10. Page 4.5-30, M 5-5 under Section 4.5.6 "Mitigation Measures": Add the following sentence: "*The fair share funding amount agreed to by the TCA must be submitted prior to the issuance of any building permits for the project.*"

11. Page 4.8-15, Section 4.8.1 under "Habitat Connectivity/Wildlife Corridor": Change "*Wildlife corridors in and around the project site are shown on Figure 4.8.4. As shown, the primary wildlife movement corridors are located east and north of the project site, providing for connectivity between the Cleveland National Forest and O'Neill Regional Park.*" to read "*Local wildlife corridors in and around the project site are shown on Figure 4.8.4. As shown, the local wildlife movement corridors are located within the project area, with corridors located east, south, and north of the project site that providing for connectivity between the Cleveland National Forest, Whiting Ranch Wilderness Park, and O'Neill Regional Park.*"

12. Page 4.8-22, Section 4.8.2, second paragraph under "Indirect Impacts": Change "*The project has been designed to allow for a primary wildlife movement corridor adjacent to the east side of the property (Figure 4.8.4). This would maintain connectivity of the Aliso Creek Greenway to Cleveland National Forest. The project also provides an east-west corridor through the main central drainage to provide connectivity from the Aliso Creek Greenbelt to the open space east of the property.*" to read "*The project has been designed to allow for a wildlife movement corridor adjacent to the east side of the property (Figure*

4.8.4). This would maintain connectivity of the Aliso Creek Greenway to Cleveland National Forest. The project also provides an east-west local corridor through the main central drainage to provide connectivity from the Aliso Creek Greenbelt to the open space east of the property."

13. Page 4.8-26, Section 4.8.4, third paragraph under "Upland Mitigation": Change "*Details of mitigation for coast live oak woodlands are presented in the Coastal Sage Scrub Restoration Plan for Saddleback Meadows (Appendix I.3).*" to read "*Details of mitigation for coast live oak woodlands are presented in the Conceptual Mitigation and Monitoring Plan for CDFG Jurisdictional Areas (Appendix I.2).*"

14. Page 4.8-32, Section 4.8.6 "Mitigation Measures": Add new mitigation measure M 8-4:

"*M 8-4* *Prior to grading, all Plummer's mariposa lily bulbs shall be salvaged. The bulbs shall be stored at a qualified native plant nursery prior to transplanting them for on-site habitat enhancement. All transplanted bulbs shall be maintained, including weed control. Monitoring and reporting shall be conducted. A qualified biologist/botanist shall oversee all aspects of this mitigation plan including bulb collection and transplanting, per the recommendations of the project biologist. The Plummer's mariposa lily mitigation plan shall be reviewed and approved by the Planning and Development Services Department, prior to issuance of grading permits.*"

15. Page 4.10-14, second paragraph under "Project Impacts": Change "*Data recovery would occur prior to ground disturbing activities.*" to read "*Additional mitigation would need to be accomplished if development plans change and the site is to be disturbed.*"

16. Page 4.12-1, second paragraph under Section 4.12.1: Change *"61 fire stations"* to read *"59 fire stations.*

17. Page 4.12-1, third paragraph, second bullet under Section 4.12: Remove *"only available from a medic van"* from the sentence and add the following sentence to the end of the bullet. *"OCFA provides paramedic service both paramedic assessment and full paramedic services through a number of configurations in addition to the medic vans."*

18. Page 4.12-2, Table 4.12.1 - Fire Station Locations: The following table reflects current information and shall replace "Table 4.12.1 – Fire Station Locations" as found in the Draft Revised Subsequent EIR.

Table 4.12.1
Fire Station Locations

Station No.	Staffing and Equipment	Response Distance (miles)[a]	Response Time (maximum, minutes: seconds)[b]
Fire Station No. 42: 19150 Ridgeline Drive Trabuco Canyon, CA 92679, Portola Hills	Paramedic Assessment Unit/Brush Engine, 3 Firefighters	0.3	4
Fire Station No. 18: O'Neill Park, Trabuco Canyon Road, Trabuco Canyon, CA 92679	Paramedic Assessment Unit/Brush Engine, 3 Firefighters	4.2	8:40
Fire Station No. 16: 28891 Modjeska Canyon Road Modjeska Canyon, CA 92676	Paramedic Assessment Unit/Brush Engine, 3 Firefighters	3.5	9:30
Fire Station No. 45: 30131 Adventura, Rancho Santa Margarita, CA 92688	Paramedic Assessment Unit, Truck, 1 Battalion Chief, 8 Firefighters	5.3	10:30
Fire Station No. 54 19811 Pauling Avenue Lake Forest, CA 92610	Paramedic Assessment Unit Engine, 3 Firefighters	2.8	6:20
Fire Station No. 31 22426 Olympiad Road Mission Viejo, CA 92692	Paramedic Assessment Unit Engine (closest one to the project site), Basic Life Support Engine, 3 Firefighters	3.7	7:50

[a] *Response distance is an approximate.*
[b] *Response time is an approximate based upon an average of 35 mph and 90 seconds of call processing and turnout time with the exception of Fire Station 16 which incorporates a two minute time period added for the volunteer personnel to get to the fire station (Fire Station* 16 *does not have full time firefighters, only volunteer firefighters).*

19. Page 4.12-2, third paragraph: Change *"average response time of six minutes"* to read *"average response time of nine minutes."*

20. Page 4.12-2, fourth paragraph: Replace the last sentence *"At this location three firefighters are on duty staffing either a paramedic assessment unit or a brush engine."* to read *"At this location, 20 volunteer firefighters staff the engine when called upon to do so."*

21. Page 4.12-3, first paragraph, last sentence: Change "*eight firefighters*" to read "*seven firefighters.*"

22. Page 4.12-9, under Section 4.12.4 "Project Design Features and Standard County Conditions": Add new Standard County Condition SC 12-16:

"*SC 12-16* *Secured Fire Protection Agreement: Prior to grading, the applicant shall enter into a Secured Fire Protection Agreement with the OCFA.*"

23. Page 4.12-5, Figure 4.12.1 – Fuel Modification Plan: Please refer to the revised Figure 4.12.1 – Fuel Modification Plan as found at the end of Section 2.0 of this Response to Comments document.

24. Page 4.12-4, under Section 4.12.3 "Cumulative Impact", second paragraph: Delete the second sentence and replace with: *"Additional staffing and/or equipment may be needed to meet this demand. This issue will be addressed within the Secured Fire Protection Agreement and as with the proposed project, the related projects would be individually subject to protection and safety measures to adequately mitigate fire protection."*

25. Page 4.16-6, under Section 4.16.6 "Mitigation Measures": Add new mitigation measure: M 16-2:

    "M 16-2 Prior to undertaking construction of the project, the applicant shall enter into an improvement agreement with TCWD to provide for the design, construction, installation, dedication and funding of all necessary master plan and in tract storage facilities or alternatively pay TCWD's in lieu water storage fees."

26. Page 5-37, Alternative 6 – 44/178 Alternative "Public Services – Fire Protection and Police Protection": Replace text after first sentence with the following: *"However, the layout of the "Development Area" under this alternative would not allow for secondary access for emergency vehicles and may require the acquisition of additional easements or other mitigation measures to ensure that adequate access to the project is provided. As with the proposed project, this alternative would require a fuel modification plan to minimize or retard the spread of dry brush and wildfire into the area.*

    Fire protection impacts would be greater with implementation of Alternative 6, compared to those associated with the proposed project."

27. Page 5-47, under Section 5.5 "Environmentally Superior Alternative": Replace last sentence *"Alternative 8, the reduced residential alternative would be the environmentally superior alternative among the non no project alternatives."* To read *"Alternative 4, the Foothill Trabuco Specific Plan EIR 531 Staff alternative would be the environmentally superior alternative among the non-no project alternatives. Although Alternative 4 is environmentally superior, it would be economically infeasible to develop. Land acquisition, engineering, construction, and implementation of mitigation measures could not be amortized over 100 single-family units. These costs combined with mitigation costs, such as those associated with stabilizing the geotechnical hazards would exceed project revenues."*

28. Page 5-48, Table 5.7: A revised Table 5.7 reflects current information and shall replace "Table 5.7 – Comparison of Proposed Project and Alternative Impacts" as found in the

Draft Revised Subsequent EIR. The revised table is included at the end of Section 2.0 of this Response to Comments document.

Table 5.7
Comparison of Proposed Project and Alternative Impacts

Draft Revised Subsequent EIR 566

SECTION 3.0

RESPONSE TO WRITTEN COMMENTS

3.0 RESPONSE TO WRITTEN COMMENTS

3.1 INTRODUCTION

In order to comprehensively respond to all letters received on the Draft Revised Subsequent EIR and address each CEQA issue raised, a summary matrix has been developed which lists the commenter and the corresponding issues raised. The matrix contains the names of all commenters, and has been apportioned into 25 major comment categories, outlined as follows:

1. Land Use
2. Geophysical Resources
3. Hydrology
4. Water Quality
5. Transportation/Traffic
6. Air Quality
7. Noise
8. Biological Resources
9. Aesthetics/Visual
10. Cultural/Paleontological Resources
11. Recreation
12. Fire Protection
13. Police Protection
14. Schools
15. Libraries
16. Water Supply
17. Wastewater
18. Solid Waste
19. Electricity
20. Natural Gas
21. Procedural Issues
22. Mitigation Issues
23. Alternatives
24. Other Concerns/Issues
25. No Comment/No Response Required

All comment letters have been reviewed and placed into one or more of the above-outlined comment categories. Each original comment letter can be found in Appendix A.1 of this document. In total 27 comment letters were received during the comment period. Each comment letter has been retyped and divided into individual specific numbered comments. Each numbered comment is followed by a response.

All written comments are summarized in Table 3.1 and organized as follows:

- Draft EIR Public Agency Comment Letters (12 letters)
- Draft EIR Organization/Businesses Comment Letters (11 letters)
- Draft EIR Individual Comment Letters (4 letters)

3.2 AGENCY COMMENT LETTERS

The following agencies commented on the Draft Revised Subsequent EIR:

- U.S. Fish and Wildlife Service/State of California, Department of Fish and Game
- State of California, Governor's Office of Planning and Research - State Clearinghouse
- State of California, Department of Transportation
- California State University, Los Angeles
- South Coast Air Quality Management District
- Southern California Association of Governments
- Transportation Corridor Agencies
- Orange County Fire Authority
- Trabuco Canyon Water District
- City of Lake Forest
- City of Mission Viejo
- City of Rancho Santa Margarita

3.2.1 U.S. Fish and Wildlife Service / California Department of Fish and Game

Karen A. Evans, June 26, 2002

William E. Tippets, June 26, 2002

USFWS/CDFG 1 – Comment

The U.S. Fish and Wildlife Service (Service) and the California Department of Fish and Game (Department), hereafter referred to as the Wildlife Agencies, have reviewed the Draft Revised Subsequent Environmental Impact Report (DEIR) for the construction of the Saddleback Meadows Project, in the County of Orange, California. The project proposed development of 299 single-family houses on a 229.2-acre site in the lower foothills of the Santa Ana Mountains in southern Orange County. The proposed project also includes two new paved access roads off of El Toro road and an adjacent offsite 1.4 million-gallon water reservoir. The Wildlife Agencies have commented on various development proposals and environmental documents for this project since 1994. As we have stated in our previous comments, the proposed project poses significant unmitigated impacts to future Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP) reserve design for the Southern Subregion of Orange County.

The Department is identified as a Trustee Agency pursuant to the California Environmental Quality Act (CEQA) section 15386 and is responsible for the conservation, protection, and management of the State's biological resources. The Department is also responsible, pursuant to the California Endangered Species Act, California Fish and Game code 2050 et seq., *for the protection of species listed by the State as endangered or threatened or identified as species of concern, and the habitats they require. The Department also manages the NCCP Program (California Fish and Game Code 2800* et seq.*), a regional conservation planning effort, that includes Southern Orange County.*

The Service's primary mission is to work "with others to conserve, protect, and enhance fish, wildlife, and plants and their habitats for the continuing benefit of the American People." The Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States. Specifically, we administer the Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 et seq.*), and work in accordance with the provisions of the Fish and Wildlife Coordination Act (48 Stat. 401 as amended, 16 U.S.C. 661* et seq.*). Section 7 of the Act requires Federal Agencies to consult with the Service should it be determined that their actions may affect federally listed threatened or endangered species. Take incidental to otherwise lawful activities can be permitted under the provisions of Section 7 (Federal consultations) or 10 (permits) of the Act.*

USFWS/CDFG 1 – Response

This comment presents an overview of the project and discusses the role of U.S. Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG). No response is required.

USFWS/CDFG 2 – Comment

As noted in the DEIR, the Service has completed formal consultation with the U.S. Army Corps of Engineers (Corps) and issued a biological opinion (FWS-OR-1023.8) on the Saddleback Meadows Project's effects on the federally endangered Riverside fairy shrimp (Streptocephalus woottoni, "fairy shrimp") and its designated critical habitat and designated critical habitat for the threatened coastal California gnatcatcher (Polioptila californica californica, "gnatcatcher"), in accordance with Section 7 of the Act. To clarify, however, our biological opinion evaluated the 283-unit alternative, not the proposed 299-unit alternative discussed in the DEIR. If the 299-unit Alternative is pursued, reinitiation of consultation with the Corps would be required. Although impacts to federally listed species and their designated critical habitat have been addressed in the cited biological opinion for the Saddleback Meadows project, evaluation of impacts to wildlife movement for non-listed species in relation to development of an NCCP/HCP is outside the purview of Section 7 of the Act.

USFWS/CDFG 2 – Response

Comment noted. Although the development footprint and related biological resources mitigation program associated with the 299 unit project presented in the Revised Draft Subsequent EIR is similar to the 283 plan evaluated by the USFWS and contained in the Biological Opinion, it is acknowledged that if the Section 7 is processed for the proposed 299-unit project, additional review and a revised opinion would be required.

USFWS/CDFG 3 – Comment

Relationship of the Project to Regional Conservation Planning Efforts

The NCCP Act was approved in 1991 and established a program to provide for regional protection and perpetuation of natural wildlife diversity while allowing compatible land use and appropriate development growth. The program provides an alternative to "single-species" conservation via the formulation of regional, natural community-based habitat protection programs. The first NCCP/HCP projects in California focused on providing adequate conservation and mitigation for impacts to coastal sage scrub vegetation, the preferred plant community of the gnatcatcher.

Following the Federal listing of the gnatcatcher in 1993, the Service adopted a Special Rule for the gnatcatcher pursuant to section 4(d) of the Act incorporating the conservation and process guidelines established by the State under the NCCP Act. The guidelines set forth procedures for the creation of regional and subregional conservation plans. In accordance with the guidelines, jurisdictions enrolled in the NCCP planning program can authorize a limited amount of interim loss of coastal sage scrub during the planning period subject to six interim habitat loss provisions[1]. However, the interim habitat loss provisions are only applicable until the adoption of a regional or subregional conservation plan. In summary, per the NCCP program, conservation planning within enrolled jurisdictions may be governed by an adopted regional or subregional conservation plan, or is subject to the interim habitat loss provisions of the Special 4(d) Rule.

As an enrolled jurisdiction in the NCCP program, the County of Orange (County) has both an adopted subregional conservation plan that applies to its Central and Coastal subregions (the Orange County Central-Coastal NCCP/HCP) and is participating in development of the Southern Subregion NCCP/HCP. The County has committed to work with the Wildlife Agencies to ensure that projects within its jurisdiction do not prevent connectivity between areas of high habitat values or preclude reserve design options for the Southern Subregion NCCP/HCP.

---

[1]*The following mandatory findings must be met for a project to be approved pursuant to the interim habitat loss provisions of the Special 4(d) Rule: 1) The habitat loss does not cumulatively exceed the 5% guideline; 2) The habitat loss will not preclude connectivity between areas of high habitat values; 3) The habitat loss will not preclude or prevent the preparation of the subregional Natural Community Conservation Plan; 4) The habitat loss has been minimized and mitigated to the maximum extent practicable un accordance with the Conservation Guidelines; 5) The habitat loss will not appreciably reduce the likelihood of the survival recovery of listed species in the wild; and 6) The habitat loss is incidental to otherwise lawful activities.*

USFWS/CDFG 3 – Response

The County has committed to work with the Wildlife Agencies to ensure that projects within its jurisdiction do not prevent connectivity between areas of high habitat values or preclude reserve design options for the Southern Subregion NCCP/HCP. Although the original Saddleback Meadows project was conceived and approved long before the inception of the NCCP, the project applicant nevertheless committed to work with the Wildlife Agencies during project redesign to minimize impacts to coastal sage scrub and provide for significant on-site preservation and off-site acquisition. As a result of the coastal sage scrub restoration efforts on-site, there will be no net loss of coastal sage scrub on-site, and the quality of the habitat would be enhanced over the long-term. Additionally, 14.8 acres of coastal sage scrub is proposed to be acquired off-site (see Table 4.8.3 of the Draft Revised Subsequent EIR).

USFWS/CDFG 4 – Comment

Reserve Design Inconsistency

Our primary concern with the proposed project is the significant impact it poses to the major lower elevation wildlife movement corridor/linkage along the Santa Ana Mountain foothills of southern Orange County. Saddleback Meadows, together with the adjacent Saddle Creek and Live Oak properties, represents the only remaining unobstructed low elevation wildlife corridor/linkage between the Central and Southern Subregions of the Orange County NCCP/HCP planning areas. To highlight its importance, Orange County's Central-Coastal NCCP/HCP identifies this area as a key corridor/linkage between the subregions. The proposed development on Saddleback Meadows along the eastern and northern portions of the site as shown in Alternative 2 (the No Project, "Existing Entitlement" Alternative), Alternative 3 (the F/TSP EIR 531 Staff Alternative A), Alternative 5 (the Cluster/Single-Family/Multi-Family Residential Alternative), or Alternative 8 (the Reduced Residential Alternative) of the DEIR could substantially eliminate this corridor/linkage and thereby, severely constrain movement

of mule deer, coyote, mountain lion and other large mammals from O'Neill Regional Park in the Southern Subregion of the Central Subregion NCCP/HCP reserve. We raised similar concerns regarding the proposed development on the Saddle creek property in our comments on the recently circulated DEIR- State Clearinghouse No. 199111120 (FWS-OR-1309.1).

Pursuant to the CEQA Guidelines (Section 15130), a revised DEIR should discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable and should review the impacts in light of past, present and future probably projects that could result in related impacts, including those outside of the control of the lead agency. However, this current, revised DEIR does not adequately address cumulative impacts to the low-elevation wildlife corridor/linkage through the Saddleback Meadows, Saddle Creek and Live Oak properties. Also, it appears that a comprehensive plan for maintaining a viable corridor/linkage through these properties has not been completed. For example, the Saddleback Meadows DEIR shows a northern wildlife corridor extending from Saddleback Meadows through the adjacent Saddle Creek property. However, the Saddle Creek DEIR does not show this corridor, which could be blocked by the residential development proposed in the DEIR. In addition, development on the Live Oak property could further limit wildlife movement between the subregions. Therefore, the Saddleback Meadows DEIR should evaluate cumulative impacts to wildlife movement in consideration of past development, the proposed development on the Saddle Creek and Live Oak properties and other probable developments, and demonstrate that the Saddleback Meadows project will not preclude the retention of a viable low-elevation wildlife corridor/linkage connecting the Central and Southern Subregions through all three properties. We wish to work with the County and property owners to develop a comprehensive plan to accomplish this vital component of the Southern Subregion NCCP/HCP.

USFWS/CDFG 4 – Response

After the close of the public review period of the Draft Revised Subsequent EIR, the County and the Wildlife Agencies released the draft Planning Guidelines for the Southern Subregion NCCP/HCP on July 30, 2002. These Guidelines have not been approved by the resource agencies or the County; however, they do represent a milestone in the continuing efforts by the County, resource agencies, the public, and the landowners to form the NCCP/HCP in the Southern Subregion. These draft Planning Guidelines, are they presently exist, include discussion of wildlife movement corridors and habitat linkages in the Southern Subregion in the following general terms:

> *"General Policy 2. Site and design new development to accommodate wildlife movement and dispersal via wildlife corridors and habitat linkages.*
>
> *The planning area provides important wildlife movement corridors and habitat linkages for a variety of wildlife species. These corridors and linkages facilitate dispersal by smaller, less mobile species and frequent movement (e.g., daily, weekly, etc.) by large mammal species such as mountain lion, mule deer, coyote and bobcat. The species identified below only highlight a much broader suite of species served by the habitat linkages and corridors. Accordingly, the species identified should not be interpreted as the only species that benefit from the linkages and corridors. It can be reasonably assumed that habitat linkages and corridors that function for large mammals (except coyote) also function for many other species.*

For purposes of this discussion, a distinction is drawn between wildlife corridors and habitat linkages.

- *Habitat linkages: These are areas of natural habitat that function to join two larger parches of habitat. They serve as connections between habitat patches and help reduce the adverse effects of habitat fragmentation by providing a potential route for gene flow and long-term dispersal. Habitat linkages may serve both as "live-in" habitat and avenues of gene flow for small animals such as reptiles, amphibians, and rodents. Habitat linkages may be represented by continuous habitat or by closely-spaced habitat "islands" that function as stepping stones for dispersal and movement (especially for birds and flying insects).*
- *Wildlife corridors: Corridors tend to be linear features that connect large patches of natural open space and provide avenues for frequent movement, dispersal or migration of larger animals. As defined here, wildlife corridors generally serve a more limited function than habitat linkages because the corridors primarily are used for transit of larger species rather than as live-in habitat for a broader suite of species. Also, functional wildlife corridors often include man-made structures such as culverts and flood control channels that large animals can quickly transit to access more suitable habitat areas.*

Known and likely key wildlife movement corridors and habitat linkages in the planning area include the following:

- *The Saddleback Meadows (R) area provides a lower elevation habitat linkage between the Southern Subregion planning area and the Central Subarea component of the Central and Coastal Subregion NCCP/HCP reserve system.*
- *The area north of Oso Reservior (S), including O'Neill Regional Park and the nursery provides a lower elevation "stepping stone" habitat linkage between the Southern Subregion planning area and the Central Subarea component of the Central and Coastal Subregion NCCP/HCP reserve system. With habitat restoration, this linkage would be suitable for the California gnatcatcher.*
- *Live Oak Canyon (T) provides a north-south wildlife corridor for large mammals from Arroyo Trabuco and O'Neill Regional Park to the Cleveland National Forest and a habitat linkage for dispersal of the cactus wren, possibly the California gnatcatcher and other smaller species."*

Section 4.8 of the Draft Revised Subsequent EIR identifies the project site as a primary wildlife corridor based on the evidence reviewed and collected at the time. Based on the draft Planning Guidelines, this has been revised (please see Section 2.0 of this Response to Comments document). It is the project biologist's contention that the primary wildlife linkages for the gnatcatcher occurs at the lower elevations in the vicinity of the project identified in the Guidelines as Habitat Linkage (S) northerly of Upper Oso Reservoir crossing El Toro Road to Whiting Ranch Wilderness Park. The project biologist further contends that wildlife corridors for larger mammals occur in and around the adjacent foothills consistent with corridors depicted on the F/TSP and that the proposed project conforms to the F/TSP corridor requirements.

Further confirmation of this view is contained in a letter received by the County after distribution of the Draft Revised Subsequent EIR. The letter from Dr. Dennis Murphy, a professor and Program Director at the University of Nevada, Reno, who was the chief architect of the original guidelines for the NCCP outlines his professional opinion that local wildlife would not be dependent on engineered habitat pathways within a suburban development, but instead on O'Neill Regional Park, Whiting Ranch Wilderness Park and through the numerous east-west corridor connections along the Cleveland National Forest (please see Appendix C of this Response to Comments document). These connections are also identified on the F/TSP. Dr. Murphy notes that mule deer, mountain lion, and other large mammals are far more likely to use these areas to the east and north of the site, even without project development. Further, mountain lions should hardly be encouraged into small natural spaces in already suburbanized Orange County.

At the request of the Wildlife Agencies during the project design process, the design of the current project evolved through numerous modifications and has resulted in the retention of an existing local corridor that allows for mammal movement through and around the property. Furthermore, the project includes an extensive revegetation effort to enhance large parcels of currently disturbed potential habitat, and an additional mitigation component off-site (see Section 4.8.4 and Appendix I of the Draft Revised Subsequent EIR). The proposed local corridor and habitat enhancement plan was developed after numerous consultations and site visits with the Wildlife Agencies. The preservation of the local wildlife corridor and the habitat restoration effort appears to comply with both the letter and spirit of the draft NCCP Planning Guidelines' intent to improve wildlife residency and movement, and in this case due to its degraded state, beyond that presently available to wildlife.

Cumulative impacts to wildlife movement corridors are evaluated qualitatively within an approximately one mile radius of the project site. Evaluation of cumulative impacts beyond this distance is not appropriate. The original natural topography of the adjacent areas that have been developed including Portola hills, Hidden Ridge, Cook's Corner, St. Michael's Abbey, El Toro Road, the private nursery, Painted Trails, and Upper Oso Reservoir suggest that all would have been more favorable as wildlife corridors compared to the adverse topography of the Saddleback Meadows project site. Access to areas to the north could have occurred along the corridor now defined by Aliso Creek and El Toro Road. Access to the east could have crossed the areas now covered by the reservoir, Painted Trails, the private nursery, and the Hidden Ridge development. Regional access to the north as a primary corridor has been forclosed by the proximity of the mass grading and non-native vegetation of Portola Hills and the development of El Toro Road and St. Michael's Abbey. What was once a borad expanse is now a very narrow corridor where mammals are confined to a narrow drainage channel and an undercrossing of El Toro Road via a man-made culvert. The culvert has a paved invert and is also used by equestrians and hikers.

These development patterns reduce the effectiveness of a wildlife corridor through the proposed project site. This is consistent with the findings of the F/TSP, approved in 1991, which designates wildlife corridors to the south and to the east to accommodate regional wildlife movement. Corridors that are still viable based on past and proposed development.

Regional access to the east via a wildlife corridor south of the proposed project site has been preserved for small mammals, birds and insects to transverse the existing private nursery between Hidden Ridge and the reservoir/Painted Trails. On a regional basis, there is also opportunity for access to areas east of the project site (e.g., Live Oak Canyon) via Arroyo Trabuco and Trabuco Canyon.

Adjacent projects including Live Oak Plaza (as approved) and Saddle Creek (as currently proposed) are consistent with the findings of the F/TSP and revegetation of the disturbed portions of Live Oak Plaza would further facilitate the use of the corridors.

USFWS/CDFG 5 – Comment

To address our concerns for Saddleback Meadows, the Wildlife Agencies recommend further consideration of Alternative 4 (F/TSP EIR 531 Staff Alternative B) of the DEIR as it would allow continued movement of wildlife through the area while still meeting the project's objective of "develop(ing) a single-family, rural community that balances residential development with protection of on-site sensitive resources and values of the surrounding community." Alternative 6 (the 44/178 Alternative) may be able to mitigate significant impacts to wildlife movement if remedial grading requirements can be limited within the corridor/linkage area.

USFWS/CDFG 5 – Response

Please see Section 3.3.2 (Connor 30 – Response) of this Response to Comments document regarding the feasibility of Alternatives 4 and 6.

USFWS/CDFG 6 – Comment

Geotechnical

According to the DEIR, the site is characterized by several unfavorable geothechnical conditions including unstable landslides and presence of ground water that could compromise the site's ability to support the project. Mitigation would include the construction of canyon subdrains and back drains to minimize or eliminate the effects of ground water. The Final EIR (FEIR) should discuss how these changes would affect groundwater availability and timing for use by riparian vegetation in upper Aliso Creek.

USFWS/CDFG 6 – Response

As discussed in Section 4.2.2 and Appendix C of the Draft Revised Subsequent EIR, the proposed remedial grading related subdrains have been proposed to prevent a buildup in groundwater pressure, which could potentially affect post grading on-site geotechnical conditions. Any groundwater intercepted by the proposed subdrains would ultimately discharge into Aliso Creek at the western edge of the project site, resulting in no net adverse effect to groundwater availability or timing for use by Aliso Creek vegetation.

USFWS/CDFG 7 – Comment

Hydrology/Beneficial Uses

The Santa Ana Regional Water Quality Control board has designated the existing biological beneficial uses of "warm freshwater habitat," "wildlife habitat," and "rare, threatened, or endangered species" for portions of Aliso Creek, including the reach downstream from the Saddleback Meadows project. The Wildlife Agencies are concerned about the onsite and downstream effects the project-related changes in the surface flows may have on these beneficial uses and on the habitats and biological resources supported by Aliso Creek. In addition to modifications in peak flows resulting from an increase in impervious surface, we are concerned about changes on the velocity, volume, duration, and frequency of dry-weather and non-peak wet-weather flows. Even small changes in the flow regime often effect changes in the stream community that, over time, can seriously damage stream habitats. Increases in flows from impervious surfaces associated with urbanization can result in: 1) stream bed scouring and habitat degradation; 2) shoreline erosion and stream bank widening; 3) loss of aquatic species; and 4) decreased baseflow (USEPA 1999). Downstream sections of Aliso Creek are known to be sediment-deficient and have already been adversely affected by scour, erosion and subsequent habitat degradation. The Wildlife Agencies recommend that every effort be made to integrate measures to ensure full protection of the beneficial uses and biological resources of Aliso Creek. The development design and construction operations should minimize the modifications of dry and wet-weather flows and integrate onsite best management practices (BMPs) that would attenuate the flows to reduce impacts on the stream morphology and habitats onsite and downstream. Examples of BMPs to consider include appropriately sized grassy swales and vegetated detention basins. Proper design of structural BMPs will require analyses of the sediment transport and hydrological regime of the headwaters of Aliso Creek. The project is located within Reach 1 of the Aliso Creek Watershed Management Feasibility Study, Orange County, California *prepared by the Corps. We recommend this study be consulted to determine possible effects of the project on the Aliso Creek watershed.*

USFWS/CDFG 7 – Response

The proposed project will comply with the requirements of Section 401 of the Clean Water Act (Water Quality Certification) as administered by the California Regional Water Quality Control Board (RWQCB). The concerns raised by the resource agencies regarding changes to surface flow and peak flow are addressed in Section 4.4 of the Draft Revised Subsequent EIR. The project design includes a drainage system which recreates existing flow regimes to the maximum extent

practicable, in conjunction with stormwater management requirements. A comprehensive set of Best Management Practices (BMPs) have been proposed to minimize the effects of project-related urban runoff on Aliso Creek, including a riverine system of grassy swales and detention basins. All impacts to water quality and downstream surface flow impacts have been mitigated to less than significant levels.

USFWS/CDFG 8 – Comment

Significance Criteria for Biological Resources

The thresholds of significance for biological resources provided in section 4.8.2 of the DEIR do not appear to be consistent with the CEQA definition of rare, threatened, and endangered species (see CEQA Guidelines, § 15380). In addition, the Department recommends that the significance criteria in the body of the DEIR be revised to be consistent with CEQA Sections 15064.7 and 15065, and Appendix G of the CEQA Guidelines.

USFWS/CDFG 8 – Response

As stated in Section 15064.7 of the *CEQA Guidelines*, each public agency is encouraged to develop thresholds of significance. The significant thresholds related to biological resources contained in the Draft Revised Subsequent EIR are derived from Public Resources Code Section 21001(c) and criteria established by the County and resource agencies. These thresholds, although not verbatim, include issues contained in Appendix G of the *CEQA Guidelines*, and adequately define potentially significant impacts.

USFWS/CDFG 9 – Comment

Annual Grasslands

The project proposes that mitigation requirements for cumulative impacts to raptor foraging habitat (consisting primarily of coastal sage scrub and grasslands) will be met in conjunction with the proposed coastal sage scrub mitigation. The Department recommends mitigation measures be incorporated specifically for impacts to annual grassland. These areas provide foraging areas for raptors and small mammals and proposed impacts to a total of 103.7 acres on-and offsite should be considered significant. Appendix I.1 of the DEIR indicated that raptor species including Cooper's hawk (Accipiter cooperii), a state species of special concern (CSC), sharp-shinned hawk (A. striatus, CSC), red tailed hawk (Buteo jamaicensis) red shouldered hawk (B. striatus), and American kestrel (Falco sparverius) were observed during the surveys of the project site, and other species including northern harrier (Circus cyaneus, CSC) and loggerhead shrike (Lanius ludovicianus, CSC) have at least a moderate potential of using the grasslands onsite for foraging. We therefore recommend that annual grassland mitigation at a 0.5:1 preservation-to-impact ratio in an offsite area with long-term conservation potential to be included in the FEIR.

USFWS/CDFG 9 – Response

As stated on page 4.8-11 of the Draft Revised Subsequent EIR, much of the annual grasslands on-site have been heavily disturbed by historic cattle ranching operations, and support significant amounts of cardoon (*Cynara cardunculus*), an artichoke-like plant that grows in areas where soils have been highly disturbed and compacted. This is an aggressive plant species that often dominates areas that have been heavily grazed. The raptor species noted as occurring on-site will benefit from the sage scrub restoration effort, as well as from off-site preservation of sage scrub and off-site restoration of riparian and oak woodland habitat. As stated in Section 4.4.2 of the Draft Revised Subsequent EIR, impacts to annuals grasslands would not be significant and no additional mitigation is proposed. Given the heavily disturbed condition of the annual grasslands mitigation of project impacts is not warranted. The development of the coastal sage scrub mitigation plan with USFWS favored the replacement of the disturbed annual grasslands with coastal sage scrub habitat.

USFWS/CDFG 10 – Comment

Intermediate Mariposa Lily

The DEIR states that impacts to intermediate mariposa lily (Calochortus weeddii var. intermedius) would not be significant. This species is listed by the California Native Plant Society as a "1B" plant (Plants rare threatened, or endangered In California and elsewhere). Species included on List 1B must be fully considered under CEQA. The Department recommends that the FEIR include mitigation for impacts to this species (for example, see Rancho Protrero Leadership Academy EIR, County of Orange, 2001).

