs (41-,45-, and 52-foot r.o.w) An encroachment easement is required from the County of Orange to accommodate the project access road where it traverses County owned property along the western-most boundary of the site

The project has been designed to minimize impact on the existing land form. The homes have been located on the relatively level areas in a broad crescent shape flowing along the southern and eastern sides of the site, while the steep terrain of the central canyon area has been left as open space. Development is kept off the eastern and northern major ridgelines bordering the property. A primary design consideration in establishing the rural-like character of Saddleback Meadows is presenting a landscape enveloped community when viewed from the surrounding areas and from within the development. In response to this design intent and the interests of St. Michael's Abbey, the Ramakrishna Monastery and the neighboring Hidden Ridge community, specific grading techniques, site planning, and landscape elements will be incorporated within the project. The intent of these features will be to enhance the views of Saddleback Meadows from the surrounding areas This will be accomplished through

1 Creative contour grading that emphasizes and expands upon landforms,

2. Berming at select and appropriate locations to blend with natural terrain features while providing screening and buffering views into the project site from St. Michael's Abbey, the Ramakrishna Monastery and Hidden Ridge;

3. Creative site planning techniques that minimize rows of backyards along highly visible edges, incorporates slopes, landscape zones and landforms between homes and the surrounding neighbors, and neighborhood streets that climb with the terrain rather than flat roads common to non-terrain sites, and

4 An aesthetic community-wide landscape program that provides visual enhancement through significant perimeter and interior plantings (plant pallets will require OCFA approval), responds to seasonal changes, and provides filtered views of the community from the surrounding areas

This plan goes to great lengths to mitigate off-site views of the project from neighboring properties, specifically St Michael's Abbey, the Ramakrishna Monastery, and the Hidden Ridge Community. This will be accomplished through a combination of thoughtful landscape design and the extensive use of berming techniques which will be integrated with the landform contouring, especially along the Main Spine Road, and along view sensitive development edges. This

approach will also enhance the project's edge conditions which will provide for more sensitive edge transitions to the project's large open space areas and O'Neill Regional Park.
A wildlife movement corridor has been incorporated into the project design to address the importance of regional wildlife movement linkages between regionally important open space areas such as O'Neill Regional Park, Whiting Ranch Wilderness Park and the Cleveland National Forest. This plan utilizes an east/west corridor alignment similar to that shown in the Foothill/Trabuco Specific Plan. This wildlife corridor, which bisects the project (called the central corridor), is a component of a three corridor concept which together is designed primarily to accommodate small and medium size mammals and birds, but would not preclude the occasional potential movement of large mammals as well. This corridor is comprised of a minimum 400' wide wildlife corridor with 50' setbacks located on either side. The onsite wildlife corridor is proposed to utilize an at-grade crossing (400') where the wildlife corridor traverses the development's main spine road. Due to the low level of traffic on this end of the project, the at-grade crossing is not anticipated to inhibit wildlife movement. Loffel walls are used in select locations to minimize the extent of manufactured slopes Loffel walls allow for the growth of plant materials on and around the wall, eventually helping to screen the wall behind a blanket of vegetation.

Statistical Summary*

ONSITE	ACREAGE	% OF SITE
Residential Lots	45 8	21%
Streets (private)	17 8	8%
Regional Park	90.0	41%
Restricted Scenic Preservation Easement	68 5	30%
Subtotal	222.2	100%

* Acreages and percentages are approximations subject to refinement at the Tentative Map/Final Map stages.

OPEN SPACE/ TRAIL CONCEPT

The proposed Open Space/Trail Concept for Saddleback Meadows incorporates a variety of refinements which result in minimizing environmental impacts In response to the Natural Communities Conservation Program (NCCP) goals and objectives, the project provides for a viable Wildlife Movement Corridor incorporated into the design of the project providing access from the Aliso Creek Corridor to O'Neill Regional Park. The design proposes the primarily undisturbed open space areas, along with re-vegetated slope areas of the project, for fee dedication to serve as an extension of O'Neill Regional Park Trail connections are provided, linking the project to existing regional riding and hiking trails and bikeways. The project proposes a Trail Staging Area/Pocket Park, Ridgetop Park and the dedication of a significant amount of natural and re-vegetated open space. The proposed Trail Staging Area/Pocket Park provides a

direct link to the regional trail located on El Toro Road and the other proposed recreation features (Ridgetop Park and the Picnic area).

The Open Space/Trail Concept is composed of the following major elements:

1. Trails

a. Live Oak Canyon Regional Riding and Hiking Trail

- Project proposes the dedication of a 16' wide Recreation Easement along the El Toro Road frontage (approx. 1350 l f) Final Alignment is subject to approval by the Manager, Harbors Beaches and Parks.

- Maintenance for this Trail/Recreation Easement will be the responsibility of the County of Orange

b. Local Riding and Hiking Trail

- Project proposes the dedication of a 16' wide Recreation Easement (approx. 4800 l.f., for local riding and hiking trail purposes, of which approximately 1,550 l.f traverses Restricted Scenic Preservation Easement areas , while approximately 3,250 l f will traverse the Regional Park dedicated areas Final Alignment is subject to approval by the Manager, Harbors Beaches and Parks.

- This plan provides a linkage from the proposed Trail Staging Area/Pocket Park to the Live Oak Canyon Regional Riding and Hiking Trail on El Toro Road. Another trail will link the proposed Trail Staging Area/Pocket Park to the proposed Ridgetop Park (a.k a "Bridlewood Look-Out Park") and the "Picnic Area".

- Maintenance for this Trail/Recreation Easement will be the responsibility of the County of Orange

2. Regional Park

As designated on the Open Space/Trail Concept Map:

- This category of open space will serve as an extension of O' Neill Regional Park

- This category of open space encompasses approximately ±90 acres (±41% of the project)

- As a extension of O' Neill Regional Park, these open space areas, which include the wildlife movement corridor, would be offered for dedication to the County of Orange.
- The Regional Park will encompass areas which include the following areas which lie outside of the required fuel modification zones "undisturbed" open space; Native

Enhancement Transition Areas; re-vegetated remedial graded and manufactured slope areas; Oak Woodlands; Oak Restoration Areas; undisturbed portions of the existing Olive Grove, as well as the preserved existing and re-created Ephemeral Ponds.

- Coastal Sage Scrub, Oaks, and other biological resources requiring on-site mitigation would take place in the areas dedicated for Regional Park purposes

- The proposed Trail Staging/Pocket Park , Ridge Top Park (a.k a.Bridlewood Look-Out Park) and Picnic Area will be located in the Regional Park extension. These features will be subject to approval of the Regional Park Development Plan

- The final boundary of the Regional Park and the Riding and Hiking Trail alignments will be subject to the approval of the Manager of Harbors, Beaches, and Parks.

3. Restricted Scenic Preservation Easements

Areas designated as the following (approx. 68.5 acres) on the Open Space/Trail Concept Plan Map are to ensure that the scenic qualities of these edge areas are not impacted in the future by structures and development after they have been established

- El Toro Road Community Edge Area
- Fuel Modification Zones (Wet Zone and Non-Irrigated Zones only)
- These areas will be maintained by an HOA and/or Community Maintenance District
- Community slopes(Between residential lots and Roads).

CONTOUR GRADING CONCEPT

The grading concept for this alternative reflects a contour grading approach which utilizes techniques emphasizing variations and takes advantage of the curvilinear street and lotting design, rather than repetitive uniformity Contour grading and the creative use of berms and landforms along the community's spine road provide for screening and buffering of views into the project site from various offsite locations Numerous design features work together to establish the rural-like character. Contour grading with landform enhancement provides for edge treatments responsive to the natural terrain The community's spine road alignment responds to the terrain and allows for landscape plantings on both sides to create the rural-like experience while driving through the community Creative site planning responds to the intended rural character with setbacks from the spine road. This allows the project a more natural and organic ambiance in keeping with the rolling hillside setting. These contour grading techniques consist of the following·

1 Integrate grading into the context of existing topography using horizontal rounding of contours;

2 Blending of manufactured contours with natural existing contours,

3. Rounding at the top and toe of slopes to avoid harsh transitions, and

4. Design of development enclaves of varying size and irregular spacing to avoid a uniformly "terraced" appearance.

Earthwork Volumes:

Conventional Grading

- Balanced Cut/Fill (approximate)
  Cut Quantity ±2,100,000 c y
  Fill Quantity: ±2,100,000 c.y.

- Total Import Quantity 0
  Total Export Quantity: 0

Remedial Grading

- Total Remedial Grading (Remove & Replace) approximately ±6,800,000 c.y

Note: These figures are approximations subject to refinement at the Tentative Map and Final Map stages.

LANDSCAPE / REVEGETATION CONCEPT

The Landscape / Revegetation Concept for Saddleback Meadows seeks to integrate the landscape of the proposed project with the site's existing setting and that of the surrounding foothill region. The use of landscape materials (with native and introduced plant pallets approved by the OCFA), and the manner in which the landscape design concept is integrated into the project will reinforce the ability of Saddleback Meadows to respond to the following:

1 Views into the community from surrounding properties;
2. Views from within the Saddleback Community,
3. The desire to create a community character which reflects the transitional nature of the property from a suburban to semi-rural setting.

Interspersing primarily sycamore tree groupings at strategic locations throughout the project will blend the different landscape zones and integrate this community into the surrounding preserved natural open space areas. A predominant image of nature, open space and natural vegetation will be accomplished via:

1 Tall trees and shrub massings planted on slopes between the residential enclaves and within natural open spaces, on slopes between homes, and along community streets;

2. A priority given to landscape plantings, i.e views of the community shall be through the landscape which blankets the architecture of the neighborhoods, thus allowing the landscape (incorporating Sycamores, Oaks, and other appropriate trees) to predominate over the built environment, and

3 Side slope and street tree plantings in the neighborhoods to provide for visible tree canopies above the roof lines.

4. An interlace of the natural and introduced landscape as one fabric.

The Landscape Concept consists of five (5) functional, yet integrated, areas and zones as shown on the Landscape / Revegetation Concept Plan These areas and zones are as follows:

1) El Toro Road Community Edge Area

The El Toro Road Community Edge area will play a key role in providing a physical and visual buffer for the project from off-site views. Predominantly manufactured slopes are planned along El Toro Road In addition, a key component of this edge is the preservation of Aliso Creek and it's existing riparian habitat along El Toro Road, just north of the proposed main project entry point Therefore, this community edge adjacent to the road will be landscaped with introduced and native compatible plants reflecting and continuing the riparian landscape found along the Aliso Creek/El Toro Road Corridor. The California Sycamore, commonly found in riparian areas, will be the major slope tree along the El Toro Road Community Edge.

Further up the manufactured slope, the landscape will transition from riparian plants to ornamental and native compatible plants suitable for erosion control and for buffering and screening. Tree plantings at side-yard property lines of the residential lots located at the top of slopes will reduce the visual impact of dwellings when viewed from off-site. Meanwhile these tree groupings are intended to maintain views for individual lots. Additionally, this edge treatment is designed to provide visual screening of the project from vehicles traveling along El Toro Road

2) Community Slope Area

Manufactured slopes will be landscaped to visually enhance the project, to control erosion, and to provide buffering/screening where appropriate and feasible. Trees will be located at the top of slopes and clustered near side-yard property lines of residential lots as well as on the slope itself. Trees planted on the slope will take into consideration the maximum tree height at maturity relative to its vertical location to the top of slope, so that views from residential lots will not be impaired when slope landscaping reaches full maturity. This will blend the manufactured on-site slopes with off-site natural areas, integrating the community landscape into the surrounding environs. California Sycamore and some Coastal Live Oak trees will be used in strategic locations throughout the community slopes, continuing the community landscape theme.

Major oak woodland areas and areas of the olive grove which are not impacted by development and/or remedial grading activities are identified on the Landscape/Revegetation Concept Plan as preserved. These areas identify major preserved tree stands and tree groupings only. For identification of individual preserved and impacted oak trees, refer to Sweetwater Environmental Biologists' Oak Tree Inventory, dated December 21, 1995.

3) Fire Fuel Modification Zones

The proposed project is within a designated "Special Fire Protection Area", consequently, the development and construction of the project are subject to requirements designed to mitigate the increased fire hazard (Ordinance 3960). The Orange County Fire Authority (OCFA) requires a fuel modification program along all edges of residential development exposed to fire hazard areas. The fuel modification program addresses three zones consisting of a "Setback Zone", "Wet Zone", and a "Non-Irrigated Zone", as shown on the Landscape and Revegetation Concept Plan Map. Maintenance responsibility for the setback zone lies with the private owner Maintenance responsibility for the other zones will be with the H.O.A./ Community Maintenance District.

Saddleback Meadows' residential edges contain both upslope and downslope conditions with a combination of both manufactured and natural undisturbed slopes. The intent of the fuel modification is to utilize these slopes as a transition area between natural open space (fire hazard areas) and the residential edge and to provide an acceptable level of fire safety. The revegetated portion of these slopes will be landscaped using native compatible plant species which will meet

the public safety goals of the OCFA, reinforce the naturalized appearance of the manufactured slopes, and satisfy the aesthetic requirements of the project. Fire Fuel Modification Zones are designed to reflect the native enhancement transition zone criteria for plant material selection The plant palettes for both of the Fire Fuel Modification Zones and the Native Enhancement Transition Zone overlap and contain many of the same species and varieties of plants. These plant pallets will be required to meet the approval of the OCFA.

Setback Zone - Is a twenty-foot (20') wide area within the rear yard setback of all residential lots abutting the fuel modification zone. No combustible construction or materials will be allowed in this zone. This zone will be maintained by the individual homeowner. (Not shown on the Landscape / Revegetation Concept Plan, see Preliminary Fuel Modification Plan).

Wet Zone - is a fifty-foot (50') wide landscape area, beginning at the residential rear yard property line. This zone includes an automatic irrigation system and low fuel fire resistive, native compatible plants.

Non-Irrigated Zone - Fire fuel modification zones are 100' wide. However, several upslope areas with 50' widths will be permitted with O.C.F.A. approval. In natural undisturbed slopes, existing native planting will be non-irrigated, pruned and thinned. The OCFA requires that all "dead and dying" materials be removed, pruned and thinned in non-irrigated zones Manufactured slopes will be **temporarily** irrigated and landscaped with native and native-compatible plant materials. Landscaping is intended to naturalize over time with irrigation to be abandoned upon establishment and naturalization.

Application of the Orange County Fire Authority's (OCFA) fuel modification criteria to the area located along the upper north-easterly project boundary, dictates that the fuel modification zone traverse off-site onto private property. This will require that an easement be obtained from the adjacent property owner, for the purposes of fuel modification, prior to the issuance of a grading permit. Maintenance responsibility for any off-site fuel modification zones will be the same as for on-site fuel modification zones (i.e. H O.A. / Community Maintenance District)

4) Native Enhancement Transition Area

Natural areas disturbed by remedial grading and located within designated open space areas will require revegetation with native or naturalized plant material to re-establish the previous coastal sage scrub (CSS). A high priority will be placed upon selecting plant material which is indigenous to the undisturbed natural areas and surrounding areas and which will provide a landscape with as much habitat value as is practical.

5) Existing Undisturbed Vegetation Area.

Open space areas undisturbed by remedial grading activities will be preserved and incorporated into the overall landscape concept. Only minimal clean-up of abandoned agricultural uses , if

necessary is planned The elimination of livestock grazing on the property will allow the natural transition and succession of grasses to CSS and Chaparral plant communities over time. The majority of Oak Woodland mitigation will occur in this area within stands of existing non-native vegetation.

SADDLEBACK MEADOWS
RURAL CHARACTER STATEMENT

Purpose and Intent

The purpose and intent of this "character statement" booklet is to express the preliminary community design concepts that will eventually create the visual and physical character that the Saddleback Meadows community will have. This booklet addresses the basic design elements and considerations necessary in developing any community character, and ties those elements and considerations to the Saddleback Meadows community. It responds to the project teams intent for a rural community theme and character, as well as responding to design considerations expressed by Saint Michael's Abbey, Hidden Ridge residential community, and the Ramakrishna Monastery. It is a preliminary study intended to reflect the underlying design vocabulary that has been a consistent component of all land use and site planning studies conducted for this property.

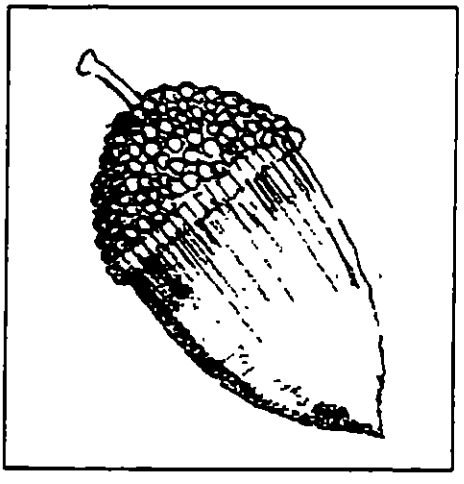
This "Rural Character Statement" is intended to be used as a guideline for community design and as a "tool of measure" to be used by the Planning Commissioners during the review of the Use Permit. The Use Permit requires a precise grading plan, detailed landscape plans, fuel modification plans and programs, architectural plans for all structures, and the precise location of all building and structures.

The planning and design of any proposed community is a combination of the physical site plan on the land and the design parameters initially established relating to the desired community character. The end result is a community whose physical character and composition relates directly with the landscape, streetscape and architectural fabric.

Approaching the Saddleback Meadows project with this philosophy, and with the desire to plan and design a community reflecting the qualities and character of a rural townscape, the initial community design elements establishing the rural character are presented in this booklet.

The "Rural Townscape" Character

The term "rural character" conjures up images of small towns set upon the land amidst a country setting. Winding roads are enveloped in trees and tree canopies. Rolling hills, field walls of stone and rock, woodlands, grasslands and fields surround the towns and provide a separation between each town. Natural areas outside of the towns are enjoyed by the people of the area for hiking, bicycling and horseback riding, exploring and treasure hunting, picnics, and rides in the country. Seasonal color through changing foliage and wild flowers accent the landscape, further emphasizing the character and appeal of the rural townscape and surrounding environment.



Villages and towns are visible and apparent within the landscape, yet blend with the land through a multitude of introduced, as well as natural features and elements. These include:

A. Country roads that transition into a town's main street;
B Open fields or woodlands filtering into the outskirts of the town through open fields and parks, eliminating the visual boundary of the town and the country;
C. In hillside environments, steep winding streets that climb with the hillside;
D. Streetside elements such as wood rail fencing, simple wooden signs, and old street lamp;
E. The informal arrangement of trees and other plantings, whether curbside or used in other manners, accenting the natural appeal rather than rigid uniformity; and
F. Buildings and related architecture presenting softer earth tone qualities and utilizing materials that blend and are in harmony with the landscape and the natural elements.

The Rural Character of Saddleback Meadows

The character of the Saddleback Meadows community will be observed from two perspectives, these being:

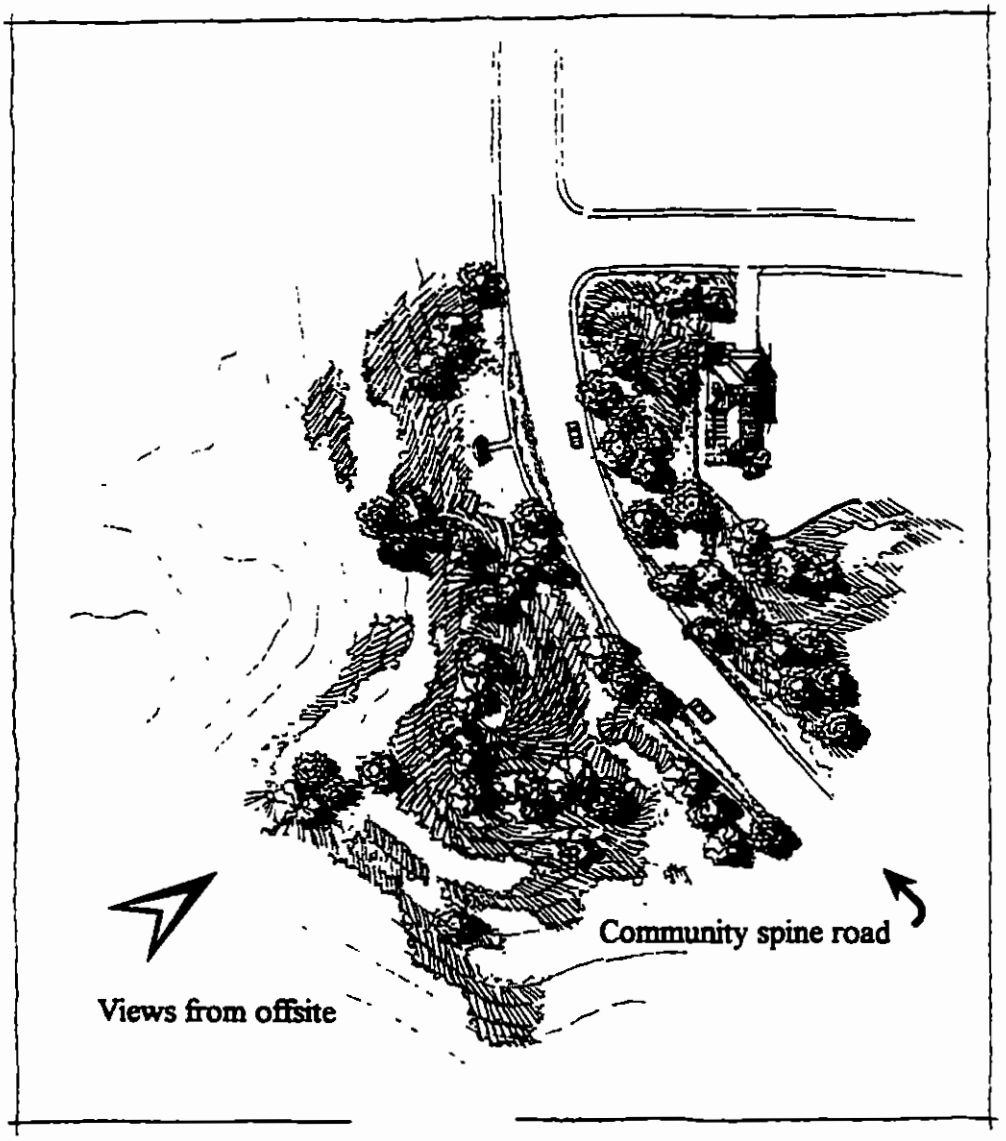
A. The "macro" scale.
    1. Public views into the community from off-site (El Toro Road, Saint Michael's Abbey, Hidden Ridge and the Ramakrishna Monastery), and
    2. Views of the community from within.

B. The "micro" scale:
    1. Views of community elements along highly visible public edges noticeable by the passing public, such as the El Toro Road edge and natural slopes adjacent to Saint Michael's Abbey, Hidden Ridge, and the Ramakrishna Monastery; and
    2. Visual elements and design details throughout the community noticeable from within the community.

The Saddleback Meadows community will incorporate community wide design elements and features reflective of the rural character. These features and elements will respond to the "macro" and "micro" levels of concern, as well as addressing the design considerations expressed by the adjacent neighbors.

A primary design consideration in establishing the rural character of Saddleback Meadows is presenting a landscaped enveloped community when viewed from the surrounding areas and from within. In response to this design intent and the interests of the Abbey, Hidden Ridge and the Monastery, specific grading techniques, site planning, and landscape elements will be incorporated within the plan The intent of these features will be to enhance the views of Saddleback Meadows from the surrounding areas. This will be accomplished through:

1. Creative contour grading that emphasizes and expands upon landforms;
2. Berming at select and appropriate locations to blend with natural terrain features while providing screening and buffering views into the project site from the Abbey, Hidden Ridge and the Monastery;
3. Creative site planning techniques that minimize rows of backyards along highly visible edges, incorporates slopes, landscape zones and landforms between homes and the surrounding neighbors, and neighborhood streets that climb with the terrain rather than flat roads common to non-terrain sites; and
4. An aesthetic community wide landscape that provides visual enhancement through significant perimeter and interior plantings, providing filtered views of the community from the surrounding areas and responds to seasonal changes.



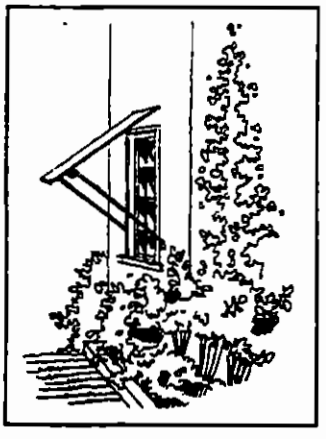
Numerous design features work together to establish the rural character. Contour grading with landform enhancement provides for edge treatments responsive to the natural terrain. The community's spine road alignment responds to the terrain and allows for landscape plantings on both sides to create the rural experience while driving through the community. Creative site planning responds to the intended rural character with setbacks from the spine road.

Contour grading and the creative use of berms and landforms along the community's spine road provide for screening and buffering of views into the project site from offsite.

Based upon the above described design considerations, the following design elements will be part of the Saddleback Meadows community to respond to views into the community from the surrounding areas and the desire to create the rural community character.

A. Blend the homes, streets and community elements with the natural surroundings This is accomplished through:

1.) Color compatibility of architecture with the natural landscape;
2.) The use of natural and natural-like materials in architecture and streetscape elements;
3.) Site planning and grading design encouraging landforms and berming, particularly along main community streets; and
4.) An interlace of the natural and introduced landscape as one fabric

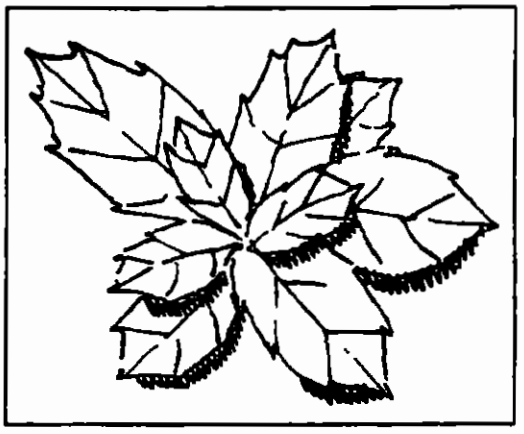


B Predominant image of green, nature, open space and plant materials, accomplished via:

1.) Tall trees and shrub massings planted on slopes between the residential neighborhoods and within natural open spaces, on slopes between homes, and along community streets;
2.) Priority given to landscape plantings, i.e. views of the community shall be through the landscape which blankets the architecture of the neighborhoods, thus allowing the landscape (incorporating Sycamores, Oaks, and other appropriate trees) to predominate over the built environment; and

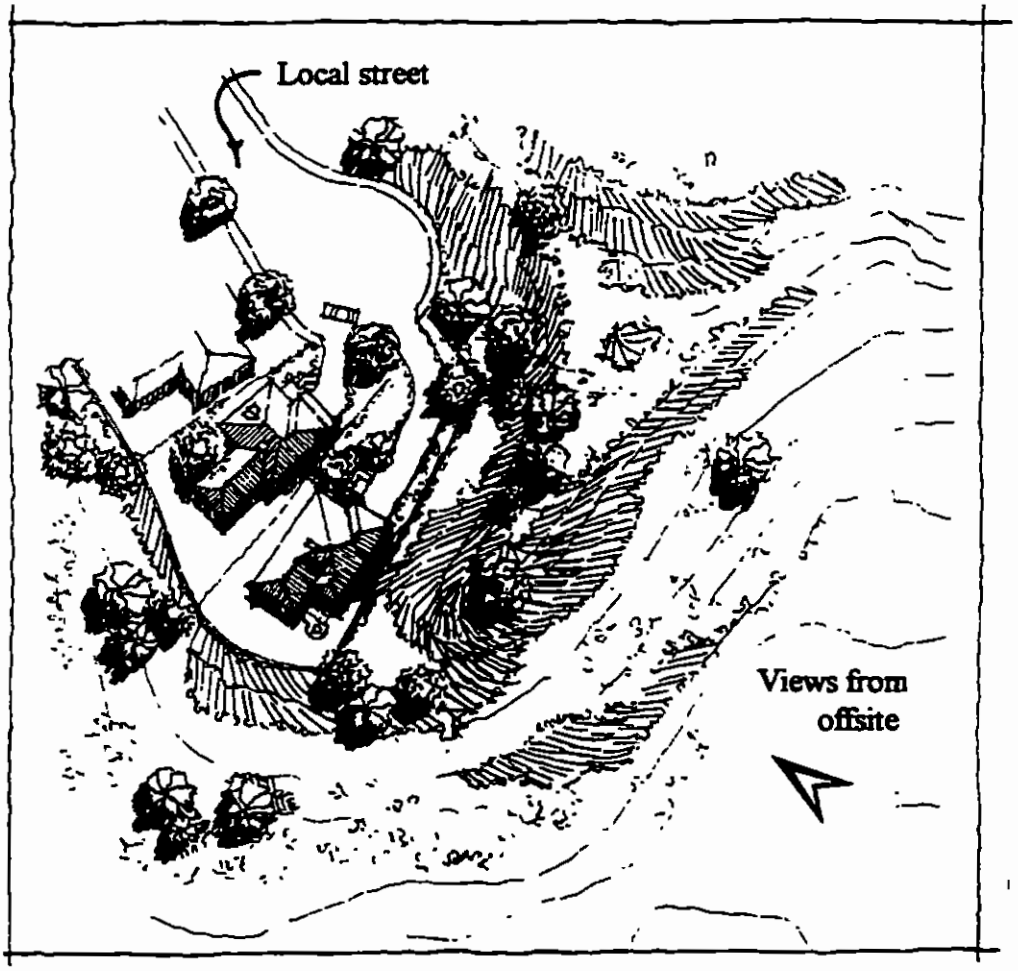
3.) Side slope and street tree plantings in the neighborhoods to provide for visible tree canopies above the rooflines.

The following design parameters will be part of Saddleback Meadows in response to views from within the community and the desire to create the rural community character:

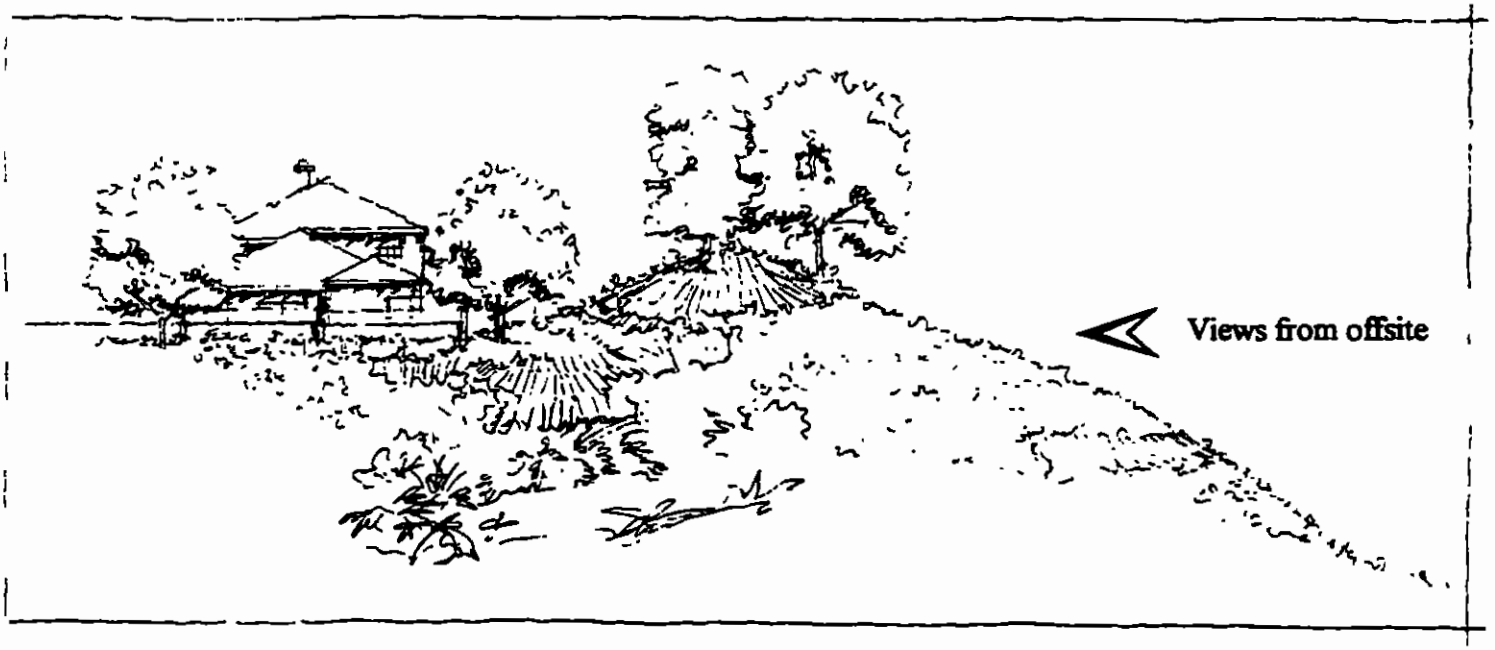


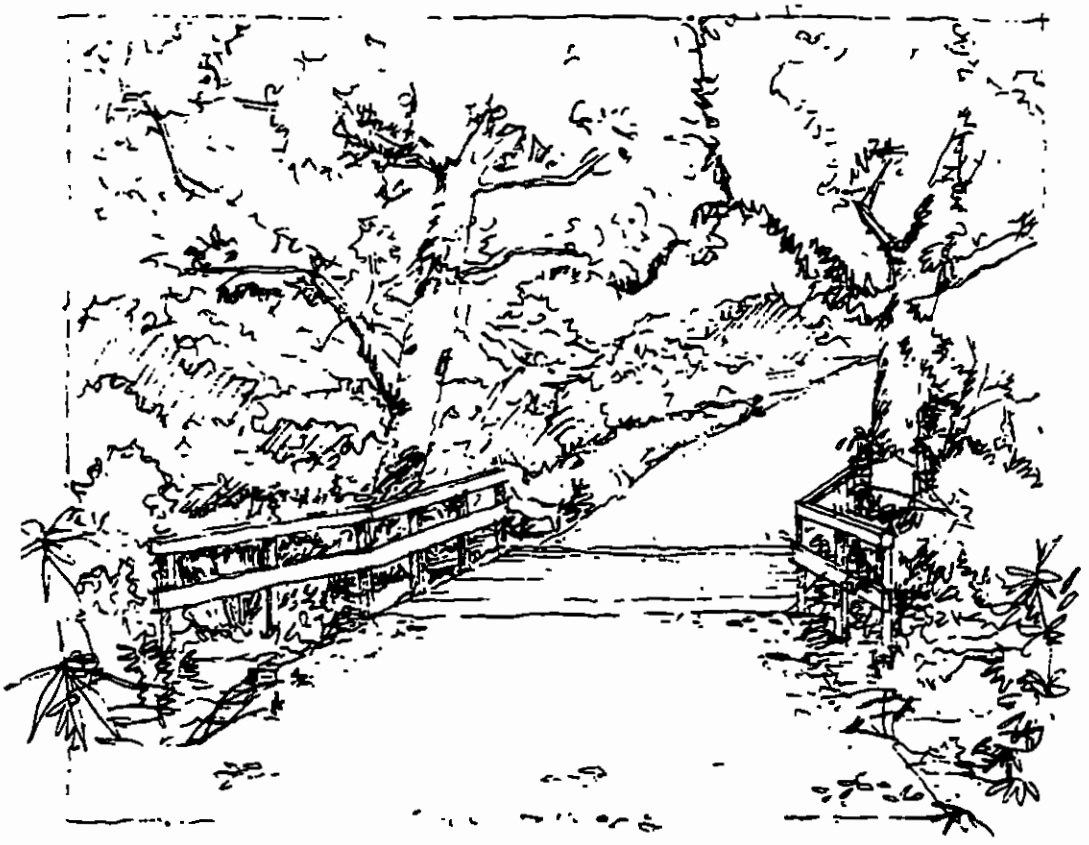
A. View windows into natural open spaces from the community streets and "pocket parks";
B. Informal plantings of landscape elements along the community streets, slopes and within the neighborhoods;
C. Blending of landscape elements and landform features transitioning from the natural to the man-made;
D. Movement in three-dimensions through landforms and plant massings, curvilinear, winding streets, and grade elevation in streets to accommodate the natural terrain;
E. Architecture: roofs, facades, design elements and details having a theme of natural materials and elements; and
F. Visual imagery along the community streets:
    1.) Informal slope plantings with tall canopy type trees for visual enclosure, presence and seasonal color;
    2.) Natural appearing materials such as wood rail fencing, stone/rock walls;
    3.) Narrow meandering walks and trails;
    4.) Minimal but thematic street signs and street lighting; and
    5.) Neighborhood tree planting requirements.