USFWS/CDFG 10 – Response

Although impacts to this sensitive species were not assessed in the Draft Revised Subsequent EIR as being significant, due to the limited number of individuals impacted, an additional mitigation requirement has been added in response to this and other comments. The applicant has agreed to transplant potentially impacted bulbs of this species to appropriate open space areas on-site. Please see Section 2.0 of this Final Revised Subsequent EIR, which includes additional mitigation for the intermediate mariposa lily (new mitigation measure M 8-4).

USFWS/CDFG 11 – Comment

Cactus Wren

According to the DEIR, impacts to the cactus wren (Campylorhynchus brunneicapillus cousei) are not considered significant. As proposed in Appendix I.3 to the DEIR, the coastal sage scrub mitigation plan does not specifically include salvage or container stock planting of prickly-pear (Opuntia spp.) required for cactus wren nesting and foraging. By providing suitable replacement habitat, a potentially significant impact to cactus wren may be mitigated.

To provide replacement habitat for cactus wren impacted by implementation of the project, we recommend that the coastal sage scrub palette is revised to include a substantial amount of prickly-pear. This may be achieved by salvage of existing plant material followed by direct replanting within the mitigation area or by collecting pads prior to impact and rooting them in containers. In addition, we recommend that reference sites are currently reporting cactus wren be chosen to provide an adequate baseline for comparison.

USFWS/CDFG 11 – Response

Comment noted. The salvage of prickly pear cactus will be incorporated into the final sage scrub restoration plan.

USFWS/CDFG 12 – Comment

Oak Woodland Mitigation Plan

Mitigation for oak woodland impacts is described on page 4.8-26 of the DEIR and we concur with the restoration approach in concept. However, unlike the coastal sage scrub mitigation plan, details of the oak woodland mitigation strategy are not adequately described in Appendix I.3 such that the impacts can be shown to be mitigated below a level of significance. For example, the proposed locations for oak woodland restoration should be depicted and described. In addition, container sizes, understory species, and maintenance activities specific to the oak woodland restoration should be detailed.

USFWS/CDFG 12 – Response

The commenter is correct in noting that page 4.8-26 of the Draft Revised Subsequent EIR incorrectly cites Appendix I.3 for details for coast live oak woodland mitigation. Details of mitigation for coast live oak woodlands are included in the *Conceptual Mitigation and Monitoring Plan for CDFG Jurisdictional Areas* in Appendix I.2 of the Draft Revised Subsequent EIR. Please see Section 2.0 of this Response to Comments document for a correction.

Figure 4.8.7 of the Draft Revised Subsequent EIR identifies the proposed oak woodland restoration areas on-site. Restoration of oak woodland within CDFG jurisdictional areas is described in Appendix I.2 of the Draft Revised Subsequent EIR and was developed in coordination with CFDG resulting in the issuance of a 1603 Streambed Alteration Agreement (see Appendix B of this Response to Comments document). SC 8-6 summarizes the size and number of container stock required for oak restoration (see Section 4.8.4 of the Draft Revised Subsequent EIR). The details included in Section 4.8 and Appendix I.2 of the Draft Revised Subsequent EIR demonstrates that the impacts can be mitigated to below a level of significance.

USFWS/CDFG 13 – Comment

The Wildlife Agencies appreciate the opportunity to review and comment on the DEIR. If you have any questions please contact Mr. David Zoutendyk of the Service at (760) 431-9440 or Mr. Brad Henderson of the Department at (310) 214-9950.

USFWSCDFG 13 – Response

3.2.2 State of California, Governor's Office of Planning and Research – State Clearinghouse

Tal Finney, May 9, 2002

Terry Roberts, June 11, 2002

State Clearinghouse 1 – Comment

This is to acknowledge that the State Clearinghouse has received your environmental document for state review. The review period assigned by the State Clearinghouse is:

Review Start Date: *April 26, 2002*

Review End Date: *June 10, 2002*

We have distributed your document to the following agencies and departments:

California highway Patrol
Caltrans, District 12
Department of Conservation
Department of Fish and Game, Region 5
Department of Forestry and Fire Protection
Department of Housing and Community Development
Department of Parks and Recreation
Department of Water Resources
Native American Heritage Commission
Office of Historic Preservation
Regional water Quality Control Board, Region 9
Resources Agency
State Lands Commission

The State Clearinghouse will provide a closing letter with any state agency comments to your attention on the date following the close of the review period.

Thank you for your participation in the State Clearinghouse review process.

State Clearinghouse 1 – Response

The comment has been received and noted. No response is required.

State Clearinghouse 2 – Comment

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on June 10, 2002, and the comments from the responding agency (ies) is (are) enclosed. If

this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the Project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please not that Section 21104(c) of the California Public Resources Code states that:

> *"A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."*

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

State Clearinghouse 2 – Response

The comment has been received and noted. No response is required.

3.2.3 State of California, Department of Transportation

Robert F. Joseph, May 28, 2002

Caltrans 1 – Comment

Thank you for the opportunity to review and comment on the Draft EIR dated April 2002 for Saddleback Meadows. The project is located on the eastern side of El Toro Road, one half mile from the Santiago Canyon/Live Oak Canyon Road junction.

The project consists of the development of 299 detached single family residences on 66.9 acres out of a total 222-acre site. The nearest State Routes are SR-241 and I-5.

Caltrans District 12 status is a reviewing agency on this project and has the following comments:

As indicated in the report, the proposed project will generate 3690 trips per day that mostly use El Toro Road. This report has not yet included west/south of El Toro beyond Santa Margarita Parkway towards I-5 interchange in the Traffic study section. We have concerns that this development will ultimately contribute to the cumulative impacts at El Toro Road/I-5.

Caltrans 1 – Response

By comparing the ICU values in Tables 2-2 and 4-1 of the traffic analysis (Appendix F of the Draft Revised Subsequent EIR), project-related changes at intersections can be determined. At the Portola Parkway/El Toro Road intersection, no change in the P.M. peak hour ICU occurs. During the A.M. peak hour, only a one percent change occurs. This condition defines the outer edge of measurable traffic impacts based upon County of Orange GMP criteria.

Caltrans 2 – Comment

We recommend that the project proponents work to coordinate their efforts with the City of Lake Forest and their project "The Arbor on El Toro Specific Plan" in terms of project phasing, filing a traffic management plan during construction, and avoiding impacts to El Toro Road and ultimately the I-5 during traffic peak periods.

Caltrans 2 – Response

As stated in Section 4.5.2 of the Draft Revised Subsequent EIR, impacts from construction activities would have short-term, but not significant impacts on vehicular traffic along streets adjacent to the project site during the grading and excavation phase. No significant impacts would occur to El Toro Road or Interstate 5 during these phases.

Caltrans 3 – Comment

Other than identifying the County Bikeway network, this project doesn't evaluate or stipulate the use of alternative modes of transportation, such as buses, to be incorporated into the development. Such alternatives would work to reduce future congestion in the region while at the same time help to improve the overall air quality.

Caltrans 3 – Response

As stated in Section 4.5.1 of the Draft Revised Subsequent EIR, the nearest bus route with a stop near the intersection of Glenn Ranch Road and Portola Parkway is located approximately 1.5 miles southwest of the project site. The traffic analysis included in the Draft Revised Subsequent EIR was prepared to evaluate the worst-case traffic impacts on the area circulation system. The use of alternative modes of transportation would reduce vehicle impacts. The Orange County Transportation Authority (OCTA) provides local transit service in the project area and is responsible for determining the need for additional transit facilities.

Caltrans 4 – Comment

The project proponents will insure that during construction all loads will be contained that may use state routes and that no net runoff increase will flow over, into or under State Right of Way.

Caltrans 5 – Response

As stated in Section 4.6.6 of the Draft Revised Subsequent EIR (mitigation measure 6-7), dirt hauled off-site shall be wet down or covered to ensure "spill-over" is minimized.

Caltrans 6 – Comment

Please continue to keep us informed of this project and other future developments, which could potentially impact our transportation facilities.

Caltrans 6 – Response

Comment noted.

3.2.4 California State University, Los Angeles

Patricia Martz, June 10, 2002

California State University, Los Angeles 1 – Comment

I have reviewed the cultural resources section of the DEIR and have the following comments:

The cultural resources section of the EIR does not accurately reflect the findings and recommendations provided in the cultural resources appendix. In some cases there are serious contradictions

California State University, Los Angeles 1 – Response

Although there may be some minor discrepancies between the Section 4.10 (cultural resources) of the Draft Revised Subsequent EIR and the findings and recommendations provided in Appendix J, due to summarizing all the information, the mitigation measures recommended in both documents are essentially equivalent. As in the Appendix J, CA-ORA-710 and CA-ORA-711 are the only two sites recommended eligible for listing on the National Register of Historic Places and/or the California Register of Historical Resources. CA-ORA-710 would remain undisturbed in dedicated open space and CA-ORA-711 would be subjected to data recovery excavation prior to disturbance.

California State University, Los Angeles 2 – Comment

The cultural resources appendix indicates that this project is subject to a Corps of Engineers 404 permit and therefore the cultural resources are subject to the provisions of Section 106 of the National Historic Preservation Act. The EIR does not indicate this and the treatment of the archaeological sites is not in compliance with the Act as amended in 1999.

California State University, Los Angeles 2 – Response

While Section 4.10 of the Draft Revised Subsequent EIR may not specifically indicate that a 404 permit was required and that the cultural resources portion of the project was subject to Section 106 of NHPA, it is not correct that the archaeological sites were not treated in compliance with the Act. The U.S. Army Corps of Engineers (USACE) claimed jurisdiction of seven of the sites on the Saddleback Meadows property (CA-ORA-710, -711, -713, -715, -1255, -1256, and CA-ORA-1435H). In accordance with stipulations in Section 106, test excavations at these (and the remainder) of the sites on the property, and subsequent consultation with the USACE, Native American groups, and the State Historic Preservation Officer (SHPO) established that only two of the sites (CA-ORA-710 and CA-ORA-711) were eligible for listing on the National Register. Consultation continued with a treatment plan being developed and circulated to guide mitigation of the adverse effects of the project via regional background research and data recovery excavation of CA-ORA-711.

California State University, Los Angeles 3 – Comment

The investigations to determine the significance/importance of the archaeological sites are inadequate. The excavation of three 1 x 1 meter units in CA-ORA-713 is not sufficient to determine the depth, nature, condition and extent of a site of this size. Since the site appears to be dispersed over a large area, remote sensing and/or geomorphological studies should be conducted to locate areas of the site that contain buried cultural deposits and features. The discovery of buried cultural deposits and features or human burials should not be done by bulldozer.

California State University, Los Angeles 3 – Response

The commenter is incorrect that the archaeological investigations are inadequate. Every site on the property underwent a test excavation program of a sufficient number of units to characterize the subsurface. As for CA-ORA-713, a surface collection, discing followed by a second surface collection and the excavation of three 1x1 meter units was undertaken at the site. Because these methods produced small numbers of artifacts relative to the size of the area studied and the subsurface investigation produced no artifactual material, the site was deemed not eligible for listing, because it is unlikely to yield important information. The USACE and SHPO agreed with this finding. Since minimal numbers of artifacts were scattered over a large area, it is possible that CA-ORA-713 actually represents a series of small, unrelated camps.

California State University, Los Angeles 4 – Comment

Likewise the determination that CA-ORA-715 is based on the excavation of four 1 X 1 meter units. This is not sufficient to determine the depth, nature, condition, and extent of this site and to determine that it is not "significant/important."

California State University, Los Angeles 4 – Response

The test excavation was sufficient to characterize the site. The excavation of four 1x1 meter units to a depth of 30 centimeters produced only four flakes. It appears that the site is confined to the surface. All the exposed surface artifacts were collected, and there are unlikely to be any additional significant resources within the site area. The USACE and SHPO agreed and the site was determined to be not significant.

California State University, Los Angeles 5 – Comment

Pg. 4.10-12 of the EIR states that a final test excavation of site CA-ORA-1437 was undertaken in November 2001, but does not indicate the methods used or the results. There is no information to support the determination that the site is not "significant/important."

California State University, Los Angeles 5 – Response

While the EIR indeed does not include the CA-ORA-1437 test excavation document, the site was tested near the end of 2001 and found to be not significant. The report on the excavation (including methods and results) is nearing completion. It will subsequently be filed with the South Central Coastal Information Center, California State University, Fullerton (SCCIC), the Los Angeles District, USACE, with the project applicant, and the County of Orange.

California State University, Los Angeles 6 – Comment

Pg. 4.10-14 – Project Impacts: The statements regarding CA-ORA-710 are contradictory and raise doubts regarding whether the site is going to be preserved. If the sit [sic] *is to be protected through the site burial and preserved within a biological mitigation area, then why does the EIR state that data recovery would occur prior to ground disturbing activities. If the site is to be protected, why should there be ground-disturbing activities? In addition, site burial has to be done very carefully to ensure that the site will be protected. The standards/specifications for covering the site should be indicated.*

California State University, Los Angeles 6 – Response

The Draft Revised Subsequent EIR correctly states that the site is to be protected through site burial and preserved within a biological mitigation area (page 4.10-14). The statement, "data recovery would occur prior to ground disturbing activities," is not correct if it refers to CA-ORA-710 and may be better understood if it reads, "Additional mitigation would need to be accomplished if development plans change and the site is to be disturbed" (please see Section 2.0 of this Response to Comments document for this clarification). However, the site would be preserved. Burial of the site will be done "very carefully" and according to accepted archaeological standards and practices.

California State University, Los Angeles 7 – Comment

CA-ORA-1257 has not been subsurface tested and should not be graded without further investigation.

California State University, Los Angeles 7 – Response

The site was originally recorded as a sandstone bedrock feature. The 1995 investigation revisited the site and determined that the sandstone rock was made of a very soft stone, most ineffective as a grinding implement. The site area was also carefully examined for the presence of artifacts. None were found. The lack of any obvious cultural resources, caused researchers to recommended that the site be considered not significant.

California State University, Los Angeles 8 – Comment

CA-ORA-711 is considered to be significant/important. According to the DEIR, only a small fraction of the total site area was tested. Grading with monitoring, as stated on pg. 4.10-14 is not adequate mitigation for the destruction of the site.

California State University, Los Angeles 8 – Response

The comment on page 4.10-14 of the Draft Revised Subsequent EIR is incorrect, but could be read as accurate if it is combined with the previous sentence: "Data recovery would occur prior to ground disturbing activities. If grading operations at CA-ORA-711 uncover additional material . . . *further* (emphasis added) data recovery work may be required." A more accurate statement related to mitigation measures, was included in Section 4.10.5 of the Draft Revised Subsequent EIR, "Level of Significance Before Mitigation" (page 4.10-19). Under the heading "Archaeological/Historical Resources." Here it states, "The project area may have a significant impact on archaeological site CA-ORA-711 unless data recovery excavation is performed."

California State University, Los Angeles 9 – Comment

Pg. 4.10-20: The DEIR makes the assumption that the completion of a data recovery excavation program, (or even worse, monitoring during grading) constitutes a no adverse effect. This is not the case. The implementing regulations for Section 106 of the National Historic Preservation Act (36 CFR 800.5(a)(2)(iii) along with 800.5(a)(2)(I), as amended May 1999, acknowledge the reality that destruction of a site and recovery of its information and artifacts is adverse and no longer consider data recovery as sufficient mitigation to reduce the impacts to a level of insignificance.

Even if this project were not under the jurisdiction of the federal government, CEQA was patterned after the National Environmental Policy Act and the pertinent federal regulations. Therefore, to ignore the reality that the destruction of an archaeological site, including the destructive process of archaeological excavations, is a significant impact seems counter to the spirit and intent of CEQA.

California State University, Los Angeles 9 – Response

The commenter is correct in noting that a reasonable and good faith effort should be made to protect and preserve sites, but is incorrect to say that the significant impact of data recovery excavation was ignored. A reasonable and good faith effort was made to prevent the destruction of significant sites on the property (e.g., CA-ORA-710 will be preserved by capping), but it was deemed infeasible to save CA-ORA-711. As stated in Section 21083.2 (c) of CEQA, "*to the extent that unique archaeological resources are not preserved in place or are not left in an undisturbed state, mitigation measures shall be required...*" Further, CEQA allows excavation as mitigation for archaeological resources per Section 21083.2 (d). As stated in the Draft Revised Subsequent EIR, impacts to archaeological site CA-ORA-711 will be mitigated through data recovery and therefore impacts would not be significant. The remainder of the sites on the property were considered not significant, but a qualified archaeologist will still monitor grading of those sites (see M 10-4 on page 4.10-19 of the Draft Revised Subsequent EIR).

All data recovery work at the site will be guided by a research design that follows the Office of Historic Preservation (OHP) Guidelines for Archaeological Research Designs, and is approved by the USACE and SHPO. The subsequent report documenting the excavation will follow the OHP Archaeological Resource Management Reports (ARMR) guidelines.

California State University, Los Angeles 10 – Comment

According to CEQA: When archaeological resources are involved, avoidance, or preservation in an undisturbed state is the preferable course of action. Section 21083.2 then provides that preservation may include:

a. Planning construction to avoid archaeological sites
b. Deeding sites into permanent conservation easements
c. Capping or covering sites with a layer of soil before building on the sites.
d. Planning parks, greenspace, or other open space to incorporate archaeological sites.

When avoidance is possible, then data recovery excavation may be the only feasible mitigation measure.

California State University, Los Angeles 10 – Response

Please see Section 3.2.4 (California State University, Los Angeles 9 – Response) of this Response to Comments document.

California State University, Los Angeles 11 – Comment

According to CEQA, data recovery is the last resort after the lead agency considers all of the above preservation methods and determines that they are not possible or feasible. With the exception of CA-ORA-710 (but the EIR also implies that the site may be impacted – see above) the only mitigation measures that have been considered for the remaining sites to be impacted by the proposed project are data recovery excavation, or worse yet, grading with monitoring.

California State University, Los Angeles 11 – Response

Please see Section 3.2.4 (California State University, Los Angeles 9 – Response) of this Response to Comments document.

California State University, Los Angeles 12 – Comment

Based on the above comments, the DEIR is inadequate in that (1) There is not sufficient information to support the determinations that all of the sites to be impacted by the project (except two) are not significant/important. (2) The DEIR fails to provide documentation that the CEQA recommended preservation alternatives to the total destruction of six of the seven archaeological sites to be impacted by the proposed project have been considered. The developer should be required to conduct a good faith examination of the feasibility of the preservation measures. They should be encouraged to incorporate one or more of the preservation measures and include the preservation plan in the EIR. If the determination is that none of the preservation measures are possible or feasible, the justification for this determination and documentation that serious consideration was given to preservation methods should be included in the EIR, (3) Grading and monitoring is not adequate mitigation for the destruction of a significant archaeological site.

If it is determined that data recovery excavation and destruction of the sites is the only feasible option, the investigations should be guided by a research design that follows the California Office of Historic Preservation Guidelines for Archaeological Research Designs (Preservation Planning Bulletin No. 5, February 1991. Dept. of Parks and Recreation, Office of Historic Preservation). The report documenting the excavations should follow the Office of Historic Guidelines for Archaeological Resource Management Reports (Preservation Planning Bulletin No. 5, December 1989).

California State University, Los Angeles 12 – Response

Please see Section 3.2.4 (California State University, Los Angeles 9 – Response) of this Response to Comments document.

3.2.5 South Coast Air Quality Management District

Mike A. Nazemi, June 7, 2002

SCAQMD 1 – Comment

The South Coast Air quality Management District (AQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final Environmental Impact Report.

Pursuant to Public Resources Code Section 21092.5, please provide the AQMD with written responses to all comments contained herein prior to the certification of the Final Environmental Impact Report. The AQMD would be happy to work with the Lead Agency to address these issues and any other questions that may arise. Please contact Charles Blankson, PhD., Transportation Specialist – CEQA Section, at (909) 396-3304 if you have any questions regarding these comments.

SCAQMD 1 – Response

Comment noted. The South Coast Air Quality Management District (SCAQMD) has been provided with a copy of this Response to Comments document.

SCAQMD 2 – Comment

Project Size: In the Public Notice announcing the availability of the DRSEIR, it is stated that the proposed project will occupy an area measuring 229.2 acres and approximately 71 percent of this, or 158.6 acres will be devoted to open space. In the Project Summary in the DRSEIR on page 1-3, it is stated that the proposed project will occupy 222 acres and 70 percent or 155.1 acres will be devoted to open space. It is not clear from the above statements whether the project area is 229.2 acres or 222 acres? Please provide accurate information on the size of the project area since it has implications for grading emissions and subsequently air quality.

SCAQMD 2 – Response

The project size stated in the Draft Revised Subsequent EIR of 222 acres is correct. The Public Notice incorrectly stated the project as 229.2 acres.

SCAQMD 3 – Comment

Emissions Inventory: In table 4.6.2 on page 4.6-7 of the DRSEIR, emissions data are provided for the years 2000 and 2010. While the 2010 forecasts are the same as those reported in the SCAQMD Final 1997 AQMP, the 2000 data is different. See Table B-6 on page III-B of Appendix III of the SCAQMD Final 1997 AQMP. Please correct the discrepancy.

SCAQMD 3 – Response

The year 2000 data in Table 4.6.2 represent an update of those reported in the 1997 AQMP. The year 2000 data represent "actual" emissions reported by the California Air Resources Board for the air basin in the most recent "2000 California Air Quality Almanac." The updated almanac emissions inventory was believed to be more accurate than the AQMP forecasts prepared several years previously.

SCAQMD 4 – Comment

URBEMIS2001: It is reported in Appendix G of the DSEIR that the lead agency used URBEMIS7G to calculate project emissions. There are two points to be noted about this. The first is that both Appendix G and the SDEIR limit the discussion on the construction activity impacts to the fugitive dust and PM_{10} emissions. PM_{10} emissions are reported to be less than the PM_{10} significance threshold. However, as noted on page 4.6-12 of the DRSEIR, construction also entails the use of internal combustion engines and on-road and off-road mobile, semi-mobile and other diesel-powered equipment which generate emissions of NO_x, CO and also PM_{10}. There are also ROG emissions from paints and other architectural coatings. The lead agency fails to mention that the URBEMIS7G output table shows very large ROG construction emissions. At 1,171.19 pounds per day during the Summer, these are very significant emissions. The lead agency needs to address these high ROG emissions and propose measures to reduce them to less than the significance threshold in the Final SEIR. The second point is that URBEMIS2001 is currently available on ARB Webpage and has replaced URBEMIS7G as the model of choice and should be used to estimate project emissions. The lead agency is therefore encouraged to use URBEMIS200 [sic] *which uses current emission factors and therefore reflects project emissions more accurately. In discussing the proposed project's air quality impacts, construction and operational emissions as well as the corresponding significance thresholds should be presented in the main text of the Final SEIR. If construction ROG emissions still exceed the significance threshold, the lead agency should propose mitigation measures accordingly.*

SCAQMD 4 – Response

The algorithm that calculates ROG emissions from paints and coatings in the URBEMIS7G model has a "bug" that grossly distorts the likely daily emissions. The current VOC limit for architectural coatings is 100 grams/liter, or about 0.8 pounds/ gallon. The model estimate of 1,171.19 lbs/day would suggest that there is a daily application of almost 1,500 gallons of paint. Painting 299 homes in the project would occur over many days or even months. Extrapolation of this daily estimate over an extended project phasing would predict the use of tens of thousands of gallons of paint (hundreds of gallons per home). This model output clearly is incorrect. At 0.8 lbs/gallon, the application of 93.75 gallons of paint would create 75 lbs/day of VOC emissions, (SCAQMD threshold) or the paint needed for one to two homes per day is consistent with the probable phasing of the proposed development. VOCs from the application of paint may approach, but not likely exceed, the construction activity emissions significance threshold.

The URBEMIS2001 version of the model was not available when the calculations were initially performed. The result from the "new" model are reasonably identical from the older version. Because of a higher percentage of SUVs in the travel fleet than previously estimated, and because the emissions standards are less stringent on these vehicles, the project-related emissions increase, but remain at less than significant as follows (lbs/day):

	ROG	NOx	CO	PM-10	SOx
URBEMIS7G (Ver 5.1.0)	38.3	41.0	278.0	25.7	0.0
URBEMIS2001° (Ver 6.2.2)	50.0	45.4	504.2	26.4	0.0
SCAQMD Threshold	55	55	550	150	150

° = 75% auto, 10% light truck/SUV, 10% heavy SUV, 2% med-truck, 1% lite-heavy truck, 1% bus, 1% motorcycle; Year = 2003.

Source: Giroux & Associates, 2002

The updated calculations above do not change any conclusions regarding impact (in)significance of the proposed project.

SCAQMD 5 – Comment

Screening Tables: The lead agency used the Screening Table in the SCAQMD 193 CEQA Air Quality Handbook (Table 6-2) to determine that construction-related equipment combustion emissions from the project will not be significant. See discussion on page 4.6-12 of the DRSEIR. Please note that although the screening tables were developed by the AQMD, the AQMD no longer supports the use of these tables in determining the significance of project emissions. This is because the mobile source emission factors used in computing the tables are from an old version of the California Air Resources Board EMFAC model.

SCAQMD 5 – Response

The construction-related equipment combustion emissions procedures have not changed from when the SCAQMD Handbook Screening Tables for Construction (Table 6-2) were developed. If anything, equipment and on-road vehicles are "cleaner" now than in 1993 when the tables were developed. If the tables were accurate for Conditions in 1993, and if the proposed project is determined to be less than significant under 1993 conditions, the project will be less than significant under current criteria with an even larger margin of safety.

3.2.6 Southern California Association of Governments

Jeffrey M. Smith, May 7, 2002

SCAG 1 – Comment

Thank you for submitting the Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows to SCAG for review and comment. As areawide [sic] *clearinghouse for regionally significant projects, SCAG reviews the consistency of local plans, projects and programs with regional plans. This activity is based on SCAG's responsibilities as a regional planning organization pursuant to state and federal laws and regulations. Guidance provided by these reviews is intended to assist local agencies and project sponsors to take actions that contribute to the attainment of regional goals and policies.*

We have reviewed the Saddleback Meadows, and have determined that the proposed Project is not regionally significant per SCAG Intergovernmental Review (IGR) Criteria and California Environmental Quality Act (CEQA) Guidelines (Section 15208). The proposed project is not a residential development of more than 500 units. Therefore, the proposed Project does not warrant comments at this time. Should there be a change in the scope of the proposed Project, we would appreciate the opportunity to review and comment at that time.

A description of the proposed Project was published in SCAG's April 30, 2002 Intergovernmental Review Clearinghouse Report for public review and comment.

The project title and SCAG Clearinghouse number should be used in all correspondence with SCAG concerning this Project. Correspondence should be sent to the attention of the attention of the Clearinghouse Coordinator. If you have any questions, please contact me at (213) 236-1867. Thank you.

SCAG 1 – Response

The comment has been received and noted. No response is required.

3.2.7 Transportation Corridor Agencies

Macie Cleary-Milan, June 10, 2002

Transportation Corridor Agencies 1 – Comment

Thank you for forwarding the Draft Environmental Impact Report No. 566 for the proposed Saddleback Meadows Project. The Transportation Corridor Agencies (TCA) has reviewed the above-subject draft environmental document and would like to make the following comment for your review:

The DEIR identifies the intersection of Portola Parkway and the FTC-N as being impacted. The DEIR states, "The addition of one southbound left turn lane at the intersection of Portola Parkway (NS) at Foothill Transportation Corridor (EW) would be required for 2005 condition." Mitigation measure M 5-5 specifies that the project shall pay its fair share funding of this improvement. The fair share funding amount agreed to by the TCA must be submitted prior to the issuance of any building permits for the project.

Transportation Corridor Agencies 1 – Response

Comment noted. The mitigation measure M 5-5 has been amended to reflect this comment. Please see Section 2.0 of this Response to Comments document.

3.2.8 Orange County Fire Authority

Gene F. Begnell, June 6, 2002

OCFA 1 – Comment

Thank you for the opportunity to comment on the Draft EIR for the Saddleback Meadows project. In response to our review, we would like to offer the following:

Page 4.12-1, Section 4.12.1, Second paragraph. "61 fire stations" should read "59 fire stations.

Page 4.12-1, Section 4.12.1, Third paragraph, Third bullet. Remove "only available from a medic van" from the sentence. OCFA provides paramedic service both paramedic assessment and full paramedic services through a number of configurations in addition to the medic vans.

Page 4.12-2, Table 4.12.1, Fire Station Locations. Several things are wrong with this table.

- *Fire Station 18 is 4.2 miles from the project, not 1.5. The response time to the project for FS18 would be calculated at 8 minutes and 40 second using an average of 35 mph and 90 seconds of call processing and turnout time.*
- *Fire Station 16 is located 3.5 miles from the project and would calculate at 9 minutes and 30 seconds using the same formula as above with a two minute time period added for the volunteer personnel to get to the fire station. This station does NOT have paramedics or full time firefighters. It is staffed with volunteer firefighters only.*
- *Fire Station 45 is located 5.3 miles away with a response time calculation of 10 minutes and 30 seconds.*
- *Additionally, Fire Station 54 is located 2.8 miles from the project, with a response time calculation of 6 minutes and 20 seconds.*
- *Fire Station 31 is located 3.7 miles away with a response time of 7 minutes and 50 seconds. This is the closest paramedic unit to the project.*

Page 4.12-2, Third paragraph. Change "average response time of 6 minutes" to "average response time of nine minutes".

Page 4.12-2, Forth [sic] *paragraph. Replace the last sentence, "At this location three firefighters are on duty staffing either a paramedci* [sic] *assessment unit or a brush engine." With "At this location, 20 volunteer firefighters staff the engine when called upon to do so."*

Page 4.12-3. First paragraph, last sentence. Should read 7 firefighters rather than 8 firefighters.

OCFA 1 – Response

Comments noted. Section 4.12 of the Draft Revised Subsequent EIR has been amended to reflect these comments. Please see Section 2.0 of this Response to Comments document.

OCFA 2 – Comment

Page 4.12-9. Add new condition SC12-16. Secured Fire Protection Agreement. "Prior to grading, the applicant shall enter into a Secured Fire Protection Agreement with the OCFA. The reason for the timing this agreement is that the service needs for the project increases at the point of grading and continues to increase as the project is built. Service agreements will need to be in place at this time.

OCFA 2 – Response

Comment noted. An additional Standard County Condition has been added to reflect this comment. Please see Section 2.0 of this Response to Comments document.

OCFA 3 – Comment

As noted in Section 4.12.3, Cumulative Impact, the seven related projects in this area may have an effect on the service delivery within the area. Additional staffing and/or equipment may be needed to meet this demand. This issue will be addressed within the Secured Fire Protection Agreement.

OCFA 3 – Response

Comment noted. Section 4.12.3 has been amended to reflect this comment. Please see Section 2.0 of this Response to Comments document. However, this would not change the conclusions included in the Draft Revised Subsequent EIR that as related projects would be individually subject to protection and safety measures as required by the Orange County Fire Authority, no cumulative impacts would occur.

OCFA 4 – Comment

Page 5-9, Alternatives, Alternative 2 – No Project Alternative, this project would have many issues with fuel modification both "onsite" and "offsite."

OCFA 4 – Response

Comment noted. As stated in Section 5.4.2 of the Draft Revised Subsequent EIR, Alternative 2 – No Project Alternative would result in greater fire protection impacts as compared to the proposed project.

OCFA 5 – Comment

Page 5-38 [sic], *Alternatives, Alternative 6 – 44/178 Alternative. It should be noted that the layout of the "Development Area" does not allow for secondary access for emergency vehicles and may require the project to acquire additional easements or other mitigation measures to insure that adequate access to the project is provided.*

OCFA 5 – Response

Comment noted. Section 5.4.6 and Table 5.7 has been amended to reflect this comment. Please see Section 2.0 of this Response to Comments document.

OCFA 6 – Comment

The project area is within the designated Special Fire Protection Area and is as a result a significant wildfire risk. These risks will require special mitigation measures in accordance with OCFA standards. All other standard conditions of development including access will also be applicable to the proposed project.

OCFA 6 – Response

Comment noted. The Draft Revised Subsequent EIR includes Project Design Features, Standard County Conditions, and a mitigation measure to ensure impacts from the potential wildfire risk would be less than significant.

3.2.9 Trabuco Canyon Water District

Bruce Boner, May 8, 2002

TCWD 1 – Comment

Trabuco Canyon Water District (District) is in receipt of the Draft Revised Subsequent Environmental Impact Report No. 566 (DEIR 566) for the above captioned project (Project). Based upon our review of the document, the following comments are being submitted to the County of Orange (County) with regard to the project and the environmental proceedings being undertaken by the County with respect to the Project. Please note that the District reserves the right to provide or submit additional or supplemental comments relative to the DEIR566 and other or further documents provided or furnished by the County with respect to the Project or the environmental proceedings undertaken by the County with respect to the Project during the review and/or public hearing process for this matter.

TCWD 1 – Response

Comment noted. No additional response is required.

TCWD 2 – Comment

Request for Notices

Pursuant to the provisions of the California Environmental Quality Act (CEQA) and Public Resources Code Section 21091.1, the District hereby requests that copies of all notices and other documents mailed in relation to the above-referenced Project be furnished to the District. If there are any fees and charges required for the provision of such notices, please provide us with an invoice for such costs, and we will reimburse the appropriate County department. This request for notice specifically includes, but is not necessarily limited to, notices of all hearings, proposed actions to be taken with regard to the developmental process and, in particular, any Notice of Determination prepared, furnished or filed with regard to this Project.

TCWD 2 – Response

Comment noted. The Trabuco Canyon Water District has been provided with a copy of this Response to Comments document and will be provided with any additional notices with regard to the proposed project.