Based upon the above description of design intent in creating the rural character for the Saddleback Meadows community and responding to neighboring design interests, the following pages provide examples of design features and elements of the Saddleback Meadows project

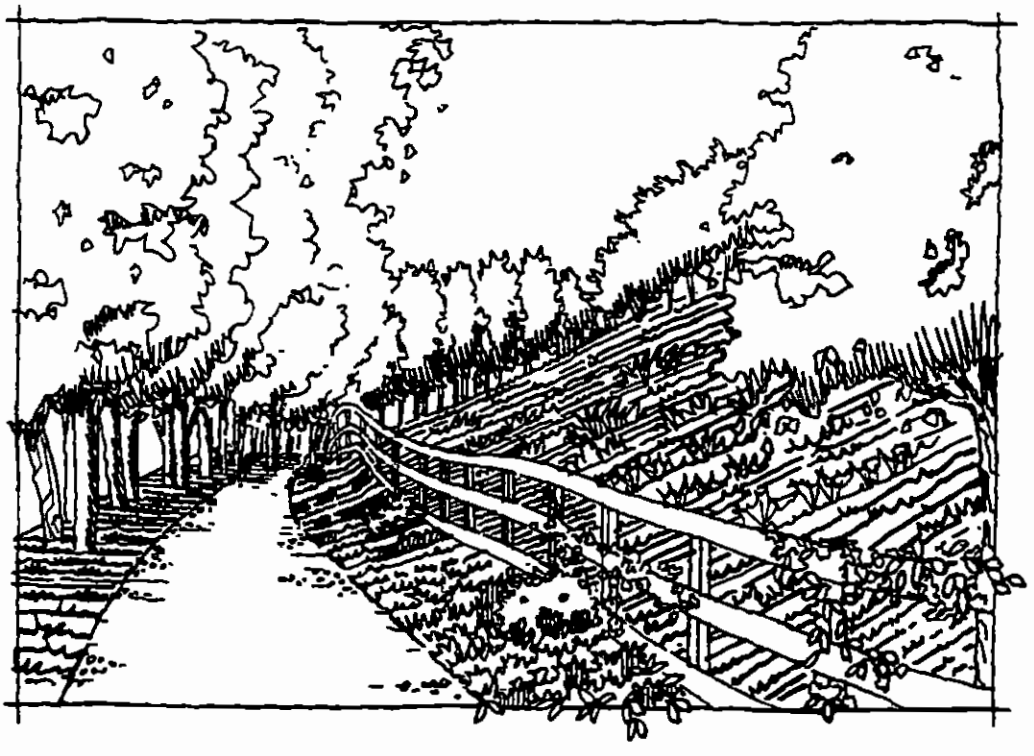


Consideration given to landforms and the replication of the existing terrain features along select project edges provides for a sense of "enclosure" for the neighborhoods while buffering views into the project from surrounding areas.

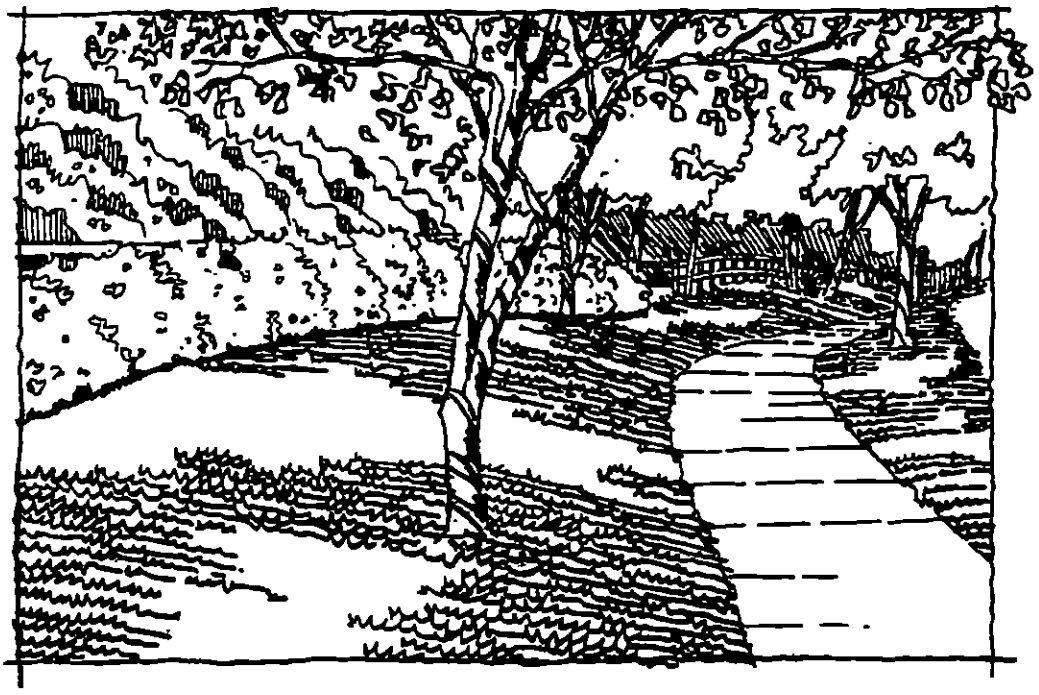




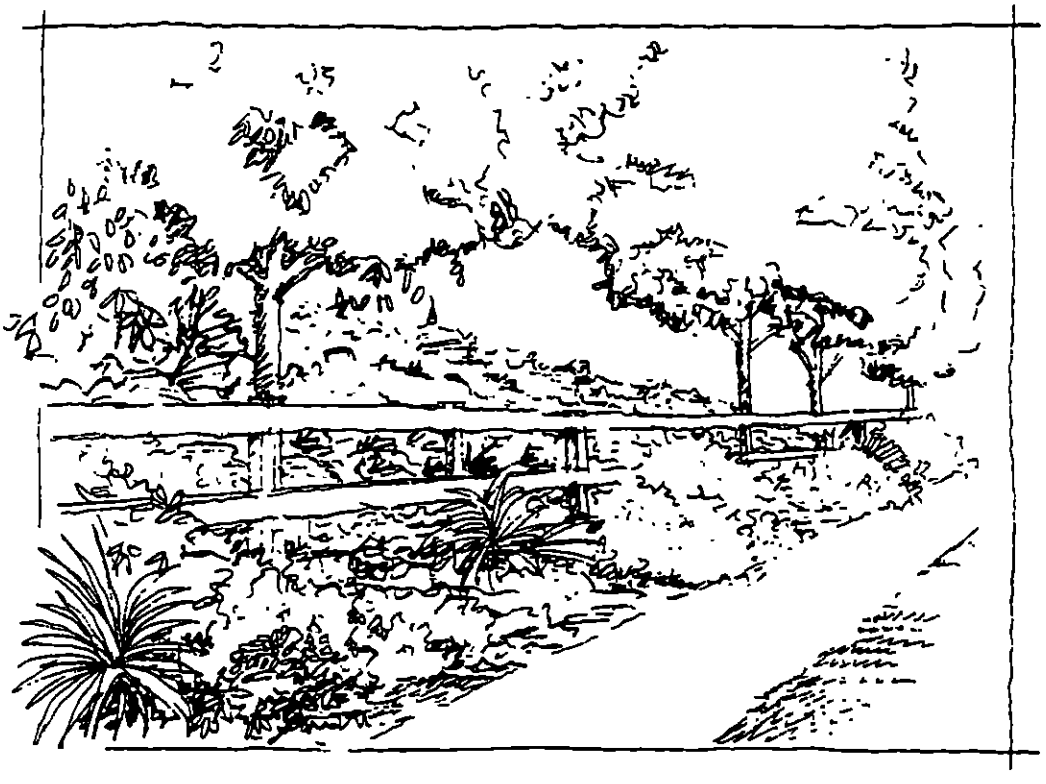
Riding, hiking and bicycling trails provide access to natural open spaces and should feature natural elements and materials. Wooden bridges provide access across swales while visually reinforcing the rural character.



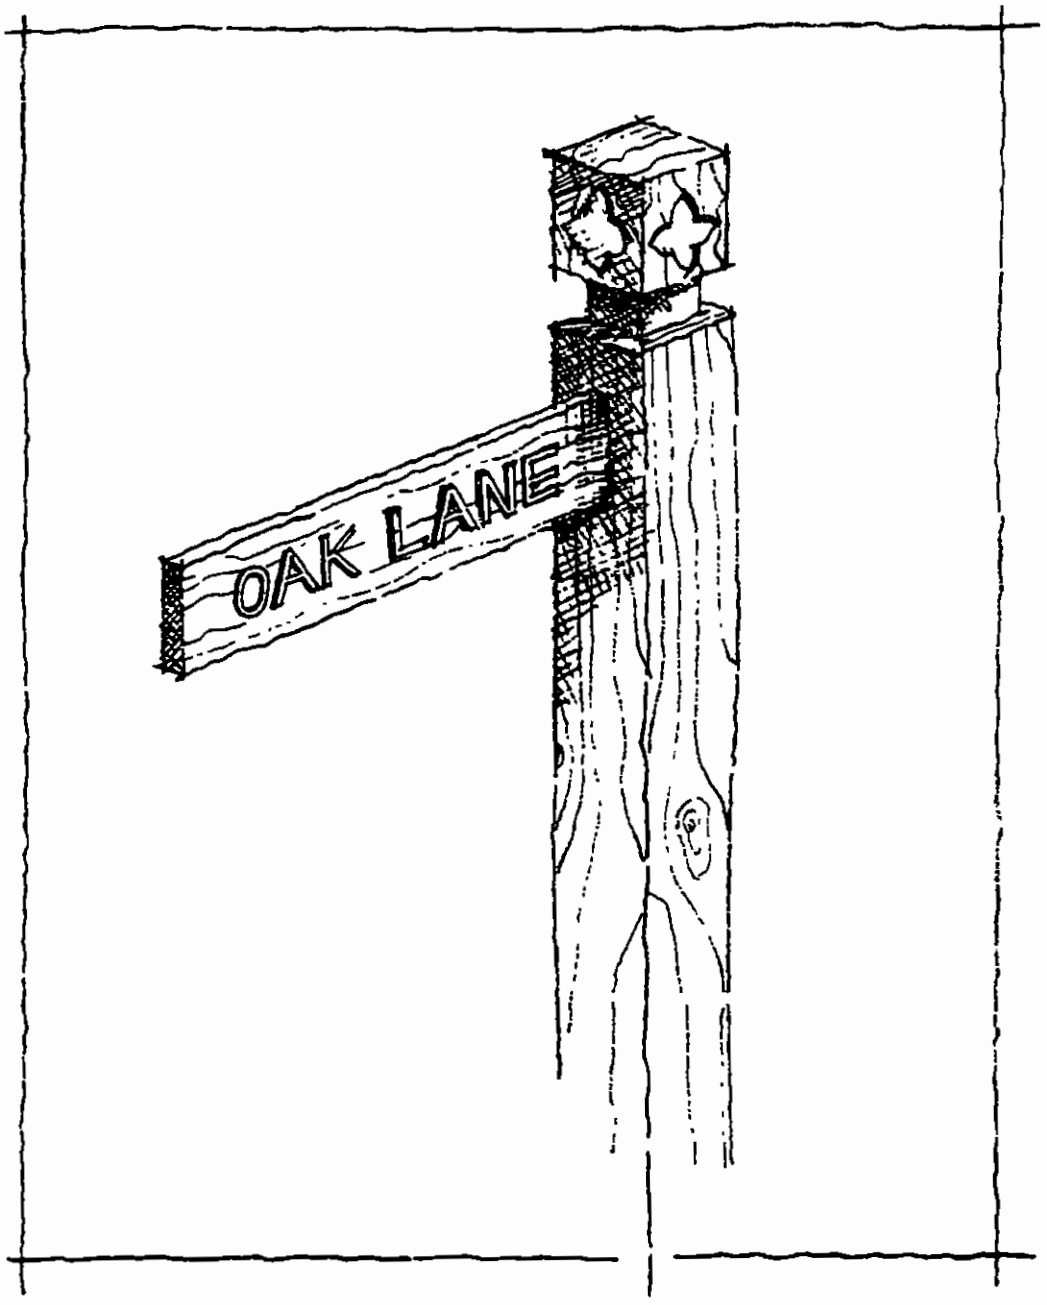
Horse trails and/or bicycle trails can be incorporated as part of the community theme. Landscape setbacks from streets and thematic fencing encourage the rural flavor of the community.



Meandering sidewalks along the community's spine road, enveloped by trees and landscape plantings, provide for an enjoyable walking experience through the community.



Visual accents of seasonal color in the landscape and natural appearing materials in fences and streetscape elements encourages the rural character within the community.



Simple wood-like sign posts provide information and direction while reflecting the desired character of the community.

Visual detail along public edges (El Toro Road) emphasizes the rural nature of Saddleback Meadows. Wood-like fencing, canopy trees and slope planting reflect the community theme and allow for filtered views into the hills beyond.

AREA PLAN 95-7
Alternative 4 - 299 Lots
SADDLEBACK MEADOWS

DESCRIPTION

This alternative has 299 single-family detached dwelling units. It is based upon a modified version of Alternative No. 4 contained in Subsequent Environmental Impact Report No. 566. This alternative originated as staff Alternative No. 8 in EIR No. 561 The intent of this alternative Area Plan design is to respond to the design considerations expressed by St. Michael's Abbey, the Ramakrishna Monastery, and Hidden Ridge Community. This Area Plan also begins to incorporate community-wide design elements and features reflective of a rural-like character within the context and constraints of the site and the developer's objectives. These design elements and features were first presented at the July 30, 1996 Planning Commission Hearing, in a document entitled "Saddleback Meadows Rural Character Statement".

The average lot size for this project is approximately 6,541 s.f., with a minimum lot size of 5,000 s.f.. Access to the project would be provided via a gate guarded private street off El Toro Road immediately south of the existing Aliso Creek/Trail undercrossing structure. An emergency only access connects with Valley Vista Way The project site is approximately 222.2 acres in size Total open space is approximately 72% (utilizing PDSD's criteria for calculating open space).

The project acreage (222.2 acres) does not include the adjacent off-site water tank site A water tank with a maximum capacity of 1.4 million gallons, and associated access road, are proposed off-site adjacent to the northeast corner of the project site to provide water service to the proposed project. The proposed water tank site was previously dedicated to the Trabuco Canyon Water District when the existing Final Tract Map was recorded (Tract No. 10692). The water tank will be approximately 30-feet tall, 100 to 110-feet in diameter, and will be bermed, landscaped, and painted a complimentary color to the surrounding setting. A total of approximately 8 acres of off-site area would be affected as a result of project implementation to accommodate slope area, access roads, related remedial grading, the water tank, and County of Orange fuel modification requirements

Onsite circulation is proposed with a system of private streets consisting of a primary spine street (56-foot r.o.w.) and a series of cul-de-sacs (41-,45-, and 52-foot r o w). An encroachment easement is required from the County of Orange to accommodate the project access road where it traverses County owned property along the western most boundary of the site.

The project has been designed to minimize impact on the existing land form. The homes have been located on the relatively level areas in a broad crescent shape flowing along the southern and eastern sides of the site, while the steep terrain of the central canyon area has been left as open space. Development is kept off the eastern and northern major ridgelines bordering the property A primary design consideration in establishing the rural-like character of Saddleback Meadows is presenting a landscape enveloped community when viewed from the surrounding areas and from within the development In response to this design intent and the interests of St. Michael's

Abbey, the Ramakrishna Monastery and Hidden Ridge, specific grading techniques, site planning, and landscape elements will be incorporated within the plan. The intent of these features will be to enhance the views of Saddleback Meadows from the surrounding areas. This will be accomplished through.

1 Creative contour grading that emphasizes and expands upon landforms;
2. Berming at select and appropriate locations to blend with natural terrain features while providing screening and buffering views into the project site from St Michael's Abbey, the Ramakrishna Monastery and Hidden Ridge,
3. Creative site planning techniques that minimize rows of backyards along highly visible edges, incorporates slopes, landscape zones and landforms between homes and the surrounding neighbors, and neighborhood streets that climb with the terrain rather than flat roads common to non-terrain sites; and
4. An aesthetic community-wide landscape that provides visual enhancement through significant perimeter and interior plantings, responds to seasonal changes, and provides filtered views of the community from the surrounding areas.

A wildlife movement corridor has been incorporated into the project design to address the importance of regional wildlife movement linkages between regionally important open space areas such as O'Neill Regional Park, Whiting Ranch Wilderness Park and the Cleveland National Forest. Unlike the proposed project which does not incorporate any type of wildlife corridor, this alternative utilizes an east/west corridor alignment similar to that shown in the Foothill/Trabuco Specific Plan This wildlife corridor, which bisects the project (called the central corridor), is a component of a three corridor concept which together is designed primarily to accommodate small and medium size mammals and birds, but would not preclude the occasional potential movement of large mammals as well This corridor is comprised of a minimum 400' wide wildlife corridor with 50' setbacks located on either side. The onsite wildlife corridor is proposed to utilize an at-grade crossing (400') where the wildlife corridor traverses the development's main spine road. Due to the low level of traffic on this end of the project, the at-grade crossing is not anticipated to inhibit wildlife movement Loffel walls are used in select locations to minimize the extent of manufactured slopes. Loffel walls allow for the growth of plant materials on and around the wall, eventually screening the wall behind a blanket of vegetation

Statistical Summary*

ONSITE	ACREAGE	% OF SITE
Residential Lots	44.9	20%
Streets (private)	17 5	8%
Other Dedicated Natural Open Spaces	93 1	42%
Trail Staging Area/Pocket Park	.6	0%
Open Space (dedicated to H.O A.)	66.1	30%
Subtotal	222.2	100%

* Acreages and percentages are approximations subject to refinement at the Tentative Map/Final Map stages.

OPEN SPACE/ TRAIL CONCEPT

The proposed Open Space/Trail Concept for Saddleback Meadows incorporates a variety of refinements which result in minimizing environmental impacts. In response to the Natural Communities Conservation Program (NCCP) goals and objectives, the project provides for a viable Wildlife Movement Corridor incorporated into the design of the project providing access from the Aliso Creek Corridor to O'Neill Regional Park The design proposes the primarily undisturbed open space areas, along with revegetated slope areas of the project, for fee dedication as a potential extension of O'Neill Regional Park Trail connections are provided, linking the project to existing regional riding/hiking trails and bikeways The project proposes a Trail Staging Area/Pocket Park, Ridgetop Park and significant dedicated natural open space. The proposed Trail Staging Area/Pocket Park provides a direct link to the regional trail located on El Toro Road and the other proposed recreation features (Ridgetop Park and the Old Ranch House Site).