TCWD 3 – Comment

Background Information

Our general legal counsel, Bowie, Arneson, Wiled & Giannone, provided written comments on behalf of the District on August 11, 1997 and supplemental comments on October 17, 1997, photocopies of which are attached hereto.

We request that these letters be included as part of the record of proceedings for the environmental review of the Project, Including DEIR566.

TCWD 3 – Response

The above referenced letters were responded to in the Response to Comment for Subsequent EIR No. 566 (1997) and are included in Appendix A of this Response to Comments document.

TCWD 4 – Comment

As stated in the October 17, 1997 letter, there remains a "significant question as to whether the mitigation measure referenced includes and covers necessary master plan and in-tract wastewater facilities." We again request that mitigation monitoring language, as required by Public Resources Code Section 21081(a)(1) and Section 21081.6, be incorporated within the final environmental impact report prepared for the Project.

Trabuco Canyon Water District further states that the District's Rules and Regulations require improvement agreements to be entered into in order for the District to approve tract maps and for the District to provide water and wastewater service to any property within its boundaries. The District previously requested of California Quartet to undertake negotiations relative to entering new improvement agreements relative to the Project. No response has been received by the District.

TCWD 4 – Response

Comment noted. Please see Section 2.0 of this Response to Comments document regarding the additional mitigation measures.

TCWD 6 – Comment

In addition to the above, a Sub-Area Master Plan must be prepared and financed by the developer to define needed facility improvements which include:

> *Water: Pump stations, reservoir, pressure reducing valves and pipelines.*
> *Sewer: Local collection lines only. The project has already purchased regional wastewater collection, treatment and capacity.*

All fees and capacity charges must be reevaluated following completion of the Sub-Area Master Plan.

TCWD 6 – Response

See mitigation measures M 16-1 (Section 4.16) and M 17-1 (Section 4.17) included in the Draft Revised Subsequent EIR.

3.2.10 City of Lake Forest

Gayle Ackerman, May 29, 2002

City of Lake Forest 1 – Comment

The City of Lake Forest has received the Draft Environmental Impact Report for the Saddleback Meadows development. Public Works staff has reviewed the Water Quality Technical Report, Appendix E and Traffic Study, Appendix F of the EIR and offers the attached comments. Development Services staff has reviewed the body of the EIR and offers the following comments;

City of Lake Forest 1 – Response

Comment noted. No additional response is required.

City of Lake Forest 2 – Comment

Section 3.7 and Table 3-1 discuss related projects. Please confirm project 3, Los Angeles Athletic Club is the name of the self-storage facility located on the corner of Marguerite Parkway and El Toro Road. In addition, the Gateway Commercial Center Project located on the corner of Portola Parkway and El Toro Road, within the City of Lake Forest, should be considered in the EIR. Please see City staff for information on the approved project.

City of Lake Forest 2– Response

Comment noted. Please see Section 2.0 of this Response to Comments document for clarifications to Table 3.1. However, these revisions did not change any conclusions included in the Draft Revised Subsequent EIR.

City of Lake Forest 3 – Comment

The applicant should be advised that the City of Lake Forest does not permit any off-site signage. Therefore, there shall be no advertising or directional signage placed within the city of Lake Forest or along streets within the City's jurisdiction.

City of Lake Forest 3 – Response

Comment noted. No off-site signage for the proposed project is proposed within the City of Lake Forest.

City of Lake Forest 4 – Comment

We would like to continue to receive information and documents on the project. Please send all further correspondence to myself, Ms. Gayle Ackerman, AICP, Director of Development Services at 2361 Lake Center Drive, Suite 100, Lake Forest, CA 92630, telephone number (949) 461-3460.

City of Lake Forest 4 – Response

Comment noted. The City of Lake Forest will receive all future environmental documents and notices pertaining to the proposed project. No additional response is required.

City of Lake Forest 5 – Comment

I have reviewed the Conceptual Water Quality Management section of Saddleback Meadows EIR. The following are comments for the subject document.

In the Developed Conditions section of the Report, page 6, it states that "The permanent open space will be dedicated to the County of Orange as a regional park and will be maintained by the County or a third-party conservation group." The report indicated that this open space area is 88.2 acres.

- *Has the County of Orange agreed to accept the open space area and the maintenance responsibility associated with it?*
- *What impacts will this dedication have on the City if and when this area is annexed to the City of Lake Forest?*
- *Will the public have access to this regional park?*

Please respond to these questions and provide additional information to clarify this item and its impact on the City of Lake Forest.

City of Lake Forest 5 – Response

Section 2.3 of the Draft Revised Subsequent EIR described the details of the proposed open space, which includes approximately 83.25 acres as a natural resource protection area. This area would provide an opportunity to expand O'Neill Regional Park (page 2-16 of the Draft Revised Subsequent EIR).

The proposed project site is not within the City of Lake Forest's sphere of influence and there are no plans at this time to annex any portion of the site to the City. It would therefore be speculative to assume annexation and discuss potential impacts to the City.

City of Lake Forest 6 – Comment

In the Developed Conditions section of the Report, Page 6, states that "Only lots 1 through 37 connect directly to an existing storm drain facility in El Toro Road". Please provide all required Hydrology and Hydraulic backup information to show that the existing facility has enough capacity to accommodate this portion of the development. Furthermore, provide detail information on the watershed that contributes to this existing facility on El Toro Road and the down stream impacts of this development.

City of Lake Forest 6 – Response

Project watershed drainage was discussed in Section 4.3 and Appendix D of the Draft Revised Subsequent EIR, which include all necessary hydrologic data for the proposed project. The water quality analysis was included in Section 4.4 and Appendix E of the Draft Revised Subsequent EIR.

City of Lake Forest 7– Comment

Section 7 entitled "Monitoring, Inspection and Maintenance, page 12, Subsection (g) entitled "Common Area Catch Basin Inspection", the inspection and power wash of the screen for the stormceptor should be performed more than once per year. In fact, the first few years after completion of this project, the inspection rate should be 3-4 times per year, or after a sizeable rainstorm. This rate of inspection will be needed until such time as the newly planted vegetation/ landscaping begin to contribute to the reduction of erosion. After that, the rate may be reduced to 2-3 times per year to allow for continuous and proper clean screens for all stormceptors.

City of Lake Forest 7 – Response

As stated in PDF 4-16 included in the Draft Revised Subsequent EIR, structural BMPs (such as the stormceptors) will be maintained for effectiveness and a detailed plan for maintenance, inspection and for assessing effectiveness will be included in the project's final SWPPP and the WQMP (PDF 4-17). These plans will be prepared and approved by the applicable County departments and regional jurisdictions.

City of Lake Forest 8 – Comment

Same section as stated in item 3 above, page 12, subsection (h) entitled "Street Sweeping Private Streets and Parking Lots". Please be more specific in regards to statement "This procedure will be intensified around October 15th of each year…" In other words, is the street sweeping required twice a week or more? The term "intensified" needs to be clearly defined.

City of Lake Forest 8 – Response

"Intensified" is defined to mean an increase above the weekly basis, dependent on site conditions. As stated above, a detailed plan for maintenance will be included in the project's final SWPPP and WQMP.

City of Lake Forest 9 – Comment

75% of this area ultimately drains to Aliso Creek, which is an impaired water body and is under an enforcement action (California Water Code Section 13225) from the San Diego Regional Water Quality Control Board. What specific measures are to be undertaken by this development to eliminate pollutant runoff from entering the curb and gutter as required by the NPDES permit and in support of the enforcement action.

City of Lake Forest 9 – Response

Please see Section 4.4 of the Draft Revised Subsequent EIR for a discussion of detailed stormwater water quality runoff mitigation measures, including by not limited to the following: PDF 4-1, PDF 4-2 PDF 4-3, PDF 4-13, PDF 4-14, PDF 4-16, PDF 4-17, SC 4-1, SC 4-2, SC 4-3, SC 4-4. Please also see Section 3.3.8 (Saddleback Canyons Conservancy 4 – Response) of this Response to Comments document.

City of Lake Forest 10 – Comment

We have reviewed the Saddleback Meadows Traffic Report prepared by Urban Crossroads for the County of Orange. The following comments are for the subject document.

The following intersections are STOP sign controlled and should be analyzed utilizing the 2000 HCM: Santiago Canyon Rd./Modjeska Canyon Rd., Santiago Canyon Rd./Ridgeline Rd. and Santiago Canyon Rd./Live Oak Canyon Rd. The intersection analyses Tables should be updated to reflect the delay/LOS for each of these intersections under each scenario which was analyzed.

City of Lake Forest 10 – Response

Use of the 2000 HCM is used as a general guidance for traffic analysis. All intersections in the Saddleback Meadows Traffic Study were analyzed using the required Intersection Capacity Utilization (ICU) methodology, based on the County of Orange guidelines. The ICU approach is a planning methodology that expresses the volume of traffic as a percentage of the overall intersection capacity and a more appropriate model to analyze traffic impacts associated with the proposed project. To compare the operations at these study area intersections for Year 2005 with and without project conditions, as well as Year 2025 with and without project conditions, the same intersection methodology was utilized. This approach enables the analyst to provide a comparison of intersection peak volume-to-capacity relationships for different conditions. In effect, this methodology assumes that traffic signals will be installed when warranted as the area develops.

City of Lake Forest 11 – Comment

Although the intersection of El Toro Rd./Live Oak Canyon Rd. does not meet a warrant for signalization under existing conditions, the HCM worksheets indicate that this intersection is currently operating at acceptable Levels of Service B during both the AM and PM peak hours. Therefore, further analyses should be completed to determine if signalization is needed based upon other factors such as accident data or safety concerns.

City of Lake Forest 11 – Response

The project traffic analysis completed for the proposed project indicates that a signal is warranted under existing conditions based on the existing peak hour intersection turning movements.

Additional warrant issues should be explored by the County of Orange and City of Lake Forest prior to programming this location for installation of a traffic signal.

City of Lake Forest 12 – Comment

The volumes provided in the count data found in Appendix B do not match the northbound and southbound through volumes at the intersection of Portola Parkway and the Foothill Transportation Corridor Ramps under existing conditions as shown in Figures 2E and 2F. A discussion should be added on how the northbound and southbound existing through volumes were derived for the AM and PM peak hours.

City of Lake Forest 12 – Response

The intersection of Portola Parkway and the Foothill Transportation Corridor is considered an urban interchange. In effect, an urban interchange combines the movements of two intersection locations (the northbound and southbound ramps) into one intersection. The movements presented in Appendix F of the Draft Revised Subsequent EIR do in fact reflect the volumes presented on Exhibit 2-E and 2-F. Due to the configuration of the intersection, some counts actually include multiple movements. For example, the A.M. peak hour northbound through movement count volumes of 1,548 vehicles actually includes the northbound left turn movement of 478 vehicles. The actual A.M. peak hour northbound through movement is 1,070 (1548-478). Exhibits 2-E and 2-F present the actual turning movement counts.

City of Lake Forest 13 – Comment

On Table 2-2. the Level of Service at Portola Parkway/Glenn Ranch Road should be "B" and not "A."

City of Lake Forest 13 – Response

The peak hour Intersection Capacity Utilization (ICU) value of 0.62 presented on Table 2-2 (and Table 4.5.1) is consistent with results presented in Appendix F of the Draft Revised Subsequent EIR. The commenter is correct that this value should have been listed on Table 2-2 (and Table 4.5.1) with Level of Service of "B." The intersection would continue to operate at an acceptable level of service (LOS). Please see Section 2.0 of this Response to Comments document.

City of Lake Forest 14 – Comment

The peak hour project volumes for the AM inbound and PM outbound movements at the project access point on El Toro Road, as shown in Exhibits 3-C and 3-D, do not equate to the projected trip generation provided in Table 3-2. The Figures and intersection analyses worksheets should be revised to reflect the current numbers.

City of Lake Forest 14 – Response

The trip generation values presented in Table 3-2 in Appendix F of the Draft Revised Subsequent EIR are consistent with the project trip generation results shown on Exhibits 3-C and 3-D. For presentation purposes, the trip generation values included in Table 3-2 were rounded to the nearest 5 for all peak hour trips and the nearest 10 for all daily trips. This rounding explains the variation between Table 3-2 and Exhibits 3-C and 3-E.

City of Lake Forest 15 – Comment

Table 3-5 should be revised to reflect the Level of Service on each road segment based upon the roadway capacity values found in Table 2-1.

City of Lake Forest 15 – Response

Table 3-5 in Appendix F of the Draft Revised Subsequent EIR is not intended to provide a roadway capacity analysis. As noted on page 3-22 of Appendix F, Table 3-5 presents a summary of the average daily traffic volumes on Santiago Canyon Road.

City of Lake Forest 16 – Comment

On Table 4-4 the following Levels of Service should be corrected to reflect to following Levels of Service:

El Toro/Valley Vista Way – PM peak hour – LOS B
Saddleback Ranch/Glenn Ranch – PM peak hour – LOS B
Portola Parkway/El Toro – AM peak hour – LOS D
Portola Parkway/El Toro – PM peak hour – LOS C

City of Lake Forest 16 – Response

Comment noted. Please see Section 2.0 of this Response to Comments document for an updated Table 4-4 (Table 4.5.8), which has been corrected for three of these four items. The Saddleback Ranch/Glenn Ranch intersection was reported correctly as LOS A. The analysis conclusions remain unchanged.

City of Lake Forest 17 – Comment

It is unclear as to who is responsible for the Year 2005 improvement (Southbound Left Turn Lane) required at the study intersection of Portola Parkway/Foothill Transportation Corridor. This should be indicated in the study.

City of Lake Forest 17 – Response

This improvement is already accommodated by the overall physical design of the interchange. Project participation in the improvement is addressed in the following mitigation measure included in Section 4.5 of the Draft Revised Subsequent EIR:

M 5-5 The project shall pay its fair share of the improvement of the following intersections: Portola Parkway at Glenn Ranch Road, Portola Parkway at Foothill Transportation Corridor (FTC), and the Portola Parkway at El Toro Road.

The project traffic analysis indicates that the following improvements are needed to serve long-range future (Year 2025) traffic conditions with or without the proposed project:

- Portola Parkway (NS) at Glenn Ranch Road (EW):
  - Signal modification to provide northbound right turn overlap phase
- Portola Parkway (NS) at Foothill Transportation Corridor (EW):
  - Add one northbound through travel lane
  - Add one southbound left turn lane
  - Add one southbound through travel lane
- Portola Parkway (NS) at El Toro Road (EW):
  - Add one southbound through travel lane
  - Add one eastbound left turn lane
  - Signal modification to provide southbound right turn overlap phase

City of Lake Forest 18 – Comment

Table 4-6 should be corrected. The study intersection of El Toro Rd./Valley Vista Way should have a LOS value of E instead of D.

City of Lake Forest 18 – Response

Comment noted. Please see Section 2.0 of this Response to Comments document, for an updated Table 4-6 (Table 4.5.9), which has been corrected. The analysis conclusions remain unchanged.

City of Lake Forest 19 – Comment

A discussion/table should be added to the traffic study regarding the project's impacts at each study intersection where the Level of Service is unacceptable and the project increases the ICU value, and where the intersection's operation is degraded to an unacceptable operation with the project. In addition, the proposed improvements, which would mitigate

the project's impacts, should be shown along with additional improvements which are needed without the project for Year 2025 conditions. Responsibility of the improvements should also be provided.

City of Lake Forest 19 – Response

The County of Orange utilizes a procedure for determination of the project contribution, which focuses on changes in the Intersection Capacity Utilization (ICU) between existing conditions, future no-project conditions, and future with-project conditions. The distinction between new and existing traffic performance is a key point in this analysis. Table 3.2, below summarizes the fair share calculations for 2025 conditions.

Table 3.2
Mitigation Measure (M 5-5) Fair Share Calculations

Intersection Location	Peak Hour	Existing ICU	2025 No Project ICU	2025 With Project ICU	2025 With Project Mitigation ICU	Baseline (ICU)	Total Future Traffic Share (ICU)	Project Traffic Share (ICU)	Project Fair Share (%)
Portola Pkwy. (NS) at:									
• Glenn Ranch Rd. (EW)	A.M.	0.62	0.93	0.96	0.80	0.62	0.34	0.03	**8.8%**
	P.M.	0.50	1.03	1.07	0.85	0.50	0.57	0.04	7.0%
• Foothill Trans. Corridor (EW)	A.M.	0.54	0.77	0.77	0.67	0.54	0.23	-	0.0%
	P.M.	0.79	1.05	1.06	0.64	0.79	0.27	0.01	**3.7%**
• El Toro Rd. (EW)	A.M.	0.75	1.14	1.15	0.88	0.75	0.40	0.01	**2.5%**
	P.M.	0.65	0.95	0.95	0.70	0.65	0.30	-	0.0%

Source: Urban Crossroads, 2002

The baseline traffic share is a function of the existing ICU, the future with project ICU, and the ICU after mitigation. If the ICU after mitigation is acceptable, then all future (new) traffic should contribute equally to the improvement. This is the case for the three intersections shown on Table 3.2, above.

The project contributions to future improvement needs at these intersections range from 2.5 percent at Portola Parkway/El Toro Road to 8.8 percent at Portola Parkway/Glenn Ranch Road.

City of Lake Forest 20 – Comment

Peak hour traffic volumes for some improvements under the Year 2025 without the project scenario are decreasing when compared to volumes under the Year 2025 without the project scenario. The following intersections should be reviewed and changes made to the Figures and ICU worksheets or an explanation provided on why volumes are decreasing in the year 2025.

Santiago Canyon/Modjeska Canyon
El Toro/Live Oak Canyon
El Toro/Valley Vista
Saddleback Ranch/Glenn Ranch
Portola Pkwy/Glenn Ranch
Portola Pkwy/El Toro
Santiago Canyon/Ridgeline
El Toro/Ridgeline
El Toro/Glenn Ranch
Marguerite Parkway/El Toro
Portola Pkwy/Trans. Corr.

City of Lake Forest 20 – Response

As discussed in the Traffic Study (Appendix F of the Draft Revised Subsequent EIR), the 2005 traffic conditions were developed based on an annual background growth rate of three percent over a four-year time period (2001 to 2005). The 2005 traffic conditions also include all known project development such as Live Oak Plaza and the Saddle Creek/Saddle Crest development. Future 2025 traffic conditions were developed based on the latest OCTA traffic model forecasts contained in the Orange County Transportation Analysis Model (OCTAM 3.1) and the Irvine Transportation Analysis Model (ITAM 3.01).

In all cases the overall intersection traffic volumes show a substantial traffic volume increase for future 2025 conditions over 2005 conditions. However, individual turning movements may be lower in the projections for 2025 in some cases. This can occur as land uses change and additional network segments are improved in the circulation system.

City of Lake Forest 21 – Comment

Appendix J contains traffic signal warrants for the intersections of Santiago Canyon Rd./Modjeska Canyon Rd., Santiago Canyon Rd./Ridgeline and El Toro Rd./Live Oak Canyon Road under a variety of analyses and conditions. The body of the report does not discuss why traffic signal warrants were applied or when (under what time-frame) the signal may be required.

City of Lake Forest 21 – Response

Based on the County of Orange guidelines for traffic analysis, all intersections in the Saddleback Meadows Traffic Study were analyzed using the required Intersection Capacity Utilization (ICU) methodology. The ICU approach is a planning methodology that expresses the volume of traffic as

a percentage of the overall intersection capacity. To compare the operations at these study area intersections for Year 2005 with and without project conditions, as well as Year 2025 with and without project conditions, the same intersection methodology was utilized. This approach enables the analyst to provide a comparison of intersection peak volume-to-capacity relationships for different conditions. In effect, this methodology assumes that traffic signals will be installed when warranted as the area develops.

City of Lake Forest 22 – Comment

There is an existing bike path/trail, which runs along the eastside and parallel with El Toro Road. The main project access will intersect this bike path/trail. Provisions should be provided for signing the bike path/trail with the proper controls.

City of Lake Forest 22 – Response

Section 4.5.4 of the Draft Revised Subsequent EIR included a Standard County Condition to ensure that the bike lane along El Toro Road in the project area would meet County requirements (see SC 5-5).

City of Lake Forest 23 – Comment

There is a discrepancy in the trip generation provided in a letter dated October 17, 2001 to Mr. Pike Oliver, California Quarter LTD, from Mr. Bill Lawson, Urban Crossroads, Inc. regarding "Alternative Development Scenarios" for the Saddleback Meadows Alternatives. This letter should be revised so the trip generation data provided in the letter reflects the trip generation information indicated in Table 2 of the aforementioned letter.

City of Lake Forest 23 – Response

The trip generation rates contained in the Draft Revised Subsequent EIR, Appendix F (Traffic Study) are correct.

3.2.11 City of Mission Viejo

Charles E. Wilson, May 30, 2002

City of Mission Viejo 1 – Comment

Thank you for the opportunity to review and comment on Zone Change ZC98-3 and Area Plan AP98-2 for Saddleback Meadows (aka Bridlewood) in the County of Orange. Of particular interest to the City of Mission Viejo are the transportation-related components of the Draft Revised Subsequent Environmental Impact Report (EIR 566) for the Saddleback Meadows project filed with the County of Orange. The City's comments are as follows:

1. *Project Trip Generation:*

   The project traffic study identifies a residential trip distribution assumption wherein twenty-five percent of the daily traffic would enter/leave the project site, using El Toro road north of the project entrance, and with twenty five percent continuing along Santiago Canyon Road. Page 3-5 of the project traffic study states that "trip distribution patterns for this study are consistent with previous traffic studies and were reviewed by the County staff prior to completion of this traffic analysis." The City of Mission Viejo continues to believe that the 25% assignment of traffic to El Toro Road, north of the project access, is high. The City of Mission Viejo recommends that the Draft EIR provide narrative discussion which explains the land uses or destinations that exist or are proposed north of the project site, which would cause one-quarter of the project's daily trips to use this segment of El Toro Road, versus using El Toro Road south of the project site to access freeways, major highways, and public facilities. The assumptions used in the project trip distribution would have a resultant impact on analyzed intersections south of the project entrance to El Toro Road, and, in particular, would increase Intersection Capacity Utilization (ICU) calculations if a greater percentage of project trips were assigned southerly along El Toro Road.

City of Mission Viejo 1 – Response

The project distribution pattern is logical and consistent with other project traffic studies in the area. For example, the project trip distribution for Saddle Creek/Saddle Crest also indicates that 25 percent of the project traffic would be assigned north of El Toro Road.

Exhibit 2-D (Figure 4.5.3) included in the Draft Revised Subsequent EIR, indicates that the existing daily traffic volumes on El Toro Road north of Live Oak Canyon Road range from 5,300 to 5,700 vehicles per day. Existing average daily traffic volumes on El Toro Road south of the proposed project range from 8,400 to 28,700 daily vehicles. The traffic volumes on Santiago Canyon Road north of Live Oak Canyon Road represent approximately 18 percent to 63 percent of the daily traffic volumes on El Toro Road south of the proposed project site. The project traffic distribution pattern is therefore consistent with the relative magnitude of existing traffic activity in the Trabuco Canyon area.

North of the project site, El Toro Road becomes Santiago Canyon Road and continues to an interchange with the Eastern Transportation Corridor (SR-241). Santiago Canyon Road also extends into the City of Orange where it becomes Chapman Avenue. Chapman Avenue connects with the Costa Mesa Freeway (SR-55) and continues westerly to the City of Garden Grove. East of the Costa Mesa Freeway, the Santiago Canyon Road/Chapman Avenue corridor provides direct access from the project to Santiago Canyon College, Irvine Regional Park, numerous City of Orange commercial centers, and the Chapman Medical Center. The Santiago Canyon Road/Chapman Avenue corridor therefore provides access to many destinations, freeways, major highways, and public facilities without toll charges. Utilization of this corridor by at least 20 percent of the project traffic is to be expected.

The County apologizes for the miscommunication regarding the commenter's request for a copy of the Draft Revised Subsequent EIR. However, it should be noted that copies of the document were available at area libraries (see Section 1.0 of this Response to Comments document) and at the County of Orange. It should be noted that no comments were presented at the Planning Commission hearing on July 16, 2002 and furthermore, no comments were received as of August 8, 2002. The Center for Biodiversity will still have the opportunity to submit comments on the project at the scheduled Planning Commission hearing on August 28, 2002.

City of Mission Viejo 2 – Comment

2. *El Toro/Glenn Ranch Road Intersection:*

   The El Toro/Glenn Ranch Road intersection is a Measure M intersection that is fully assigned to the City of Mission Viejo. In compliance with countywide Measure M requirements, the City of Mission Viejo must maintain this intersection at a Level of service "D" or better.

The project traffic study identifies that the El Toro/Glenn Ranch Road intersection will maintain a Level of service A through project buildout in Year 2005, but that the intersection is projected to operate at a Level of Service "E" in the pm peak period in Year 2025 buildout, with or without the project. The project traffic study further identifies that the completion of additional El Toro Road improvements, specifically, the addition of through lanes that increases El Toro Road's lane capacity from a two-lane to a four-lane facility, will allow this intersection to operate at a Level of Service "C" in the pm peak period, thus maintaining consistency with Measure M Growth Management Program level of service standards.

The City of Mission Viejo recognizes that the implementation of additional El Toro Road improvements is not necessitated by the Saddleback Meadows project, since project buildout, and associated levels of service standards, can be maintained at the El Toro/Glen Ranch Road intersection with existing improvements. In conjunction with Measure M Interjurisdictional Planning Forums, the City of Mission Viejo will monitor the operation of El Toro Road and will work with the County of Orange, to allow for the implementation of the additional El Toro Road lane improvements in advance of any failing intersection performance at the El Toro/Glenn Ranch Road intersection.

On behalf of the City of Mission Viejo, I thank you for your consideration of our comments. If you have any questions, please feel free to call Elaine Lister or me at (949) 470-3053.

City of Mission Viejo 2 – Response

As discussed above, future level-of-service issues at this intersection are projected to occur with or without the project. The project traffic contribution would be mitigated (please see Section 4.5 mitigation measure M 5-5, of the Draft Revised Subsequent EIR).

3.2.12 City of Rancho Santa Margarita

Kathleen Haton, May 16, 2002

City of RSM 1 – Comment

Thank you for the opportunity to review and comment on the Zone Change (ZC) 98-3 and Area Plan (AP) 98-2 for the proposed Saddleback Meadows development. It is our understanding that the existing zoning allows for 705 manufactured homes, 1.7 acres of commercial, and 130 acres of open space. The proposed development will include 299 single-family detached dwelling units and 155 acres of open space.

The City of Rancho Santa Margarita has reviewed the Zone Change and Area Plan and has the following comments:

1. *Saddleback Meadows Rural Character Statement Page 6 (graphics): It is not clear from which direction the views from offsite are from.*

City of RSM 1 – Response

The comment refers to the Area Plan for the Saddleback Meadows project and does not pertain to the EIR. However, the illustrations are intended to be conceptual and are not from a specific location.

City of RSM 2 – Comment

Page 6-1: Grading Concept: Contour grading is discussed but there are not any graphics that show where cut and fill areas will occur.

City of RSM 2 – Response

The level of detail requested by the commenter is not required and the comment refers to the Area Plan for the Saddleback Meadows project. However, the extensive amount of remedial grading required will result in cut operations to stabilize existing landslide areas. Fill operations would be associated with the upper limits of areas. Please see Section 4.2 and Appendix C of the Draft Revised Subsequent EIR for a more detailed discussion of grading/landform alteration proposed for the site.

City of RSM 3 – Comment

Please include the City of Rancho Santa Margarita on your mailing list for review of any documents related to this project.

If you have any questions or concerns about our comments, please call me at (949) 635-1800.

City of RSM 3 – Response

Comment noted.

3.3 ORGANIZATIONS/BUSINESS LETTERS

The following organizations/business commented on the Draft Revised Subsequent EIR:

- The Center for Biological Diversity
- Connor, Blake & Griffin, LLP (representing the Vedanta Society of Southern California)
- The Gas Company
- Juaneno Band of Mission Indians
- Mark R. McGuire
- Orange County Regional Recreational Trails Advisory Committee
- Rural Canyon Conservation Fund
- Saddleback Canyons Conservancy
- Sierra Club
- Trails 4 All
- Terrell Watt, AICP (representing National Audubon Society, Endangered Habitats League and Rural Canyons Conservation Fund)

3.3.1 The Center for Biological Diversity

Kassie Siegel, June 24, 2002

TCBD 1 – Comment

These comments are submitted on behalf of the Center for Biological Diversity ("Center"), a non-profit public interest membership organization dedicated to the preservation of native species and their habitats. On June 11, 2001 our Legal Assistant Susie Roe called the County of Orange Environmental Planning and Services Division requesting a copy of the EIR for the Saddleback Meadows Project, SCH No. 1996121072. Ms. Roe was told by staff that the EIR could only be sent via the authority of Mr. Bill Grieman, then on vacation. Ms. Roe left a voicemail for Mr. Grieman, who never returned the call. Today. June 24th, Ms Roe called Mr. Grieman to check on the status of the request for the EIR, and was told that he was unsure when and if it could be sent because the comment period is now over. This is outrageous. First, the comment period is not "over" as it is not yet the close of business. Second, the Center has a right to review the EIR regardless of whether the comment period is "over" or not. Third, the County of Orange Environmental Planning and Services Division should not be incapable of sending out a copy of an EIR while one staff member is on vacation. The actions of the County staff have deprived the Center, our members and staff, and members of the public with an interest in protecting the biological resources of the Saddleback Meadows project site with an opportunity to comment on this project.

From reviewing the comments of the Sierra Club and others, it seems apparent that the Draft Supplemental EIR is deeply flawed, the environmental impacts of this project are unacceptable, and the mitigation proposed is entirely inadequate. The Center will submit further comments once we have received the EIR. The Center requests that the comment period be extended due to the County's failure to timely release a copy of the EIR upon request. Should the deadline not be extended, the Center will submit comments and strongly urges the county to consider them and respond fully in the final EIR. As you know, the CEQA Amendments of 1994 make it clear that an organization exhausts its administrative remedies (and therefore preserves its rights to judicial review of the project approval) by submitting comments at any time prior to the certification of the EIR. Pub. Resources Code § 2177(a)(b); Galante Vineyards v. Monterey Peninsula Water Management District (6th Dist. 1997), 60 Cal. App.4th 1117-1121.

Thank you for your consideration of these comments. Please contact me at (909) 659-6053 x. 302 should you have any questions.

TCBD 1 – Response

The County apologizes for the miscommunication regarding the commenter's request for a copy of the Draft Revised Subsequent EIR. However, it should also be noted that copies of the document were available at area libraries (see Section 1.0 of this Response to Comments document) and at the County of Orange Planning and Development Services Department. In addition, the commenter will have the opportunity to submit verbal and written comments and raise concerns or issues at the scheduled Planning Commission hearings (July 16 and August 28, 2002). Please see Section 3.3.9 of this Response to Comments document for responses to comments from the Sierra Club.

3.3.2 Connor, Blake & Griffin, LLP (representing the Vedanta Society of Southern California)

Edward M. Connor, June 9, 2002

Connor 1 – Comment

On behalf of the Vedanta Society of Southern California ("Vedanta"), we hereby submit our comments on "Draft Revised Subsequent Environmental Impact Report No. 566" ("DRSEIR 566" or the "DRSEIR") for the 299-unit single family housing project (the 299-Unit Project") proposed for the Saddleback Meadows property (the "Property"). Vedanta's specific comments on DRSEIR 566 are set forth in Exhibit "A" attached hereto and are incorporated herein by reference. We request that each of the comments set forth in Exhibit "A" receives full and complete response pursuant to section 15099 of the State CEQA Guidelines.

Connor 1 – Response

Comment noted, all written comments submitted on the Draft Revised Subsequent EIR are included in this Response to Comments document.

Connor 2 – Comment

We are particularly disappointed that, after having described the "44/178 Alternative" in detail in the letter which we sent you on August 31, 2001, in response to the Notice of Preparation DRSEIR 566, California Quartet's Consultant, HDR, has chosen to address a radically different alternative under the guise of the "44/178 Alternative." In our letter, we clearly described the "44/178 Alternative" as dividing the Property into a 44-acre "Development Parcel" and a 178-acre "Conservation Parcel." We stressed that the "Conservation Parcel" was to be permanently preserved in its natural condition as undeveloped and undisturbed open space, and that no development activities (e.g., remedial grading) were to be permitted outside of the 44-acres of the "Development Parcel." However, in the DRSEIR, the "44/178 Alternative" is inexplicably preserved as a 127-unit single family housing project.

As was disclosed by California Quartet's representatives during Vedanta's settlement negotiations with them and various County officials in 1998, a 127-unit alternative would require a development area of at least 75 acres and would entail massive remedial grading and a 50-foot loeffel wall that would destroy virtually all of the vernal ponds, oak trees, and sensitive habitat areas that would otherwise be preserved by the 44-acre development footprint that is the hallmark of the "44/178 Alternative" proposed by Vedanta.

We consider the unfair and distorted presentation of the "44/178 Alternative" that is contained in DRSEIR 566 to be so deceptive and misleading that it requires the DRSEIR to be redrafted and recirculated. Section 15088.5(a)(3) of the State CEQA Guidelines has clearly been triggered in this regard. Moreover, given the conclusory and deficient nature of many of the other sections of DRSEIR 566, recirculation is also required under section 15088.5(a)(4) of the State CEQA Guidelines.

What is required is a fair and honest evaluation of the merits of the "44/178 Alternative." As the County's own staff members proved in developing the 65-unit "Mathews Alternative" in April 1998, the "44/178 Alternative" would provide California Quartet with a feasible – albeit lower density – housing project which would preserve and protect the environmentally-sensitive resources on this unique "wildlife corridor" property. Regrettably, the County has so far allowed California Quartet's consultant to evade the state law requirements which mandate that this project alternative be adequately analyzed and reported on in the DRSEIR. We cannot believe the County has allowed this blatant misconduct to occur and we hope that you will rectify this immediately.