1. Trails

a. Regional Riding and Hiking Trail
   - Dedication of 16' wide Recreation Easement along El Toro Road frontage (approx. 1350 l.f.)
   - County Maintenance Responsibility

b. Local Riding and Hiking Trail
   - Dedication of 16' wide Recreation Easement (approx 4800 l.f., of which approximately 1550 l f. traverses Restricted Scenic Preservation Easement, and approximately 3250 l.f. traverses Other Dedicated Natural Open Space)
   - Linkage from proposed Trail Staging Area/Pocket Park to the regional trail on El Toro Road and another trail linking the regional trail to the proposed Ridgetop Park (a.k.a. Bridlewood look-out park) and the Old Ranch House Site
   - County Maintenance Responsibility

2. Other Dedicated Natural Open Space

As designated on the Open Space/Trail Concept Map
- Potential extension of O'Neill Regional Park
- Approximately 93.1 acres (42% of project site)
- Fee Ownership Dedication
- Includes undisturbed open space, some Native Enhancement Transition Areas and some revegetated manufactured slope areas
- Includes Coastal Sage Scrub Restoration/Enhancement Areas
- Includes preserved significant Oak Woodlands and Oak Restoration Areas outside of fuel modification zones
- Includes portion of existing Olive Grove area undisturbed by grading/fuel modification
- Includes preserved existing and re-created Ephemeral Ponds
- Includes Ridge Top Park (Bridlewood look-out park)

- County Maintenance Responsibility

3. Restricted Scenic Preservation Easements

Areas designated as the following on the Open Space/Trail Concept Plan Map·
- El Toro Road Community Edge Area
- Fuel Modification Zones (Wet Zone and Non-Irrigated Zones only)
- HOA/Community Maintenance District Responsibility

4. Community Slope Area

- As designated on the Open Space/Trail Concept Plan Map
- HOA Owned
- HOA/Community Maintenance District Responsibility

CONTOUR GRADING CONCEPT

The grading concept for this alternative reflects a contour grading approach which utilizes techniques emphasizing variations and takes advantage of the curvilinear street and lotting design, rather than repetitive uniformity. Contour grading and the creative use of berms and landforms along the community's spine road provide for screening and buffering of views into the project site from various offsite locations Numerous design features work together to establish the rural-like character. Contour grading with landform enhancement provides for edge treatments responsive to the natural terrain. The community's spine road alignment responds to the terrain and allows for landscape plantings on both sides to create the rural-like experience while driving through the community. Creative site planning responds to the intended rural character with setbacks from the spine road. This allows the project a more natural and organic ambiance in keeping with the rolling hillside setting These contour grading techniques consist of the following.

1. Integrate grading into the context of existing topography using horizontal rounding of contours;
2 Blending of manufactured contours with natural existing contours;
3. Rounding at the top and toe of slopes to avoid harsh transitions, and
4 Design of development enclaves of varying size and irregular spacing to avoid a uniformly "terraced" appearance.

Earthwork Volumes:

Conventional Grading

LANDSCAPE / REVEGETATION CONCEPT

The Landscape / Revegetation Concept for Saddleback Meadows seeks to integrate the landscape of the proposed project with the site's existing setting and that of the surrounding foothill region The use of landscape materials (both native and introduced) and the manner in which the landscape design concept is integrated into the project will reinforce the ability of Saddleback Meadows to respond to the following:

1. Views into the community from surrounding properties;
2. Views from within the Saddleback community;
3 The desire to create a community character which reflects the transitional nature of the property from a suburban to semi-rural setting

Interspersing primarily sycamore tree groupings at strategic locations throughout the project will blend the different landscape zones and integrate this community into the surrounding preserved

natural open space areas A predominant image of nature, open space and natural vegetation will be accomplished via

1. Tall trees and shrub massings planted on slopes between the residential neighborhoods and within natural open spaces, on slopes between homes, and along community streets,
2. A priority given to landscape plantings, i.e. views of the community shall be through the landscape which blankets the architecture of the neighborhoods, thus allowing the landscape (incorporating Sycamores, Oaks, and other appropriate trees) to predominate over the built environment; and
3. Side slope and street tree plantings in the neighborhoods to provide for visible tree canopies above the rooflines.
4 An interlace of the natural and introduced landscape as one fabric.

The Landscape Concept consists of five (5) functional yet integrated areas and zones as shown on the Landscape / Revegetation Concept Plan These areas and zones are as follows.

1) El Toro Road Community Edge Area

The El Toro Road Community Edge area will play a key role in providing a physical and visual buffer for the project from off-site views Predominantly manufactured slopes are planned along El Toro Road In addition, a key component of this edge is the preservation of Aliso Creek and it's existing riparian habitat along El Toro Road, just north of the proposed main project entry point. Therefore, this community edge adjacent to the road will be landscaped with introduced and native compatible plants reflecting and continuing the riparian landscape found along the Aliso Creek/El Toro Road Corridor. The California Sycamore, commonly found in riparian areas, will be the major slope tree along the El Toro Road Community Edge

Further up the manufactured slope, the landscape will transition from riparian plants to ornamental and native compatible plants suitable for erosion control and for buffering and screening Tree plantings at side-yard property lines of the residential lots located at the top of slopes will reduce the visual impact of dwellings when viewed from off-site Meanwhile these tree groupings are intended to maintain views for individual lots Additionally, this edge treatment is designed to provide visual screening of the project from vehicles traveling along El Toro Road.

2) Community Slope Area

Manufactured slopes will be landscaped to visually enhance the project, to control erosion, and to provide buffering/screening where appropriate and feasible. Trees will be located at the top of slopes and clustered near side-yard property lines of residential lots as well as on the slope itself. Trees planted on the slope will take into consideration the maximum tree height at maturity relative to its vertical location to the top of slope, so that views from residential lots will not be impaired when slope landscaping reaches full maturity This will blend the manufactured on-site slopes with off-site natural areas, integrating the community landscape into the surrounding

environs. California Sycamore and some Coastal Live Oak trees will be used in strategic locations throughout the community slopes, continuing the community landscape theme.

Major oak woodland areas and areas of the olive grove which are not impacted by development and/or remedial grading activities are identified on the Landscape/Revegetation Concept Plan as preserved. These areas identify major preserved tree stands and tree groupings only. For identification of individual preserved and impacted oak trees, refer to Sweetwater Environmental Biologists' Oak Tree Inventory, dated December 21, 1995

3) Fire Fuel Modification Zones

The Orange County Fire Authority (OCFA) requires a fuel modification program along all edges of residential development exposed to fire hazard areas. The fuel modification program addresses three zones consisting of a "Setback Zone", "Wet Zone", and a "Non-Irrigated Zone", as shown on the Landscape and Revegetation Concept Plan Map. Maintenance responsibility for the setback zone lies with the private owner. Maintenance responsibility for the other zones will be with the H.O.A./ Community Maintenance District.

Saddleback Meadows' residential edges contain both upslope and downslope conditions with a combination of both manufactured and natural undisturbed slopes. The intent of the fuel modification is to utilize these slopes as a transition area between natural open space (fire hazard areas) and the residential edge and to provide an acceptable level of fire safety. The revegetated portion of these slopes will be landscaped using native compatible plant species which will meet the public safety goals of the OCFA, reinforce the naturalized appearance of the manufactured slopes, satisfy the aesthetic requirements of the project. Fire Fuel Modification Zones are designed to reflect the native enhancement transition zone criteria for plant material selection. The plant palettes for both of the Fire Fuel Modification Zones and the Native Enhancement Transition Zone overlap and contain many of the same species and varieties of plants.

Setback Zone - Is a twenty-foot (20') wide area within the rear yard setback of all residential lots abutting the fuel modification zone. No combustible construction or materials will be allowed in this zone. This zone will be maintained by the individual homeowner. (Not shown on the Landscape / Revegetation Concept Plan, see Preliminary Fuel Modification Plan)

Wet Zone - is a fifty-foot (50') wide landscape area, beginning at the residential rear yard property line This zone includes an automatic irrigation system and low fuel fire resistive, native compatible plants.

Non-Irrigated Zone - Fire fuel modification zones are 100' wide. However, several upslope areas with 50' widths will be permitted with O.C.F.A. approval. In natural undisturbed slopes, existing native planting will be non-irrigated, pruned and thinned Manufactured slopes will be **temporarily** irrigated and landscaped with native and native-compatible plant materials. Landscaping is intended to naturalize over time with irrigation to be abandoned upon establishment and naturalization

Application of the Orange County Fire Authority's (OCFA) fuel modification criteria to the area located along the upper north-easterly project boundary, dictates that the fuel modification zone traverse off-site onto private property. This will require that an easement be obtained from the adjacent property owner, for the purposes of fuel modification, prior to the issuance of a grading permit. Maintenance responsibility for any off-site fuel modification zones will be the same as for on-site fuel modification zones (i e H.O A / Community Maintenance District).

4) Native Enhancement Transition Area

Natural areas disturbed by remedial grading and located within designated open space areas will require revegetation with native or naturalized plant material to re-establish the previous coastal sage scrub (CSS). A high priority will be placed upon selecting plant material which is indigenous to the undisturbed natural areas and surrounding areas and which will provide a landscape with as much habitat value as is practical.

5) Existing Undisturbed Vegetation Area.

Open space areas undisturbed by remedial grading activities will be preserved and incorporated into the overall landscape concept. Only minimal clean-up of abandoned agricultural uses , if necessary is planned. The elimination of livestock grazing on the property will allow the natural transition and succession of grasses to CSS and Chaparral plant communities over time. The majority of Oak Woodland mitigation will occur in this area within stands of existing non-native vegetation.

AREA PLAN 95-7
Alternative 8 - 299 Lots
SADDLEBACK MEADOWS

DESCRIPTION

This alternative has 299 single-family detached dwelling units. It is based upon EMA staff's version of Alternative No 8. The average lot size for this project is approximately 6,400 s.f., with a minimum lot size of 5,000 s.f. Access to the project would be provided via a gate guarded private street off El Toro Road immediately south of the existing Aliso Creek/Trail undercrossing. An emergency only access connects with Valley Vista Way. The project site is 222.2 acres in size. Total open space is approximately 72% (utilizing EMA's criteria for calculating open space).

The project acreage (222.2 acres) does not include the adjacent off-site water tank site. A 1.4 million gallon water tank and associated access road is proposed off-site adjacent to the northeast corner of the project site to provide water service to the proposed project. The proposed water tank site was dedicated to the Trabuco Canyon Water District when the existing Final Tract Map was recorded (Tract No. 10692) The water tank will be approximately 30-feet tall, 100 to 110-feet in diameter, bermed, landscape, and painted a complimentary color to the surrounding setting. A total of approximately 8 acres of off-site area would be affected as a result of project implementation to accommodate slope area, access roads, related remedial grading, the water tank, and County of Orange fuel modification requirements.

Onsite circulation is proposed with a system of private streets consisting of a primary spine street (56-foot r.o.w.) and a series of cul-de-sacs (41-,45-, and 52-foot r.o.w.). An encroachment easement is required from the County of Orange to accommodate the project access road where it traverses County owned property along the western most boundary of the site.

The project has been designed to minimize impact on the existing land form. The homes have been located on the relatively level areas in a broad crescent shape flowing along the southern and eastern sides of the site, while the steep terrain of the central canyon area has been left as open space. Development is kept off the eastern and northern major ridgelines bordering the property.

A wildlife movement corridor has been incorporated into the project design to address the importance of regional wildlife movement linkages between regionally important open space areas such as O'Neill Regional Park, Whiting Ranch Wilderness Park and the Cleveland National Forest Unlike the proposed project, this alternative utilizes an east/west corridor alignment similar to that shown in the Foothill/Trabuco Specific Plan The wildlife corridor which bisects the project (called the central corridor) is a component of a three corridor concept which together is designed primarily to accommodate small and medium size mammals and birds, but would not

preclude the occasional potential movement of large mammals as well. This corridor is comprised of a minimum 400' wide wildlife corridor with 50' setbacks located on either side. The onsite wildlife corridor is proposed to utilize an at-grade crossing (400') where the wildlife corridor traverses the main spine road Due to the low level of traffic on this end of the project, the at-grade crossing is not anticipated to inhibit wildlife movement. Loffel walls with a maximum height of 12' are used in strategic locations to minimize the extent of slopes and to save one of the existing stock ponds, located near the southeast corner of the site. Loffel walls allow for the integration of plant materials onto the wall, eventually screening the wall behind a blanket of vegetation.

Statistical Summary*

ONSITE	ACREAGE	% OF SITE
Residential Lots	44 7	20%
Streets (private)	18 0	8%
Other Dedicated Natural Open Spaces	91.9	41%
Trail Staging Area	.6	0%
Open Space (dedicated to H.O.A.)	67.0	31%
Subtotal	222.2	100%

* Acreages and percentages are approximations subject to refinement at the Tentative Map stage.

OPEN SPACE/ TRAIL CONCEPT

The proposed Open Space/Trail Concept for Saddleback Meadows incorporates a variety of refinements which result in minimizing environmental impacts. In response to Natural Communities Conservation Program (NCCP) goals and objectives, the project provides for a viable Wildlife Movement Corridor incorporated into the design of the project providing access from the Aliso Creek Corridor to O'Neill Regional Park. The design proposes the primarily undisturbed open space areas along with some revegetated disturbed slope areas of the project for fee dedication as a potential extension of O'Neill Regional Park. Trail connections are provided, linking the project to existing regional riding/hiking trails and bikeways The project proposes a trail staging area, ridgetop park and significant dedicated natural open space. The proposed Trail Staging Area provides a direct link to the regional trail located on El Toro Road and the other proposed recreation features (ridgetop park and old ranch house site)

1. Trails

a Regional Riding and Hiking Trail
-Dedication of 16' wide Recreation Easement along El Toro Road frontage (approx. 1350 l.f.)
-County Maintenance Responsibility

b. Local Riding and Hiking Trail

-Dedication of 16' wide Recreation Easement (approx. 4800 l f., of which approximately 1550 l.f traverses Restricted Scenic Preservation Easement, and approximately 3250 l.f. traverses Other Dedicated Natural Open Space)
-Linkage from proposed Trail Staging Area to the regional trail on El Toro Road and another trail linking the regional trail to the proposed ridgetop park (a.k.a Bridlewood look-out park) and old ranch house site.
-County Maintenance Responsibility

2. Other Dedicated Natural Open Space

As designated on the Open Space/Trail Concept Map:
- Potential extension of O'Neill Regional Park
- Approximately 91.9 acres (41% of project site)
- Fee Ownership Dedication
- Includes undisturbed open space, Native Enhancement Transition Areas, and some revegetated manufactured slope areas
- Includes Coastal Sage Scrub Restoration/Enhancement Areas
- Includes preserved significant Oak Woodlands and Oak Restoration Areas outside of fuel modification zones
- Includes portion of existing Olive Grove area undisturbed by grading/fuel modification
- Includes preserved existing and re-created Ephemeral Ponds
- Includes Ridge Top Park (Bridlewood Lookout Park)
- County Maintenance Responsibility

3. Restricted Scenic Preservation Easements

Areas designated as the following on the Open Space/Trail Concept Plan Map:
- El Toro Road Community Edge Area
- Fuel Modification Zones (Wet Zone and Non-Irrigated Zones only)
- HOA/Community Maintenance District Responsibility

4. Community Slope Area

- As designated on the Open Space/Trail Concept Plan Map
- HOA Owned
- HOA/Community Maintenance District Responsibility

CONTOUR GRADING CONCEPT

The grading concept for this alternative reflects a contour grading approach which utilizes techniques emphasizing variations and takes advantage of the curvilinear street and lotting design, rather than repetitive uniformity. This allows the project a more natural and organic ambiance in keeping with the rolling hillside setting. These contour grading techniques consist of the following.

- Integrate grading into the context of existing topography using horizontal rounding of contours;

- Blending of manufactured contours with natural existing contours;
- Rounding at the top and toe of slopes to avoid harsh transitions; and
- Design of development enclaves of varying size and irregular spacing to avoid a uniformly "terraced" appearance.

LANDSCAPE / REVEGETATION CONCEPT

The Landscape / Revegetation Concept for Saddleback Meadows seeks to integrate the landscape of the proposed project with the site's existing setting and that of the surrounding foothill region

Interspersing sycamore and oak tree groupings at strategic locations throughout the project will blend the different landscape zones and integrate this community into the surrounding preserved natural open space areas. The Landscape Concept consists of five (5) functional yet integrated areas and zones as shown on the Landscape / Revegetation Concept Plan. These areas and zones are as follows:

1) El Toro Road Community Edge Area

The El Toro Road Community Edge area will play a key role in providing a physical and visual buffer for the project from off-site views. Predominantly manufactured slopes are planned along El Toro Road. In addition, a key component of this edge is the preservation of Aliso Creek and it's existing riparian habitat along El Toro Road, just north of the proposed main project entry point Therefore, this community edge adjacent to the road will be landscaped with introduced and native compatible plants reflecting and continuing the riparian landscape found along the Aliso Creek/El Toro Road Corridor. The California Sycamore, commonly found in riparian areas, will be the major slope tree along the El Toro Road Community Edge.

Further up the manufactured slope, the landscape will transition from riparian plants to ornamental and native compatible plants suitable for erosion control and for buffering and screening. Tree plantings at side-yard property lines of the residential lots located at the top of slopes will reduce the visual impact of dwellings when viewed from off-site. Meanwhile these tree groupings are intended to maintain views for individual lots Additionally, this edge treatment is designed to provide excellent visual screening of the project from vehicles traveling along El Toro Road.

2) Community Slope Area

Manufactured slopes will be landscaped to visually enhance the project, to control erosion, and to provide buffering/screening where necessary. Trees will be located at the top of slopes and clustered near side-yard property lines of residential lots as well as on the slope itself. Trees planted on the slope will take into consideration the maximum tree height at maturity relative to its vertical location to the top of slope, so that views from residential lots will not be impaired when slope landscaping reaches full maturity This will blend the manufactured on-site slopes with off-site natural areas, integrating the community landscape into the surrounding environs California Sycamore and some Coastal Live Oak trees will be used in strategic locations throughout the community slopes, continuing the community landscape theme

Major oak woodland areas and areas of the olive grove which are not impacted by development and/or remedial grading activities are identified on the Landscape/Revegetation Concept Plan as preserved. These areas identify major preserved tree stands and tree groupings only. For identification of individual preserved and impacted oak trees, refer to Sweetwater Environmental Biologists' Oak Tree Inventory, dated December 21, 1995.

3) Fire Fuel Modification Zones

The Orange County Fire Authority (OCFA) requires a fuel modification program along all edges of residential development exposed to fire hazard areas. The fuel modification program addresses three zones consisting of a "Setback Zone", "Wet Zone", and a "Non-Irrigated Zone", as shown on the Landscape and Revegetation Concept Plan Map. Maintenance responsibility for the setback zone lies with the private owner. Maintenance responsibility for the other zones will be with the H.O.A./ Community Maintenance District.

Saddleback Meadows' residential edges contain both upslope and downslope conditions with a combination of both manufactured and natural undisturbed slopes. The intent of the fuel modification is to utilize these slopes as a transition area between natural open space (fire hazard areas) and the residential edge and to provide an acceptable level of fire safety The revegetated portion of these slopes will be landscaped using native compatible plant species which will meet the public safety goals of the OCFA, reinforce the naturalized appearance of the manufactured slopes, satisfy the aesthetic requirements of the project. Fire Fuel Modification Zones are designed to reflect the native enhancement transition zone criteria for plant material selection. The plant palettes for both of the Fire Fuel Modification Zones and the Native Enhancement Transition Zone overlap and contain many of the same species and varieties of plants.

Setback Zone - Is a twenty-foot (20') wide area within the rear yard setback of all residential lots abutting the fuel modification zone. No combustible construction or materials will be allowed in this zone. This zone will be maintained by the individual homeowner. (Not shown on the Landscape / Revegetation Concept Plan, see Preliminary Fuel Modification Plan).

Wet Zone - is a fifty-foot (50') wide landscape area, beginning at the residential rear yard property line This zone includes an automatic irrigation system and low fuel fire resistive, native compatible plants.