In the interest of providing the decision-makers of the County if Orange and the members of the public with a complete and non-deceptive evaluation of the project alternatives, environmental impacts, and feasible mitigation measures associated with the 299-Unit Project, we respectfully request that DRSEIR 566 be revised and recirculated before any public hearings are scheduled on this matter.

Connor 2 – Response

As stated in Section 5.1 of the Draft Revised Subsequent EIR, the range of alternatives required within an EIR is governed by the "rule of reason" which requires an EIR to include only those alternatives necessary to permit a reasoned choice. The alternative analysis included in the Draft Revised Subsequent EIR discussed eight alternatives to the proposed project. These alternatives were based on criteria pursuant to CEQA including the potential to reduce or eliminate significant impacts, and attain most of the project objectives. Further, the discussion of alternatives need not be exhaustive, and there is no requirement within CEQA that specific alternatives advocated by an individual or interest group be included. As stated in the *CEQA Guidelines* Section 15126.6(a) "An EIR need not consider every conceivable alternative to a project."

Nevertheless, Alternative 6 (44/178 Alternative) as described in the Draft Revised Subsequent EIR reflects the Memorandum of Understanding executed by the applicant and the Saddleback Lands Conservancy on November 3, 1998. The 65-unit alternative as suggested by the commenter was found by County staff in 1998 to not be economically feasible due to remedial grading requirements and was therefore, not included in the EIR. The remedial grading and fuel modification requirements of this alternative would extend into the area to be encompassed within the 178-acre conservation parcel regardless of whether 65 or 127 lots were included within the 44-acre development parcel.

The alternative analysis included in the Draft Revised Subsequent EIR meets the requirements of CEQA; therefore no revisions or re-circulation of the Draft Revised Subsequent EIR is required.

Connor 3 – Comment

1. *Draft Revised Subsequent Environmental Impact Report No. 566 ("DRSEIR 566" or the "DRSEIR") fails to identify, analyze, and mitigate the impacts associated with the failure of the 299-unit single family*

housing project (the 299-Unit Project") to comply and be consistent with the goals, objectives, components, regulations, and guidelines of the Foothill/Trabuco Specific Plan (the "FTSP"). At page 4.1-12, the DRSEIR simply concludes that the 299-Unit Project "would be in substantial compliance with or consistent with the previously approved and Recorded Map 10692" and, therefore, as a result of the fact that the 705-unit manufactured housing project (the "705-Unit Project") described in Recorded Map 10692 was exempted – due to bankruptcy code concerns – from compliance with the FTSP, the 299-Unit Project should likewise be exempted. However, the DRSEIR fails to provide any legal or factual support for this conclusion. The FTSP provides an exemption for the development of the Saddleback Meadows property (the "Property") only if it is developed in accordance with the Recorded Map 10692 – i.e., if the 705-Unit Project is developed. If any proposed development "deviates" from the Recorded Map 10692, an amendment to the FTSP is required to "(1) determine an appropriate density cap for the property; (2) establish new development regulations for the Bridlewood Residential District; and (3) be consistent with all of the provisions of the Specific Plan." (FTSP at page III-20, para. 3.2(b).) By seeking to create an entirely new exemption from the FTSP for the Property, and by submitting an entirely new subdivision map for the Property, the developer has acknowledged that the 299-Unit Project deviates from Recorded Map 10692 and is not covered by the exemption from the FTSP provided for the 705-Unit Project. DRSEIR 566 incorrectly concludes that the 299-Unit Project is exempt from the FTSP because it "would be in substantial compliance with or consistent with previously approved and Recorded Map 10692." If the DRSEIR seeks to rely on this patently false conclusion, some attempt must be made to support it by providing a good faith comparison to the 705-Unit Project and the 299-Unit Project to prove that they are the same project. If they are essentially the same project, then the environmental analysis set forth in the DRSEIR is fatally flawed because the 299-Unit Project is portrayed as involving far fewer impacts.

Connor 3 – Response

The F/TSP established a specific "residential district" for the Saddleback Meadows property. The principal that either the approved map moves forward or an alternative is considered. The F/TSP never ruled out consideration of an alternative to the 705-lot plan, particularly that which would represent a lessening of environmental impact as compared to the recorded map. Section 3.2 "Special Provisions" of the F/TSP states: "Any development proposal which deviates from the approved Saddleback Meadows Planned Community zoning and Recorded Tract 10692 *and which cannot be found to be in substantial compliance* with these approvals shall require a Specific Plan amendment" (emphasis added). As stated in Section 4.1.2 of the Draft Revised Subsequent EIR, the proposed project would be in substantial compliance with the recorded map with respect to residential gross density and providing for the provision of a substantial increase in open space and the presence of a wildlife corridor as outlined in the F/TSP. Therefore the proposed project is in compliance with the residential district provisions of the F/TSP. Substantial compliance does not require that the proposed project (299 residential units) result in the same impacts as the recorded map (705 units). Many of the impacts associated with the 705-unit project were eliminated or substantially reduced due to compliance with the conditions of the Biological Opinion (BO)

(included as Appendix I.4 of the Draft Revised Subsequent EIR), changes in the existing environment, and reduction of trip generation and other impacts directly correlated with the number of residential units.

Connor 4 – Comment

2. *DRSEIR fails to identify, analyze, and mitigate the impacts – including the adverse precedent – associated with the creation of an entirely new exemption for the Property from the goals, objectives, components, regulations, and guidelines of the FTSP. If a new exemption is to be created, the DRSEIR should (a) identify all other projects, if any, which have received a similar exemption from the FTSP and (b) identify each of the goals, objectives, components, regulations, and guidelines of the FTSP with which the 299-Unit Project is inconsistent, but will nonetheless be exempted from, including, but are not limited to, (a) the goals and objectives relating to rural character and resource preservation; (b) the resources overlay component relating to wildlife corridors, oak woodlands, tree management/preservation, and streambeds; (c) Bridlewood Residential District Regulations; (d) landscaping regulations; (e) grading standards relating to the maximum height of manufactured slopes and the 70% "natural open space" requirement; (f) area plan submittal requirements; (g) grading, drainage and site planning guidelines; and (h) architectural guidelines.*

Connor 4 – Response

As stated in Section 3.3.2 (Connor 3 – Response) above, the proposed project is in substantial compliance with the approved map does not propose development beyond the boundaries of the previously approved impact area, and would not result in the " . . . creation of an entirely new exemption for the property from the goals, objectives, components, regulations and guidelines of the F/TSP." The proposed project is not an exemption from the Bridlewood Residential District. The proposed zone change would amend the F/TSP Bridlewood District.

Connor 5 – Comment

3. *DRSEIR 566 fails to properly identify, analyze, and mitigate the land use compatibility impacts of the 299-Unit Project on the Ramakrishna Monastery and St. Michael's Abbey. At page 4.1-13, under the heading "Level of Significance Before Mitigation," DRSEIR 566 concludes that "due to a natural space buffer, implementation of the proposed project would not result in significant land use compatibility impacts to the Rama Krishna Monastery or St. Michael's Abbey." However, at page 19, under the heading "Significant Impacts of the Project Prior to Mitigation," "Addendum PA980103 to Certified Final Subsequent Environmental Impact Report 566" ("Addendum No. 1") earlier concluded that the 299-Unit Project "would result in significant land use compatibility impacts to O'Neill Regional Park, the Ramakrishna Monastery, St. Michael's Abbey, and surrounding residential communities." Moreover, despite the incorporation of the identical "Project Design Features" which are proposed under DRSEIR 566, "Draft Environmental Impact Report No. 561" ("DEIR 561") concluded that the very similar 318-unit single family housing project which it analyzed would have a significant, unavoidable, adverse impact on land use*

compatibility with O'Neill Regional Park, the Ramakrishna Monastery, and St. Michael's Abbey. (DEIR 561 at page 8-1.) The DRSEIR fails to explain or reconcile these clearly inconsistent and contradictory conclusions.

Connor 5 – Response

It should be noted that Draft EIR 561 was not certified and therefore, its preliminary findings are subject to revision based on refined and/or updated analysis. As stated in Section 9.0 of the Draft Revised Subsequent EIR, as a result of changes in project design and the construction of other developments within the F/TSP, all unavoidable adverse impacts (with the exception of cumulative air quality) included in previous documentation have been eliminated. The proposed project includes additional buffer space between the Abbey and the development (from a 300-foot natural open space buffer to a 1,200-foot buffer). This refinement was in response to specific suggestions from the Abbey.

In addition, the current proposed project includes a 2,000-foot natural open space buffer between the project development and the Rama Krishna Monastery. Although, the dimension of this buffer is the same as for the project evaluated in the previous environmental document (Subsequent EIR No. 566), the impact is no longer significant due to the reduction of units in the project and average lot sizes that are more than twice as large as those included in the project evaluated in the previous environmental document[1] (from 705 manufactured residential units to 299 single-family units). Therefore, no impacts with regard to land use would occur.

Connor 6 – Comment

4. *DRSEIR 566 fails to properly identify, analyze, and mitigate the land use compatibility impacts of the 299-Unit Project on O'Neill Regional Park. At page 4.1-11, the DRSEIR concludes that the 299-Unit Project is "not incompatible" with O'Neill Regional Park. This conclusion is reached based on the fact that a portion of the Property is to be dedicated to the County of Orange (the "County") for incorporation into O'Neill Regional Park and that portion of the Property purportedly would cause O'Neill Regional Park to be "substantially buffered from the development by natural undisturbed, open space and topography." However, a comparison of the Open Space Plan for the 299-Unit Project (Figure 2.11) and any map or diagram indicating the surrounding property boundaries (e.g., Figure 4.1.2, 2.3, or 2.6) reveals that the 299-Unit Project abuts a significant portion of the property boundary shared by the Property and O'Neill Regional Park. Indeed, the 299-Unit Project will require grading and fuel modification activities to be conducted in a portion of O'Neill Regional Park. (See, e.g., Figure 4.2.5 (grading cannot conveniently stop at property boundary as indicated in Removal Area "C") and 4.12.1.) Hence, not only does the DRSEIR fail to provide any factual support for its conclusion that the 299-Unit Project is "not incompatible" with*

[1] *Residential units have been reduced from 705 to 299 and average lot sizes have increased from 3,900 square feet to about 7,000 square feet.*

O'Neill Regional Park, but it actually provides information demonstrating that this conclusion is obviously incorrect. Moreover, as noted in the previous paragraph, earlier environmental documents regarding the 299-Unit Project and the similar 318-Unit Project concluded that such projects did have significant land use compatibility impacts on O'Neill Regional Park, but DRSEIR 566 has not explained or reconciled these inconsistencies.

Connor 6 – Response

Land use compatibility is based on the long-term relationship between the proposed project and O'Neill Regional Park. Temporary construction impacts caused by grading are not considered a land use compatibility issue. Under existing conditions, a portion of the park abuts residential lots in the Hidden Ridge, Painted Trail and Rancho Santa Margarita residential projects (please refer to Figures 3.1 and 4.1.1 of the Draft Revised Subsequent EIR). This exposes park users to existing vistas of residential development. In addition, a portion of the park is operated as a private nursery.

The proposed project includes offsetting residential lots by 320 to 750 feet from the existing park boundary. Some lots are located at approximately 65 feet from the park boundary, but are 25 or more feet below a ridge and thus visually shielded from the park. Therefore, the proposed project would not be incompatible with the adjacent O'Neill Regional Park and no significant impacts would occur. No grading will occur in O'Neill Regional Park.

Please see Section 3.3.2 (Connor 8 – Response) of this Response to Comments document regarding fuel modification and potential grading encroachment.

Connor 7 – Comment

5. *DRSEIR 566 fails to properly identify, analyze, and mitigate any of the environmental impacts which would result if title and possession of a significant portion of O'Neill Regional Park were to revert back to Vedanta due to any construction or other activities associated with the 299-Unit Project. In 1974, Vedanta granted the approximately 245 acres located immediately to the south of the Property, and the west and southwest of the Monastery, to the County so that the land could be made a part of O'Neill Regional Park and be permanently maintained as open space. The grant of this land included several conditions subsequent pursuant to which the land would revert back to Vedanta in the event of a breach of any of those conditions. The conditions expressly prohibit any grading activities, the placement of any soils, and the removal of any trees, shrubs, or natural growth from the land gifted to the County. All of the grading maps in the DRSEIR attempt to show that no grading will be conducted in O'Neill Regional Park. For example, Figure 4.2.5 shows that when the limits of remedial grading—which generally trace the contours of the land and the outline of the geotechnical conditions which purportedly are to be remedied—reach the property line between the Property and O'Neill Regional Park, the limits of remedial grading miraculously make a sharp turn and follow precisely along the property line in order to stay out of O'Neill Regional Park. Clearly, this is not possible and, as currently designed, the 299-Unit Project requires certain grading – and also fuel-*

modification activities – to be conducted within the portion of O'Neill Regional Park which Vedanta gave to the County. Moreover, the 299-Unit Project provides for a storm drain to discharge into the natural drainage course which runs directly into O'Neill Regional Park. (See Figure 4.3.2.) Each of these constitutes a breach of the conditions subsequent to Vedanta's gift of land to the County and would cause such land to revert back to Vedanta. DRSEIR 566 should acknowledge his fact and identify, analyze, and mitigate the environmental impacts which would result therefrom. If the DRSEIR is going to continue to insist that no grading or other activities will be conducted within the O'Neill Regional Park, then DRSEIR 566 should provide an explanation of how grading and all other activities will be excluded from O'Neill Regional Park.

Connor 7 – Response

While the comment related to the remedial grading line for the proposed project is generally correct, the comment does not consider the opportunity to adjust the remedial grading line in response to site specific conditions. The remedial grading line shown in Figure 4.2.5 is located at the top of a back-cut into the development area. As such, the back-cut can be adjusted for short stretches in order to control its precise location and stay away from sensitive areas, such as O'Neill Regional Park. Adjacency to the area in question in the comment is an example of such a site-specific design.

The commenter is also correct regarding Figure 4.12.1 of the Draft Revised Subsequent EIR, which depicts off-site fuel modification. Figure 4.12.1 depicted the standard fuel modification of the Orange County Fire Authority (OCFA). However, the OCFA also allows alternate methods in response to site-specific conditions. A revised Figure 4.12.1 is included in Section 2.0 of this Response to Comments document and depicts the use of an alternative method (i.e., expansion of the 50-foot irrigated wet zone) to confine the fuel modification to the limits of the property.

As shown in Figure 4.3.1 in the Draft Revised Subsequent EIR, the project site currently drains towards O'Neill Regional Park. Post development hydrology would be in substantial conformance with existing hydrologic conditions and thus not result in a significant impact under CEQA. However, this would not constitute a breach of the conditions regarding gifting the land to the County, as it would not change the existing drainage conditions.

Connor 8 – Comment

6. *DRSEIR 566 fails to properly identify, analyze, and mitigate the land use compatibility impacts of the 299-Unit Project on all surrounding residential areas. At page 4.1-10, the DRSEIR states that the 299-Unit Project "has a lower gross density than the surrounding area projects." However, in reaching this conclusion, the DRSEIR 566 relies solely upon two nearby projects which are located outside the FTSP – i.e., Portola Hills and Hidden Hills/Hidden Ridge – while ignoring two nearby residential projects that are within the FTSP. (See Table 4.1.2.) DRSEIR 566 fails to acknowledge or analyze the fact that the "gross density" for the 299-Unit Project (1.3 dwelling units/acre) is double that of Santiago Canyon Estates (gross density*

of 0.66 dwelling units/acre) and four times that of the proposed Saddle Creek/Saddle Crest (gross density 0.33 dwelling units/acre.)

Connor 8 – Response

The commenter is correct in that gross density for that of Santiago Canyon Estates and the proposed Saddle Creek/Saddle Crest would be lower than that for the proposed project. As stated in Section 4.1.1 of the Draft Revised Subsequent EIR, density comparisons were made with two developments adjacent and closest to the proposed project: Hidden Hills/Hidden Ridge (which abuts the project site to the south) and Portola Hills (which is located west of the project site across El Toro Road). The existing density for the neighboring properties Portola Hills and Hidden Hills/Hidden Ridge, if applied to this site, would allow 666 dwelling units for the proposed project. The F/TSP zoning for the Upper Aliso Residential District to the north would allow 222 dwelling units, while the F/TSP zoning for the Trabuco Canyon Residential District to the east would allow 111 dwelling units.

The General Plan designates Saddleback Meadows and neighboring sites to the south and west as "Suburban Residential." Density allowed under this category ranges from 0.5 dwelling units/acre (du/ac) to 18 du/ac. The proposed project includes 1.4 du/ac. Neighboring property to the north and east are designated as "Rural Residential." Saddleback Meadows may be regarded as a rural transition area because of its location along a heavily traveled road (El Toro Road) and at the western edge of the F/TSP area. Thus, 299 units is a reasonable density for this location.

Connor 9 – Comment

7. *DRSEIR 566 fails to properly identify, analyze, and mitigate the impacts associated with the inconsistency between the 299-Unit Project and the Aliso Creek Corridor Specific Plan. At page 4.1-12, the DRSEIR concludes that the 299-Unit Project "would be in conformance with the Aliso Creek Corridor Specific Plan" and, therefore, makes no attempt to mitigate the impact of any inconsistency with such Specific Plan. However, at page 19, Addendum No. 1 concludes that the 299-Unit Project "would also conflict with policies of the Aliso Creek Corridor Specific Plan." DRSEIR 566 fails to explain or reconcile these inconsistent and contradictory conclusions.*

Connor 9 – Response

As stated in Section 4.1.2 of the Draft Revised Subsequent EIR, the Aliso Creek Corridor Specific Plan pre-dates both the F/TSP and Recorded Tract Map 10692 and sets land use goals, objectives and policies for a large regional planning area from the Cleveland National Forest to the Pacific Ocean. The F/TSP further refines these goals, objectives and policies to guide future development in the Foothill-Trabuco area. The proposed project would incorporate several aspects of the Aliso Creek Corridor Specific Plan (i.e., riparian preservation and habitat conductivity, Section 4.8) and

have also been included to reduce impacts to Aliso Creek and the surrounding area (i.e., proposed drain system to reduce sediment transport, Section 4.3).

Connor 10 – Comment

8. *DRSEIR 566 fails to identify, analyze, and mitigate the grading and other geophysical impacts associated with the 299-Unit Project. The impacts and mitigation measures which DRSEIR 566 fails to address, include, but are not limited to, the following:*

   a *The impacts which the grading activities for the 299-Unit Project will have on the Trabuco Canyon area and its residents based on how long it will take to complete the proposed grading. Although all previous environmental impact reports the County has prepared for the Property have likewise failed to fully address these impacts, they did, at least, concede in the "Geophysical Resources" subsection that, depending on the project, grading would take between 10 and 18 months to complete, based on an average daily grading quantity of 30,000 cubic yards. (See Addendum No. 1 at p. 21; "Final Subsequent Environmental Impact Report No. 566" ("FSEIR 566") at p. 4-22; DEIR 561 at p. 4-28.) The "Geophysical Resources" subsection of the DRSEIR, however, is strangely silent on this issue and the "Project Description" section (p. 2-16) now simply contains a single sentence and footnote stating that grading will require approximately 13 months to complete based on an average of 30,000 cubic yards per day and 21-work days per month. Not only is this estimate incorrect using the County's own numbers (a total of 9.25 million cubic yards of grading at an average of 30,000 cubic yard per day and 21-work days per month translates to 14.68 months of grading), but, as Vedanta and its consultants have repeatedly stated in connection with all previously proposed projects, an average of 30,000 cubic yards per day – especially for the remedial grading – is very unrealistic. Although 30,000 cubic yards per say may possibly be achieved for the 2.45 million cubic yards of conventional grading, a figure of 1,000 cubic yards per day is a much more reasonable assumption for the 6.8 million cubic yards of remedial grading that is proposed. Using these figures (and DRSEIR 566's estimate of 21-work days per month), grading would take longer than 36 months or 3 years to complete. The DRSEIR fails to justify its estimate regarding how long grading for the 299-Unit Project will take, and it also fails to address the impacts that conducting grading activities for that amount of time would have on Trabuco Canyon and its residents – including, but not limited to, the excessive noise, dust, and traffic delays associated with excavating and recompacting more than nine million cubic yards of soil which will remain exposed to the wind during dry seasons, and the rain during wet seasons, over the course of the several years it will take to complete all of the proposed rough grading.*

Connor 10 – Response

The commenter is correct, the grading is projected to take about 15 months, not the 13 months stated on page 2-16 of the Draft Revised Subsequent EIR. Please see Section 2.0 of this Response to Comments document. The *average* grading rate of 30,000 cubic yards per day is based on the geotechnical engineer's experience of similar projects and has been confirmed by a local grading firm

based on their experience on similar projects. No traffic delays are projected due to the grading operations. Actual grading production on any given day will vary over the course of the project; however, the average grading rate of 30,000 cubic yards per days can be sustained over the course of the project. Dust and noise issues were analyzed in Sections 4.6 and 4.7, respectively, of the Draft Revised Subsequent EIR.

Connor 11 – Comment

b *The impacts associated with the heavy ground water seepage into the excavations at the site which DRSEIR 566 anticipates will occur (p. 4.2-18 mitigation measure M 2-20), including, but not limited to (i) the impact of the discharge of collected groundwater seepage, (ii) the impact of the interruption in subsurface ground water flow on downstream wells, and (iii) the impacts of the presence of the deep water shear keys for buttress fills on the final groundwater conditions. The DRSEIR also fails to address whether there is a potential for surfacing of ground water behind the effective subsurface dam created by the shear key of the buttress fill.*

Connor 11 – Response

The comment is referred to the full discussion of mitigation (mitigation measure M 2-20) in Section 4.2 of the Draft Revised Subsequent EIR; which indicates that seepage will reach "...maximum discharge in two to five days...decreasing in volume with time... being less at higher site elevations as well as in cuts made in late in the year." Therefore, the discharge of collected groundwater seepage is expected to be minor over the course of the grading effort.

Connor 12 – Comment

c *The impact of buttress backcut failures. DRSEIR 566 projects a buttress backcut failure rate of 10 percent (See DRSEIR 566 at p. 4.2-20, mitigation measure M 2-34.) However, due to the subsurface conditions typified by landslides within landslides, this 10 percent estimate is overly optimistic. Moreover, the effect of backcut failures on upstream and asjacent properties, regardless of the percentage of failures, are not addressed.*

Connor 12 – Response

As noted in mitigation measure M 2-34 (page 4.2-20 of the Draft Revised Subsequent EIR), the ten percent back cut failure rate is a statistical probability and not site specific. The mitigation measure includes industry standards that would be employed to effectively reduce the risk of back cut failures and confine such failures to minor "pop outs" within the limits of grading.

Connor 13 – Comment

d *The impact of new soil stability problems which will be created by increasing the amount of water that is discharged into the Property's natural drainage courses and the ground water table. (As stated in the "Hydrology" and "Water Quality" subsections of DRSEIR 566 daily nuisance and storm water runoff will be discharged into the Property's natural drainage courses.) In particular, (i) the increased erosion that will occur in the Property's natural drainage courses during storm flows due to the fact that the weak alluvial soils which are present in those courses will have been softened by the daily nuisance runoff that will be discharged into such drainage courses, (ii) the weakened support for existing landslides which will also result from the discharge of daily nuisance runoff and increased storm water runoff into the Property's natural drainage courses, and (iii) the new instability problems which will be created by the ground water levels being raised by the infiltration of irrigation and other new sources of water.*

Connor 13 – Response

As noted in Section 4.3 of the Draft Revised Subsequent EIR, the property is currently subject to erosion as can be seen in the highly incised drainage courses that now characterize the property. The revegetation of the open space areas and the natural drainage courses as outlined in Section 4.8 Draft Revised Subsequent EIR would reduce or eliminate most of this erosion. The other two issues raised by the commenter have been considered by the geotechnical consultant and will be further analyzed in the final geotechnical report (Standard County Condition SC 2-1). However, to ensure compliance with these important issues an additional mitigation measures has been added. Please see Section 2.0 of this Response to Comments document.

Connor 14 – Comment

e *The special grading requirements which are necessary to perform the extremely deep fill that are proposed. Although the DRSEIR acknowledges that fill depths will exceed 50 feet and settlement associated with those fills of 4 to 6 inches can be expected (p. 4.2-20) mitigation measure M 2-33), fill depths of up to 130 feet will actually be required to construct the proposed shear keys for the buttress fills. Fills of such great depths require, inter alia, (i) additional evaluation that may necessitate compaction criteria well in excess of code minimums, (ii) special moisture conditioning of fill during compaction, and (iii) long-term settlement monitoring prior to building construction.*

Connor 14 – Response

Comment noted. Standard County Condition SC 2-1 in Section 4.2.4 of the Draft Revised Subsequent EIR requires the preparation of a final geotechnical report prior to issuance of grading permits, which would ensure compliance with the County's Grading Manual, soil compaction requirements. Additionally, mitigation measure M 2-16 specifies compaction requirements, and mitigation measure M 2-27 requires on-going testing and observation during construction.

Connor 15 – Comment

f *Imposing a 100 percent performance bond to cover the possibility of the developer's failure to complete the extremely large amount of conventional and remedial grading required for the 299-Unit Project.*

Connor 15 – Response

A 100 percent performance bond is a standard condition of obtaining a Grading Permit from the County of Orange. The bond would cover both remedial and mass grading for the proposed project.

Connor 16 – Comment

9. *DRSEIR 566 fails to properly identify, analyze, and mitigate the hydrology impacts associated with the 299-Unit Project. The impacts which the DRSEIR fails to address, include, but are not limited to, the impacts of discharging daily nuisance water runoff and increased storm water runoff into the natural drainage courses of the Property. The natural drainage courses of the Property are dry for a majority of the year (only receiving water during storms). However, the daily nuisance water runoff from the 299-Unit Project will cause the drainage courses to be wet year-round and, therefore, more susceptible to, inter alia, erosion. Moreover, the character of the water being dumped into the natural drainage courses will change from slower-moving water carrying soil and debris to faster-moving water that has less soil and debris and, therefore, is prone to picking up soil and debris. DRSEIR 566 acknowledges that, by increasing the flows in the Property's natural drainage courses, the 299-Unit Project will have erosion and sedimentation impacts, but the DRSEIR fails to address any of these impacts. Instead, any analysis of this issue is improperly deferred until after the certification of DRSEIR 566 – i.e., until a point in the approval process where the public is not permitted an opportunity to review and comment on that analysis, and the County is not required to respond to any public comments.*

Connor 16 – Response

Hydrology impacts have been addressed in both Sections 4.3 and 4.8 of the Draft Revised Subsequent EIR. The biological mitigation measures take into account the addition of nuisance flows and provides for a riparian habitat designed to thrive under the potentially year round flows, thus reducing the potential for increased erosion. In addition, the re-vegetation of the degraded portions of the property (which will remain in open space) will also result in reduced flows over that currently experienced on the project site. The project has been designed to provide more storm drain outlets than typically found in residential subdivisions. This will distribute flows to most of the natural drainages rather than concentrate runoff from the project in one or two of the natural drainages.

Connor 17 – Comment

10. *DRSEIR 566 fails to identify, analyze, or mitigate any of the water quality impacts associated with the 299-Unit Project because the entire "Water Quality" subsection of the DRSEIR is based upon a conceptual water quality management plan for a different project. At page 4.4-1, the DRSEIR states that its "Water Quality" subsection "summarizes the findings and conclusions of the Conceptual Water Quality Management Plan for Saddleback Meadows Proposed VTTM 15230 County of Orange, California" which is included in the DRSEIR as Appendix "E." However, as its complete title indicates, the "Conceptual Water Quality Management Plan for Saddleback Meadows Proposed VTTM 15230, Development Alternative for 283 Residential Home sites, County of Orange, CA" which is found in Appendix "E" was prepared to address a different project – i.e., the 283-unit single unit family housing project which is Alternative No. 8 in the DRSEIR. As such, the entire "Water Quality" subsection must be revised to correctly identify, analyze, and mitigate the water quality impacts of the 299-Unit Project as opposed to the 283-Unit Project which it currently addresses.*

Connor 17 – Response

The commenter is correct that the Conceptual Water Quality Management Plan included as Appendix E of the Draft Revised Subsequent EIR was for one of the project alternatives. The correct plan has been included as Appendix D of this Response to Comment document. However, Section 4.4 of the Draft Revised Subsequent EIR was developed based on a Water Quality Management Plan developed for the 299 proposed project.

Connor 18 – Comment

11. *Assuming arguendo that the "Water Quality" subsection of DRSEIR 566 did address the 299-Unit Project, such subsection nonetheless fails to fully and properly identify, analyze and mitigate the water quality impacts associated with the 299-Unit Project because, inter alia, it fails to fully describe how pollutants will be filtered from the daily nuisance and storm water runoff from the 299-Unit Project and what the impacts will be of discharging polluted runoff into the Property's natural drainage courses and O'Neill Regional Park, and the area's groundwater. The DRSEIR claims that a riverine system will be used to filter pollutants from the daily nuisance and storm water runoff from approximately 80 percent of the 299-Unit Project. (See, e.g., p. 4.4-13 at PDF 4-1.) In reliance on the riverine system, stormceptor filters will be installed on the storm drains serving the 20 percent of the Project which is located in the northeastern quadrant of the Property only. However, nowhere is it depicted or explained in DRSEIR 566 how flows from the 299-Unit Project will be directed into the riverine system. Indeed, Figure 4.3.2, entitled Proposed Drainage Improvements, shows that all of the runoff from the 299-Unit Project will be directed into the storm drain system and discharged into the Property's natural drainage courses, but the storm drains serving a majority of the 299-Unit Project will not have filters to reduce the amount of pollution and runoff. The DRSEIR also acknowledges that the riverine system is designed to accommodate low flows only, but it fails to explain how any flows that exceed the capacity of the riverine system will be filtered for pollutants given that*

the storm drains collecting runoff from 80 percent of the Project will not have filters installed due to the existence of the riverine system. Moreover, the DRSEIR acknowledges that the filters that will be installed will not trap bacterial indicators or toxic constituents. (DRSEIR 566 at p. 4.4-11.) Instead the DRSEIR relies upon 3,300 lineal feet of the Property's natural drainage courses to filter these pollutants. However, the DRSEIR does not in any way address the impacts that these pollutants will have on the Property's natural drainage courses – some of which flow into O'Neill Regional Park – and the area's groundwater.

Connor 18 – Response

Figure 4.3.2 of the Draft Revised Subsequent EIR depicts graphical representations of the storm drain system and is not intended to depict actual storm drain locations. As noted, the design of the riverine system is designed to accommodate low flows since it is the nuisance flows and the first flows of the rainy season that carry the predominant urban pollutants. High stage flows are generally free from pollutants and can bypass the riverine system. As stated in Section 4.3 of the Draft Revised Subsequent EIR, use of the riverine system and the stormceptors would remove the urban pollutants and result in less than significant impacts. Detailed design of the storm drain and water quality components will be accomplished as noted in the Standard County Conditions (SC 3-2 and SC 4-2).

Connor 19 – Comment

12. *DRSEIR 566 fails to properly identify, analyze, and mitigate the impacts the 299-Unit Project would have on the Natural Communities Conservation Plan ("NCCP") program and the County's ability to complete its Southern NCCP Subregion and to link the Southern and Central/Coastal NCCP Subregions. Previous environmental impact reports for the Property included four or more pages of text addressing the NCCP and the impacts of the proposed projects on the NCCP. (See, e.g., FSEIR 566 at pp. 4-127 – 4-130, 4-144; DEIR 561 at 99. 4-123 – 4-126, 4-139 – 4-140.) The DRSEIR, however, contains less than one page of very cursory discussion regarding the NCCP and it fails in any way to address the impacts of the 299-Unit Project on the NCCP and the County's NCCP planning efforts. Moreover, DRSEIR 566 fails to, inter alia, (i) acknowledge that the United States Fish and Wildlife Service and the California Department of Fish and Game (collectively, the "Wildlife Agencies") have repeatedly informed the County that the Property provides a critical habitat corridor/linkage necessary for the completion of the NCCP Southern Subregion and (ii) identify the findings which the NCCP requires to be made with respect to the impacts of the 299-Unit Project will have on the coastal sage scrub habitat located on the Property. The DRSEIR should be revised to include an appropriate and complete discussion of the impacts of the 299-Unit Project on the NCCP.*

Connor 19 – Response

Section 4.8 of the Draft Revised Subsequent EIR discusses the key issues of wildlife connectivity and preservation of significant resources (i.e., Riverside fairy shrimp, wetlands, coastal sage scrub and coast live oak woodland). The goals of the Natural Community Conservation Planning Program (NCCP) are discussed in Section 4.8.1. Please see Section 3.2.1 (USFWS/CDFG 4 – Response) of this Response to Comments document.

Connor 20 – Comment

13. *DRSEIR 566 fails to properly identify, analyze, and mitigate the impact of the 299-Unit Project on wildlife movement on the Property and throughout the NCCP Southern and Central/Coastal Subregions. The DRSEIR touts that the 299-Unit Project has been designed to incorporate a wildlife movement corridor that will permit wildlife to continue to travel safely across the Property. (See, e.g., DRSEIR 566 at p. 4.8-27.) However, the DRSEIR fails to acknowledge that the Wildlife Agencies have previously informed the County that the wildlife corridor proposed as part of the 299-Unit Project does not "retain appropriate topography and habitat to ensure the continued function of the wildlife movement corridor/linkage that exists on Saddleback Meadows." (October 29, 1998 Letter from the Wildlife Agencies to the Orange County Board of Supervisors.) As such, the DRSEIR needs to be revised to contain an analysis of the adequacy of the proposed wildlife movement corridor/linkage and the impact of failing to provide an adequate corridor/linkage.*

Connor 20 – Response

Please see Section 3.2.1 (USFWS/CDFG 4 – Response) of this Response to Comments document.