Non-Irrigated Zone - Fire fuel modification zones are 100' wide. However, several upslope areas with 50' widths will be permitted with O.C.F.A. approval. In natural undisturbed slopes, existing native planting will be non-irrigated, pruned and thinned. Manufactured slopes will be **temporarily** irrigated and landscaped with native and native-compatible plant materials. Landscaping is intended to naturalize over time with irrigation to be abandoned upon establishment and naturalization.

Application of the Orange County Fire Authority's (OCFA) fuel modification criteria to the area located along the upper north-easterly project boundary, dictates that the fuel modification zone traverse off-site onto private property. This will require that an easement be obtained from the adjacent property owner, for the purposes of fuel modification, prior to the issuance of a grading permit. Maintenance responsibility for any off-site fuel modification zones will be the same as for on-site fuel modification zones (i.e H O A. / Community Maintenance District).

4) Native Enhancement Transition Area

Natural areas disturbed by remedial grading and located within designated open space areas will require revegetation with native or naturalized plant material to re-establish the previous coastal sage scrub (CSS) A high priority will be placed upon selecting plant material which is indigenous to the undisturbed natural areas and surrounding areas and which will provide a landscape with as much habitat value as is practical.

5) Existing Undisturbed Vegetation Area.

Open space areas undisturbed by remedial grading activities will be preserved and incorporated into the overall landscape concept Only minimal clean-up of abandoned agricultural uses , if necessary is planned. The elimination of livestock grazing on the property will allow the natural transition and succession of grasses to CSS and Chaparral plant communities over time. The majority of Oak Woodland mitigation will occur in this area within stands of existing non-native vegetation.

ALTERNATIVE 9
LANDFORM GRADING/VIEWSHED PROTECTION ALTERNATIVE

Overview

In response to actions taken at the July 30, 1996 Orange County Planning Commission Public Hearing and comments received on the Draft EIR during the public review period, an additional alternative (Alternative 9) has been developed by the applicant to incorporate identified comments Alternative 9 is based on the Staff Alternative 8 design, which was previously evaluated in the Response to Comments document dated July. 1996, with the addition of strategically designed landform grading and landscaping to screen views of the proposed onsite development area from surrounding land uses. In addition, the majority of the development area is now located south of the primary onsite spine road, creating a single loaded street through the majority of the project site

The following features have been incorporated into Alternative 9:

- Contour grading that emphasizes and expands on existing landforms,
- Berming at selected locations to blend with natural terrain features while providing screening and buffering views into the project site from St. Michael's Abbey and the Hidden Ridge community,
- Site planning techniques that minimize rows of backyards along highly visible edges, incorporates slopes, landscape zones, and landforms between homes and surrounding land uses.
- Community wide landscaping that provides visual enhancement through perimeter and interior plantings, providing filtered views of the proposed development area from the surrounding areas

Section 15088 of the CEQA Guidelines encourages the development of additional alternatives to the proposed project, as a means of mitigating impacts in response to comments received on the Draft EIR. A revised Area Plan package was submitted to the Orange County Environmental Management Agency on September 10, 1996 to reflect the Alternative 9 land plan features and contains the Area Plan description, Open Space/Trail Concept, Contour Grading Concept and the Landscape/Revegetation Concept. Unless otherwise noted, the impacts assessment contained within this document compares Alternative 9 to the proposed project evaluated in the Draft EIR.

Alternative 9, as with all of the other eight (8) alternatives, has been evaluated in terms of meeting the following development objectives of the proposed project:

- Develop a residential community which preserves onsite sensitive biological , cultural and aesthetic resources and conforms to existing landform conditions in response to County and community concerns.
- Minimize visual effects on surrounding properties through the application of sensitive grading design, habitat restoration and landscape screening.
- Remediate and provide geotechnical stabilization for onsite and slide areas affecting the proposed development area.

- Implement the policies contained in the General Plan, Foothill/Trabuco Specific Plan, Aliso Creek Corridor Concept Plan and the Air Quality Management Plan.
- Minimize adverse affects to surrounding properties, O'Neill Regional Park and Aliso Creek through buffer/setback zones, design features and landform grading.
- Implement design guidelines and development standards to ensure compliance with current planning and zoning law requirement through the Area Plan process.
- Develop a resource management plan to enhance onsite biological features including a wildlife movement corridor, sensitive species, pond re-creation, habitat restoration and oak tree preservation, in compliance with Natural Communities Conservation Planning Program goals.
- Create a fire safe community through incorporation of an area-wide fuel modification program.
- Provide trail connections to the regional riding and hiking trail system
- Dedicate right-of-way and site stabilization for the widening and improvement of El Toro Road.

Project Description

Alternative 9 proposes the construction of 318 single family detached dwelling units on minimum 5,000 square foot lots (average 6,452 sq ft lots), with a series of landform grading, resource enhancement and recreation components, summarized as follows:

- Landform grading along the northern side of the primary spine road, and selected portions of the southern development edge, designed to screen offsite views of the development area.
- A wildlife corridor system designed to accommodate primary wildlife movement through a 500 foot wide east-west corridor and secondary movement through a 150 foot wide informal north-south corridor, with at-grade crossings.
- Preservation of the southerly ephemeral pond
- 0.4 acre passive park/trail head staging area
- 0.2 acre passive ridge top lookout park
- A 10 foot wide hiking trail connecting the Aliso Creek Riding/Hiking Trail and the Live Oak Hiking Trail to the trail staging area and O'Neill Regional Park.
- Relocation of residential lots adjacent to the wildlife corridor and St Michael's Abbey.
- Preservation of additional oak woodland associated with the east-west wildlife movement corridor.
- Revegetation of the wildlife movement corridors with native plant materials

Implementation of Alternative 9 would require a total grading quantity of 8.9 million cubic yards. The above outlined features of Alternative 9 would contribute to an incremental reduction in impacts to aesthetics and recreation, as compared to the proposed project, and similar or incrementally increased impacts to all other environmental factors evaluated in the Draft EIR. In addition, Alternative 9 incorporates the most recent position of the resource agencies (U.S. Fish and Wildlife Service, California Department of Fish and Game, and the Army Corps of Engineers) pertaining to the location and width of the onsite wildlife movement corridors.

The Alternative 9 site plan is shown in Exhibit 1, with the contour grading concept shown in Exhibit 2 and the landscape and revegetation plan shown in Exhibit 3. Alternative 9 land uses are summarized in Table 1.

Table 1
Alternative 9 Land Use Summary

Land Use	Area	% of Site
· SF Residential Lots	47.1 Acres	21.2 %
· Streets	18.0 Acres	8.1 %
· Manufactured Slope (Including Park Areas)	54.0 Acres	24 3 %
· Remedial Grading (outside of lot slopes)	35.2 Acres	15 8 %
· Fuel Modification (outside of grading limits)	5 7 Acres	2 6 %
· Undisturbed Open Space	62 2 Acres	28.0 %
TOTAL ONSITE	222.2 Acres	100%
Offsite (EL Toro)	2 9 Acres	-
Water Tank Site	2.9 Acres	-
Offsite Fuel Mod.	2 4 Acres	-
TOTAL OFFSITE	8.2 Acres	-
TOTAL PROJECT	230 4 Acres	-

Alternative 9 proposes a total onsite impact area of 160.0 acres, 3.4 acres more than the proposed project, and 11.4 acres more than Staff Alternative 8 Total onsite undisturbed open space would be 62.2 acres or 28 % of the project site. Total onsite open space (including undisturbed and disturbed) would be 157 1 acres or 71% of the project site.

Land Use

The project site is located within the Bridlewood Residential District of the Foothill/Trabuco Specific Plan, and alternative 9 proposes 318 single family residential dwelling units on minimum 5,000 square foot lots (average 6,542 sf lots). This alternative would impact an incrementally larger portion of the project site (160.0 acres as opposed to the 156 5 acres for the proposed project) with project development, and would provide incrementally less undisturbed open space (62.2 acres vs 65.6 for the proposed project). Alternative 9 would provide for additional recreational amenities, as compared to the proposed project, including a passive park and trailhead staging area.

A major design feature of Alternative 9 is the single loaded primary spine road (residential development south of the spine road and landform grading to the north), which is intended to screen offsite views of the onsite development area. Landform grading and limited use of loffel walls are proposed to minimize the views of the development area from offsite locations. In addition, Alternative 9 would provide for a wildlife movement corridor system, including an at-grade spine road crossing, similar to Staff Alternative 8, which would effectively apportion the development into three residential areas Additional single family residential dwellings

are proposed within the north central portion of the project site, as compared to the proposed project, which proposes undisturbed open space in the same area.
Much of the discussion on pages 4-1 through 4-17 of DEIR 561 remains appropriate for this alternative The DEIR indicates that Zone Change 95-5, which would amend the Foothill/Trabuco Specific Plan and Area plan 95-7 are required approvals to implement the proposed project. The zone change would substitute the Residential Estates (Planned Development) District regulations of the Orange County Zoning Code for the existing Bridlewood Residential District land use regulations. The proposed project would be in conformance with the Housing Element of the Orange County General Plan through the implementation of appropriate mitigation measures.

No significant unavoidable adverse impacts to land use would occur with implementation of Staff Alternative 9.

Soils and Geology

Implementation of Alternative 9 would require 2.1 million cubic yards of cut and fill conventional grading and 6.8 million cubic yards of remedial grading (remove and replace) for a total grading quantity of 8.9 million cubic yards The required grading for Alternative 9 would require 0.2 million cubic yards more than that required (8 7 million cy) for implementation of the proposed project. Grading quantities incrementally increased under this alternative as a result of the additional earthwork required to create the landform grading along the visually prominent project edges. As indicated in Table 1, Alternative 9 would result in 3.4 acres more disturbance area than the proposed project. A series of crib/retaining/loffel walls has been incorporated into this alternative to reduce remedial grading requirements, manufactured slope heights and minimize sensitive resource impacts. A supplemental geotechnical evaluation of Alternative 9 is included in Appendix A of this document.

Much of the general discussion on pages 4-18 through 4-37 of the DEIR and in Appendix D (Geotechnical Evaluation) of the Draft EIR remain appropriate for Alternative 9. Prior to implementation of mitigation measures, grading would result in significant impact related to slope stability, landslides, mudslides, subsidence and erosion. Review by County geotechnical experts, implementation of the proposed remedial grading features, including removals/cleaners, buttress construction, subsurface systems, and temporary stockpiling, would not result in any impact to the stability of adjacent properties An average daily grading quantity of 30,000 cubic yards/day (total grading 8.9 million cubic yards) would require approximately 300 days (10 months) to complete grading operations

No significant unavoidable adverse impacts to soils and geology would occur with implementation of Alternative 9.

Water / Hydrology

Alternative 9 would generate similar storm water runoff volumes and similar domestic water supply requirements, as the proposed project. Due to the enhanced habitat restoration and landform/contour grading provided with this alternative, temporary irrigation related water supply impacts are expected to be greater than the proposed project. In addition, this alternative would require less alteration of onsite natural drainages than the proposed project, incrementally reducing the potential for increased urban runoff impacts

Much of the discussion on pages 4-38 through 4-49 of the DEIR and Appendix E (Hydrology Study) in the Technical Appendices of the Draft EIR remain appropriate for this alternative. Twelve (12) standard conditions/mitigation measures requiring compliance with the Master Plan of Drainage, NPDES, erosion control

strategies, construction of site drainage systems and compliance with county and state water quality management standards will result in no significant effects to water/hydrology under this alternative.

.Transportation and Circulation

Estimated traffic generation volumes associated with this alternative would be approximately 3.820 trips per day, identical to the proposed project. The resulting impacts to existing level of service values would be the same as identified in the Draft EIR for the proposed project.

The discussion on pages 4-50 through 4-78 of DEIR 561 and Appendix F (Traffic Report) of the Draft EIR of the Technical Appendices remain appropriate for this alternative Because of its reduction from the recorded tract map and imposition of (41) PDFs, SCs and AMs, Alternative 9 will not result in any additional negative impacts. Implementation of Alternative 9 would result in the same improvements to El Toro Road through the existing Road Fee programs, similar to the proposed project.

No significant unavoidable adverse traffic and circulation impacts would occur with Alternative 9, following implementation of outlined mitigation measures

Air Quality

Implementation of Alternative 9 would result in similar vehicular generated emissions as compared to the proposed project, and similar impacts to regional air quality. Temporary short term emissions associated with grading and construction operations would increase slightly over those associated with the proposed project, as a result of the additional grading requirements associated with the landform grading

All of the discussion on pages 4-79 - 4-97 and Appendix G (Air Quality Assessment) of the Draft EIR remain adequate for this alternative.

As with any large project located within the South Coast Air Basin, a non-attainment area, not projected to reach attainment until 2010 or later, Alternative 9 would result in unavoidable cumulative air quality impacts. If the alternative is approved, it will require the decision-makers to adopt a Statement of Overriding Considerations regarding air quality. This statement must indicate that the specific overriding economic, legal, social, technological or other benefits of the project outweigh the significant cumulative effect on the environment.

As with the proposed project, impacts to cumulative air quality would remain unavoidable and adverse.

Noise

A number of noise sensitive land uses are located in the vicinity of the project site including, St. Michael's Abbey, Ramakrishna Monastery, O'Neill Regional Park and residential land uses. Since the site currently contains no noise generating uses, development of 318 single family residential dwelling units would result in an increase in noise levels emanating from the project site. This change in noise levels, would be similar to noise generated by the proposed project and could be perceived to be intrusive to surrounding land uses. Noise impacts to St Michael's Abbey would be incrementally reduced under this alternative, as compared to the proposed project, as a result of relocation of the lots in close proximity to the Abbey on the north side of the spine road and the intervening topography that would be created by the landform grading However, the Alternative 9 land plan moves the primary spine road closer to St. Michael's Abbey, as compared to the proposed project, incrementally increasing spine road related noise impacts. Alternative 9 extends the limits of the upper portion spine road further to the west than the proposed project, resulting in residential lots being located within 600 feet of the

eastern Abbey property boundary. These noise impacts would be partially offset by the buffering effects of the landform grading proposed to screen views of the site from surrounding land uses. Impacts to the Ramakrishna Monastery, adjacent residential land uses and O'Neill Regional Park would be similar to those created by the proposed project.

All of the discussion on pages 4-98 - 4-115 of the DEIR and Appendix H (Acoustical Analysis) remain appropriate for this alternative. The 14 mitigation measures in the DEIR remain adequate to effectively attenuate noise impacts.

No significant unavoidable adverse impacts to noise would occur with implementation of Alternative 9.

Biological Resources

Alternative 9 has been designed in direct response to comments received on the Draft EIR from state and federal resource agencies and the public pertaining to the location and dimension of the propose onsite wildlife movement corridor. To address the concerns of the resource agencies, Alternative 9 was designed based on the biological features incorporated into Staff Alternative 8, which proposes a wildlife corridor system designed to adequately accommodate all wildlife movement through and around the site. Staff Alternative 8 designates the primary wildlife movement corridor as an east-west corridor, 500 feet wide, with an at-grade crossing. This east-west corridor is designed to accommodate larger mammal movement through and around the site A secondary 150 foot wide north-south wildlife movement corridor is proposed in the same general location as the corridor incorporated into the proposed project, and would function as a corridor for small mammals and birds. The resource agencies support this type of hierarchal corridor system, and have indicated that it would help to meet the goals of the NCCP program to a greater extent than the proposed project A supplemental biological evaluation of Alternative 9 is included in Appendix B of this document.

A comparison of the biological impacts of Alternative 9, Staff Alternative 8 and the proposed project is shown in Table 2.

Implementation of Alternative 9 would directly impact 160.0 acres of habitat onsite and 8.2 acres of habitat offsite to accommodate the construction of 318 single family residential dwelling units onsite Site alteration under this alternative would impact incrementally less habitat than the proposed project (43.3 acres of Venturan-Diegan transitional coastal sage scrub, 5.7 acres of Coast Live Oak Woodland, 3 3 acres of Southern Mixed Chaparral, 0.2 acres of Southern Sycamore Riparian Woodland, 2.0 acres of Mule Fat Scrub, 0.6 acres of Ephemeral Pond, 101.8 acres of annual grassland, and 3.1 acres of agriculture. Impacts to coastal sage scrub would be 2.1 acres less than impacts associated with the proposed project Of the 298 oak trees onsite, 175 or 59% would be impacted under Alternative 9, 8 trees more than the proposed project. The 0.6 acres of impacted ephemeral ponds would directly impact the Riverside Fairy Shrimp.

The proposed biological resource enhancement features of Alternative 9 are identical to Staff Alternative 8 and would more specifically meet the goals of the ongoing NCCP program, summarized as follows.

- Wildlife movement corridor system, including revegetation with native plant materials.
- Preservation of the highest quality onsite ephemeral pond would substantially reduce impacts to Riverside Fairy Shrimp.
- Implementation of all habitat restoration onsite

Table 2
Onsite Vegetation Impact Comparison
(Acres)

Habitat	Alternative 9			Staff Alternative 8			Proposed Project		
	Ex	Impact	%	Ex	Impact	%	Ex	Impact	%
Verturan Diegan Costal Sage Scrub	67.1	43.3	65	67.1	43.9	65	67.1	45.4	68
Coast Live Oak Woodland	14.5	5.7	39	14.5	5.7	39	14.5	7.4	51
Southern Mixed Chaparral	5 4	3.3	61	5.4	4.7	87	5.4	4.2	78
Southern Sycamore Riparian Woodland	0.5	0.2	40	0.5	0.4	80	0.5	0.3	60
Mule Fat Scrub	2.9	2.0	69	2.9	1.9	66	2.9	2.0	69
Ephemeral Pond	0.8	0 6	75	0.8	0.6	75	0.8	0.7	88
Annual Grassland	126.4	101.8	81	126.4	103.2	82	126 4	96 1	76
Agriculture	4 6	3.1	67	4.6	4 6	100	4.6	0.5	11
Total	222.2	160.0	72	222.2	148.6	67	222.2	156.6	71

Much of the discussion on pages 4-116 through 4-166 of DEIR 561 and Appendices I, J an K (Biological Assessment, Oak Tree Report and Pond Mitigation Plan) remain appropriate for the proposed alternative. Imposition of the 14 mitigation measures in the DEIR will mitigate most biological impacts. However, incremental increases in impacts to coastal sage scrub, oak woodland, ephemeral ponds and the Riverside fairy shrimp would remain significant under this alternative following mitigation.

If the alternative is approved, the decision-makers must adopt a Statement of Overriding Considerations regarding impacts to biological resources This statement must indicate that the specific overriding economic, legal, social, technical or other benefits of the project outweigh the significant cumulative effect on the environment

Impacts to biological resources under Alternative 9 would be reduced as compared to the proposed project Significant unavoidable adverse impacts to the Riverside Fairy Shrimp and coastal sage scrub would remain, as with the proposed project, until such time as a biological opinion and an interim loss habitat mitigation plan are approved by the applicable resource agencies.

Aesthetics

This alternative, as with the proposed project, would substantially alter the existing topography and visual character of the project site. Slightly less of the project site would be left in undisturbed natural open space as compared to the proposed project. The wildlife corridor system included in Alternative 9 would help to break up the long linear massing of housing which would result with implementation of the proposed project and create areas of housing separated 150 to 500 foot stretches of open space. In addition, overall aesthetic impacts to surrounding land uses would be reduced under this alternative, as compared to the propose project, do to the extensive use of landform grading along the visually prominent portions of the development edge.

Visual impacts to St. Michael's Abbey would be reduced under this alternative as compared to the proposed project due to the relocation of residential lots north of the onsite spine road , extensive landform grading and implementation of a trail head/staging area. View impacts of the project site from the Ramakrishna Monastery would be reduced as compared with the proposed project by implementation of the wildlife corridor system and associated open space areas, and through the use of loffel walls which would reduce the height and intensity of adjacent manufactured slopes. The wildlife corridors would replace manufactured slope, housing and associated lighting with natural and revegetated open space. In addition, specialized grading proposed under this alternative to preserve the highest quality onsite ephemeral pond would create substantially less manufactured slope adjacent to the Monastery.

Most of the discussions on pages 4-167 thru 4-192 of the DEIR remain appropriate for this alternative. The 19 mitigation measures in the DEIR will reduce most impacts to below a level of significance. However, significant viewshed impacts to the Ramakrishna Monastery and O'Neill Regional Park would remain under this alternative.

If the alternative is approved, it will require the decision-makers to adopt a Statement of Overriding Considerations regarding aesthetic impacts This statement must indicate that the specific overriding economic, legal, social, technological or other benefits of the project outweigh the significant cumulative effect on the environment.

Implementation of Alternative 9 would greatly reduce the significant unavoidable adverse aesthetic impacts to the Abbey Significant unavoidable adverse aesthetic impacts would remain for the Ramakrishna Monastery and O'Neill Regional Park.

Cultural / Scientific Resources

Alternative 9 would result in incrementally more disturbance to the project site, as compared to the proposed project, and would have similar impacts to potential onsite cultural and scientific resources CA-ORA-710 has been recorded in the vicinity of the knoll adjacent to the Abbey property, and would be preserved under this alternative.

All of the discussion on pages 4-193 thru 4-209 of DEIR 561 and Appendix L (Cultural Resources Assessment) remain adequate for this alternative. Imposition of the 21 mitigation measures in the DEIR, including PDFs, SCs and AMs will ensure that all project impact are reduced to below a level of significance.

No significant unavoidable adverse impacts to cultural scientific resources would occur with implementation of Staff Alternative 8.

Recreation

Alternative 9 would provide for enhanced recreational amenities as compared to the proposed project including access to existing and proposed trails, an interpretive trail head park / staging area, and an passive ridge top lookout park. Alternative 9 would achieve the goals outlined in the Recreation Element of the Foothill/Trabuco Specific Plan.

Much of the discussion on pages 4-210 through 4-218 of the DEIR remain appropriate for this alternative. The DEIR includes 15 mitigation measures relating to recreation, which require the applicant to provide trail connections and develop the view/lookout park

No significant unavoidable adverse impacts to recreation would occur with implementation of Alternative 9.

Hazards

The project site is located in a high fire hazard area, and as a result, all future development would be subject to risk during wildfires The circulation system proposed with this alternative provides for similar emergency access as the proposed project, with 241 units served off of a single means of access It should be noted that Alternative 9 proposes a single loaded primary spine road onsite, which would reduce fire hazards to proposed residents by allowing for direct access to major onsite wildland areas and allowing for additional non combustible areas adjacent to residential areas. The location of the Alternative 9 hiking trail is proposed to travel through the primary east-west wildlife movement corridor, which could result in an increase in human/wildlife interaction hazards.

All of the discussion on pages 4-219 through 4-228 of the DEIR remain appropriate for Alternative 9. Because of the inclusion of nine (9) PDFs and (21) SCs, as well as the design features of the alternative, potential hazard impacts are reduced to below a level of significance.

No significant unavoidable adverse impacts to hazards would occur with Alternative 9

Public Services

Demand for public services and utilities under Alternative 9 would be identical to the proposed project, due to the same number of proposed residential lots and associated residents. No unavoidable adverse impacts to public services and utilities would result under this alternative.

All of the discussion on pages 4-229 thru 4-241 of the DEIR remain appropriate for the provision of public services, including sheriff, fire, schools, library and solid waste. Because of the ten (10) PDFs and eighteen (18) SCs, no unavoidable impacts will be generated with the proposed alternative

No significant unavoidable adverse impacts to public services would occur with Alternative 9.

Utilities & Service Systems

Demand for utilities and service systems would be identical under this alternative, as compared to the proposed project, since the same number and type of residential units are proposed. All of the discussion on pages 4-242 thru 4-252 of the DEIR remain appropriate for the alternative regarding utilities and service systems , and the provision of water, wastewater, electricity, natural gas, cable and communications Because of the ten (10) PDFs and eight (8) SCs, no unavoidable impacts would occur under this alternative, in these service areas.

Conclusion

The impacts associated with implementation of Alternative 9 would be less than those associated with implementation of the proposed project for aesthetics and recreation, with all of the other environmental factors expected to experience similar or increased impacts. Impacts considered significant, unavoidable and adverse for the proposed project, as identified in the Draft EIR, would remain as such, with the exception of aesthetic impacts to St. Michael's Abbey , which would be greatly through the use of landform grading and the elimination of residential lots north of the onsite spine road. No additional significant adverse effects would occur as a result of implementation of Alternative 9 beyond those identified for the proposed project in the Draft EIR.

October 22, 1996	Saddleback Meadows Zone Change 95-5, Area Plan 95-7 and EIR 561 for California Quartet, Ltd.	3

SUMMARY OF REQUEST (Description for agenda)

Consideration of Saddleback Meadows development proposal for California Quartet, Ltd., consisting of Draft EIR 561, Zone Change 95-5, and appeal of Area Plan 95-7.

ADDITIONAL DATA:

The following discussion summarizes the key issues related to the Saddleback Meadows project. The attachments and exhibits contained within this transmittal package present detailed information on the issues related to this project, analysis of those issues, and copies of all documents associated with the processing of Draft EIR 561, Zone Change 95-5, and Area Plan 95-7. The following section on procedural matters is a clarification of the processing complexities for the Saddleback Meadows development proposal.

RECOMMENDED ACTION

1. Conduct public hearing.
2. Adopt draft Resolution certifying EIR 561 (Attachment 8).
3. Adopt draft Ordinance for staff alternative Zone Change 95-5 (Attachment 7) which provides for a maximum of 299 dwelling units and a minimum of 70% open space on 222 acres.
4. Adopt draft Resolution which serves to approve Alternative 8 Area Plan 95-7 to include thirty-three conditions of approval (Attachment 9).

Attachment F

ADDITIONAL DATA (continued):

PROCEDURAL MATTERS:

Although this project has been subject to "concurrent processing" per standard County procedures, the Planning Commission actually considered three separate aspects of this project, including draft Environmental Impact Report (EIR) 561, Zone Change 95-5 and Area Plan 95-7.

Regarding the status of EIR 561, by a unanimous vote, the Commission determined that the EIR adequately describes the environmental impacts of the proposed project and the alternatives, including Staff Alternative 8, and has recommended that your Board certify this document.

The second item relates to the zone change (which is a proposed amendment to the Foothill/Trabuco Specific Plan). The subject property is part of the "Bridlewood Residential District." These district regulations exempt Saddleback Meadows from other provisions of the Specific Plan. As discussed in more detail below, the applicant's proposal is for 318 detached single-family houses. As with the CEQA issue, the Planning Commission's action on a zone change is advisory to your Board. As described below, a majority of the Commission did not vote to recommend any change to the current zoning. Section 65855 of the Government Code requires that your Board can act on a zone change only after consideration by, and a recommendation from, the Planning Commission. Therefore, what is now before your Board is the applicant's request for a zone change accompanied by a negative recommendation from the Planning Commission. As a legislative action, your Board has full discretion in taking action on the zone change itself.

The third item relates to the area plan. Pursuant to the County Zoning Code, the Planning Commission is the decision-making body for area plans. After considering this aspect of the project, the Commission voted to deny the area plan consistent with their action on the zone change. Subsequent to the Planning Commission action, the applicant, California Quartet, Ltd., appealed this decision to your Board and reiterated their desire that the zone change case be forwarded to your Board, pursuant to Government Code Section 65856 (see Attachments 5 and 10).

As far as the area plan is concerned, Zoning Code Section 7-9-150.4(d) outlines the options which are at your Board's disposal for this appeal:

1) Approve or disapprove the application;
2) Add, modify or delete conditions;
3) Approve a modified application; or
4) Refer the application back to the approving authority with directions for action by the approving authority or for recommendations or reports to the Board of Appeals.

BACKGROUND

The Saddleback Meadows property consists of 222 undeveloped acres currently used for cattle grazing. It is located on the easterly side of El Toro Road near Valley Vista Way and is in the western edge of the Foothill/Trabuco Specific Plan area. North of the project site is St. Michael's Abbey, which operates a boarding school for boys. South of the project site is Hidden Hills/Hidden Ridge residential development, O'Neill Regional Park, and the Ramakrishna Monastery. West of the project site is the Portola Hills residential development. Attachment 1 contains a discussion of site conditions, current land use regulations, and surrounding uses.

Saddleback Meadows has a current entitlement to develop 705 manufactured homes and 1.7 acres of commercial use in compliance with Recorded Tract Map 10692. The applicant began its efforts to develop this property in April, 1994, with the submittal of a grading permit application to develop Recorded Tract Map 10692 consistent with the Saddleback Meadows Planned Community Regulations. In January, 1995 the Planning Commission, while considering appeal of the requirements to prepare an EIR as the appropriate CEQA documentation for the grading permit, requested the applicant consider a redesign of his 705 manufactured housing project. The applicant withdrew its appeal and proceeded with a redesign of the project site. Attachment 2 contains a chronology of key events for processing of this project.

APPLICANT'S PROJECT PROPOSAL AS PRESENTED TO THE PLANNING COMMISSION

In response to the January, 1995 Planning Commission request for a redesign, the applicant developed a proposal requesting that: 1) the Bridlewood Residential District of the Foothill/Trabuco Specific Plan be amended (Zone Change 95-5) to permit 318 dwelling units and a continuation of the exemption from other provisions of the Foothill/Trabuco Specific Plan; and, 2) a conceptual plan of development be approved (Area Plan 95-7) to allow for the eventual development of 318 detached single-family homes with approximately 68% dedicated open space areas.

The applicant's proposed project is presented in Attachment 6 and Exhibit D and is discussed in detail in Attachment 3.

The proposed project was reviewed by the Foothill/Trabuco Specific Plan Review Board. In summary, they recommended that the project be limited to 110 dwelling units, have a design similar to EIR 561 Alternative 4, and be consistent with all provisions of the Foothill/Trabuco Specific Plan. The Minutes of the Review Board are contained in Exhibit A.

Although staff acknowledged at the Planning Commission hearings that the applicant's 318 detached single-family homes proposal is superior to the existing Recorded Tract Map 10692 entitlement for 705 manufactured homes, staff determined that it was unacceptable because it did not provide the following:

1) An east-west wildlife corridor viable enough for NCCP purposes.
2) A useable recreational trail alignment.
3) A satisfactory level of "rural character."
4) A lower density of development.
5) 70% dedicated open space requirement.

STAFF ALTERNATIVE 8 PRESENTED TO THE PLANNING COMMISSION

As a result of the analysis for the applicant's project proposal, EMA staff recommended to the Planning Commission approval of Alternative 8, a modified Zone Change and Area Plan that provide for the following:

Zone Change

- A maximum of 299 dwelling units.
- A minimum of 70 percent dedicated open space.
- Substantial overall compliance with the Foothill/Trabuco Specific Plan.

Area Plan

- A maximum of 299 dwelling units.
- A minimum of 400' wide east-west wildlife corridor.
- An east-west recreational trail system.
- Substantial overall compliance with the Foothill/Trabuco Specific Plan.
- Thirty-three conditions of approval.
- Development of a rural character.

The density cap of 299 dwelling units was selected, based primarily on the fact that (1) the adjacent existing development in Portola Hills and Hidden Hills/Hidden Ridge is at twice the staff recommended density and (2) the General Plan allows up to 444 units for this property. The 70 percent dedicated "natural open space" (see below) will contribute to a rural character. In addition, several conditions of approval regarding future development and design further this goal. The area plan, as conditioned, will be in substantial overall compliance with the Foothill/Trabuco Specific Plan.

EMA recommends that the Zone Change include a definition of natural open space as follows:

> "The open space area remaining after approved development is completed that has a natural appearance and will remain undisturbed thereafter except for possible approved fuel modification. Such areas may include, depending on design and landscaping, passive parks, manufactured slopes, and recreation trails, but shall not include athletic fields or golf courses."

This recommendation is consistent with earlier actions of the Board of Supervisors regarding two other developments in Foothill/Trabuco. For each project, the Planning Commission and the Board of Supervisors took action regarding open space which allowed approved grading in the areas to be dedicated as "natural open space." Staff is recommending the same standard for Saddleback Meadows.

The staff-proposed project is presented in Attachment 7 and Exhibit E and is discussed in detail in Attachment 3.

PLANNING COMMISSION ACTION

The Planning Commission conducted five public hearings on this project. Key issues raised during the hearing process and written comments on Draft EIR 561 are discussed in Exhibit G and are summarized in Attachments 3 and 4.

At their final hearing (on July 30, 1996), the Planning Commission recommended certification of EIR 561 by the Board of Supervisors. The Planning Commission was unable to agree on a recommendation to change zoning and, therefore, denied the Zone Change. In addition, and based largely on this fact, they denied the Area Plan.

Individual members of the Commission stated that they were not opposed to the project, per se, but that they could not agree on the appropriate density (number of dwelling units) for the project. One member advocated a maximum of 100 units, two members advocated a maximum of 260 units, and two members advocated the applicant's proposed 318 units but would be willing to compromise with the staff alternative of 299 units. Four members expressed support for the design footprint of Alternative 8, one member supported the design footprint of Alternative 4. The Planning Commission did not express objection to other elements of staff Alternative 8 Zone Change or any of the Area Plan's thirty-three conditions of approval (see the Minutes of the Planning Commission contained in Exhibit B).

COMPLIANCE WITH CEQA

Draft EIR 561 has been prepared in compliance with the requirements of the CEQA Statutes and Guidelines as well as County of Orange procedures to address the environmental impacts related to the proposed Saddleback Meadows project. It was circulated for public review on February 5, 1996. The comment period on Draft EIR 561 closed on March 25, 1996. Written comments were received from 60 parties; oral testimony before the Planning Commission was received from approximately 50 parties. The Response to Comments (RTC) document was prepared and circulated to commentors on June 28, 1996.

Based on the DEIR and the Response to Comments documents, staff has concluded that EIR 561 provides adequate CEQA documentation for Staff Alternative 8 (as described more fully above and in Attachment 7 and Exhibit E and Attachments 3 and 4). On July 30, 1996, the Planning Commission concurred with staff's conclusion and voted to recommend that your Board certify EIR 561.

Proposed Final EIR 561 consists of the following:

- Draft Board of Supervisors Resolution Certifying Final EIR 561, including Exhibit 1: Statement of Findings and Facts in Support of Saddleback Meadows Project and Exhibit 2: Statements of Overriding Considerations.
- Draft EIR 561, Volume 1
- Technical Appendices, Volumes 2 and 3
- Response to Comments Documents
- EMA Reports, including Attachments, and Planning Commission Minutes dated March 19, 1996, April 2, 1996, June 5, 1996, July 10, 1996 and July 30, 1996.

Further steps were taken by staff to provide information on an additional alternative which was developed by the applicant as a result of public testimony received at the Planning Commission hearings. To this end, an Alternative 9 document, consisting of the applicant's conceptual area plan (Alternative 9) and an assessment of its environmental impacts was distributed on September 20, 1996.

The complete CEQA documentation is found in Attachments 4 and 8 and Exhibit G.

Your Board, using independent judgement, must certify Final EIR 561 prior to taking any action to approve the project which is now before you. Exhibit G consists of a Draft Resolution which will serve to certify EIR 561.

APPLICANT'S NEWLY PROPOSED ALTERNATIVE 9 FOR BOARD OF SUPERVISORS CONSIDERATION

As noted in the letter transmitting this alternative area plan, the applicant has modified the original project as detailed in Exhibit F. In the interest of ensuring widespread understanding of this alternative, EMA distributed it and an assessment of its environmental impacts, Response to Comments Document #2, to interested parties on September 20, 1996.

This alternative reflects several concepts which were presented by various speakers in public hearings before the Planning Commission, but they have been presented as a coherent package within the parameters of an area plan for the first time in the document contained in Exhibit F.

In sum, staff has concluded that Alternative 9, if modified to have a ceiling of 299 units, has merit in that it responds to concerns raised in public testimony and correspondence related to aesthetics and land use compatibility. Environmental impacts are essentially the same as those for Staff Alternative 8. No new unavoidable adverse impacts have been identified.

SUMMARY

Your Board is being asked to consider three specific recommendations for action on the Saddleback Meadows Project. Those staff recommended actions are as follows:

1) Adopt the draft Resolution certifying EIR 561 prior to taking any actions to approve the project (see Attachment 8)

2) Adopt the draft Ordinance for Staff Alternative Zone Change 95-5 (see Exhibit B) which provides for a maximum of 299 dwelling units and a minimum of 70% dedicated open space. However, if the Board through consideration of public testimony and deliberation at the public hearing selects a different maximum number of dwelling units for Zone Change 95-5, staff would recommend that a minimum of 70% dedicated open space still be required for the project.

3) Adopt the draft Resolution which serves to approve Alternative 8 Area Plan 95-7 to include thirty-three conditions of approval (Attachment 9).

Should your Board act on a variation of Staff Alternative, as documented in Attachment 7 and Exhibit E, staff recommends that these exhibits be revised and returned to you on the Consent Calendar Agenda for November 19, 1996.

December 17, 1997

Members, Board of Supervisors
County of Orange
10 Civic Center Plaza
Santa Ana, CA 92702

Dear Board Members:

During hearings on October 22 and December 3, 1997, this Commission has considered the environmental documentation required for implementation of the project known as Saddleback Meadows (Subsequent Environment Impact Report (SEIR) No. 566). As you know, this project involves the implementation of a previously-approved subdivision allowing 705 units of manufactured housing as well as a small commercial site.

The property in question is one of the most difficult sites with which this Commission has ever dealt. The site's geology is complex; biology sensitive; and compatibility with the adjoining land uses (St. Michaels Abbey and the Ramakrishna Monastery) is extremely problematic.

After exhaustive (and exhausting) testimony and deliberations on the topic, our Commission certified SEIR No. 566. We concluded that the document has merit and that it conforms with the California Environmental Quality Act. We did not conclude that the project addressed in the SEIR has merit, however.