Connor 21 – Comment

14. *DRSEIR 566 fails to identify, analyze, and mitigate the biological resources impacts associated with the 299-Unit Project because, inter alia:*

    a *The DRSEIR fails to properly identify the sensitivity of the intermediate mariposa lily (calochortus weedii var intermedous) and based thereon erroneously concludes that there will be no significant impact of it requiring any mitigation. (See DRSEIR 566 at p. 4.8-21 and Appendix I.1 at p. 17). In Appendix I.1, the DRSEIR erroneously identifies the sensitivity of the intermediate mariposa lily as California Native Plant Society ("CNPS") List 4. (See Appendix I.1 at p. 9.) In the text, the DRSEIR correctly lists the intermediate mariposa lily as CNPS List 1B, but then proceeds to conclude that, due to its low sensitivity status, the impact of destroying all plants found on the Property is not significant. (See DRSEIR 566 at pp. 4.8-13, 4.8-21.) However, as explained in Appendix "C" to Appendix I..1 of the DRSEIR, the presence of intermediate mariposa lily on the CNPS List 1B means that it is "rare, threatened, or endangered in California and elsewhere and is eligible for state*

listing." Indeed, the only higher listing under the CNPS system is List 1A which includes only those plants that are presumed to be extinct. DRSEIR 566 needs to be revised to correct the inconsistency between its text and Appendix I.1 and, if it is going to maintain its conclusion that there will be no significant impacts on the intermediate mariposa lily, it need to provide facts to support such conclusion because, contrary to how the DRSEIR currently reads, the intermediate mariposa lily does not have a low sensitivity status.

Connor 21 – Response

Section 4.8 and Appendix I of the Draft Revised Subsequent EIR correctly identify the intermediate Mariposa lily as a CNPS list 1B species. However, the commenter is correct regarding an inconsistency as Table 2 of Appendix I.1 incorrectly identifies the species as a list 4 species.

Under CEQA, the Final EIR (which consists of the Draft EIR and the Response to Comments) is the primary document considered during approval or rejection of a project by the lead agency. Although impacts to this sensitive species were not assessed in the Draft EIR as being significant, due to the limited number of individuals impacted, an additional mitigation requirement has been added to the project in response to this and other comments. The applicant has agreed to transplant the potentially impacted bulbs of this species to appropriate open space areas on-site. Please see Section 2.0 of this Response to Comments document.

Connor 22 – Comment

b *The DRSEIR erroneously concludes that the 299-Unit Project will not have a significant impact on the federally-listed endangered Riverside fairy shrimp because the impacts to it will be mitigated to a level of insignificance by the creation of several ephemeral ponds on the Property. However, as the Biological Opinion on the Saddleback Meadows Residential Development Project found in Appendix I.4 states, at pages 19-20, creation of such ponds is experimental and has never been done successfully, especially with respect to the conditions found on the Property.*

Connor 22 – Response

The mitigation for the Riverside fairy shrimp was developed through extensive discussions with USFWS. Additionally, the biological consultant for the project has constructed several restoration sites in San Diego County that currently support Riverside fairy shrimp populations. Many of the known locations of Riverside fairy shrimp, including ponds on-site, occur in man-made ponds. The proposed mitigation basins will be designed to provide appropriate hydrological conditions necessary for the shrimp to persist. The ponds are being created at a greater than 2:1 mitigation ratio, resulting in a net long-term increase in fairy shrimp on-site. The proposed project also provides for a detailed ten-year monitoring program, as well as permanent management of open space on-site including existing ponds proposed for preservation. At the conclusion of the ten-year

monitoring period, the ponds as well as the open space will be managed and maintained by a third-party conservation group. Under existing conditions, that is with no active monitoring or maintenance, two of the ponds have been lost due to siltation or breaching with a third under constant repair by the rancher.

Connor 23 – Comment

c *Although one of the technical reports found in the appendices to the DRSEIR 566 acknowledges that the Property has been designated as critical habitat for the Riverside fairy shrimp and the coastal California gnatcatcher pursuant to the U.S. Endangered Species Act, the text of the DRSEIR fails to acknowledge this fact. Neither the text of DRSEIR 566, nor any of the appendices thereto, address in any way the significance of the designation.*

Connor 23 – Response

The Biological Opinion (BO) referenced and included as Appendix I.4 in the Draft Revised Subsequent EIR specifically addresses critical habitat for both the Riverside fairy shrimp and the coastal California gnatcatcher. As noted in Standard County Conditions SC 8-5 in Section 4.8.4 of the Draft Revised Subsequent EIR, the applicant is required to provide written proof that the activity complies with the Federal Endangered Species Act. SC 8-5 specifically states, "A BO issued by the USFWS shall be considered written proof." The BO issued for the proposed project provides that written proof.

Connor 24 – Comment

d *The DRSEIR fails to properly and adequately mitigate the impacts the 299-Unit Project will have by destroying the hundreds of acres of oak woodlands, vernal ponds, coastal sage scrub habitat, and other biotic communities on the Property which are home to sensitive, threatened, or endangered flora and fauna. The mitigation DRSEIR 566 offers regarding these impacts fall far below that which is required by law, inter alia, the FTSP, the NCCP, the state and federal endanger* [sic] *species legislation.*

Connor 24 – Response

The biological resources and impacts to those resources were discussed in Section 4.8 and detailed technical reports included as Appendix I of the Draft Revised Subsequent EIR. The proposed project has been subject to review of the regulatory agencies including CDFG, which issued a draft Streambed Alteration Agreement (1603) for the applicant's signature in December 2001; USFWS, which issued a final BO in October 2001; and the U.S. Army Corps of Engineers (USACE) as part of their processing of an Individual 404 Permit. The draft 1603 Permit is included in Appendix B of this Response to Comments document.

See also Section 3.2.1 (USFWS/CDFG comments/responses) of this Response to Comments document.

Connor 25 – Comment

15. *DRSEIR 566 fails to properly identify, analyze and mitigate the "Aesthetic/Visual" impacts associated with the 299-Unit Project. At page 4.9-22 through 4.9-23, the DRSEIR concludes that the 299-Unit Project will not have a significant aesthetic or visual impact prior to mitigation. However, at page 4-192, DEIR 561 concludes that, despite the use of many of the same contoured grading and viewshed screening techniques which are proposed for the 299-Unit Project, the 318-unit single family housing project which was the subject of DEIR 561 would nonetheless have unavoidable significant aesthetic and visual impacts (including night glare impacts) on the Ramakarishna Monastery, St. Michael's Abbey, and O'Neill Regional Park. DRSEIR 566 fails to explain and reconcile these inconsistent and conflicting conclusions.*

Connor 25 – Response

As noted above (Connor 5 – Response), Draft EIR 561 was not certified and therefore its preliminary findings are subject to revision based on refined and/or updated analysis. The state of the art of computer modeling has allowed a more sophisticated analysis of visual impact than was possible at the time Draft EIR 561 was prepared. The commenter is referred to Section 4.9 of the Draft Revised Subsequent EIR for the updated visual analysis provided for the proposed project.

Connor 26 – Comment

16. *DRSEIR 566 fails to fully and properly identify and analyze the importance of the archaeological sites found on the Property. At page 4.10-19, the DRSEIR concludes that archaeological site CA-ORA-711 is the only site on the Property which is deemed to be important or significant. However, at page 104, Addendum No. 1 concludes that there are a total of four archaeological sites on the Property which are deemed to be important or significant. Those sites are CA-ORA-710, CA-ORA-713, CA-ORA-715, and CA-ORA-1435H. DRSEIR 566 should have an analysis explaining and reconciling these inconsistent conclusions regarding the important of certain of the archaeological sites found on the Property.*

Connor 26 – Response

As stated in Appendix J of the Draft Revised Subsequent EIR, CA-ORA-1435H was deemed not eligible for testing per guidelines of the National Registrar of Historic Places, and CA-ORA-713 and CA-ORA-715 were determined to not be significant (see letter dated August 6, 2001 in Appendix J).

Site CA-ORA-710 will be covered and protected as part of a biological mitigation area within the project site (please see Project Design Feature PDF 10-1 on pages 4.10-15/4.10-16 of the Draft Revised Subsequent EIR).

Connor 27 – Comment

17. *DRSEIR 566 fails to identify, analyze, and mitigate the impacts associated with project "Hazards" as both the Initial Study and the Introduction to the DRSEIR (see [page I-4) indicated that it would. Indeed, the Initial Study identifies "Hazards" as one of six areas of potentially significant impacts which might result from the 299-Unit Project, but DRSEIR 566 fails to contain a section identifying and analyzing such impacts. All previous environmental documentation for the Property contained a separate section in which "Hazards" such as wildfire, emergency access, and wildlife interaction were all identified and analyzed. (See Addendum No. 1 at pp. 4-219 – 4-228.) Although the DRSEIR does address certain wildfire hazards and fuel modification requirements under the "Public Services – Fire Protection" subsection, it does not address any other hazards, such as the fact that the Project has only one main access road, which Addendum No. 1 identifies as an area of concern and which the Orange County Fire Authority proposed mitigation measures to specifically address. An analysis of the "Hazards" analyzed in the previous environmental documents for the Property should be conducted with respect to the 299-Unit Project.*

Connor 27 – Response

Section 4.12 of the Draft Revised Subsequent EIR includes an analysis of the appropriate hazards relevant to the proposed project, in the context of existing conditions. The Initial Study identified wildland fire as the only hazard for the proposed project (see Appendix A of the Draft Revised Subsequent EIR). The inconsistency in Section 1.4.2 of the Draft Revision Subsequent EIR is acknowledged. Please see Section 2.0 of this Response to Comments document regarding a revision to page 1-4 of the Draft Revised Subsequent EIR.

Connor 28 – Comment

18. *DRSEIR 566 fails to properly describe the "44/178 Alternative" as initially proposed by Vedanta in October 1998 and again in the comments Vedanta submitted regarding the Notice of Preparation (the "NOP") for the DRSEIR. As proposed by Vedanta, although the developer would be free to develop the project of its choice on the 44-acre "Development Parcel," the 178-acre "Conservation Parcel" would be left in its undisturbed natural state – i.e., no development activities of any kind would be conducted on such parcel, including, but not limited to, grading of any kind. However, as described in the DRSEIR, the "44/178 Alternative" allows for the development of 127 single-family housing units on the "Development Parcel" which, as Vedanta indicated in its comments on the NOP, can only be developed on such Parcel if a substantial amount of remedial grading and other construction activities are conducted on the "Conservation Parcel." Indeed, shortly after Vedanta proposed the "44/178 Alternative" in October 1998, the developer conceded that, in order to develop 127 single-family housing units on the "Development Parcel" – which is not contemplated under the "44/178 Alternative" as proposed by Vedanta. Therefore, a new analysis of the "44/178 Alternative" should be conducted based upon a proper description of the alternative which identifies a range of units which can safely be accommodated within the "Development Parcel." This analysis should include, inter alia, an analysis of the geotechnical conditions to determine the greatest number of units*

that can be developed on the 44-acre "Development Parcel" with the least amount of rough grading. The grading study is of critical importance because it will not only address the economic feasibility of the "44/178 Alternative," but also determines the nature and extent of the environmental resources which can be spared from the bulldozer's blade. As requested in Vedanta's comments on the NOP, this analysis should consider two versions of the "44/178 Alternative," one in which the developer is required to dedicate the 178-acre "Conservation Parcel" to the County (which has been the County's standard practice on all other major development projects approved during the past 25 years) and another in which the "Conservation Parcel" is purchased by a governmental entity (such as the United States Fish and Wildlife Service and the California Department of Fish and Game), a private entity, private person (s), or any combination thereof.

Connor 28 – Response

Please see Section 3.3.2 (Connor 2 – Response) of this Response to Comments document regarding alternatives.

Connor 29 – Comment

19. *DRSEIR 566 fails to provide sufficient factual information about each of the proposed alternatives to allow for meaningful evaluation, analysis, and comparison with the 299-Unit Project. The DRSEIR provides very little factual information regarding the proposed alternatives and their environmental impacts. Instead, DRSEIR 566 simply makes very general and conclusory statements regarding whether each impact will be greater or less than the 299-Unit Project and each of the other alternatives. Very little factual information is provided which permits differential impacts to be quantified and meaningfully analyzed. For example, no information is provided to allow the number of acres of oak trees, vernal ponds, coastal sage scrub, or any of the other biological resources which are affected under each alternative to be compared with the 299-Unit Project. Similarly, the extent to which each of the alternatives comply with the various goals, objectives, components, regulations, and guidelines of the FTSP is not provided so as to allow a comparison of the alternatives with the 299-Unit Project. Indeed, the alternatives analysis in DRSEIR 566 is almost entirely devoid of any factual information which would support its conclusions regarding the relative impacts of the 299-Unit Project and each of the alternatives. Accordingly, an entirely new analysis of each of the alternatives is necessary to provide the factual information required to conduct a meaningful evaluation, analysis, and comparison of the alternatives with the 299-Unit Project. (Note: Although the DRSEIR provides grading quantities for many of the alternatives, it curiously fails to state a remedial grading quantity for the "44/178 Alternative" while nonetheless conceding that remedial grading will be required for that alternative.)*

Connor 29 – Response

The discussion of alternatives need not be exhaustive. As stated in the *CEQA Guidelines* Section 15126.6(d), "the EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. A matrix displaying the major

characteristics and significant environmental effects of each alternative may be used to summarize the comparison." The alternative analysis included in Section 5.0 of the Draft Revised Subsequent EIR included the appropriate level of detail per the requirements of CEQA; therefore no revisions or new alternative analysis would be required.

Connor 30 – Comment

20. *DRSEIR 566 fails to provide any factual information which supports its conclusion that, except for the "No Project Alternative," Alternative No. 8 is the environmentally superior alternative. Alternative 8 is a "reduced density alternative" which simply lowers the number of single family dwelling units by 16 units – i.e., from 299 down to 283. In reaching this conclusion, the DRSEIR provides absolutely no explanation or factual support for how a 283-unit single family housing project – which has virtually the identical environmental impacts as a 299-Unit Project – could possibly be an environmentally superior alternative to Alternative 4 (a 100-unit single family housing project which leaves 85% of the Property as natural open space), Alternative 6 (the "44/178 Alternative") or Alternative 7 (the "Acquisition Alternative" in which the entire property is purchased by a governmental entity, private entity, or private person (s) for preservation as permanent open space).*

Connor 30 – Response

As stated in Section 5.1 of the Draft Revised Subsequent EIR, the *CEQA Guidelines* require an EIR to "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives" (*CEQA Guidelines* Section 15126.6(a)).

As noted by the commenter, Alternative 4 (Foothill Trabuco Specific Plan EIR 531 Staff Alternative B) is the development alternative that is most environmentally superior to the proposed project. This is correctly summarized in a review of each impact by alternative in Table 5.7 of the Draft Subsequent Revised EIR. Further, as correctly identified by the commenter, although Alternative No. 8 is environmentally superior to the proposed project, Alternative 4 is environmentally superior to Alternative 8. This clarification has been made in Section 2.0 of this Final EIR.

However, it should be noted that economic feasibility is inherent to any project and the *CEQA Guidelines* state, "Among factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, . . . " (Section 15126.6(f)(1)). Although Alternative 4 is environmentally superior, it would be economically infeasible to develop. Land acquisition, engineering, construction, and implementation of mitigation measures could not be amortized over 100 single-family units. These costs combined with mitigation costs such as those associated with stabilizing the geotechnical hazards would exceed project revenues.

Similarly, Alternatives 6 (44/178 Alternative) and 7 (Acquisition Alternative) would not be feasible. Alternative 6 would meet the project objectives, but would result in an increase in impacts to recreation resources and fire protection as compared to the proposed project (see Section 5.4.6 of the Draft Revised Subsequent EIR and Section 2.0 of this Response to Comments document). In addition, it should be noted that full property acquisition is necessary for Alternative No. 7 and partial acquisition of the "Conservation Parcel" is integral to the feasibility of Alternative 6. No party with the resources and willingness to consummate a transaction has materialized, in spite of intensive exploration regarding this issue in late 1996, early 1997, early 1998 and from late spring through fall 1998.

Connor 31 – Comment

21. *DRSEIR 566 fails to consider a residential housing alternative which complies with the goals, objectives, components, regulations, and guidelines of the FTSP, nor does it explain why such an alternative would be unacceptable. In its comments on the NOP, Vedanta specifically requested that the DRSEIR identify and analyze at least one reduced-density alternative which complies with all of the goals, objectives, components, regulations, and guidelines of the FTSP. Instead, in Alternative No, 8, the DRSEIR identifies and analyzes a reduced-density alternative that eliminates only 16 out of 299 dwelling units and which complies with virtually none of the goals, objectives, components, regulations, and guidelines of the FTSP. Indeed, DRSEIR 566 fails to provide any explanation for why an FTSP-compliant alternative was not considered.*

Connor 31 – Response

Please see Section 3.3.2 (Connor 2 – Response) regarding the range of alternatives required for an EIR. The commenter is incorrect in indicating that no alternatives were discussed in the Draft Revised Subsequent EIR that would meet the goals, objectives, components, regulations and guidelines of the F/TSP. Alternative 4 would meet the requirements of the F/TSP. In addition, Alternative 2 would also meet the F/TSP goals, as the Bridlewood Residential District was established to recognize the existing zoning and tract map approvals for the Bridlewood (Saddleback Meadows) property.

3.3.3 The Gas Company

Robert S. Warth, May 16, 2002

The Gas Company 1 – Comment

This letter is not to be interpreted as a contractual commitment to serve the proposed project but only as an information service. Its intent is to notify you that the Southern California Gas Company has facilities in the area where the above named project is proposed. Gas service to the project could be served without any significant impact on the environment. Gas facility additions for the expansion would be in accordance with the company's policies and extension rules on file with the California Public Utilities Commission at the time contractual arrangements are made.

The availability of natural gas service, as set forth in this letter, is based upon present conditions of gas supply and regulatory policies. As a public utility, the Southern California Gas Company is under the jurisdiction of the California Public Utilities Commission. We can also be affected by actions of gas supply or the condition under which service is available, gas service will be provided in accordance with revised conditions.

Estimates of gas usage for non-residential and residential projects are developed on an individual basis and are obtained from the Commercial-Industrial/Residential Market Services Staff by calling (800) 427-2000. We have developed several programs, which are available upon request to provide assistance in selecting the most energy efficient appliances or systems for a particular project. If you desire further information on any of our energy conservation programs, please contact this office for assistance.

The Gas Company 1 – Response

Section 4.20 of the Draft Revised Subsequent EIR includes an evaluation of the impact of the proposed project on existing natural gas utilities and service systems. The ability of The Gas Company to serve the proposed project, without any significant impact on the environment is noted.

3.3.4 Juaneño Band of Mission Indians, Acjachemen Nation

Damien Shilo, June 10, 2002

Juaneño Band of Mission Indians 1 – Comment

After review of the cultural resources section of the DEIR, we, the Juaneño Band of Mission Indians ("tribe") are concerned about the protection of this land regarding both archaeological and anthropological impact. We feel that there has been an inadequate investigation into the significance/importance of the archaeological sites. The report indicates that there were three 1 x 1 meter units used to determine the archaeological significance/importance. This is an inadequate sampling of the area to make a determination for the size of this project. Also, we feel that the monitors should be from the local tribe. The practice of finding out of area monitors who do not understand the cultural significance of the local area needs to be corrected. There is also a concern for the wildlife corridor and endangered species, neither of which are adequately addressed.

Juaneño Band of Mission Indians 1 – Response

Please see Section 3.2.4 (California State University, Los Angeles 2 – Response, and California State University, Los Angeles 3 – Response) of this Response to Comments document.

Juaneño Band of Mission Indians 2 – Comment

There is not sufficient information to support the determinations made. The DEIR fails to provide documentation that the CEQA recommended preservation alternatives to the total destruction of archaeological sites be impacted. The developer should be required to conduct a good faith examination of the feasibility of the preservation measures. They should be encouraged to incorporate one or more of the preservation measures and include the preservation plan in the EIR. Grading and monitoring is not adequate mitigation for the destruction of a significant archaeological site.

Juaneño Band of Mission Indians 2 – Response

Prior to the commencement of the current study, a Native American Contacts List and Sacred Lands File Search was requested from Rob Wood of the Native American Heritage Commission. Any Native American monitor hired for the project will be selected from this list.

Juaneño Band of Mission Indians 3 – Comment

If it is determined that date recovery excavation and destruction of the sites is the only feasible option, the investigations should be guided by a research design that follows the California Office of Historic Preservation Guidelines for Archaeological Research Designs (Preservation Planning Bulletin No. 5, February 1991. Dept. of Parks and Recreation, Office of Historic Preservation). The report documenting the excavations should follow the Office of Historic Preservation Guidelines for Archaeological Resource Management Reports (Preservation Planning Bulletin No. 5, December 1989).

Juaneño Band of Mission Indians 3 – Response

Please see Section 3.2.4 (California State University, Los Angeles 10 – Response) of this Response to Comments document.

3.3.5 Mark R. McGuire

June 25, 2002

McGuire 1 – Comment

I represent the Rutter Development Corporation in connection with its entitlement and natural resources permitting efforts for the Saddle Crest and Saddle Creek residential development projects near the Saddleback Meadows project site. The southern boundary of the Saddle Creek project constitutes the northern border of the Saddleback Meadows project. Rutter Development supports the current proposed project and certainly sees it as preferable to the massive mobilehome [sic] park previously approved for the site. However, Rutter Development takes exception to Figures 4.8.2 and 4.8.4 in the Biological Resources section of the SEIR.

Figure 4.8.2 is labeled "Proposed NCCP Southern Subregional Planning Area," but it does more than simply delineate the subregional boundaries. The "reserve area" overlay on this exhibit has no basis in any approved or even proposed plan. Consequently, this exhibit should be replaced with one that simply shows the boundaries of the southern subregional planning are and overlays the project's boundaries. Similarly, Figure 4.8.4 is labeled "Proposed Regional Wildlife Movement Corridors" but there is no discussion regarding who is "proposing" the establishment of these corridors or for what species they are proposed to function as corridors. The "proposed" corridors in the exhibit do not correspond to the wildlife corridors shown in the adopted Foothill Trabuco Specific Plan or any other formally adopted or even proposed plan. Therefore, this exhibit should also be deleted, replaced or modified in the Final SEIR.

McGuire 1 – Response

Please refer to Section 3.2.1 (USFWS/CDFG 4 - Response) of this Response to Comments document. The wildlife corridor locations shown in Figures 4.8.2 and 4.8.4 are conceptual and are intended to depict local small mammal wildlife movement between localized areas. Regional wildlife movement corridors are located to the east and north within and adjacent to the Cleveland National Forest. The depicted wildlife movement corridors have been the subject of numerous meeting with both USFWS and CDFG and the exhibits depict the conceptual locations of these corridors.

Figure 4.8.2 shows the proposed boundary of the NCCP Southern Subregional Planning Area and depicts the draft NCCP proposal which was in place at the time of Draft Revised Subsequent EIR circulation.

McGuire 2 – Comment

Thank you for the opportunity to comment on the draft SEIR for the Saddleback Meadows project. Please feel free to call if you have any questions or wish to discuss this matter.

McGuire 2 – Response

Comment noted.

3.3.6 Orange County Regional Recreational Trails Advisory Committee

Alice Sorenson, May 31, 2002

RRTAC 1 – Comment

As you know, the Regional Recreational Trails Advisory Committee (RRTAC) is a Board-appointed committee composed of equestrians, mountain bicyclists, and hikers. Recently, the RRTAC approved a motion to provide an additional riding and hiking trail through the proposed Saddleback Meadows project site.

The Committee was given a presentation regarding the subject project. Staff noted that the project is already proposing a local trail (referred to in this letter as "Trail A") along the main entry road extending west to east through the project. To provide a loop route we suggest an additional local trail ("Trail B"), to begin at Trail A and go north around the east side of St. Michael's Abbey. Trail B would then connect with the proposed Live Oak Plaza project site and connect to the Live Oak Canyon Regional Trail. We also request an additional link from Trail B to the proposed Saddle Creek project at the north edge of the Saddleback Meadows project near the connection to Live Oak Plaza. Mr. Jeff Dickman, County's Chief of Trail Planning, concurred with this concept.

The RRTAC hereby expresses its support for the additional local trail through the proposed Saddleback Meadows project ("Trail B"). We appreciate your department's efforts to provide this trail, and we would like to be kept informed of its progress.

RRTAC 1 – Response

Recreational impacts associated with implementation of the proposed project have been mitigated to less than significant and therefore, no further mitigation (such as the additional trail suggested by the commenter) is required. However, the commenter's suggestion will be forwarded on to the decision makers.

3.3.7 Rural Canyons Conservation Fund

Ray Chandos, May 28, 2002

Rural Canyons 1 – Comment

The Rural Canyons Conservation Fund, founded in 1983, advocates for the preservation of Orange County's unique inland rural canyon areas through a program of public education and participation in land use decisions affecting the area's unique scenic natural resources.

We comment as follows on the above referenced proposals:

1. *The area plan application is incomplete.*

The Foothill Trabuco Specific Plan (FTSP) lists certain informational items that must be provided when a proposed area plan is submitted. Several such items are missing from the subject proposal, including:

- *a site-specific resources assessment by a qualified field biologist;*
- *a site-specific oak woodlands analysis;*
- *a site-specific wildlife corridor analysis;*
- *a hydrological analysis;*
- *detailed mapping of areas within 50 vertical feet or 200 horizontal feet of designated major ridgelines or rock outcroppings;*
- *a detailed viewshed analysis of the proposed development as viewed from scenic highways;*
- *a conceptual grading plan at a minimum scale of 1:40 clearly delineating existing and proposed contour elevations, the location and elevation of all building pads, access roads, driveways, slope percentages, heights of manufactured slopes, the total area of disturbance, area of the flat graded pad on each parcel, and the location of retaining and crib walls;*
- *clear delineation of the building lines for assessing setbacks;*
- *a consistency report evaluating the project's consistency with each of the regulations and guidelines contained in the FTSP; and*
- *three-dimensional models of the site before and after proposed grading.*

(FTSP III G.2.0(e), pages III-90 through III-93.)

Because key information is missing from the application we received, we cannot fully assess the extent of non-compliance with the FTSP at this time, and therefore reserve the right to comment further if and when complete information becomes available.

Rural Canyons 1 – Response

The comments refer to the Area Plan for the Saddleback Meadows project and do not raise a direct or indirect significant physical environmental issue or other issue pursuant to CEQA. No additional response is required. However, the commenter is directed to additional information regarding the project included in Tentative Tract Map 15230 and the Draft Revised Subsequent EIR. See also Section 3.3.2 (Connor 3 – Response) of this Response to Comments document regarding consistency with the F/TSP.

Rural Canyons 2 – Comment

2. *The proposed spot amendment of the Foothill Trabuco Specific Plan improperly renders the FTSP internally inconsistent and inequitable, and is therefore invalid in its face.*

State law requires that general and specific plans maintain internal consistency. However, the FTSP amendment proposed as part of this project renders the FTSP internally inconsistent. This inconsistency arises from the following language contained in the proposed spot amendment:

> *"Any development shall be in compliance with every regulation of this District (BWR) and* shall be exempt from all of the Regulations and Guidelines included in this Specific Plan other than those provided for by this District." (Proposed Draft Ordinance, Exhibit 1, paragraph 3.4 (c) italics added.)

This spot amendment conflicts with other general language within the FTSP:

> *"This specific plan is adopted pursuant to regulations contained in the Orange County Zoning Code. It is specifically intended by such adoption that the development standards and provisions contained herein shall regulate* all development *within the Specific Plan area." (FTSP III.C.3.0, page II-29, emphasis added.)*

> *"It is uncertain whether this development cap can be achieved* since all development is required to be consistent with the Specific Plan regulations and guidelines." *(FTSP II.D.3.0(b), page II-29, emphasis added.)*

> *"All development within the Specific Plan Area shall be required to be phased in a manner, which is consistent with the requirements of the Growth Management Plan (GMP) Element." (FTSP II.F.1.0(a), page II-43.)*

> *"For all development projects, a minimum of 50 percent of all shrubs to be planted should be native species." (FTSP IV.G.1.0(a), page IV-16.)*

Moreover, as will be shown below, the proposed development which the above spot amendment attempts to legitimize actually conflicts with and undermines the overarching goals and objectives for the Specific Plan area at the expense of the Specific Plan's integrity.

The proposed "wildcard" zoning also creates a class of unwarranted special privileges for this project's applicant, effectively denying other persons subject to the FTSP the equal protection of the law, in violation of the state and federal constitutions.
The proposed spot zoning amendment, therefore, is invalid on its face and thereby subject to nullification by the courts.

Rural Canyons 2 – Response

This comment does not raise a direct or indirect significant physical environmental issue or other issue pursuant to CEQA.

Rural Canyons 3 – Comment

3. *The proposed spot amendment of the FTSP is barred by the FTSP itself.*

The FTSP explicitly provides how the Specific Plan may be amended to allow for development, as is now being proposed, that deviates from the recorded tract map for the Saddleback Meadows site:

> *"If a development proposal on the aforementioned [Bridlewood, Lyon Ranch, Santiago Ranch, and Zadeh] sites deviates from these approvals and cannot be found to be in substantial compliance with these approvals, a Specific Plan Amendment shall be required for the individual site. Said Specific Plan Amendment* shall *1) determine an appropriate density cap for the property; 2) establish new Land Use District Regulations for the site; and 3) be consistent with all of the provisions of the Specific Plan, as amended." (FTSP III.C.10.0(d), page III-4.)*

> *"Any development proposal, which deviates from the approved Saddleback Meadows Planned Community zoning and Recorded Tract 10692 and which cannot be found in substantial compliance with these approvals shall require a Specific Plan Amendment which* shall: *1) determine an appropriate density cap for the property; 2) establish new development regulations for the Bridlewood Residential District; and 3) be consistent with all the provisions of the Specific Plan." (FTSP III.D.3.2.(b), page III-20, italics added.)*

The proposed spot amendment exempting Saddleback Meadows from all but the revised district regulations clearly conflicts with the above requirements of the FTSP, which unequivocally mandate that the amended zoning regulations for Saddleback Meadows must be consistent with all *of the provisions of the FTSP. Thus the proposed spot amendment is facially invalid, and, as will be shown below, the proposed area plan is in actual conflict with numerous of the FTSP's substantive requirements.*

Rural Canyons 3 – Response

This comment does not raise a direct or indirect significant physical environmental issue or other issue pursuant to CEQA.

Rural Canyons Conservation Fund 4 – Comment

4. *A site development or use permit is required prior to any grading.*

The proposed spot amendment explicitly allows issuance of a "preliminary grading permit" prior to approval of a site development or use permit. (Proposed Draft Ordinance, Exhibit 1, paragraph 3.4(d).) This flies directly in the face of the following general regulation of the FTSP:

> *"Grading: Grading shall be permitted within the Specific Plan Area only upon approval of a site development permit or use permit by the Planning Commission. No grading permits shall be issued without the approval of a precise plan of development, i.e., site development permit or use permit." (FTSP III.C.6.1, page III-2.)*

Rural Canyons 4 – Response

This comment does not raise a direct or indirect significant physical environmental issue or other issue pursuant to CEQA.

Rural Canyons Conservation Fund 5 – Comment

5. *Development depicted on the proposed area plan improperly conflicts with the FTSP.*

Since, as shown above, the proposed wildcard exemption from all of the FTSP's general substantive and procedural requirements is invalid, all of the FTSP's general provisions apply to this project. Unfortunately, the proposed development violates numerous of these provisions, including:

- *"Rural Character/Forest Buffer: To preserve the rural character of the area and provide a buffer between urban development and the Cleveland National Forest." (FTSP I.C.1.0(a)," Goals and Objectives," page I-5.)*

By any measure of the term, the proposed development, due to its extreme intensity and scale, is anything but "rural" in character. On the contrary, it is a conventional suburban housing tract, to be constructed after mass grading the site in the amount of 11.7 million cubic yards. At 5,000 square feet minimum, the lot sizes are far below the minimum ½ acre permitted in the adjacent FTSP areas, and the proposed average density of 1.35 dwelling units per acre vastly exceeds the prevailing minimum of 1 dwelling unit per 2 acres. The proposal includes manufactured slopes 120 feet high, contour elevation changes of 91 vertical feet, and retaining walls 40 feet high.

Characterizing such a proposal as "rural" can only be described as "Orwellian." The submitted area plan application does include a "Rural Character Statement." However, this document merely sets forth general platitudes and idealized sketches on the subject, not specific to the proposed project, and not demonstrating how the concepts would actually be implemented. In the context of this project, "rural" must in large measure be defined in terms of compliance *with the regulations and guidelines of the FTSP, which purport and serve to implement the general goal of* preserving *the area's rural character. Thus the subject proposal is rural to the extent of its compliance with the detailed requirements of the FTSP, and that compliance leaves much to be desired.*

- *"Except for those legal building sites existing at the time of Specific Plan adoption where compliance with this requirement would preclude development of a single residence on the existing building site, mapping shall identify a minimum corridor width (other than for the wildlife corridor parallel to Live Oak Canyon Road) at all locations of 400 feet measured perpendicular to the corridor's boundary." (FTSP II.C.2.2(c)(3), page II-11, underlining in original.)*

The proposal fails to delineate a 400-foot-wide wildlife corridor through the project. The corridor mentioned in the text of the area plan actually diminishes to under 200 feet wide where it passes between the main spine road on the south and St. Michael's Abbey on the north.

- *"Development shall maintain a 50-foot setback of all structures and barrier fencing from all corridors. Uses within the setback zone shall be limited to low-intensity, residential-related activities such as recreation and private open space." (FTSP II.C.2.4(a), page II-14.)*

The proposed wildlife corridor violates this setback requirement where it passes between the southern and northern clusters of housing units.