As a result of out efforts to review land use issues associated with this project, we as a Commission would like to recommend in the strongest possible terms that your Board revisit an alternative zoning designation for Saddleback Meadows. Specifically, a majority of this Planning Commission feels that Alternative 4, as portrayed in SEIR No. 566, has far fewer negative enviornmental impacts.* Commissioner Moody, while not supportive of that particular alternative, does agree that the 705-unit development is an inappropriate land use for this location.

Our understanding, based on advice from County Counsel and planning staff, is that our options to deviate from the project as described in SEIR No. 566 were limited to modifications solely within the CEQA frame work. Further, we believe that your Board has the authority to reconsider the previously-denied zone change. We urge you to do so.

Very truly yours,

Shirley Commons Long

Shirley Commons Long, Chair
Orange County Planning Commission

cc: Members, Planning Commission
Tom Mathews, Director P&DSD

* Please note that this is the alternative which was recommended to your Board on October 22, 1996, by the Planning & Development Services Department and was more fully addressed in Proposed Final EIR No. 561. The zoning associated with that alternative was denied at that point and that EIR was not certified.

MEMORANDUM

date: 2-20-98

to: Carlene Baskovitch, Urban Vision

from: Scott Taylor

cc: Mike McKnight, TPG
Eric Ruby, Westec

subject: Saddleback Meadows, Modified Alternative 4

This memo provides an analysis of biological issues for the Modified Alternative 4 of the Saddleback Meadows project. The results of our analysis are presented under four issues corridor analysis, vegetation impacts, oak tree impacts, and sensitive species impacts. This analysis is based on the Alternative 4 - 299 Lots Development Plan Concept map (February 10, 1998).

Corridor Analysis

The corridor analysis is based on the results of a study in San Diego County for Otay Ranch (Ogden 1992) According to this study, an "ideal" corridor provides at least 500 feet of vegetative cover with 250 foot native vegetation buffers For corridors where development is not visible from the corridor, a narrower buffer would be acceptable In instances where corridors are relatively short (that is, less than 500 feet long), the corridor should be no less than 400 feet in total width At interfaces with developed areas, vegetative or opaque fencing was recommended to reduce visibility of developed areas from the corridor

The wildlife corridor through Saddleback Meadows under Modified Alternative 4 would traverse the southern and eastern site boundary next to O'Neill Regional Park, then cross through the site in the northern half. It is planned on a west-facing slope

8100 La Mesa Blvd , Suite 290
La Mesa, CA 91941-6452
e-mail helix@4dcomm.com
phone: (619) 462-1515
fax (619) 462-0552

that is on the west side of an existing saddle that is approximately 1,540 feet in elevation above sea level The narrowest point of the corridor is where it crosses through a 'pinch point' between residential development blocks.

The corridor pinch point for Modified Alternative 4 is 400 feet wide with 50-foot setbacks on each side and approximately 800-feet long. Most of this pinch point falls within the remedial grading zone, except for a patch approximately 300-feet long and 200-feet wide at the eastern end of the corridor that would remain undisturbed A 50-foot wide spine road for the development would cross the corridor at grade. The middle strip of the graded portion of the corridor, approximately 200-feet wide, would be restored to native vegetation. The next 200 feet out (100 feet on each side) would be within the non-irrigated fuel modification zone The outer 100 feet (50 feet on each side) would be landscaped as an irrigated fuel modification zone.

Overall, positive and negative aspects of the corridor's design and revegetation plans for this project's mitigation will increase the viability of the wildlife connectivity through Saddleback Meadows The corridor, as planned in this alternative, is expected to be wide enough for wildlife movement. Topography on either side of the corridor is conducive to wildlife movement because it coincides with an area of natural canyon topography. The revegetation within the corridor is expected to provide the necessary cover for wildlife to add to the corridor's viability. The 50-foot wide spine road crossing the corridor is not expected to inhibit wildlife due to the low traffic levels anticipated for this road. This wildlife corridor is expected to function adequately

Vegetation Impacts

Impacts due to this alternative would be similar to those for the project Modified Alternative 4 would impact approximately 160 0 acres of the site, leaving 62.2 acres in undisturbed open space (Table 1)

Approximately 45.8 acres of Venturan-Diegan transitional coastal sage scrub (including 2 5 acres off site), 5 7 acres of coast live oak woodland (175 individual oaks), 0 21 acre of southern sycamore riparian woodland, and 2.01 acres of mule fat scrub will be impacted by the proposed project In addition, all but two of the manmade stock ponds (0 6 acre) supporting the Riverside fairy shrimp will be directly impacted. One of the preserved ponds is just west of the former ranch while the other is in the southeast corner of the site near O'Neill Canyon. All of the above impacts are significant according to the California Environmental Quality Act. A federal Clean Water Act permit issued by the U.S. Army Corps of Engineers will be necessary for direct impacts to 3.1 acres of wetlands (2 01 acre of mule fat scrub and 0 21 acre of southern sycamore riparian woodland and 0.88 acre of Waters of the U S (intermittent streams [0 28 acre] and manmade stock ponds [0.6 acre]) A streambed

alteration agreement with the California Department of Fish and Game will also be required for the 2.62 acres of impacts to wetland vegetation.

Oak Tree Impacts

Based on the recent oak inventory (SEB 1995), total of 175 oak trees (approximately 59 percent) occur within the remedial grading zone and are considered impacted A total of 123 oak trees (approximately 41 percent) occur outside the remedial grading zone and are considered preserved.

Sensitive Species Impacts

Eight stands of Catalina mariposa lily and three stands of intermediate mariposa lily fall completely or partially within the impact area of Modified Alternative 4. Two stands of Catalina mariposa lily and one stand of intermediate mariposa lily will likely remain to some degree despite the impact. An estimated 259 of the 435 individuals of Catalina mariposa lily will likely be lost, leaving an estimated 176 individuals in two stands in open space or within the non-irrigated fuel modification zones These impacts are not significant because of the low level of sensitivity of the plant, its generally wide distribution in southern California, and the relatively small population size on site. Two stands of intermediate mariposa lily (9 individuals) will be graded, while one stands (9 individuals) are within the non-irrigated fuel modification zone and are assumed to remain. This impact is not significant because of the small size of the on-site population.

The orangethroat whiptail, coastal whiptail, at least five cactus wren territories, and at least 10 southern California rufous-crowned sparrow territories would be affected by the loss of 45.8 acres of Venturan-Diegan transitional coastal sage scrub The western spadefoot occurs on the property in at least two ponds, one of which would be impacted by the proposed project. These impacts are significant but mitigable considering the low level of sensitivity of these species Cooper's hawks were found foraging on site, but no nests were observed. Impacts to Cooper's hawks will, therefore, be limited to foraging habitat and are not significant The 0.6 acre of impacts to manmade stock ponds will impact the Riverside fairy shrimp, and this impact is considered significant

In accordance with the NCCP, the loss of 45 8 acres of Venturan-Diegan transitional coastal sage scrub due to the project is less than the allowable 5 percent of the total coastal sage scrub in the subregion According to the NCCP Evaluation Logic Flow Chart, the coastal sage scrub on the project site has intermediate value for long-term conservation because although it is not the most dense coastal sage scrub in the region, it is located next to a higher value district (O'Neill Regional Park).

Table 1

SADDLEBACK MEADOWS MODIFIED ALTERNATIVE 4
EXISTING VEGETATION AND PROJECT IMPACTS

Habitat	Existing Acreage	On-Site Impacts	Percent	Preserved On-Site	Percent	Off-Site Impacts

Attention: Messrs. Pike Oliver and Michael McKnight

Subject: Supplemental Geotechnical Assessment for
Contingency Plan – 299 Lots
Saddleback Meadows Development
Orange County, California

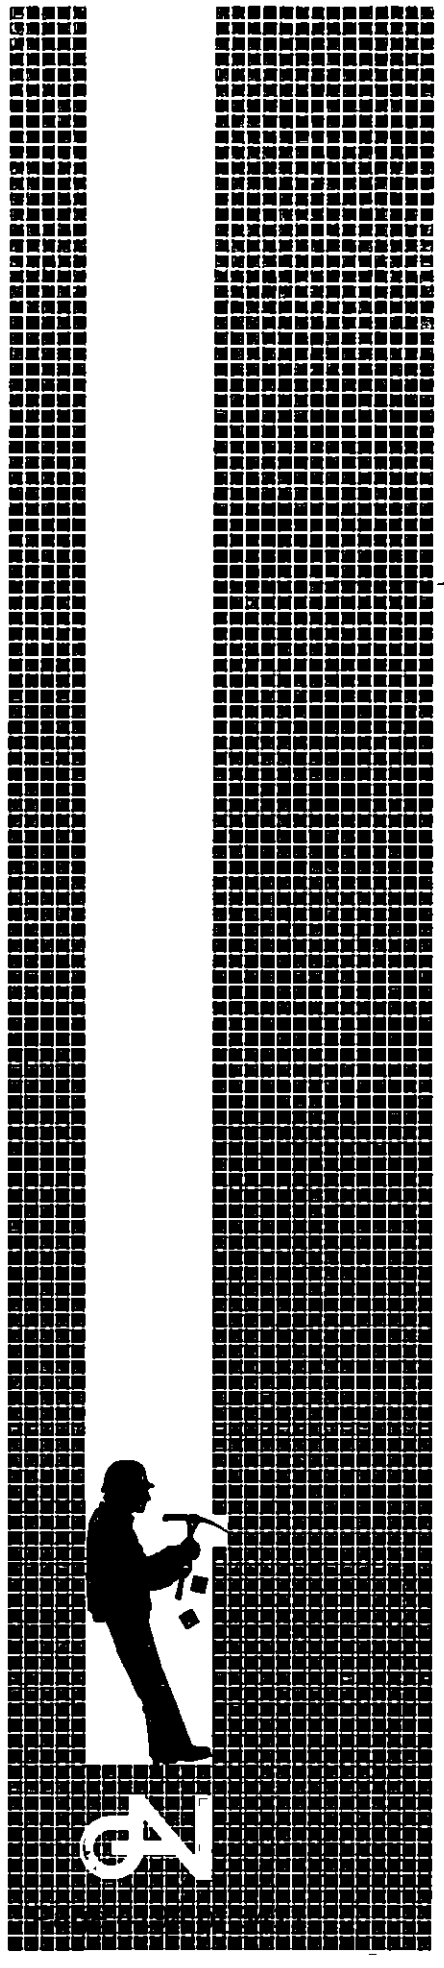
Gentlemen:

1. INTRODUCTION

a) This report presents the results of our supplemental investigation for the Saddleback Meadows Contingency Plan – 299 Lots, prepared by Michael Madden Associates, dated February 10, 1998.

b) The Contingency Plan is the product resulting from the revision and compilation of earlier development concept plans. The Contingency Plan contains 299 residential lots.

c) The Contingency Plan, which was prepared by Hunsaker and Associates, and used as the base plan for our Geotechnical EIR contained 318 lots. This 299–lot Contingency Plan by Michael Madden Associates is geotechnically very similar, with only minor changes, mostly involving the proposed loffel walls.



d) References cited during the most current investigation and for previous work on the site are presented in *References, Appendix A.* The Geotechnical EIR for Tentative Tract 15230 is dated November 27, 1995 *(presented as Reference No. 9).* Our previous Geotechnical Investigation report for Tentative Tract 10692, the Entitled Plan, is dated January 6, 1994 *(Reference No. 8).*

e) The current Saddleback Meadows Contingency Plan contains minor earthwork revisions, including graded berms for use as view shed barriers.

f) Geotechnical Cross Sections A–A', B–B' and C–C' from the 318 Lot Plan have been revised showing the new grades. The site geology and the locations of exploratory excavations are shown on the *Geologic Map, Plate 1.* The Geologic Key is shown on *Plate 2.* The Logs of Borings for the most recent site exploration are included in this report (Borings BC–1 through BC–17) Logs of Borings and Test Pits for previous exploration by GANA and other consultants are found in the GANA report dated January 1, 1994 (Ref. 8).

2. PURPOSE

a) The purpose of this investigation was to evaluate the Saddleback Meadows Contingency Plan and its impact on the site conditions, to revise the previous geotechnical cross sections to reflect the new grades, to conduct stability analyses and to provide other additional geotechnical data to supplement our previous Geotechnical EIR of November, 1995.

b) A secondary purpose was to evaluate the extent of the removal areas, the grading envelope and the estimated removal volumes.

3. SCOPE

The scope of services we have provided for this assessment is outlined as follows

a) Evaluation of the Contingency Plan grades and their impact on the site;

b) Revision of the Geotechnical Cross Sections A–A', B–B' and C–C' to evaluate stability influence of new grades;

c) Conducted static and pseudostatic stability analyses along portions of the revised cross sections;

d) Review and evaluation of major landslide structures and re-evaluation of the materials shear strengths to provide clarification of changes from previous reports;

e) Preparation of graphic illustrations;

f) Evaluation of the extent of removal areas, the grading envelope and the estimated removal volumes;

g) Preparation of this report presenting our findings, conclusions and recommendations.

4. QUALIFICATIONS

a) A more detailed evaluation of the slope stability, including analyses of buttress backcuts and forecuts, individual cut slope buttresses, etc. will be conducted during the 40-scale grading plan review which accompanies the grading permit application.

b) Although no major changes are anticipated in the final grading plan from the current plan, any revisions will be reviewed and re-analyzed, if required.

c) Shear strength parameters utilized in our Slope Stability analyses are presented in Section 9,d. They reflect the lower values, or the more conservative results of tests obtained from samples taken from the site. The shear test results are presented in *Direct Shear Diagrams, Figures 2 and 3.*

5. FIELD EXPLORATION

a) The first generated Logs of Borings, test pits and dozer pits, excavated prior to our latest site exploration are presented in the January 6, 1994 report.

b) Logs of Borings excavated during the most recent subsurface exploration on the site are presented in the *Field Exploration, Appendix B.* Boring, Test Pit and Dozer Pit locations are shown on the *Geologic Map, Plate 1.*

6. STABILITY ANALYSES

The results of our stability analyses for the major landslides on-site are presented in the *Stability Analyses, Appendix C, Volume 1 (cross sections with results) and Volume 2 (Computer Output).* All procedures and results conform to the County of Orange Grading Code regulations. Stability analyses were conducted utilizing the Alternate 4 plan grades.

7. SITE CONDITIONS

7.1 Location

The location of the site is shown on the *Location Map, Figure 1.*

7.2 Surface Conditions

A description of the surface conditions at the site is presented in the November, 1995 report. Based on several site visits since our most recent subsurface exploration, the site conditions are essentially unchanged, with the exception of some additional erosion within the canyon along the north boundary with the Abbey property and within the gullies on site.

7.3 Geologic Conditions

a) The geologic conditions at the site are essentially the same as those presented in the November, 1995 report, maps and cross sections

b) Some minor adjustments have been made to the cross section where changes were warranted by additional review and analysis of the subsurface data.

c) Explanations for the changes made to the geologic conditions shown in the January 6, 1994 report are presented in this report.

8. REVISED GEOLOGIC CONDITIONS

a) A number of changes have been made to the geologic map and cross sections for the January 6, 1994 report. These changes were included in the Geologic Map and Geologic Cross Sections in the November 27, 1995 report. As a result of new subsurface data found in our recent Borings BC-1 through BC-17 and from additional field mapping, a number of changes have been made on the geologic map and cross sections for our January 6, 1994 report.

b) These revisions are shown in the cross sections for this report and in the November 27, 1995 report, and they are summarized and described as follows:

8.1 Central Ridge Area

a) The ridge area above and to the east of the old ranch house was originally shown as a landslide with a possible lower slide surface; Cross Section 7-7', Plate 9 illustrates this in the January, 1994 report

b) Section B-B' of the November, 1995 report and in this report, depicts the revised geologic structure in this area.

c) The landslide interpretation was eliminated for the following reasons:

i) The Petra boring data, in Boring PB-9 does not show any shears or landslide materials.

ii) The bedrock materials observed in our recent deep Borings BC-5, BC-12 and BC-14 were observed to be essentially undisturbed and only minor shear surfaces were observed in the borings. A slide surface deeper than the BC-5 and BC-12 borings is very unlikely.

iii) The rupture surface logged in Boring BB-13, located just south of the east end of Section B-B', was originally interpreted as a basal landslide surface. We have, however, determined that since the surface was not encountered in PB-9, it must pass beneath the boring, which would cause the extrapolation of any potential slide surface to occur well below the deepest slide surface shown in Section B-B'. Therefore, the shear surfaces encountered in Boring BB-13 are interpreted as being of a tectonic derivation since it is unreasonable to assume that basal landslide surfaces would be present at the projected depth. The structural projection of the "basal surface" in the BB-13 boring is shown on the upper east end of Section B-B' of this report.

iv) Based on our geologic mapping in the canyon north of the ridge, we regard the exposed bedrock on the south side of the canyon is undisturbed and the materials on the north side are disturbed.

v) Regardless of whether there is a slide or no slide condition present, the only consequence would be a negligible variation in remedial grading quantities. If a slide is present, an estimated 4 percent increase in the remedial grading quantities would be required to construct an upper shear key in the area of Boring BC-14. However, there would be no change in the present grading envelope.

8.2 Reconstruction of Landslide Structure

8.2.1 Main Slide Area (Sections A-A' and B-B')

a) Our subsurface exploration that was conducted within the past year was initiated to provide more detail to the structure of the deeper slide surfaces and refine remedial grading quantities.

b) Boring BC-1 was drilled to encounter and confirm the location of the basal slide surface shown in Sections 2-2' and 3-3' of the January 6, 1994 report. Section A-A' of this report was constructed essentially along the same line as section 2-2'.

c) At a depth of 120 feet, BC-1 did not encounter this projected slide plane which had been expected from the information obtained in BA-9 and BC-1 (in Section 2-2'). However, an ash bed and a thick, fat, sheared clay zone was encountered at 152 to 154 feet, which was interpreted as the slide material encountered in BA-9.

d) Based on the projection of the rupture zones in BA-9 and BC-1, the structure was extrapolated upslope and downslope along Section A-A' and generally parallel to the known structures; becoming flat and then warping upward along the fault zone to the west and becoming steeper, upslope to the east

e) Another deeper slide surface was constructed based on the subsurface date from Borings BA-4 and B-22. Structurally, it generally parallels the BA-9 surface.

f) A hypothetical slide surface was constructed connecting the lower and intermediate surfaces in the area of the A-A'/B-B' intersection (refer to the queried, dashed contact).

g) A shallower slide surface was constructed based on boring data found in Borings BA-3 and BA-11. The upper and lower splays to the west represent two hypothetical options. They represent the toe geometry typical of generic landslides common to the south County.

8.2.2 Southerly Slide Area (Section C-C')

a) Cross Section C-C' of the November 27, 1995 report and C-C' in this report were constructed generally along the same trend as Section 4-4' of the January 6, 1994 report.

b) Based on the subsurface data from our recent Boring BC-15 and a re-evaluation of boring data from B-7, B-36, BA-13 and PB-10, we have eliminated the deep slide interpretation in the east half of Section C-C'. The shallow landslides remain.

c) Along Section C-C', the first deep slide surface from the east that passes through B-37 and beneath PB-29 is a hypothetical surface. The intermediate surface above is based on data from B-37 and PB-29.

9. SLOPE STABILITY ANALYSES

a) Slope stability analyses were performed using the UTEXAS2 Slope Stability computer program on what has been determined to be typically critical cross sections. The output documents for the slope stability analyses are presented in the *Stability Analyses, Appendix C, Volume 2.*

b) The strength parameters utilized in the analyses were selected based on the combined results of the field exploration, data from prior consultants and our laboratory test data. The laboratory shear tests include those which were conducted on specimens from hand-driven samples collected by a geologist during the down-hole logging process. They were obtained from the borings drilled specifically to explore the actual rupture surfaces. Lastly, the shear strength values used reflects those values used for similar previous investigations completed over the years in the same and adjacent site areas. The test results were reported in our previous report *(Reference January 6, 1994 report).*

c) The strength parameters used in the static analyses are based on the residual shear strengths, whereas those used in the seismic analyses are based on the peak strengths. Graphic plots of the laboratory results of the shear tests are shown in *Figures 2 and 3.* They also depict the shear strength values used in our slope stability analyses. It is notable that the values used in the analyses are more conservative than the actual strengths obtained.

d) The shear strengths used in the analyses are as follows:

Geologic Conditions	Angle of Friction (degrees)		Cohesion (lb/ft^2)	
	Static	Seismic	Static	Seismic
Rupture Surface	9	15	150	450
Fill	25	28	250	450
Bedrock/Across Bedding	30	30	350	350
Along Bedding	21	21	138	138

e) Remedial measures have been proposed where the factors of safety failed to reach the required 1.5 for the static condition and 1.1 for the seismic condition. The remedial grading is shown on the enclosed cross sections in Appendix C. Although the horizontal acceleration of 0.15g is required by County Code, the application of it to this site and to the computer programs for slope stability currently in vogue are in doubt; the values have been increased to meet the County standard.

10. CONCLUSIONS AND RECOMMENDATIONS

a) The remedial grading required for the Saddleback Meadows Contingency Plan – 299 Lots (dated June 22, 1998) is significantly reduced from the 705-unit grading concept for the original Entitled Plan. The total Remedial Grading quantity is approximately 6.8 million cubic yards.

b) We conclude that the site is developable.

The opportunity to be of continued service is sincerely appreciated. If you have any questions, please call.

APPENDIX B

Field Exploration

a) The site was explored utilizing a truck–mounted bucket auger drill rig to excavate 17 borings to depths of 77 to 173 feet below the existing ground surface. All borings were subsequently backfilled. Approximate locations of the borings are shown on the *Geologic Map, Plate 1*, of the November 1995 report.

b) The soils and bedrock encountered in the borings were logged and sampled by our Geologist. The soils were visually classified in accordance with the Unified Soil Classification System described in *Figure B-1*. The Logs of the Borings are presented in *Figures B-2 to B-18*. (The logs, as presented, are based on the field logs, modified as required from the results of the laboratory tests.) Driven ring and bulk samples were obtained from the excavations for laboratory inspection and testing. The depths at which the samples were obtained are indicated on the logs.

c) The number of blows during sampling was recorded, together with the depth of penetration, the driven weight and the height of fall. The energy required per foot of penetration for given samples was then calculated, and is indicated on the logs. These drive energies provide a measure of the density or consistency of the soil.

d) Ground water and seepage was encountered as noted on the Logs of Borings

UNIFIED SOIL CLASSIFICATION SYSTEM

MAJOR DIVISIONS			GROUP SYMBOLS	DESCRIPTIONS
COARSE GRAINED SOILS (More than 50% of material is LARGER than No. 200 sieve size.)	GRAVELS (More than 50% of coarse fraction is LARGER than the No. 4 sieve size.)	CLEAN GRAVELS (Little or no fines)	GW	Well graded gravels, gravel-sand mixtures, little or no fines.
			GP	Poorly graded gravels or gravel-sand mixtures, little or no fines.
		GRAVELS WITH FINES (Appreciable amount of fines)	GM	Silty gravels, gravel-sand-silt mixtures.
			GC	Clayey gravels, gravel-sand-clay mixtures.
	SANDS (More than 50% of coarse fraction is SMALLER than the No 4 sieve size.)	CLEAN SANDS (Little or no fines)	SW	Well graded sands, gravelly sands, little or no fines.
			SP	Poorly graded sands or gravelly sands, little or no fines.
		SANDS WITH FINES (Appreciable amount of fines)	SM	Silty sands, sand-silt mixtures.
			SC	Clayey sands, sand-clay mixtures.
FINE GRAINED SOILS (More than 50% of material is SMALLER than No. 200 sieve size.)	SILTS AND CLAYS (Liquid limit LESS than 50)		ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity.
			CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, loan clays.
			OL	Organic silts and organic silty clays of low plasticity.
	SILTS AND CLAYS (Liquid limit GREATER than 50)		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts.
			CH	Inorganic clays of high plasticity, fat clays.
			OH	Organic clays of medium to high plasticity, organic silts.
HIGHLY ORGANIC SOILS			Pt	Peat and other highly organic soils.

BOUNDARY CLASSIFICATIONS: Soils possessing characteristics of two groups are designated by combinations of group symbols.

PARTICLE SIZE LIMITS

SILT or CLAY	SAND			GRAVEL		COBBLES	BOULDERS
	FINE	MEDIUM	COARSE	FINE	COARSE		

No.200 No.40 No.10 No.4 3/4 in. 3 in. 12 in.

LOG OF BORING

Drill Rig	Boring Diameter:	Boring Elevation	Boring Number
EZ Bore 90	24 inches	1083 feet	BC-11
Date Drilled: September 25, 1995 AK	This log is a representation of subsurface conditions at the time and place of drilling. With the passage of time or at any other location there may be consequential changes in conditions		

SAMPLE: BULK | TUBE | DRIVE ENERGY FT. KIPS/FT | FIELD MOISTURE % DRY WEIGHT | DRY DENSITY LB/CU FT | SHEAR RESISTANCE KIPS/SQ FT | DEPTH, FEET | SOIL/ROCK SYMBOL | SOIL/ROCK TYPE | Description and Remarks

Siltstone: light grayish-brown, weathered, brittle, moderately well cemented, poorly bedded

@ 1 foot, becomes pinkish-gray

@ 3 feet, becomes light grayish-green to grayish-brown, increasingly brittle

@ 4.1 feet, Bedding: N49W,21NE

@ 5 feet, Silty SANDSTONE: very fine-grained, dark blue-gray, moderately hard, highly micaceous

@ 6 feet, SILTSTONE: dark grayish-green, moderately hard, micaceous, somewhat fractured

@ 8.7 feet, Fracture: N85E,76SE, well cemented and hard

@ 10.4-10.9 feet, Sheared SILTSTONE: moderately hard, polished, faint striations, strongly defined on fresh surfaces; base comprised of soft/loose, brittle moist SILTSTONE; Rupture Surface: N71W,27NE; Striations: N51E

@ 10.9 feet, SILTSTONE: dark grayish-green, well cemented, moderately hard, micaceous, somewhat broken

@ 12.6-13.0 feet, Siliceous SILTSTONE Bed: light reddish-brown to dark grayish-green, fracture and broken; Bedding: N21W,27NE

@ 15.1-16.4 feet, Fault: N41E,52NW, infilled with dry pinkish-gray ASH, loose intermixed with broken Siltstone fragments

@ 16.4 feet, Silty SANDSTONE: fine-grained, light gray, moderately well cemented, poorly bedded, massive, moist

@ 17.9 feet, becomes light grayish-green to light yellow-brown, dry, poorly cemented and somewhat weathered and crumbly

@ 23.9 feet, grades to dark grayish-green yellow banding; better cemented, poorly bedded

BEDROCK

Clayey SILTSTONE: pinkish-brown, very stiff, some tight random shears to 86.2 feet
VAQUEROS-SESPE FORMATION

Sandy SILTSTONE: brown
@ 87.2 feet, becomes greenish-gray and more Sandy
@ 88 feet, Bedding: N70E,22NW
@ 88 feet, some pink-brown mottling
@ 90 feet, Fracture: N30E,55NW: dark green-gray on NW side and pinkish-brown on SE side
@ 93 feet, becomes harder, grades to Silty SS

Silty SANDSTONE: very fine- to fine-grained, greenish-gray, very dense
VAQUEROS-SESPE FORMATION

Bottom of Boring at 100 feet.
Notes:
1) Seepage at 35, 71 and 75 feet.
2) No caving.
3) Boring down-hole logged and backfilled.

LOG OF BORING

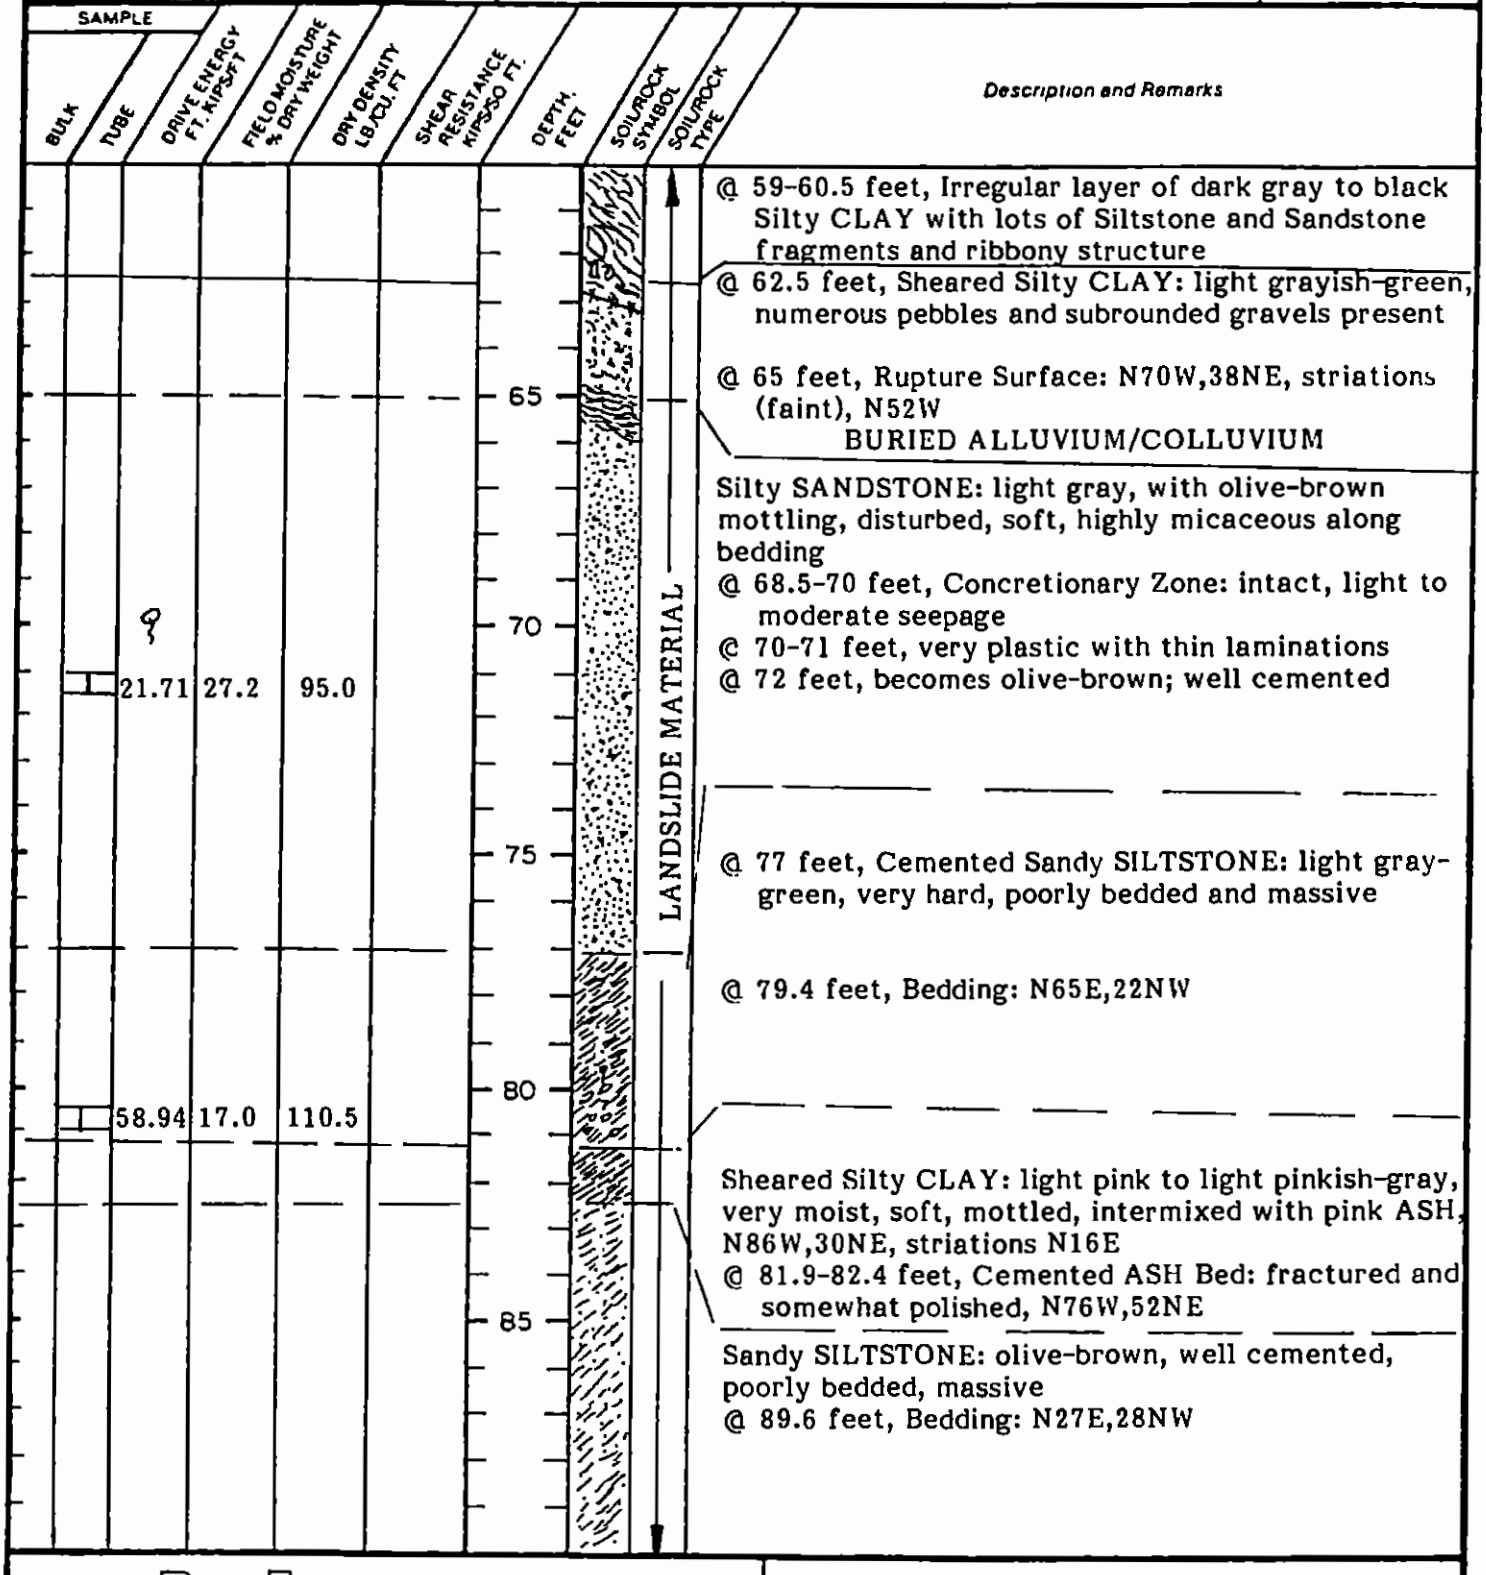
Drill Rig:	Boring Diameter:	Boring Elevation	Boring Number:
Bucket Auger	30 inches	1073 feet	BC-17
Date Drilled: 10/12/95 GDH	This log is a representation of subsurface conditions at the time and place of drilling. With the passage of time or at any other location there may be consequential changes in conditions.		



@ 59-60.5 feet, Irregular layer of dark gray to black Silty CLAY with lots of Siltstone and Sandstone fragments and ribbony structure

@ 62.5 feet, Sheared Silty CLAY: light grayish-green, numerous pebbles and subrounded gravels present

@ 65 feet, Rupture Surface: N70W,38NE, striations (faint), N52W

BURIED ALLUVIUM/COLLUVIUM

Silty SANDSTONE: light gray, with olive-brown mottling, disturbed, soft, highly micaceous along bedding

@ 68.5-70 feet, Concretionary Zone: intact, light to moderate seepage

@ 70-71 feet, very plastic with thin laminations

@ 72 feet, becomes olive-brown; well cemented

@ 77 feet, Cemented Sandy SILTSTONE: light gray-green, very hard, poorly bedded and massive

@ 79.4 feet, Bedding: N65E,22NW

Sheared Silty CLAY: light pink to light pinkish-gray, very moist, soft, mottled, intermixed with pink ASH, N86W,30NE, striations N16E

@ 81.9-82.4 feet, Cemented ASH Bed: fractured and somewhat polished, N76W,52NE

Sandy SILTSTONE: olive-brown, well cemented, poorly bedded, massive

@ 89.6 feet, Bedding: N27E,28NW

LANDSLIDE MATERIAL

@ 120.5-121 feet, Bentonitic ASH, pinkish-gray, somewhat cemented and stiff, appears intact

Sandy SILTSTONE: olive-brown, well cemented, hard
Silty SANDSTONE: fine-grained, light gray, micaceous, hard, poorly bedded

@ 126.9 feet, Sandy SILTSTONE: olive-brown, very well cemented, well indurated, poorly bedded and massive

Silty SANDSTONE: fine-grained, light gray, well cemented, hard, poorly bedded

@ 137.2-137.4 feet, Sheared Silty CLAY: olive-brown, polished, irregular faint striations, moist, stiff, N73W,24NE

Silty SANDSTONE: light gray, well cemented, hard, massive, poorly bedded

@ 141.8 feet, Silty CLAY : intermixed with broken scattered cherty fragments
@ 142.4 feet, Sheared Silty CLAY: remolded, mottled, chaotic mixture with pockets of pink ASH
@ 143.2 feet, Rupture Surface (?) N20W,41NE, striations (highly irregular) N18E to N70E

Sandy SILTSTONE: olive-brown, well cemented, poorly bedded
@ 146 feet, becomes dark pinkish-brown, highly polished on fresh surfaces, unsheared, well cemented, intact
@ 147.5 feet, Bedding: N40W,44NE