Please include this letter in the official record of proceedings for this project. Thank you for the opportunity to comment.

Rural Canyons 5 – Response

Please see Section 3.3.2 (Connor 3 - Response) of this Response to Comments document regarding the proposed project's consistency with the F/TSP.

3.3.8 Saddleback Canyons Conservancy

Gloria D. Sefton, June 10, 2002

Saddleback Canyons Conservancy 1 – Comment

The Saddleback Canyons Conservancy is dedicated to protecting and enhancing the environment and quality of life in the Foothill/Trabuco Canyon Specific Plan (FTSP) area and surrounding areas of Orange County. The following comments are provided in response to the DEIR.

NONCOMPLIANCE WITH THE FTSP

The proposed project lies within the FTSP area. The proponents of the project have proposed a zone change (ZC 98-3) that would be required to amend the FTSP for the project ("Bridlewood Residential District"). Such an amendment to the FTSP would exempt the project from all regulations and guidelines ion the FTSP other than those provided by Bridlewood Residential District.

Upholding the integrity of the FTSP is of utmost concern to the Saddleback Canyons Conservancy. The proposed project site serves as a transitional buffer between the suburban developments of Lake Forest and Mission Viejo to the rural canyons area. The project's proximity to the Cleveland National Forest (within 1 mile) speaks to the need to for compliance to – not exemption from – the development guidelines set forth in the FTSP.

The proposed development violates the spirit and letter of the FTSP. The primary goals of the FTSP are to "preserve the rural character of the area and provide a buffer between urban development and the Cleveland National Forest." The project in no way conforms to such a goal. Indeed, 299 tract homes on a mass-graded site is anything but "rural." It is time to stop suburban sprawl, say "no" to continued mass development, and "yes" to a preservation and conservation plan.

Saddleback Canyons Conservancy 1 – Response

Please see Section 3.3.2 (Connor 3 - Response) of this Response to Comments document regarding the proposed project's consistency with the F/TSP.

Saddleback Canyons Conservancy 2 – Comment

DESTRUCTION OF HABITAT AND INTERFERENCE WITH WILDLIFE CORRIDORS

The project site is within the Southern Orange County Natural Communities Conservation Plan (NCCP) and provides a critical wildlife connector between the Central and Southern NCCP subregions and the Cleveland National Forest. In addition, the site itself provides habitat for the federally endangered Riverside fairy shrimp, and the federally threatened coastal California gnatcatcher, among other special status species. In view of the fact that the County, the U.S. Fish and Wildlife Service, and the California Department of Fish and Game have initiated the Southern

Subregion NCCP process and that preliminary reserve designs are scheduled for completion in July 2002, a revised environmental document should be prepared to incorporate this critical information.

Saddleback Canyons Conservancy 2 – Response

Please see Section 3.3.2 (Connor 19 - Response) of this Response to Comments document regarding the NCCP. The Southern Subregion NCCP process was started several years ago, while a preliminary reserve design is protected for July 2002, it will be two or three years before the reserve design is adopted.

Saddleback Canyons Conservancy 3 – Comment

FAILURE TO ADEQUATELY ANALYZE CUMULATIVE IMPACTS

The list of "related" projects is limited to a small area near the project and excludes other major projects on the NCCP Southern Subregion. Among the major projects that must be included in a revised cumulative analysis include but are not limited to the massive Rancho Mission Viejo project (14,000 homes and 427 acres of "urban activity"). Additionally the DEIR fails to mention the Rancho Protrero Leadership Academy, which also lies within the FTSP area, for which the Board of Supervisors filed a Notice of Determination in December 2001. The cumulative analysis of land use and planning, geology and soils, hydrology and water quality, traffic and transportation, biological resources, public services and utilities, aesthetics and growth inducement must consider all foreseeable projects.

Saddleback Canyons Conservancy 3 – Response

It would be inappropriate to include the Rancho Mission Viejo project in the cumulative analysis as it is in the early planning stages and not within the project study area. Please see Section 2.0 of this Response to Comments document for a revised Table 3.1, which includes the Rancho Protero Leadership Academy. However, it should be noted that this additional information did not change the conclusions of the EIR.

Saddleback Canyons Conservancy 4 – Comment

NONCOMPLIANCE WITH NEW WATER QUALITY REGULATIONS

Aliso Creek, adjacent to the project site, is listed as a Category I Priority Impaired Water Body in the EPA's National Water Quality Report (2000). New water quality regulations have recently been ordered against the County of Orange by the Regional Water Quality Control Board. These stricter regulations supplant the 1994 NPDES permit referenced in the DEIR, and were enacted due, in part, to the extremely impaired water quality existing in Aliso Creek. The DEIR fails to explain how the project can comply with these new water quality regulations.

Saddleback Canyons Conservancy 4 – Response

Section 4.4.2 of the Draft Revised Subsequent EIR describes in detail potential impacts to water quality and Aliso Creek. Implementation of the Project Design Features and compliance with the Standard County Conditions, in addition to other applicable regulatory requirements, impacts to water quality would be less than significant. In addition, a mitigation measure was included to facilitate the implementation of alternate and/or supplemental regional water quality mitigation to ensure the proposed project is consistent with the requirements of the new storm water NPDES permit (see M 4-1 on page 4.4-17 through 4.4-18 of the Draft Revised Subsequent EIR).

Saddleback Canyons Conservancy 5 – Comment

LACK OF WATER TO SUPPORT THE DEVELOPMENT

The Orange County Register recently reported (May 18, 2002) that "drought conditions have dried up two wells that the Trabuco Canyon Water District relies on to supply Trabuco Canyon and Rancho Santa Margarita residents." The TCWD is seeking additional appropriative water rights from the State Water Resources Control Board. Yet, as reported in correspondence to me dated May 14, 2002 from the State Water Resources Control Board, further processing of the TCWD's request for additional water rights is being held in abeyance until several senior priority applications in the watershed are processed. This water shortage should be recognized as an impediment to the advancement of any new development in the area served by the TCWD.

Saddleback Canyons Conservancy 5 – Response

As stated in Section 4.16.2 of the Draft Revise Subsequent EIR, the Trabuco Canyon Water District (TCWD) indicates that it would be able to accommodate the required water supply demand for the proposed project. A letter received from TCWD on July 15, 2002 indicates that the district has sufficient capacity to serve the site.[1]

Saddleback Canyons Conservancy 6 – Comment

CONCLUSION

The project is out of compliance with the FTSP. The project is not rural. The project significantly and negatively impacts biological resources and wildlife corridors. The project site is adjacent to the impaired Aliso Creek. The water district has severe water shortage problems. An additional 299 homes adds to suburban sprawl and downstream negative environmental impacts. The project should not proceed. The site should be set aside as a preserved habitat/wildlife corridor, and protected as open space for generations to come.

[1] *Letter to Kris Weber, Hunsaker & Associates, dated July 15, 2002 from Brian Bertsch, Project Manager, Trabuco Canyon Water District*

Please incorporate this letter in to the official record of proceedings for this project.

Saddleback Canyons Conservancy 6 – Response

This comment is a summary of comments included above. No additional response is required.

3.3.9 Sierra Club

Gail Prothero, June 23, 2002

Sierra Club 1 – Comment

The Sierra Club appreciates the opportunity to comment upon the Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows – EIR 566 (DRSEIR). As strong supporters of protecting the ecological integrity and aesthetic value of the remaining open space in Orange County, our members are closely monitoring projects proposed for properties in the vicinity of the Cleveland National Forest. To facilitate this monitoring process, as well as to properly inform the general public and decision-makers, it is essential that all environmental assessment related to such projects be conducted in strict compliance with the provisions of CEQA and the CEQA Guidelines.

Unfortunately, as it is currently written, the DRSEIR does not adequately address significant issues related to the proposed Saddleback Meadows residential development and its effect on the local environment. These issues include those justifiably raised by a number of individuals in comments already provided to you; therefore, the Sierra Club wishes to incorporate into this letter, by reference, each of the following documents:

- *Comments by Terrell Watt, AICP, submitted in a letter dated June 7, 2002, on behalf of the National Audubon Society, Endangered Habitats League, and Rural Canyons Conservation Fund*
- *Comments by Edmond M. Connor, submitted in a letter dated June 9, 2002, in behalf of the Vedanta Society of Southern California*
- *Comments by Ray Chandos, submitted in a letter to Frank McGill dated May 28, 2002, in behalf of the Rural Canyons Conservation Fund*
- *Comments by Patricia Martz, PhD., submitted in a letter dated June 10, 2002*

Sierra Club 1 – Response

The Draft Revised Subsequent EIR was completed in compliance with the provisions of Public Resources Code, Division 13, Sections 21000 et seq. and the California Code of Regulations, Title 14, Division 6, Chapter 3, Sections 15000, et seq. The comment letters and responses listed above have been included in this Response to Comments document.

Sierra Club 2 – Comment

Although the Sierra Club believes that all of the issues discussed in the above documents warrant full consideration and thorough analysis in a revised DRSEIR, two are of overarching significance to our members and deserve particular emphasis.

Suburban Sprawl

The significant negative impacts of the proposed Saddleback Meadows development are all attributable to the fact that the project would further extend suburban-style development into the remaining wildlands of Eastern Orange County. Attendant to such sprawl are the inevitable habitat destruction and fragmentation; watershed and water quality degradation; increases in vehicle miles traveled, traffic congestion, and air pollution; and deterioration of viewsheds and noisesheds. An adequate DRSEIR must honestly identify the true nature of the proposed Saddleback Meadows development as suburban sprawl, analyze the cumulative impacts of allowing similar sprawl-type projects to encroach upon remaining wildlands, and propose alternative locations for providing similar amounts of housing within the existing footprint of urban/suburban Orange County.

Sierra Club 2 – Response

Impacts associated with implementation of the proposed project were discussed in Section 4.0 and various technical appendices of the Draft Revised Subsequent EIR. Cumulative impacts to biological resources were discussed in Section 4.8.3.

Alternative locations for development of the proposed project were discussed in Section 5.3 of the Draft Revised Subsequent EIR. This alternative was eliminated from further consideration due to the fact that the project applicant does not own or control any other project sites within the region and the fact that no other property within the vicinity of the project site exhibits similar existing project specific General Plan and Zoning designations that would accommodate the proposed project. Further, it is speculative and unlikely that the project applicant would assemble other contiguous properties within the area to accommodate the number and type of residences proposed. Moreover, if such properties were identified and acquired, the properties would likely have resources and environmental constraints similar to the project site. Development of the proposed project at an alternative location is unlikely to be economically viable and would be unlikely to reduce impacts in comparison to the proposed project.

Sierra Club 4 – Comment

Benefits of Preservation

Although serious and ongoing consideration has been given to acquiring the Saddleback Meadows site for preservation in its natural state, only passing attention is given to acquisition in the DRSEIR. An adequate DRSEIR would thoroughly analyze the environmental and economic benefits of acquisition, potential sources of funding and the relationship of acquisition to fulfilling the goals and objectives of all of the following: The Orange County General Plan, Foothill/Trabuco Specific Plan, Aliso Creek Corridor Specific Plan, and Central-Coastal Subregion National Community Conservation Planning/Habitat Conservation Plan.

Sierra Club 4 – Response

Section 5.0 of the Draft Revised Subsequent EIR included a discussion of various no development and/or conservation alternatives. The project applicant has engaged in numerous discussions regarding acquisition of the project site for open space and conservation purposes, with each discussion resulting in no action based upon a lack of appropriate acquisition funding.

Please see Section 3.3.2 (Connor 2 – Response) of this Response to Comments document for a discussion of the feasibility of property acquisition.

Sierra Club 5 – Comment

The Sierra Club recommends that the DRSEIR be revised to properly address all issues raised in this letter, both directly and by reference, and recirculated for public comment.

Sierra Club 5 – Response

Please refer to Section 3.3.9 (Sierra Club 1 – Response) of this Response to Comments document. No recirculation of the document is required.

3.3.10 Trails 4 All

Jim Meyer, June 4, 2002

Trails 4 All 1 – Comment

Recently the County's Regional Riding and Hiking Trails Advisory Committee (RRHTAC) that I serve on was given a presentation regarding the subject project. Staff noted that the project is already proposing a local trail (referred to in this letter as "Trail A") along the main entry road extending west to east through the project. To provide a loop route, the RRHTAC supported an additional local trail ("Trail B"), to begin at Trail A and go north around the east side of St. Michael's Abbey. Trail B would them connect with the proposed Love Oak Plaza project site and connect to the Live Oak Canyon Regional Trail.

Upon review, Trails4All would also like to offer our support for the additional local trails through the proposed Saddleback Meadows project, linking with Live Oak Plaza and the Saddle Creek projects. We appreciate your department's efforts to provide this trail, and we would like to be kept informed of its progress.

Trails 4 All 1 – Response

Please see Section 3.3.6 (RRTAC 1 – Response) of this Response to Comments document.

3.3.11 Terrell Watt, AICP

June 7, 2002

Watt 1 – Comment

This comment letter on the Draft Revised Subsequent Environmental Impact Report ("DRSEIR") for the proposed Saddleback Meadows development project ("project") is submitted on behalf of National Audubon Society, Endangered Habitats League and Rural Canyons Conservation Fund ("the commenting groups"). These comments provide a detailed and explicit outline of the problems and inadequacies presented by: (1) the project itself, including its geological impacts and impacts to the habitat of several endangered and sensitive species; (2) the DRSEIR, including fatal deficiencies under the California Environmental Quality Act ("CEQA") (Pub. Res. Code §§ 21000 et seq.) and the CEQA Guidelines (14 Cal. Code Regs. §§ 15000 et seq.); and (3) the project's inconsistency with the County General Plan.[1]

Watt 1 – Response

This comment presents an overview of the comments detailed below. Please see responses to detailed comments.

Watt 2 – Comment

A summary of the DRSEIR's major defects follows:

Inadequate Project Description: The DRSEIR's project description remains incomplete and, therefore, inadequate. Specifically, the project description lacks important details about the project that are critical to an adequate analysis of project-related and cumulative impacts. Such details include, but are not limited to: (1) fundamental engineering aspects of the project related to mass grading and the probable need for export of unsuitable cut and importation of suitable fill; (2) a detailed description and proposed uses of open space; (3) the complete Project Design Feature that includes the final drainage plan; (4) proposed home size and total development contemplated, including accessory structures and paving; (5) hazards and hazards-related project features, such as possible presence of on-site contamination; among other information about the project. Without this information, the evaluation of impacts cannot be complete.

Watt 2 – Response

As stated in Section 2.0 of the Draft Revised Subsequent EIR, the purpose of the Project Description is to describe the project in a way that will be meaningful to the public, reviewing agencies, and decision-makers. Section 15124 of the CEQA Guidelines requires that a complete Project Description contain the following information: (1) the location and boundaries of the proposed project; (2) a statement of project objectives; (3) a general description of the project's technical, economic, and environmental characteristics; and (4) a statement briefly describing the intended uses of the EIR, including a list of the agencies that are expected to use the EIR in their decision making, and a list of the approvals for which the EIR will be used. According to CEQA

(Section 15124) an adequate Project Description need not be exhaustive, but should supply the detail that is necessary for project evaluation.

The Project Description meets the requirements of CEQA and discusses grading, open space, drainage, land use and hazards. The details requested by the commenter (i.e., specific housing design, etc.) are not required.

Watt 3 – Comment

Inadequate Project Setting: The DRSEIR fails to describe key elements of the project setting adequately and completely. Such elements include, but are not limited to: (1) key general plan policies and regional policies relating to habitat planning, in particular the Southern Orange County Natural Communities Conservation Plan (NCCP); and (2) a list of cumulative projects, geographic study area for the cumulative analysis or plan based approach to cumulative impacts. This information is critical to the analysis of project-related and cumulative impacts.

Watt 3 – Response

The existing general plan designation and zoning are discussed in Section 2.1.2 and general plan policies and regional policies are discussed in Section 4.1.1 of the Draft Revised Subsequent EIR. Applicable plans and policies related to biological issues are discussed in Section 4.8 and Appendix I of the Draft Revised Subsequent EIR. Cumulative projects were summarized in Table 3.1 of the Draft Revised Subsequent EIR, please see Section 2.0 of this Response to Comments document for an updated table.

Watt 4 – Comment

Failure to Identify or Analyze the Full Extent of Significant Environmental Impacts: The DRSEIR is riddled with conclusions unsupported by facts and analysis on the significance of environmental impacts. Specifically the DRSEIR concludes, based on improperly deferred mitigation measures and mitigation measures of unproven efficacy, that all potentially significant impacts except cumulative air quality will be reduced to less than significant with mitigation. Insufficient evidence is provided to support the conclusion that all but one impact will be less than significant after mitigation.

Watt 4– Response

The Draft Revised Subsequent EIR was prepared according to the requirements of CEQA. The commenter offers no specific areas where the EIR is deficient. No further response is required.

Watt 5 – Comment

Inadequate Cumulative Impacts Analyses: The DRSEIR's cumulative impacts section is non-existent. The DRSEIR fails to provide a complete list of cumulative projects or to outline a plan based approach to the cumulative

analysis. The list of "related" projects is limited to a small area near the project and excludes other major projects in the NCCP Southern Subregion. Brief, conclusory statements are made concerning cumulative impacts throughout the DRSEIR. Moreover, the DRSEIR fails to consider feasible mitigation for the project's incremental contribution to cumulative impacts. Notwithstanding this complete lack of analysis, the DRSEIR concludes that all cumulative impacts will be less than significant with the exception of cumulative air quality.

Watt 5 – Response

Cumulative impacts were discussed under each environmental issue area within Section 4.0 of the Draft Revised Subsequent EIR. As stated in Section 3.7 of the Draft Revised Subsequent EIR, the cumulative analysis for each respective environmental subsection was described based on the related projects, as appropriate. The Natural Community Conservation Planning Program (NCCP) is discussed in Section 4.8 and Appendix I. Additionally, the NCCP represents 64,100 acres as compared to the proposed project's 222 acres.

Watt 6 – Comment

Inadequate Growth-Inducing Impacts Analysis: The DRSEIR's growth-inducing impacts section is likewise inadequate. For example, the DRSEIR fails to analyze the potentially significant growth-inducing impacts associated with the extension of utilities and roads, and the placement of a water tank and access road beyond the project site. The DRSEIR offers no analysis or even recognition of the precedent-setting effect the proposed project would have on development in the area, and development on sites where the topography and presence of biological habitat and wildlife corridors should limit such projects.

Watt 6 – Response

The F/TSP and Tract Map 10692 allow for a 705-unit manufactured housing development within the boundary of the project site. As stated in Section 2.3.4 of the Draft Revised Subsequent EIR, the water tank site was previously dedicated to the Trabuco Canyon Water District when the existing Final Tract Map 10692 was recorded, to be used for development of the water distribution facility for the proposed project site. The proposed on-site roadways and utility systems would serve only the proposed project and would not accommodate any additional development. No off-tract infrastructure improvements are proposed.

Watt 7 – Comment

Inappropriate Deferral of Feasible Mitigation Measures: The DRSEIR improperly defers mitigation measures. Many of the deferred mitigation measures, including measures related to drainage and hazards mitigation, are relied upon to reduce significant impacts without any supporting facts or analysis.

Watt 7 – Response

The mitigation measures included in the Draft Revised Subsequent EIR are based on current regulations and do not defer mitigation requirements. It is unclear as to what specific mitigation measures the commenter is regarding drainage. Upon implementation of the identified Project Design Features and Standard County Conditions, no mitigation measures would be required (see Section 4.3.6 of the Draft Revised Subsequent EIR).

Watt 8 – Comment

Failure to Analyze a Reasonable Range of Alternatives: The DRSEIR includes numerous alternatives, but fails to analyze an alternative that fully mitigates for on- and off-site impacts. Moreover, the DRSEIR fails to properly identify the environmentally superior alternative, after the no-project alternatives, as Alternative 4.

These and other major defects in the DRSEIR described below render the document inadequate as a basis for informed decision-making and legally deficient under CEQA and the planning and zoning law. The County should give no further consideration to the project until an EIR is prepared and circulated that fully complies with CEQA and the CEQA Guidelines.

Watt 8 – Response

Please see Section 3.3.2 (Connor 2 – Response and Connor 30 – Response) of this Response to Comments document.

Watt 9 – Comment

CONSIDERATION OF THE PROJECT IS PREMATURE

The County, the U.S. Fish and Wildlife Service and the Department of Fish and Game have initiated the Southern Subregion NCCP process. Preliminary reserve designs are scheduled for completion in July 2002.The project site is within the Southern Subregion and provides a critical wildlife connector between the Central and Southern NCCP subregions and the Cleveland National Forest. In addition, the site itself provides habitat for a number of special status species.

The NCCP reserve design(s) will suggest where development should and should not occur based on biological resources. This new information is fundamental to a determination of whether all or a portion of the project site should be included in a "reserve," or alternatively in a development area. A revised environmental document must include this information.

Watt 9 – Response

Please see Section 3.2.1 (USFWS/CDFG 4 – Response) and Section 3.3.2 (Connor 19 – Response) of this Response to Comments document. The NCCP process was initiated in 1993 and is only now proposing alternative palns for consideration by the public and decision makers. Final approval of the NCCP is not expected for another year or two. CEQA has no requirement that a project be evaluated against a planning or regulatory document that has not been adopted/approved. The project applicant has been in communication with U.S. Army Corps of Engineers (USACE), California Department of Fish and Game (CDFG), and U.S. Fish and Wildlife Service (USFWS) regarding NCCP related issues and has included a detailed Biological Resources Mitigation Plan (including a wildlife movement corridor) as a Project Design Feature (see Section 4.8 of the Draft Revised Subsequent EIR). Additionally, the proposed project seeks to replace the existing 705 residential lot subdivision with a new development plan that provides a wildlife corridor.

Watt 10 – Comment

BACKGROUND AND PROJECT CONTEXT

The property is located in the lower, southeastern foothills of the Santa Ana Mountains and is currently used for horse and cattle grazing. The site's topography is hilly with several steep slopes and ravines. Soils on site are highly erodable. Aliso Creek is located nears the western site boundary and generally follows El Toro Road. Drainage from the site flows to the west into Aliso Creek, which drains into the Pacific Ocean at Aliso Beach, and Oso Creek, a tributary of Trabuco and San Juan Creeks, and south to O'Neill Regional Park. DRSEIR at page 4.2-2. The site provides an essential low elevation wildlife corridor between the Central and Southern NCCP areas and the Cleveland National Forest. Such a low elevation corridor is needed for gnatcatchers and other species. The site also supports important wetlands that provide habitat for Riverside fairy shrimp and western spade foot toad.

Watt 10 – Response

This comment restates the existing setting of the proposed project. No response is required.

Watt 11 – Comment

Under the proposed project, a gated community of 299 single-family residential lots would be built on approximately 222 acres. The total developed area would be approximately 66.9 acres and the total open space would be on approximately 155.1 acres. Only a portion of the area, approximately 83.25 acres would be in "natural resource preservation area." However, this area is subject to remedial grading and biological enhancement activities, thereby potentially degrading the resources even within this "natural resource preservation area." DRSEIR at page 2-16. Massive grading is needed to accommodate the project on this site. Grading would involve 70%+ of the site. It is still unclear to what extent remedial grading will extend beyond the area illustrated in the preliminary grading plan.

Watt 11 – Response

Project Design Features (PDF 8-1) and Standard County Conditions (SC 2-3) have been included to protect the natural resource preservation area (see Sections 4.8.4 and 4.2.4 of the Draft Revised Subsequent EIR). The biological impact analysis considered areas that would be impacted by both conventional and remedial grading. No grading would occur outside the project site boundary.

The final Grading Plan will be reviewed and approved by the Manager, PDS/Subdivision and Grading Services Division prior to issuance of a grading permit (Standard County Condition SC 2-2). The level of detail included in Section 4.2 and Appendix C of the Draft Revised Subsequent EIR is appropriate.

Watt 12 – Comment

In summary, the site plan can best be characterized as "suburban sprawl," with roads and units extending across the entire site, thereby fragmenting the open space areas and extending into wildlands and interfering with wildlife corridors. This pattern of development would severely impact biological resource values on- and off-site and impede wildlife migration.

Watt 12 – Response

A Final Subdivision Map (Final Map 10692) for 705 manufactured housing/mobile home units was recorded for the property in 1988. Furthermore, the property is surrounded by existing development or approved projects on nearly 50 percent of its perimeter. A Biological Resource Mitigation Plan has been incorporated into the proposed project to mitigate impacts to biological resources and enhance currently degraded habitat. In addition, the proposed project leaves a substantial amount of the site (approximately 70 percent) as open space and/or biological reserve.

Watt 13 – Comment

ANALYSIS

I. THE DRSEIR IS INADEQUATE UNDER CEQA.

The DRSEIR is deeply flawed under CEQA. An EIR must provide enough analysis and detail about environmental impacts to enable decision-makers to make intelligent judgments in light of the environmental consequences of their decisions. See CEQA Guidelines § 15151; Kings County Farm Bureau v. City of Hanford, 221 Cal.App.3d 692 (1990). Under the law, the lead agency must make a good faith effort to fully disclose the environmental impacts of the project. This requirement cannot be met unless the project is adequately described and existing setting information is complete. See County of Inyo v. City of Los Angeles, 71 Cal.App.3d 185, 199(1977). Both the public and decision-makers need to fully understand the implications of the choices presented by

the project, mitigation measures, and alternatives. See Laurel Heights Improvement Ass'n v. Regents of University of California (Laurel Heights I), 6 Cal.4th 1112,1123 (1988). The DRSEIR fails to provide sufficient information to enable informed decision-making by the County, the public, and the permitting agencies. Much important information remains improperly omitted or deferred until a later date in violation of CEQA; what information is provided remains vague and flawed.

The DRSEIR is a construction level EIR and therefore would allow for the issuance of a rough grading permit. Many of the most significant impacts are irreversible after rough grading has occurred. Thus, detailed information concerning project level impacts must be provided at this stage of project consideration so that the public, agencies and County decision-makers can fully understand the impacts of the proposed project and alternatives. Deferral of information concerning project-related and cumulative impacts, mitigation measures and alternatives is improper and unacceptable given the types of activities that will result from the approval of the project at this stage.

Watt 13 – Response

The commenter is correct in citing Section 15151 of the *CEQA Guidelines*, which states "An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. However, this section goes on to state, "An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible." The Draft Revised Subsequent EIR includes a detailed analysis of environmental factors based on a publicly circulated Initial Study and technical appendices for the following: geology, hydrology, water quality, traffic, air quality, noise, biology, and archaeology.

Please see Section 3.3.12 (Watt 11 – Response) of this Response to Comments document regarding grading.

Watt 14– Comment

- *The DRSEIR Fails to Describe the Project Adequately.*

The DRSEIR fails to describe the project and its setting accurately and completely. It omits key project features that have the potential to result in significant impacts.

The CEQA Guidelines define "project" as "the whole of an action, which has a potential for resulting in a physical change in the environment, directly or ultimately . . .." CEQA Guidelines § 15378. Among other components, an EIR's project description must contain a "general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals if any and supporting public service facilities." CEQA Guidelines § 15124(c). As the Court of Appeal has noted, "The defined project and not some other project must be the EIR's bona fide subject." County of Inyo, 71 Cal.App.3d at 185. An accurate and complete project description

is indispensable because, "[a] curtailed or distorted project description may stultify the objectives of the reporting process. Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage oft terminating the proposal . . . and weigh other alternatives in the balance. An accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR" id. at 192.

The DRSEIR also fails to provide an adequate description of the setting for the project. Such a failure is fatal under CEQA. CEQA and the CEQA Guidelines mandate that an EIR include a description of "the physical environmental conditions in the vicinity of the project...from both a local and a regional perspective . . . Knowledge of the regional setting is critical to the assessment of environmental impacts." CEQA Guidelines §§ 15125(a) and (c). This requirement derives from the principle that without an adequate description of the project's local and regional context, the EIR, and thus the decision-makers and the public who rely on the EIR, cannot accurately assess the potentially significant impacts of the proposed project.

The DRSEIR for the project is inadequate. It fails to describe key aspects of the proposed project with the potential to result in significant environmental impacts. Additionally, it fails to describe accurately and completely the environmental setting impacted by the project. Accordingly, potentially significant environmental impacts cannot be adequately analyzed or addressed by the DRSEIR and, for this reason, the DRSEIR is fatally deficient under CEQA.

Watt 14 – Response

Please see Section 3.3.12 (Watt 2 – Response) of this Response to Comments document. In addition, the environmental setting for the proposed project is described in Sections 2.1, 3.0 and throughout 4.0 of the Draft Revised Subsequent EIR for each environmental issue area. The environmental setting is adequately described under the requirements of CEQA.

Watt 15 – Comment

1. *The DRSEIR Fails to Describe Adequately the Source and Placement of Cut and Fill Material and the Extent of Grading Required to Accommodate Roads and Dwelling Units.*

Massive earthwork will be required to prepare the site for access roads and houses. More than ½ of the site (126 acres) has slopes in excess of 26% with about 32 acres with slopes exceeding 50%. Preliminary estimates in the DRSEIR are that about 2.45 million cubic yards of conventional excavation (cut) and an equal amount of fill will be required. In addition, about 6.8 million cubic yards of remedial grading are required. The DRSEIR states that cut and fill (including several areas exceeding 50 feet in depth) will he balanced on site. However, the DRSEIR and geotechnical report present information that indicates on-site materials may not be suitable to support the project without imported materials. See DRSEIR at page 4.2-l 1. Moreover, mitigation measures M 2-14 and M 2-15 suggests that off-site borrow materials will be needed and on-site material removed:

M 2-14 Any objectionable material, as determined by the Soil Engineer, shall be subject to relocation in deeper fill areas or removal off-site. DRSEIR at page 4.2-l 8

M 2-15 All borrow sites shall be approved by the Soil Engineer/ Geologist prior to on-site delivery. This will permit the timely allocation of such available materials for use on the project site.

To the extent that exportation of cut and importation of fill will be required to implement the project, this information must be provided. Related impacts to air quality, off-site grading and stockpiling and traffic, among other issues must be disclosed and analyzed in a revised environmental document.

Watt 15 – Response

The mitigation measures referenced above are standard with regard to material selection and have been included in case small amounts of on-site material would not be acceptable. It is not meant to indicate that large quantities of material will have to exported or imported. As indicated in the Draft Revised Subsequent EIR, all grading operations would be balanced on-site and import/export of cut/fill material is not proposed. However, the commenter is correct in noting that mitigation measures M 2-14 and M 2-15 could be misleading or misinterpreted. Please see Section 2.0 of this Response to Comments document for a clarification of M 2-14. M 2-15 has been deleted.

Watt 16 – Comment

Although the DRSEIR fails to provide adequate information concerning proposed cuts and fills in terms of their location and extent, the document does refer to fills in excess of 50 feet in height. The DRSEIR provides virtually no information regarding the source and placement of cut and fill material, the full extent of grading required to accommodate roads and dwelling units, and the phasing of the cut and fill operation. Without this information, the DRSEIR environmental impacts analysis does not and cannot analyze the impacts of transporting such a significant amount of fill to the project site in terms of increased traffic and air pollutants, or the impacts of the cutting and filling itself including impacts to air quality, open space, habitat, and special status species. Without an accurate and complete description of the proposed site grading and fill, the DRSEIR cannot adequately analyze environmental impacts or comment on the proposed project's consistency with the County's General Plan and grading ordinance.

A revised environmental document should include clear graphics that show cross sections where cuts and fills will exceed 50 feet. In addition, a revised environmental document must identity the sources of fill that are suitable to support the proposed development. Additional information must be provided concerning the suitability of on-site material for fill if the DRSEIR continues to assume that cut and fill will balance on-site.

Watt 16 – Response

Please see Section 3.2.12 (City of RSM 2 – Response) and Section 3.3.12 (Watt 15 – Response) of this Response to Comments document. As stated in Section 2.4 of the Draft Revised Subsequent

EIR, the proposed project includes the approval of Vesting Tentative Tract Map 15230, which provides a greater level of detail. The tentative map is on file with the County of Orange and is incorporated by reference.

Watt 17 – Comment

2. *The DRSEIR Fails to Describe Adequately the "Open Space" Areas.*

The DRSEIR fails to provide a complete description of the "open space" areas of the proposed project. Little or no information is provided regarding, among other aspects: the extent of grading to the open space; to what degree the open space will be altered from its present natural condition; the uses to which the open space will be put and the extent of those uses, including trails and recreation; and, the presence and location in the open space of utility lines, access roads and other services.

The lack of a complete description in the DRSEIR of alteration to, and ultimate uses of the open space areas renders any analysis of either project-related or cumulative impacts thoroughly inadequate. A revised description of any alteration to the open space and the uses proposed for the open space land, including the proposed water reservoir, must be completed. Once a complete description has been obtained, the DRSEIR's analysis of the environmental impacts to biological resources, geology, and air quality, among others, must be revised.

Watt 17 – Response

The Draft Revised Subsequent EIR includes descriptions of open space areas in Sections 2.1; 4.1.2; 4.8.4 and 4.8.6; 4.9.4; and 4.11.2, 4.11.4 and 4.11.6. Open space is also discussed in Table 2.1 and shown on Figures 2.8; 2.10; 2.11; 4.8.7; 4.9.10 and 4.11.2.

Watt 18 – Comment

3. *The DRSEIR Fails to Describe Adequately the Project's Master Drainage Concept and Project Features Directed as Maintaining Water Quality.*

The DRSEIR fails to adequately describe the project's drainage concept and project features purportedly directed at maintaining water quality. Specifically, the DRSEIR's environmental impacts analysis concerning hydrology states that the "Project Design Feature" to mitigate drainage impacts is "being prepared in consultation with USACE." DRSEIR at page 4.3-7. Thus, the complete master drainage concept is not included in the DRSEIR for public, decision-maker and agency review. Although a final description of the master drainage concept is still being developed, the DRSEIR nonetheless concludes that no significant impacts associated with drainage will occur. In part, this is correct: no significant impacts can be identified based on such an inadequate project description. Without a complete description of the necessary drainage facilities, the DRSEIR fails under CEQA because impacts to water quality, biological resources, habitat, special status species, and human safety cannot be assessed. Once a complete description has been obtained, a revised impacts analysis must be completed.

The DRSEIR continues to describe other aspects of the project intended to mitigate water quality impacts:

"The remainder of the project site (the northerly development area) does not have sufficient room to accommodate the land-intensive requirements of the riverine system Therefore, runoff from the balance of the developed portion of the project site would be primarily cleansed through stormceptors prior to discharge into natural drainage courses. Stormceptors trap trash, sediment, and oils. They would also trap phosphorus that is attached to the sediment. However, they have no known effect on bacterial indicators or toxic constituents, both of which are constituents of concern for Aliso Creek. Removal of bacterial indicators would occur as the runoff continues through 3,300 linear feet of natural [sic] *before reaching Aliso Creek. As part of the final design ponds and swales would be incorporated to the maximum extent feasible in the development area within many small-scale features, such as, medians, parkways, and other developed open space in order to maximize the opportunity for removal of bacterial indicators and toxic constituents prior to outletting in the natural drainages." DRSEIR at page 4.4-12.*

This paragraph suggests that:

> *Key elements of the project that are critical to reducing significant impacts to drainage and water quality have not been designed. Therefore, the project description lacks key information to support both an adequate analysis of impacts and to support a conclusion that project impacts will be less than significant.*
>
> *Mitigation may not be sufficient to address impacts associated with bacterial indicators or toxic constituents.*

A revised environmental document, based on a complete description of drainage and water quality features and feasible mitigation measures must be completed.

Watt 18 – Response

Tentative map level hydrology and water quality analysis is included in Sections 4.3 (Hydrology) and 4.4 (Water Quality) of the Draft Revised Subsequent EIR, which is consistent with the manner in which development projects are processed. Additional technical information was also included in Appendix D and Appendix E of the Draft Revised Subsequent EIR.

Watt 19 – Comment

4. *The DRSEIR Fails to Describe Adequately the Characteristics of Residential Uses*

The DRSEIR lacks a complete description of proposed uses at the project site. Specifically, the DRSEIR fails to describe key aspects of the proposed residential project including, but not limited to: the size of the houses; their lot coverage; paving for roads driveways and parking lots; and accessory uses, such as swimming pools and storage. Without an adequate description of home size, lot coverage, and accessory uses, significant environmental impacts to aesthetics and water quality, among other impacts, cannot be identified or assessed and suitable mitigation measures

cannot be proposed. To the extent this information is not available, a worst-case estimate of total site soft and hard cover must be developed and used to determine the extent of environmental impacts associated with site coverage. Without a clear understanding of how much land is to be covered by development, potentially significant environmental impacts to drainage, water quality, habitat, and special status species, among others, and the creation of geologic and flooding hazards cannot be identified, let alone assessed.

Watt 19 – Response

Section 2.0 of the Draft Revised Subsequent EIR includes a detailed project description including information pertaining to lot sizes, private streets, and proto-typical architecture as indicated in the comment. The level of detail requested in this comment such as a description of swimming pools and accessory uses is not required for an EIR. Residences will be developed in accordance with County zoning standards for the lot sizes shown on the Vesting Tentative Tract Map. The amount of land to be covered by development is clearly defined by the information in Figure 4.2.4 of the Draft Revised Subsequent EIR and provides sufficient information for assessing impacts to habitat, special status species, geologic and flooding hazards, etc. For analysis that is dependent on more detailed information (i.e., home size, lot coverage, etc.) worst-case estimates were made. For example, the visual simulations were prepared based on assumptions on the size and bulk of the proposed homes consistent with the County's zoning ordinance (see Section 4.9 of the Draft Revised Subsequent EIR). The water quality analysis made worst-case estimates of the amount of impervious surfaces that would result from implementation of the proposed project (see Section 4.4 and Appendix E of the Draft Revised Subsequent EIR). No additional analysis is required.

Watt 20 – Comment

5. The DRSEIR Fails to Describe Adequately the Proposed Project's Construction Activities and Phasing.

The project description provides a cursory description of construction phasing and activities. Among the information that is not sufficient is information about the extent and duration of grading activities. Without a description of these activities and phasing and the assumptions underlying the air quality estimates, the DRSEIR cannot adequately identify and analyze environmental impacts to air and water quality, among others, due to truck traffic and emissions, construction noise and dust. An EIR for a project such as this must include a description of the construction period activities, including, but not limited to: phasing; types of equipment; construction employment; staging areas, borrow sites and spoils disposal sites, among other details of the construction that could result in impacts. A revised environmental document must be prepared that includes this information and revised impact analyses as warranted based on the information.

Watt 20 – Response

Please see Section 3.3.2 (Connor 10 – Response) of this Response to Comments document.

Watt 21 – Comment

6. The DRSEIR Fails to Describe the Project Site's Biological Resources and Habitats Adequately.

The DRSEIR fails to adequately describe biological resources on- and off-site. The document contains inadequate information concerning on-site biological resources, including oak woodlands, aquatic resources, raptor nesting locations and wildlife corridors, and fails to provide any description of biological resources within an adequate cumulative study area, which at a minimum should include the entire Southern Subregion and Central NCCP areas.

Finally, the relationship of the project site to the Southern Orange County NCCP is not described or analyzed. There is a Figure in the DRSEIR, which illustrates a proposed Southern reserve, but the DRSEIR fails to state how this related to the proposed project. See Figure 4.8-2. Clarification is needed concerning the Southern NCCP process and its implications for this project. Without the inclusion of these, and other, key details of the on- and off-site biological regime, the DRSEIR cannot adequately analyze project-related and cumulative impacts.

Watt 21 – Response

Biological resources are described in Section 4.8 and in detail in Appendix I of the Draft Revised Subsequent EIR. Please also see Section 3.3.2 (Connor 19 – Response) of this Response to Comments document.

The commenter's request for inclusion of the entire Central and Southern Sub regions of the NCCP is not appropriate. These tow sub regions represent over 87,300 acres, as compared to the project's 222 acres.

Watt 22 – Comment

7. The DRSEIR Fails to Describe Project Inconsistencies with Applicable Plans.

A number of plans are applicable to the project site including, but not limited to:

The Orange County General Plan
The Foothill/Trabuco Specific Plan
Aliso Creek Corridor Specific Plan
The Central-Coastal Subregion Natural Community Conservation Planning/Habitat Conservation Plan (NCCP/HCP)

The DRSEIR provides a very cursory policy consistency review in the Land Use section and the biological resources sections. The consistency review does not include a table of key policies and "findings" as to project consistency with these policies. It appears that the section omits several key policy inconsistencies, including the following:

Orange County General Plan

The Orange County General Plan Resources Element includes several policies concerning protection of natural resources as follows:

Goal 1: Protect wildlife and vegetation resources and promote development that preserves these resources.

Goal 3: Manage and utilize wisely the County's landform resources.

Objective 3.1: To minimize to the extent feasible the disruption of significant natural landforms in Orange County.

Policy 1. To identify and preserve the significant wildlife and vegetation habitats of the County.

Policy 5. To protect the unique variety of significant landforms in Orange County through environmental review procedures and community and corridor planning activities.

The project as proposed appears to conflict with these overarching goals, objectives and policies of the Orange County General Plan. A revised analysis of project consistency with applicable General Plan policies must be included in a revised and recirculated environmental document.

Watt 22 – Response

Section 4.1 of the Draft Revised Subsequent EIR includes a discussion of the proposed project's consistency with applicable plans. Further, the proposed project would not conflict with the goals objective or policies of the plans identified by the commenter. As discussed in Section 2.0 of the Draft Revised Subsequent EIR, approximately 70 percent of the site would remain as open space and detailed mitigation has been developed to protect and enhance the biological resources on-site (Goal 1 and Policy 1), and contour grading would provide for edge treatments responsive to the natural terrain (Goal 3, Objective 3.1, and Policy 5).

Watt 23 – Comment

The Foothill Trabuco Specific Plan

The Foothill Trabuco Specific Plan calls for preservation of significant landform, biological, cultural and scenic resources on-site. According to the DRSEIR's alternatives analysis, only Alternative 4 is consistent with the Specific Plan requirements. Also according to the DRSEIR, "[t]he proposed project would be in substantial compliance with or consistent with the previously approved and Recorded Map 10692 with respect to proposed residential gross density and providing for the provision of a substantial increase in open space and the presence of a wildlife corridor as outlined in the F/TSP." DRSEIR at page 4.1-12. However, the proposed project would amend the F/TSP. DRSEIR at page 4.1-12. Nowhere in the DRSEIR are the proposed amendments to the F/TSP outlined.

The proposed project is inconsistent with the F/TSP in other major respects, including, but not limited to its failure to provide information required by the F/TSP (see Letter submitted by Rural Canyons Conservation Fund, dated May 28,2002, hereby incorporated by reference).

Watt 23 – Response

Please see Section 3.3.2 (Connor 3 – Response and Connor 4 – Response) of this Response to Comments document.

As stated in Section 2.4 of the Draft Revised Subsequent EIR, the project requires approval of the following discretionary approvals: Area Plan 98-2, Zone Change 98-3, Tentative Tract Map 15784 and Vesting Tentative Tract Map 15230, all of which are incorporated by reference. These documents provide the level of information required by the F/TSP.

Watt 24 – Comment

The Central-Coastal Subregion Natural Community Conservation Planning/Habitat Conservation Plan (NCCPHCP)

Figure 4.8.2 indicates that the entire project site is located within an NCCP "reserve area." The DRSEIR fails to point this out or to analyze the implications of this for the project. A significant theme of all of these plans is the protection of key wildlife corridors in the area. It is clear from the project site plan that minimal provisions will be made for continued wildlife movement and those species that attempt to traverse the on-site corridor will be subject to significant additional constraints including: modified topography, new road corridors, presence of new residents in the area, increased noise and lighting as well as residential units in the path of the Northern Corridor. See Figure 4.8.4. The project will have significant impacts on wildlife migration that must be identified in the environmental document and called out as inconsistencies with applicable policies in the above-listed Plans. To the extent that wildlife corridors are assumed on adjacent privately owned properties, the revised environmental document should explain how these corridors would be maintained and not destroyed by cumulative development projects.

Watt 24 – Response

Please see Section 3.2.1 (USFWS/CDFG 4 - Response) of this Response to Comments document.

Watt 25 – Comment

B. The DRSEIR's Analysis of Environmental Impacts Is Inadequate.

The DRSEIR's analysis of environmental impacts fails to provide the necessary facts and analysis to allow the County and the public to make an informed decision. Without such detail, the DRSEIR is deficient under CEQA. The

role of the EIR is to make manifest a fundamental goal of CEQA: to "inform the public and responsible officials of the environmental consequences of their decisions before they are made." Laurel Heights I, 6 Cal.4th at 1123. To do this, an EIR must contain facts and analysis, not merely bare conclusions. See Citizens of Goleta Valley v. Board of Supervisors, 52 Cal.3d 553,568 (1990). Any conclusion regarding the significance of an environmental impact not based on analysis of the relevant facts fails to achieve CEQA's informational goal.

As set forth below, the DRSEIR is riddled with conclusory statements regarding environmental impacts, unsupported by facts and necessary analysis. Furthermore, the DRSEIR attempts to defer analysis of environmental impacts to a later date. As discussed below, such deferral is not an option. CEQA mandates that environmental impacts be identified and analyzed in the EIR, not at a later date. See Sundstom v. County of Mendocino, 202 Cal.App.3d 296 (1988) (holding that a negative declaration was invalid when county approved a project while postponing the resolution of uncertainties regarding environmental impacts to a later date).

Watt 25 – Response

Please see Section 3.3.12 (Watt 4 – Response) of this Response to Comments document. It is unclear as to what the commenter is referring to regarding "… defer analysis…" The Draft Revised Subsequent EIR fully analyzed impacts to each environmental resource area, please see Section 4.0.

Watt 26 – Comment

1. *The DRSEIR Fails to Analyze Impacts to Biological Resources Adequately.*

The DRSEIR's biological impacts analysis is inadequate in numerous respects, including, but not limited to:

Underestimation of project-related impacts to biological resources: The DRSEIR fails to adequately characterize the extent of project-related impacts to biological resources: First, the uses and management of the open spaces on the project-site are not sufficiently defined and "locked-in" to ensure that biological resources located in these areas will not be impacted. For example, if there are recreational uses in the open space areas, wildlife may not use these migration corridors. In addition, impacts could be associated with the public and private landscaping plans, which are not required to be prepared until after project approval and EIR certification. See SC 8-7 and SC 8-8. No criteria are specified in the DRSEIR for these plans. Moreover, because the full extent of grading and importation of fill/exportation of cut is not disclosed, there are likely to be additional impacts to biological resources on- and off-site that are not described in the DRSEIR. If recreation and other uses are to be prohibited in the open space areas, a revised DRSEIR must state how these restrictions will be enforced and cite examples where similar restrictions have been effective (e.g. more effective than "fencing," which is a proposed mitigation measure).

Watt 26 – Response

The proposed project's potential impacts to biological resources have been thoroughly analyzed and detailed mitigation has been developed. The project was re-designed at the request of the U.S. Fish

and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG) to provide an east/west wildlife corridor to connect the project area to the Cleveland National Forest. Please see Section 4.8 and Appendix I of the Draft Revised Subsequent EIR and Appendix B of this Final Revised Subsequent EIR.

SC 8-7 and SC 8-7 both include detailed criteria regarding the preparation of public and private area landscape plans (please see page 4.8-30 of the Draft Revised Subsequent EIR). These Standard County Conditions require review and approval of all landscape plans by the County. Said plans must take into account the County standard plans for landscaped areas, adopted plant palette guides, applicable scenic requirements, and water conservation measures. The level of detail required regarding landscape plans for the proposed project is consistent with the standard manner in which development projects are processed.

Please see Section 3.3.11 (Watt 16 – Response) of this Response to Comments document regarding grading.

Watt 27 – Comment

Deferral of analysis and mitigation: The DRSEIR improperly defers surveys for trees that host nesting raptors. Trees on the project site that provide nesting should be identified prior to certification of the EIR and protection provided as required under the federal MTBA. DRSEIR at page 4.8-22.

Watt 27 – Response

PDF 8-1 included in Section 4.8.4 of the Draft Revised Subsequent EIR does not defer surveys for trees that host raptors but instead requires an *additional* survey prior to the start of construction. Please see Section 4.8.1 and Appendix I of the Draft Revised Subsequent EIR for details of all of the biological surveys, including raptor surveys, completed for the proposed project.

Watt 28 – Comment

Insufficient evidence to support a conclusion that indirect effects would be insignificant. The DRSEIR's conclusion that indirect effects are insignificant is not supported by evidence. The proposed site plan results in a pattern of development (roads and houses) that fragments the property, extends to adjacent undeveloped lands and has an extensive edge. Moreover, the project would introduce lighting, noise and residents in a wildlife area - the effects of which are not adequately disclosed or analyzed in the DRSEIR. Mitigation measures recommend "fencing" adjacent to undisturbed areas of open space. DRSEIR at page 4.8-32. Not only could such fencing result in additional impacts (e.g. impeding wildlife migration), but there is no evidence such fencing will effectively protect open space areas from trespass by children, pets and the like. Additional evidence must be provided in a revised environmental document to support the conclusion that these indirect effects are not significant, particularly where there are a number of alternative projects that would significant [sic] avoid these impacts (e.g. Alternatives 4 and 7).

Watt 28 – Response

The project site is currently being used for horse and cattle grazing. Portions of the site have been previously grazed, cleared or disturbed. As stated in Section 4.8.2 of the Draft Revised Subsequent EIR, indirect impacts would not be significant due to the inclusion of a primary wildlife corridor and the proposed open space. This would minimize indirect impacts such as fragmentation, edge effects, lighting and noise.

Fencing described in M 8-2 of the Draft Revised Subsequent EIR was included at the request of USFWS. Please see Section 3.2.1 (USFWS/CDFG 2 – Response) of this Response to Comments document regarding wildlife corridors.

Watt 29 – Comment

Insufficient evidence is provided that mitigation measures will be effective. The DRSEIR does not provide sufficient evidence that proposed mitigation measures will actually mitigate impacts to less than significant levels. First, the DRSEIR implies that the biological resource mitigation plan has the blessing of the resource agencies:

"The biological resource mitigation plan has been reviewed by the effectual regulatory agencies and a biological opinion has been issued by USFWS. The biological resource mitigation plan mitigates project related impacts to wetland/riparian habitats, sensitive upland habitats and wildlife movement..." DRSEIR at page 4.8-23

Yet, there are no letters in the DRSEIR which document that these agencies have agreed that the biological resource mitigation plan will adequately mitigate project related impacts to biological resources. Furthermore, the referenced biological opinion purports only to "transmit our biological opinion based on our review of the proposed Saddleback Meadows Residential Development Project located in Orange County, California and its effects on the federally endangered Riverside fairy shrimp (Srreptocephulus woottoni "fairy shrimp") and its designated critical habitat, and designated critical habitat for the threatened coastal California gnatcatcher (Polioptila californica californica, "gnatcatcher"), in accordance with section 7 of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.)." (Biological Opinion, dated October 26, 2001, at page 1.) I.e., this biological opinion is confined to assessing the project's effects on two species, only, and their designated critical habitats, under the federal Endangered Species Act, not CEQA. If these agencies have not signed off on the adequacy of the biological resource plan under CEQA, the DRSEIR should not leave the impression that they have done so. A revised DRSEIR must include information from the agencies concerning the adequacy of the biological resources plan so that the public and the decision-makers are fully informed about the likely changes these agencies will require in order to issue permits for the project (such changes may include additional mitigation or reconfiguration of the site plan).

Watt 29 – Response

Please see Section 3.2.1 (USFWS/CDFG Responses) of this Response to Comments document.

Watt 30 – Comment

The letters previously submitted by the wildlife agencies on prior project environmental documents raise significant concerns about the project's impacts on biological resources. Specifically, the October 29" letter states:

"Our biologists' professional opinion is that neither of the two previously submitted preferred projects (318 DU and 705 DU) nor the 299 DU Contingency Plan retain appropriate topography and habitat to ensure the continued function of the wildlife movement corridor/linkage that exists on Saddleback Meadows. As currently proposed, the 299 DU Contingency Plan development "footprint" would severely constrain wildlife movement from O'Neill Regional Park (i.e. southern NCCP planning area) to the Central NCCP reserve and Cleveland National Forest and is not acceptable." October 29, 1998 letter at page 2. See Letters from the wildlife agencies dated October 29, 1998 and August 8, 1997, hereby attached as attachments 2 and 3 and incorporated herein by reference.

Watt 30 – Response

Please see Section 3.3.2 (Connor 20 – Response) of this Response to Comments document.

Watt 31 – Comment

Second, the DRSEIR assumes that Project Features and mitigation measures will reduce project-related impacts to biological resources to less than significant levels. Such measures include highly experimental elements such as creation of new ponds and relocation of species (fairy shrimp) the possible failure of which is explicitly anticipated by the cited biological opinion No documentation is provided about projects that have successfully used these techniques.

Watt 31 – Response

Please see Section 3.3.2 (Connor 22 – Response) of this Response to Comments document.

Watt 32 – Comment

Third, the DRSEIR makes clear that drainage and water quality mitigation "features" are not yet completely designed. Questions remain whether the proposed system will maintain water quality, particularly with respect to bacterial indicators and toxic constituents. DRSEIR at page 4.4-l. Yet, the DRSEIR contains no mention of, or analysis concerning the potentially significant project-related and cumulative impacts of bacterial and toxic constituents on species in the creek system downstream of the project site. This analysis must be included in a revised environmental document. Nor does the DRSEIR explain how the project can comply with new water quality regulations recently ordered against the County of Orange by the Regional Water Quality Control Board (CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD SAN DIEGO REGION ORDER NO. R9-2002-0001 NPDES NO. CAS0108740 WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES OF URBAN RUNOFF FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE WATERSHEDS OF THE COUNTY OF

ORANGE, THE INCORPORATED CITIES OF ORANGE COUNTY, AND THE ORANGE COUNTY FLOOD CONTROL DISTRICT WITHIN THE SAN DIEGO REGION), February 13.2001.) These stricter regulations supplant the 1994 NPDES permit referenced in the DSEIR and were enacted due, in part, to the extremely impaired water quality existing in Aliso Creek, adjacent to the project, resulting in numerous beach closures at Aliso Beach.

Watt 32 – Response

Please see Section 3.3.8 (Saddleback Canyons Conservancy 4 – Response) of this Response to Comments document. The proposed project will meet the permit requirements of the RWQCB.

Watt 33 – Comment

Fourth, the DRSEIR clearly relies on the long-term maintenance of wildlife corridors on adjacent privately owned properties, some of which are planned for future development. Yet, there is no description of how these corridors would be protected from development, and no analysis of the cumulative impact of future developments that could interfere with essential corridors.

Watt 33 – Response

Figure 4.8.4 of the Draft Revised Subsequent EIR depicts the relationship between the proposed on-site wildlife movement corridor and the regional wildlife movement corridors. The project site currently has a recorded map for 705 manufactured housing/mobile home units with no provision for a wildlife corridor. Future developments would be subject to the same requirements as the proposed project with regard to potential impacts to wildlife corridors and would be required to mitigate any impacts to less than significant.

Watt 34 – Comment

Finally, the DRSEIR fails to state how the project will comply with the NCCP/Coastal Sage Scrub agreement. This information must be included in a revised DRSEIR.

Watt 34 – Response

Although the proposed project is consistent with the NCCP, the plan for this portion of the County has not been completed. The project applicant has worked with wildlife agencies to minimize impacts to coastal sage scrub and provide for significant on-site preservation and off-site acquisition. Combined, these measures fully mitigate impacts to coast sage scrub.

Watt 35 – Comment

Inadequate cumulative analysis. Similar to other cumulative discussions in the DRSEIR the biological resource section cumulative "analysis" is nonexistent. The brief discussion concludes that "...all identified related projects in the region would have to mitigate biological impacts to less than significant." DRSEIR at page 4.8-22. This statement is not sufficient to support finding that there would be no cumulatively significant impacts to biological resources in the region. A revised discussion must identify cumulative projects and their collective impacts (by species, habitat and acreage), disclose the mitigation measures that would be required, provide evidence that the mitigation would be effective and document the conclusion that there would be no significant cumulative impacts.

Watt 35 – Response

Cumulative biological impacts were discussed in Section 4.8.3 of the Draft Revised Subsequent EIR. In addition, as shown on Table 4.8.3, the project would mitigate for more habitat (on-site/off-site) than it would actually impact (53.07 acres impacted/80.48 acres as mitigation).

Watt 36 – Comment

Failure to identify potential inconsistencies with applicable plans and policies. The preliminary reserve design for the Southern Subregion NCCP, Figure 4.8-2, appears to include the site in the reserve. Not only does the DRSEIR fail to discuss the fact that the Southern Subregion NCCP is underway, with updated reserve designs due in July 2002, the DRSEIR fails to disclose that the site is identified as part of the reserve on Figure 4.8-2. A revised environmental document must discuss how the NCCP process applies to the proposed project. Specifically, since the Board of Supervisors agreed to participate in the NCCP process in 1993, can the Board properly take action on this project in advance of the NCCP process reaching major milestones concerning proposed reserve design or even more advanced outcomes? What is the relevance of the site being shown as part of the "reserve" in Figure 4.8-2?

Watt 36 – Response

Please see Section 3.3.12 (Watt 34 – Response) of this Response to Comments document. The entire project is not included as preserve in Figure 4.3.2 of the Draft Revised Subsequent EIR. As noted, the proposed project has been designed to ensure connectivity through the project and meet the objectives of the NCCP for this portion of the County.

Watt 37 – Comment

2. *The DRSEIR Fails to Disclose and Analyze Impacts to Geology and Soils Adequately.*

The DRSEIR is deficient in its analysis of geologic impacts. As noted above, the project description and the DRSEIR as a whole provide little information regarding the massive grading and fill required to actualize this proposed project. The extent of cut and fill also appears to underestimate what could be required to accommodate the project as proposed. It is not clear from the DRSEIR whether importation and exportation of fill will be necessary. If necessary, no analysis is provided of the additional impacts of such activities, including, but not limited to: traffic

associated with hauling materials, direct impacts to borrow and spoils sites, air quality implications and the like. A revised analysis must include evidence that supports the DRSEIR's assertion that grading will balance on site, or in the alternatives, the true extent of project-related impacts must be disclosed. Also, clearer graphics showing the extent and location of cuts and fills must be included in a revised document so that the public and decision-makers can fully appreciate the impacts of this project on the topography.

Watt 37 – Response

Please see Section 3.3.12 (Watt 16 – Response) of this Response to Comments document.

Watt 38 – Comment

3. The DRSEIR's Analysis of Air Quality Impacts Is Incomplete.

The Air Quality section states:

"A reasonable reduction percentage through the implementation of an aggressive transportation system management (TSM) would achieve a measurable reduction when applied to such a large baseline emissions level. If the air quality impact from mobile source emissions is to be maintained at an acceptable level, a viable TSM program is an imperative strategy toward achieving that end."

The discussion fails to discuss the fact that a leading contributor to emissions, and the least likely land use configuration to successfully result in TSM program trip reductions is suburban sprawl - the land use configuration proposed by the project. No discussion is included in the DRSEIR about meaningful ways to address air quality in terms of major policy changes to how the County uses and develops land (e.g. the County could refocus its efforts to accommodate new housing in "infill" areas, and the like). No TSM mitigation measure is included for the project, because the type of land use proposed by the project is not conducive to TSM programs. In light of the fact the County is located within a non-attainment basin, the County should evaluate bolder land use policy measures to address air quality emissions. Such measures (alternatives such as locating housing in infill areas) should be discussed in the DRSEIR.

The DRSEIR appears to understate the impacts on air quality that will be generated both by project construction and by the built project itself. As noted above, the DRSEIR fails to adequately describe construction activities and phasing, and fails to analyze potential air quality impacts associated with hauling cut and fill on-and off-site. Therefore, the DRSEIR fails to analyze and disclose the potentially significant impacts associated with these activities. As stated above, additional information concerning the suitability of on-site soils as fill for the project must be provided if the DRSEIR is going to assume that cut and fill will balance on-site. Alternatively, a revised environmental document must analyze the impacts associated with exportation of unsuitable cut material and importation of suitable fill material. This analysis must include disclosure of both 1) where the materials will be disposed of and 2) locations for imported fill.

The other major deficiency in the analysis is the lack of any meaningful analysis of cumulative air quality impacts. A revised environmental document must include such an analysis (e.g. other construction projects in the area generating air pollutants; etc.).

Watt 38 – Response

Please see Section 3.3.2 (Connor 10 – Response) of this Response to Comments document regarding construction activities. As stated above, the reference to export/import of material is incorrect. The air quality analysis correctly analyzed impacts with regard to construction activities and phasing.

As stated in Section 4.6.3, a related project with a similar timeframe as the proposed project would increase the short-term emissions for concurrent activities during any day of the construction period. Any additional construction activity during this time and in the vicinity of the project would add additional air pollutant emissions. However, these other projects would be required to include mitigation to reduce these emissions to less than significant levels.

Watt 39 – Comment

4. The DRSEIR Fails to Analyze Hazards Adequately.

The DRSEIR defers analysis of potential on-site contamination. Specifically, the potential for on-site contamination is deferred until prior to recordation of the subdivision map. See SC 2-13 at page 4.2-l 6 of the DRSEIR. At a minimum the results of a phase I site assessment should be included in a revised environmental document.

Watt 39 – Response

As stated in Section 2.1.1 of the Draft Revised Subsequent EIR, the project site is largely undeveloped and portions of the site have been previously grazed, cleared or disturbed. The site is currently being used for horse and cattle grazing and there is no historical use that would indicate the potential for on-site contamination. A Phase I study was completed in 1978 and included as Appendix O of the Draft EIR No. 561, which was incorporated by reference in Section 1.1 of the Draft Revised Subsequent EIR.

Watt 40 – Comment

5. The DRSEIR Fails to Analyze Land Use and Planning Impacts Adequately.

The DRSEIR fails to describe all relevant policies and plans, and fails to evaluate the consistency of the project with each policy. Each relevant County and other agency policy, general plan policy, regulation, guideline or standard should be summarized in a table, noting whether the project is consistent with the applicable provision and what must

be done to reconcile the two [sic] *where they are inconsistent. Instead, the DRSEIR fails to identify key County policies and fails to discuss the applicable policies and regulations of other agencies (e.g., policies of the U.S. Fish and Wildlife Service and the Regional Water Quality Control Board among others). A revised environmental document must include this analysis.*

Watt 40 – Response

Please see Section 3.3.12 (Watt 22 – Response) of this Response to Comments document. All applicable plans and policies related to the proposed project were discussed in the EIR. In addition to the land use policies included in Section 4.1; Section 4.4 included a discussion of regulatory policies of the State Water Resources Control Board and the Regional Water Quality Control Board; Section 4.5 included a discussion of Congestion Management Plans and traffic related policies of the County of Orange General Plan and the F/TSP; Section 4.6 included a discussion of the federal and state clean air standards, the Air Quality Management Plan; and Section 4.8 included a discussion of the Endangered Species Act, California Fish and Game Code, the Clean Water Act and the NCCP.

Watt 41 – Comment

6. The DRSEIR Fails to Analyze Impacts to Traffic Adequately.

The DRSEIR fails to disclose that the project's proposed land use pattern would not support sound transportation management practices because of its location, low density and contribution to the suburban sprawl pattern in Orange County. As a result, the project will perpetuate the exclusive use of automobiles for transportation, the very practice that has contributed to the traffic and air quality problems that are so acute in the County.

The Air Quality section states:

> *"A reasonable reduction percentage through the implementation of an aggressive transportation system management (TSM) would achieve a measurable reduction when applied to such a large baseline emissions level. If the air quality impact from mobile source emissions is to be maintained at an acceptable level, a viable TSM program is an imperative strategy toward achieving that end."*

No TSM mitigation measure is included for the project because the type of land use proposed by the project is not conducive to TSM programs. The DRSEIR should disclose this fact and acknowledge the poor pattern of land uses represented by this and other projects in the area, will continue to frustrate the County's progress toward acceptable traffic flows and clean air quality. A revised environmental document should discuss alternatives to the general plan land uses in the area - and explore the potential for transferring these planned units to infill sites.

Finally, the DRSEIR fails to adequately analyze cumulative traffic impacts including how projects of this type are likely to frustrate the County's attempts at a meaningful TSM program. The geographic study area for the analysis of cumulative projects is artificially small in size, and fails to provide a sufficiently large study area for many impacts,

including traffic, air quality and biological resources. See Table 3.1, Related projects. Moreover, there is no information provided on construction period traffic for even these related projects; information which must be provided and included in a revised cumulative analysis for traffic and air quality. The study area for the revised analysis should extend at least to the likely areas where new residents in the proposed project and related projects are employed. No such information is included in the DRSEIR. Thus, it is unclear how the study area was selected. Information concerning where new residents in these areas work and therefore commute, must be developed and used to form the basis for the new analysis of traffic and transit impacts.

Watt 41 – Response

Traffic issues related to land use and development of this site have been analyzed in the context of the Orange County Congestion Management Program (CMP) and the County of Orange Growth Management Program (GMP). Although each of these programs involves different specific objectives and requirements, the underlying goal from a transportation perspective is to eliminate or mitigate the impact of changes in land use on the transportation system. The CMP recommends that the study area for CMP highway system links be defined by a measure of significant traffic impact represented by three percent of roadway capacity. The GMP utilizes a more stringent test (than the CMP) of the effect of the project traffic on existing intersection operations to determine whether or not an intersection should be included in a project traffic impact analysis study effort. Intersections where the existing plus project intersection capacity utilization (ICU) increases by one percent (or more) compared to the existing ICU are included within the traffic impact analysis study area. The analysis area addresses project impacts based on direction from the County of Orange and in accordance with the GMP one percent test.

The basic approach taken in assessing the effects of the proposed project on traffic circulation in the study area has assumed that the worst case conditions would occur in association with the build-out of the General Plan land uses (as reflected in the officially adopted countywide population and employment growth forecasts) in the vicinity of the project site. A comprehensive travel demand forecasting analysis has, therefore, been undertaken for the express purpose of developing long-range traffic projections for a variety of conditions. Future conditions both with and without the proposed project have been evaluated.

The CMP also requires that the basic inputs to any model being used for traffic analysis purposes must be compared to the official regional projections of growth to verify model consistency with the official regional projections. The OCP-2000 growth forecasts are the currently adopted official projections for the County of Orange. These data has been incorporated into the OCTAM 3.1 tool used for this analysis.

The approach taken to this analysis was to use a computerized forecasting tool or traffic model to represent the interaction of the proposed project with the surrounding study area. The computerized

traffic modeling forecasts used to evaluate future build-out conditions for this traffic study were produced using a derivative of the Orange County Transportation Analysis Model (OCTAM). The OCTAM was developed by the Orange County Transportation Authority (OCTA). Inputs to OCTAM include the MPAH roadway structure and most current OCP-2000 socioeconomic data. Documentation of the traffic model is contained in the report OCTAM 3.1 Orange County Transportation Analysis Model Summary Documentation and Validation Report (OCTA, June, 2001). The commenter is also referred to that report for information concerning development of the traffic model and validation of the model. The area encompassed by the OCTAM contains the five Southern California Counties (Ventura, Los Angeles, Riverside, San Bernardino, and Orange) with most focus on Orange County.

Both the CMP and GMP are based on the evaluation of peak hour intersection operations using the ICU methodology. LOS "D" is the limit of acceptable peak hour intersection operations, with LOS "E" being defined as the beginning of deficient operations. Any peak hour intersection operations of LOS "E" or worse are, therefore, considered deficient in the project traffic analysis.

A traffic impact is considered significant if the project both: (1) contributes measurable traffic to; and (2) substantially and adversely changes the level of service to any intersection projected to experience deficient operations under foreseeable worst-case conditions.

Project Design Features, Standard County Conditions, and mitigation measures have been identified to reduce the project impact to a level of insignificance (see Section 4.5. of the Draft Revised Subsequent EIR). The feasibility of proposed mitigation measures has been evaluated on the basis of field reconnaissance and/or review of aerial photographs of the study area. The CMP and GMP then require that a project contribute a pro-rata contribution for improvements at locations requiring improvements.

Watt 42 – Comment

7. *The DRSEIR Fails to Analyze Adequately Impacts to Hydrology, Drainage and Water Quality.*

Pollution carried by storm water and urban runoff is the largest source of contamination to surface water both in California and nationwide. Construction sites, in particular, have been identified as significant dischargers of polluted storm water, involving high concentrations of silt and turbidity as well as oil and grease, trash, sewage, and other chemicals used in construction activities and equipment maintenance. Despite this well-known and well-documented problem, the DRSEIR fails to adequately describe construction activities and on-site and off-site drainage "improvements," both of which could impact the water quality of the area. See concerns raised above about the inadequate and incomplete description of the project drainage and water quality features.

Watt 42 – Response

Hydrology and drainage (Section 4.2 and Appendix D), and water quality (Section 4.4 and Appendix F) were discussed in detail in the Draft Revised Subsequent EIR.

Watt 43 – Comment

The DRSEIR concludes that there will be no significant drainage impacts after mitigation because of a highly engineered system of storm drains, catch basins, inlet/outlet structures, energy dissipators and slope drains to "control project drainage." DRSEIR at page 4.3-7. A "riverine water quality titration system" is proposed next to the road to "cleanse low flow urban runoff." DRSEIR at page 4.3-7. There is no evidence in the DRSEIR that confirms this combination of features will mitigate for the impacts associated with the introduction of impervious surfaces, the complete alteration of the on-site drainage system and redirection of the natural drainages. No examples of successful projects that are similar in features are provided in the DRSEIR.

Moreover, there is no discussion of what kind of long-term maintenance and monitoring will be needed to maintain this highly engineered system The DRSEIR merely states that the "structural and non-structural BMPs would be owned, operated and maintained by the home owner's association (HOA) or community services district." DRSEIR at page 4.4-12. Specific information about the drainage and water quality features and how they will be maintained and monitored over the long-term (including information about the cost of maintenance and monitoring) is essential to determine: first, whether the extent of drainage alterations is an acceptable project feature; and second, whether the proposed system of drainage features will actually be a viable system over the long-term, and effectively mitigate significant impacts to the natural drainage system. Specific information about the Riverine system, and the fact that the northerly development area does not have sufficient room to continue this system, suggests that the proposed project features may fall short of ensuring water quality is not adversely impacted by the project. DRSEIR at page 4.4- 11.

The revised document should include examples of projects that incorporated similar features and have been demonstrated to result in effectively addressing drainage and water quality impacts. Absent this information, the conclusion reached in the DRSEIR that "[u]pon implementation of the Project Design Features and compliance with the Standard County Conditions, water quality impacts would be mitigated to a less than significant level," is not supported by evidence.

Watt 43 – Response

The master drainage concept for the proposed project has been prepared in consultation with the County of Orange and utilizes standards and criteria of the Orange County Flood Control District (page 4.3-7 of the Draft Revised Subsequent EIR). The proposed Drainage Master Plan provides a series of water quality enhancement features designed to reduce stormwater quality impacts to Aliso Creek

Watt 44 – Comment

Finally, the significance of project-related impacts requires that the analysis of cumulative impacts to drainage and water quality be extensive. The DRSEIR fails to complete any analysis of these admittedly significant cumulative impacts, yet concludes that as a result of "required mitigation," cumulative impacts would not be significant. DRSEIR at pages 4.3-7 and 4.4-13.

Watt 44 – Response

The Draft Revised Subsequent EIR includes a comprehensive evaluation of project impacts on hydrology and water quality and a series of Project Design Features and mitigation to reduce impacts to less than significant (see Sections 4.3 and 4.4 and Appendices D and E).

Watt 45 – Comment

C. The DRSEIR Fails to Analyze Cumulative Impacts Adequately.

The DRSEIR utterly fails to analyze cumulative impacts in the manner or to the degree required by CEQA. The CEQA Guidelines define cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." CEQA Guidelines §§ 15355(a). "[I]ndividual effects may be changes resulting from a single project or a number of separate projects." Id.

A legally adequate cumulative impacts analysis views a particular project over time and must consider the impact of the project combined with other projects causing related impacts, including past, present, and probable future projects. CEQA Guidelines 15130(b)(l). Projects currently under environmental review unequivocally qualify as reasonably probable future projects to be considered in a cumulative impacts analysis. See San Franciscans for Reasonable Growth v. City and County of San Francisco, 151 Cal.App.3d 61, 74 & n. 13 (1984). In addition, projects anticipated beyond the near future should be analyzed for their cumulative effect if they are reasonably foreseeable. See Bozung v. Local Agency Formation Comm'n, 13 Cal.3d 263.284(1975). Alternatively, an EIR may utilize:

A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or areawide conditions contributing to the cumulative impact.

CEQA Guidelines § 15130(b)(l)(B). Any such planning document shall be referenced and made available to the public at a location specified by the lead agency. Id.

The discussion of cumulative impacts must include a summary of the expected environmental effects to be produced by those projects, a reasonable analysis of the cumulative impacts, and full consideration of all feasible mitigation measures that could reduce or avoid any significant cumulative effects of a proposed project. See CEQA Guidelines §§ 15126.4(a)(1) and 15130(b)(3).

The cumulative impacts concept recognizes that "[t]he full environmental impact of a proposed...action cannot be gauged in a vacuum." Whitman v. Board of Supervisors, 88 Cal.App.3d 397,408 (1097). The requirement of a cumulative impacts analysis of a project's regional impacts is considered a "vital provision" of CEQA. Bozung, 13 Cal.3d at 283. Moreover, an EIR must examine not only the anticipated cumulative impacts, but also reasonable options for mitigating or avoiding the project's contribution to significant cumulative impacts. CEQA Guidelines § 15130(b)(3). The DRSEIR does not come close to meeting these requirements for the reasons described below.

Watt 45 – Response

Please see Section 3.3.12 (Watt 3 – Response) of this Response to Comments document.

Watt 46 – Comment

1. *The DRSEIR's Cumulative Impacts Analysis' Geographic Study Area Is Too Small and Thus Inadequate Under CEQA.*

The DRSEIR considers a geographic study area far to small to reveal the true nature of the proposed project's cumulative impacts and, thus, is deficient under CEQA. The analysis of cumulative impacts appears to be based on a short list of "related" projects in the immediate area of the project. See Table 3.1 and Figure 3.2.

Among the major projects that must be included in a revised cumulative analysis include but are not limited to the massive Mission Viejo project and other projects in the Southern Subregion NCCP area. In September of 2001, the Mission Viejo Company filed an application for development of its land. As such, the cumulative analyses of land use and planning, geology and soils, hydrology and water quality, air quality, traffic and transportation, biological resources, public services and utilities, aesthetics and growth inducement must consider this potentially massive foreseeable project.

Furthermore, the document does not provide even minimal information regarding other projects within the Southern Orange County NCCP Study area. Analysis of these additional projects is particularly important given the project's location in the Southern Orange County Natural Community Conservation Program Study area.

Although the DRSEIR concludes that the project's cumulative impacts, with the exception of air quality, will not be significant, such a conclusion cannot be supported in light of the inadequacy of the geographic study area. The DRSEIR's failure to consider the 14,000 home Rancho Mission Viejo Project alone renders its scope inadequate. The DRSEIR must also acknowledge and analyze the project's significant cumulative impact on the existing severely "impacted" water quality in adjacent Aliso Creek. This failure to consider regional or area wide cumulative impacts is fatal under CEQA and, as such, the document must be revised.

Watt 46 – Response

The geographic study area used for the cumulative analysis in the Draft Revised Subsequent EIR was appropriate for this size and scale of project. Please see Section 3.2.6 of the Response to Comments document, which includes a letter from the Southern California Association of Governments (SCAG). As stated in SCAG's letter, the proposed project is not of regional significance. The project's cumulative impacts have been adequately addressed.

Watt 47 – Comment

2. *The DRSEIR Fails to Analyze any of the Cumulative Impacts Adequately.*

In addition to relying on a far too small geographic study area, the level of analysis in the DRSEIR's cumulative impacts analysis is far too cursory. An EIR must include objective measurements of a cumulative impact when such data are available or can be produced by further study and are necessary to ensure disclosure of the impact. See Kinas County, 221 Cal.App.3d at 729. Despite this mandate, the DRSEIR fails to analyze adequately a number of cumulative impacts, including, but not limited to, impacts to biological resources, water quality and drainage, and aesthetics, among others.

For example, with regard to cumulative water quality impacts, the DRSEIR states that "Ultimate development planned in the watershed in conjunction with the proposed project would potentially impact both surface and groundwater quality. Without controls, both short-term construction-related and long-term impacts due to pollutants in urban runoff could substantially impact water quality." DRSEIR at page 4.4-13. Despite this finding and despite the project's location in the watershed streams, the DRSEIR concludes that: "...as with the proposed project, related projects would be required to mitigate impacts to water quality to less than significant levels." Id. The DRSEIR fails to adequately summarize any information that would support the conclusion, and offers no supporting analysis itself. A revised environmental document must include analysis of cumulative impacts in order to support the conclusions throughout the DRSEIR that cumulative impacts will be reduced to less than significant levels. Statements such as: "cumulative projects are required to mitigate their impacts, therefore they will," are insufficient to support findings that all cumulative impacts, except air quality, will be less than significant.

Moreover, none of the cumulative impact discussions provide quantified information concerning cumulative project impacts, including, but not limited to: acres of habitat types directly/indirectly impacted by development or total construction trips. This information must be provided in revised cumulative analyses in a revised environmental document. Without such information, there is insufficient evidence to support the DRSEIR's conclusion that cumulative impacts to biological resources, traffic and water quality, among other impacts, will be insignificant. A revised document must also specify mitigation measures for cumulative impacts. Currently, the DRSEIR includes conclusory statements in each section concerning potentially significant cumulative impacts. In each case, "required mitigation" is assumed to reduce significant cumulative impacts to less than significant levels. For example, the biology section contains the following statement concerning cumulative impacts:

"However, as with the proposed project, all identified related projects within the region would have to mitigate biological project impacts to less than significant." DRSEIR at page 4.8-22.

This conclusory statement provides no evidence that cumulative impacts to biological impacts will or can in fact be mitigated, nor is there any legal requirement that "all proposed projects" mitigate biological project impacts to less than significant. CEQA requires only that such impacts be mitigated to the extent feasible, which may not be to a less than significant level. See also DRSEIR at pages 4.1-12 (cumulative loss of open space would be adverse, but not significant); 4.4-13 (ultimate development in the watershed would potentially impact both surface and groundwater quality, but such impacts would be required to be mitigated to less than significant levels); 4.12-4, and other cumulative sections throughout the DRSEIR.

Watt 47 – Response

Cumulative impacts of the proposed and related projects were evaluated for each environmental factor in Section 4.0 of the Draft Revised Subsequent EIR.

Watt 48 – Comment

Finally, as described above, the DRSEIR fails to explore the full range of mitigation measures that could potentially reduce cumulative impacts below a level of significance. An EIR must examine reasonable options for mitigating or avoiding the project's contribution to cumulative impacts. See CEQA Guidelines §15130(b)(3).

Watt 48 – Response

Project Design Features and mitigation measures were included in the Draft Revised Subsequent EIR that would serve to incrementally reduce cumulative impacts. These include, but are not limited to, remedial grading activities that would stabilize slopes currently subject to landslides above El Toro Road (PDF 2-1); reduce sediment and pollutant transport to Aliso and Oso Creeks (PDF 3-1, PDF 4-4, PDF 4-6, and PDF 4-12); transportation improvements (M 5-3, M 5-4, and M 5-5); enhancement of biological resources (PDF 8-1); and additional recreational resources (PDF 11-1, PDF 11-2, PDF 11-3, PDF 11-4, PDF 11-5).

Watt 49 – Comment

D. The DRSEIR's Discussion of Growth-Inducing Impacts is Inadequate Under CEQA.

The DRSEIR must consider the growth-inducing potential of the project in this undeveloped area. CEQA requires that an EIR include a "detailed statement" setting forth the growth-inducing impacts of the proposed project .See Public Resources Code § 21100(b)(5); City of Antioch v. City Council of Pittsburg, 187 Cal.App.3d 1325, 1337 (1986). The statement must "[d]iscuss the ways in which the proposed project could foster economic growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment." CEQA Guidelines §

15126.2(d). It must also discuss how a project may "encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively" or "remove obstacles to population growth." Id.

The DRSEIR's brief growth-inducing section concludes that the project is consistent with growth management policies of SCAG's RCP and would not extend or serve beyond the project boundaries. There is no analysis of whether the extension of roads and services on-site, and the development of a water tank and access road off-site, would facilitate growth on adjacent properties. Nor does the discussion reach any conclusion as to whether the project is or is not growth inducing as required by CEQA. The DRSEIR fails to address the potential for the off-site water tank to support development on adjacent, currently undeveloped parcels. In addition, wastewater pipes would be extended on site. The DRSEIR fails to describe the potential for these pipes to support development beyond the project site. A revised environmental document must include an adequate analysis of the project's potential for growth inducement.

Finally, the DRSEIR fails to consider the precedent set by approval of this project. Specifically, the project interprets the general plan and other County plan policies to allow this development. No information is provided on the status of "permitted" development under the applicable plans for the area including the site and beyond. Figure 4.1.3, Foothill/Trabuco Specific Plan Land Use Designations, indicates development potential on a number of presently undeveloped properties that are contiguous to the project site. No information is provided in the DRSEIR concerning the status of development within the Specific Plan (e.g., the current statistical summary). It is clear that the development of the project site could have a growth inducing effect on these adjacent properties. Overall, the DRSEIR provides little evidence that the improvements to infrastructure, it will involve and the precedent it will set will not induce growth to adjacent undeveloped properties.

Watt 49 – Response

The proposed project would not effect growth inducement related to adjacent property, as the project does not extend access or utility infrastructure to accommodate additional growth. Furthermore, the project site has a recorded Final Subdivision Map for 705 manufactured/mobile home units, which was record in 1988.

Please see Section 3.2.6 of the Response to Comments document, which includes a letter from (SCAG). As stated in SCAG's letter, the proposed project is not of regional significance.

Watt 50 – Comment

In addition, the DRSEIR must analyze the potentially eviscerating effect of all other undeveloped sites within the Foothill Trabuco Specific Plan area seeking to follow the precedent of spot-amending the Specific Plan to explicitly exempt proposed development from all of the regulations and guidelines of the Specific Plan.

A revised growth inducing analysis must be prepared and include the status of development permitted on adjacent properties under all applicable plan and policies. This analysis should inform a revised analysis of cumulative impacts, including, but not limited to the long-term sustainability of an adequate wildlife corridor system.

Watt 50 – Response

Please see Section 3.3.12 (Watt 49 – Response) of this Response to Comments document. As stated previously, an amendment to the F/TSP is not proposed or required.

Watt 51 – Comment

E. The DRSEIR Improperly Attempts to Defer Mitigation to a Later Date, Fails to Identify Feasible Mitigation Measures, and Relies on Inadequate Mitigation Measures.

CEQA requires that mitigation measures be identified and analyzed. "The purpose of an environmental impact report is…to list ways in which the significant effects of such a project might be minimized…." Pub. Res. Code § 21061. The Supreme Court has described the mitigation and alternative sections of the EIR as the "core" of the document. Citizens of GoletaValley v. Board of Supervisors, 52 Cal. 3d 553 (1990). As explained below, the DRSEIR's identification and analysis of mitigation measures, like its analysis throughout, is thoroughly inadequate. An EIR is inadequate if it fails to suggest mitigation measures, or if its suggested mitigation measures are so undefined that it is impossible to evaluate their effectiveness. See San Franciscans for Reasonable Growth v. City and County of San Francisco, 15 1 Cal.App.3d 61,79 (1984). Moreover, an EIR may not use the inadequacy of its impacts review to avoid mitigation: "The agency should not be allowed to hide behind its own failure to collect data." Sundstrom v. County of Mendocino, 202 Cal.App.3d 296,361 (1988). Nor may the agency use vague mitigation measures to avoid disclosing impacts. See Stanislaus Natural Heritage Project v. County of Stanislaus, 48 Cal.App.4th 182, 195 (1996). Lastly, the formulation of mitigation measures may not properly be deferred until after Project approval; rather, "[m]itigation measures must be fully enforceable through permit conditions, agreements, or legally biding instruments." 14 CCR § 15126.4 (a). In the present case, the DRSEIR does not come close to satisfying these basic CEQA requirements regarding impact mitigation. Most egregiously, it attempts to defer discussion and development of suitable mitigation measures until after the certification of the environmental document and the conclusion of public review.

Watt 51– Response

Please see Section 3.3.12 (Watt 7 – Response) of this Response to Comments document.

Watt 52 – Comment

1. The DRSEIR Improperly Defers Mitigation.

The DRSEIR impermissibly concludes that all of the project's environmental impacts, with the exception of cumulative air quality, will be mitigated below a level of significance, while at the same time deferring necessary analysis of mitigation measures. DRSEIR at page 9-1. Under CEQA, an EIR may conclude that impacts are insignificant only if it provides an adequate analysis of the magnitude of the impacts and the degree to which they will be mitigated.

See Sundstrom, 202 Cal.App.3d at 306-07. Thus, if an agency fails to investigate a potential impact, its finding of insignificance simply will not stand. Id. Further, CEQA generally requires that all mitigation measures be adopted simultaneously with, or prior to, project approval. An agency may defer preparation of a plan for mitigation only when the agency commits itself and/or the project proponent to satisfying specified performance standards that will ensure the avoidance of any significant effects. Id.

In the present case, the DRSEIR violates CEQA by deferring critical analyses of project impacts and necessary mitigation. The following is a non-exhaustive list of the project design features and mitigation measures that the DRSEIR improperly defers to a later date:

a. *PDF 3-1. A master drainage concept has been incorporated into project design to mitigate hydrology impacts to existing OCFCDs requirement sand standards…This Project Design Feature is being prepared in consultation with USACE.*
b. *M 4-l. The applicant shall have the option to research off-site water quality improvements to determine the technical and economic feasibility of implementing improvements that have regional water quality benefits and can also mitigate project-related impacts…*
c. *PDF 4-9. The storm drain system shall be designed to mimic natural drainage patterns as closely as possible. Emphasis added.*
d. *As part of final design, ponds and swales would be incorporated to the maximum extent feasible…DRSEIR at page 4.4-l 2.*

The DRSEIR's failure to adequately analyze the potentially significant effects of the project, and to design proper mitigation measures prior to project approval, renders the document inadequate and vulnerable to legal challenge. With the DRSEIR in its current form, decision-makers, the public and permitting agencies cannot evaluate the advisability of project approval. Too little is known, and too much is entirely unknown, about the project's environmental impacts.

Watt 52 – Response

Please see Section 3.3.12 (Watt 7 – Response) of this Response to Comment document.

Watt 53 – Comment

2. *The DRSEIR Fails to Identify Feasible Mitigation Measures.*

The DRSEIR's consideration of mitigation is inadequate because it fails to identify several feasible measures that could reduce or eliminate identified significant impacts. Mitigation is defined by CEQA as including:

a. *Avoiding the impact altogether by not taking a certain action or parts of an action.*
b. *Minimizing impacts by limiting the degree or magnitude of the action and its implementation.*
c. *Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.*

d. *Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.*
e. *Compensating for the impact by replacing or providing substitute resources or environments.*

CEQA Guidelines § 15370. The DRSEIR fails to consider measures, which could mitigate in the fashion described above significant impacts in several resource categories, including, but not limited to, biology, geologic hazards, hydrology and water quality, among others.

Watt 53 – Response

Project Design Features, Standard County Conditions, and mitigation measures have been included to mitigate impacts associated with the proposed project. Please see the following sections of the Draft Revised Subsequent EIR: Sections 4.8.4 and 4.8.6 regarding biology; Sections 4.2.4 and 4.2.6 regarding geologic hazards; and Section 4.3.4 regarding water quality.

Watt 54 – Comment

Furthermore, the DRSEIR improperly concludes that all impacts except cumulative air quality, are mitigated to below a level of significance based either on deferred mitigation measures, as discussed above, incomplete and "future" project features, or on mitigation measures of unproven efficacy. These determinations are not supported by substantial evidence. A partial list of impacts that should be identified as significant and unavoidable in a revised environmental document include, but are not limited to the following:

Project impacts to biological resources: *There is insufficient information in the DRSEIR to establish the efficacy of proposed mitigation measures including wildlife corridors and replacement ponds, and to support a finding that the impacts to biological resources will be less than significant with mitigation. Moreover, the applicant has not secured all of the necessary permits for the project and the agencies have not signed off on the adequacy of the proposed measures. Even with such agency approvals, significant impacts may remain. For these reasons, and because a feasible project alternative is proposed that would significantly reduce impacts to resources (Alt. 4), a revised environmental document should identify project related impacts to biological resources as significant and unavoidable.*

Cumulative impacts to biological resources. *In the USFWS biological opinion, the Service states under cumulative impacts:*

"At this time, we do not have adequate information to fully evaluate the potential impacts of the Saddlecreek/Saddlecrest Residential Development Project, Whispering Hills Development Project, and the Capistrano Valley Water District Pipeline Project on designated critical habitat for the gnatcatcher." Biological Opinion at page 23.

Another major project in the Southern NCCP area, the Mission Viejo Project, implicates some of the same species and habitats as the proposed project. Based on: 1) the significant amount of habitat loss involved with these development projects in combination with properties surrounding the project site "planned" for development; 2) the lack

of information concerning the efficacy of proposed mitigation measures; and 3) the lack of information concerning mitigation measures for cumulative projects, a revised environmental document should identify cumulative impacts to biological resources as a cumulatively significant and unavoidable impact.

Watt 54 – Response

Please see Section 3.3.12 (Watt 35 – Response) of this Response to Comments document.

Watt 55 – Comment

Project-related aesthetic impacts: *The DRSEIR finds that impacts to aesthetic and visual resources would be less than significant. DRSEIR at page 4.9-23. In support of this finding, the text of the document states:*

> *"The proposed project would not have a substantial negative aesthetic effect. As depicted in the visual simulations, Saddleback Meadows would be low-density and rural in character and would not conflict with the surrounding environment..." DRSEIR at page 4.9-23.*

The project is not "rural in character." Figure 2.9, Conceptual Streetscape, clearly illustrates a project that is suburban in character. Lot sizes averaging 6,672 square feet clearly represent urban/suburban development densities. The protection of fragmented areas of the project site in open space does not "transform" this suburban development into "rural" character. Based on Appendix G of the CEQA Guidelines, the transformation of this site from undeveloped to suburban in the midst of wildlife habitat would constitute a substantial degradation of the existing visual character of the site and its surroundings. Therefore, this impact should be identified as significant and unavoidable as clearly demonstrated by the visual simulations (Compare figures 4.8.4 and 4.9.1, and see Figures 4.9.4, 4.9.5, and 4.9.9, among other exhibits in the DRSEIR, which demonstrate the significant change in character of the site and surrounding area with development as proposed.)

Cumulative Aesthetic Impacts. *Figure 2.6 and 4.1.3 clearly indicate that other properties in the project area are designated for development. Cumulative development in the area should have been analyzed and mitigation measures proposed to ensure that the area's visual resources are not further degraded by planned development. Since no cumulative analysis was undertaken, and no cumulative mitigation measures are proposed, the potential for cumulatively significant and unavoidable aesthetic and visual impacts should be identified in a revised environmental document.*

Watt 55 – Response

As stated in Section 4.9 of the Draft Revised Subsequent EIR, with implementation of Project Design Features and Standard County Conditions, impacts to visual resources would be less than significant.

Watt 56 – Comment

Other impacts that should be identified as significant and unavoidable in a revised environmental document include, but are not limited to: plan and policy inconsistencies; landform alteration; project-related and cumulative drainage and water quality impacts; cumulative traffic impacts; and cumulative impacts to public services and utilities. Growth inducement should also be identified as a significant adverse result of the project. The DRSEIR does not include sufficient evidence to identity these and other impacts as less than significant after mitigation

Watt 56 – Response

These environmental factors were evaluated in the Draft Revised Subsequent EIR and found to be less than significant with implementation of Project Design Features, Standard County Conditions and mitigation measures.

Please see Section 3.3.11 (Watt 49 – Response) of this Response to Comments document.

Watt 57 – Comment

F. The DRSEIR Does Not Adequately Discuss Alternatives to the Proposed Project.

Although the alternatives section of the DRSEIR describes a number of alternatives, this section continues to fall short of the standard set by CEQA. Under CEQA, an EIR must analyze a reasonable range of alternatives to the project, or to the location of the project, that would feasibly attain most of the basic objectives while avoiding or substantially lessening the project's significant impacts. See Pub. Res. Code § 21100(b)(4); CEQA Guidelines § 15126.6(a); Citizens for Quality Growth v. City of Mount Shasta, 198 Cal.App.3d 433,443-45 (1988). As stated in Laurel Heights I, "Without meaningful analysis of alternatives in the EIR, neither the courts nor the public can fulfill their proper roles in the CEQA process…[Courts will not] countenance a result that would require blind trust by the public, especially in light of CEQA's fundamental goal that the public be fully informed as to the consequences of action by their public officials." 47 Cal.3d 376,404 (1988). The DRSEIR's discussion of altematives fails to meet these standards.

First, none of the development alternatives are "transparently" based on a comprehensive constraints map that identifies areas of high resource values and areas that should be avoided based on County plan policies. However, one of the alternatives, Alternative 4 – F/TSP EIR 531 Staff Alternative B, appears to avoid substantially more of the impacts than the proposed project and the other development alternatives. Alternative 7 - Acquisition Alternative, would protect key on-site resources because the site would be acquired rather than developed. Because of the resource values represented on the site, the site's sensitive location and its topography, all development alternatives, including Alternatives 4 and 6 would result in substantial grading of sensitive areas, impacts to water quality and biological resources and other significant impacts. A revised analysis should include an alternative based on a site constraints map, which represents current information about high value resources.

Watt 57 – Response

Please see Section 3.3.2 (Connor 2 – Response, Connor 29 – Response, and Connor 30 – Response) of this Response to Comments document.

Watt 58 – Comment

Second, the DRSEIR fails to describe an alternative location for the project housing. Therefore, no off-site alternative was evaluated. No information is contained in the DRSEIR concerning the potential for in-fill housing within the County, including on sites assembled by the applicant within incorporated and unincorporated areas to accommodate the units proposed by the project. Such sites should include "infill" sites with reuse, redevelopment and additional development potential (e.g. under performing shopping centers and other underutilized/vacant sites). The explanation in the DRSEIR concerning such sites is not supported by a methodology, analysis or facts. Moreover, the DRSEIR applied criteria to alternative sites that is unreasonably constrained. According to the DRSEIR:

"It is speculative, but unlikely that the project applicant could assemble other contiguous properties within the area to accommodate the number and type or [f] residences proposed for the project. Moreover, if such properties were identified and acquired by the applicant, the properties would likely have resources and environmental constraints similar to Saddleback Meadows. Development of the proposed project at an alternative location, therefore, is unlikely to be economically viable and would probably not reduce environmental impacts in comparison to the proposed project." DRSEIR at page 5-3.

Off-site alternatives to accommodate housing in the County should not be limited to contiguous properties. Recently, the Planning Center completed an analysis of where development could be accommodated in Orange County. See LA Times, June 17,2001 article. The study concluded that there are sufficient underutilized shopping center sites to accommodate significant development demand. Based on this information and a reasonable methodology for off-site locations, a revised analysis must describe specifically the methodology used to determine that alternative sites do not exist.

Watt 58– Response

Section 5.3 of the Draft Revised Subsequent EIR included a discussion of alternative locations for the proposed project. However, this alternative was eliminated from consideration due to the limited number of developable sites remaining in Orange County and alternative sites within outlying areas of the County are neither within the control of the applicant or unlikely to meet the project objectives. Further, it is speculative but unlikely that the applicant would assemble other contiguous properties within the area to accommodate the number and type of residences included as part of the proposed project. No additional analysis is required.

Watt 59 – Comment

Third, the DRSEIR fails to identify appropriate environmentally superior alternatives as required by CEQA. Specifically, the DRSEIR fails to identify Alternative 4 as the environmentally superior development alternative. See Table 5.7, which clearly indicates that Alternative 4 is the superior development alternative and meets the applicant's objectives. The DRSEIR improperly identities Alternative 8 as the environmentally superior alternative of the "non-no project alternatives." DRSEIR at page 5-47. This section of the DRSEIR must be revised to report the appropriate environmentally superior alternative based on the facts contained in the DRSEIR. Moreover, because Alternative 4 has fewer impacts than the proposed project, and meets project objectives, facts must be presented that this alternative is infeasible if it is rejected in favor of another development alternative.

Watt 59 – Response

Please see Section 3.3.2 (Connor 30 – Response) of this Response to Comments document.

Watt 60 – Comment

Finally, the DRSEIR fails to adequately analyze the feasibility of Alternative 7 – Acquisition Alternative. No information is provided concerning interest expressed by agencies and other conservation organizations to purchase the property and whether the applicant is a "willing seller." This information is critical to the County's consideration of the project and must be provided in a revised analysis. Moreover, this section should identify potential funding sources for purchase of the property, including Proposition 40 funding and the possibility of funding under the NCCP program if the site is upheld as important for inclusion in a reserve. The DRSEIR's statement that this alternative would not meet project objectives assumes that the County cannot develop an aggressive infill program as part of its housing element to provide for needed housing in the County. Information about the feasibility of meeting housing needs without relying on parcels that contain sensitive biological and environmental resources must be included in a revised analysis.

Watt 60 – Response

Please see Section 3.3.2 (Connor 30 – Response) of this Response to Comments document.

Watt 61 – Comment

II. THE PROJECT MUST BE DISAPPROVED OR THE DEIR MUST AGAIN BE REVISED AND RECIRCULATED.

The serious inadequacies of the DRSEIR are symptomatic of fundamental deficiencies in the project itself. Only a project as deeply flawed as this would fail to result in an adequate revised DEIR after the extensive and highly detailed comments provided by the groups and many others on the first DEIR. The enormous mass grading and placement of fill on erosion-prone soils required for the project seriously call into question the suitability of the site for residential development. The project would wreak unnecessary havoc on the habitat and corridors of several sensitive

and endangered species, including the gnatcatcher. For these reasons, the project application should be denied as inadequate and infeasible.

In the alternative and at a minimum, the County may not approve the project unless the DRSEIR is again revised and recirculated to fully disclose and analyze the project's impacts and a proper range of alternatives. Given the multiple inadequacies discussed above, this DRSEIR cannot properly form the basis of a final EIR. CEQA and the CEQA Guidelines require recirculation of a draft EIR where, as here, the document is so fundamentally inadequate in nature that meaningful public review and comment are precluded. See CEQA Guidelines § 15088.5.

CONCLUSION

As set forth above, the DRSEIR suffers from numerous deficiencies, many of which would independently render it inadequate under CEQA. Taken as a whole, the deficiencies of the DRSEIR are so pervasive as to necessitate further extensive revision of the document- and recirculated for public comment. National Audubon Society, Endangered Habitats League and Rural Canyons Conservation Fund respectfully request that the County deny the project at this time. The project should not be reconsidered until a legally adequate EIR is prepared.

Watt 61 – Response

This comment is a summary of statements included in the above comments. Responses to specific comments have been provided. The commenter's opposition to the project is noted and will be forwarded on to the decision makers.

3.4 INDIVIDUAL COMMENT LETTERS

The following individuals commented on the Draft Revised Subsequent EIR:

- Richard and Patti Gomez
- Mr. and Mrs. Michael Hodges
- Kathleen Stockwell
- Andy Wing

3.4.1 Richard T. Gomez And Patti A. Gomez

June 10, 2002

Gomez 1 – Comment

My wife and I are members of The Saddleback Canyons Conservancy which is dedicated to protecting and enhancing the environment and quality of life in the Foothill/Trabuco Specific Plan (FTSP) area and surrounding areas of Orange County; however, we submit these comments as residents and members of the concerned general public.
Compliance with the FTSP:

The FTSP was chartered by the Orange County Board of Supervisors to assure the "rural character of the area and preserve, forever, open space." The current request for exemption to the FTSP is not in keeping with the spirit or letter of the plan. Furthermore, such exemptions only serve those who would gain financially by such exemptions and do not serve the intended constituents, area residents or the planned protection envisioned by the plan.

We find this request inappropriate, unfair and a blatant disregard for the development guidelines that all residents must comply with. It is no coincidence the new project cannot comply with FTSP guidelines; it is simply too destructive. Just because a project cannot comply foes not warrant exemption; it is simply inappropriate planning, and that planning process must be revisited.

Gomez 1 – Response

Please see Section 3.3.2 (Connor 3 – Response) of this Response to Comments document regarding the proposed project's consistency with the F/TSP.

Gomez 2 – Comment

Cumulative impacts:

As you know this is not the only project currently being considered for this area. Unfortunately, each project is only evaluated with regard to itself and not for its cumulative impact on the environment. Water quality is a key component of this certain degradation and to ignore such cumulative impacts is not only a dereliction of duty and responsibility but an error in favor if an exception for a special interest project.

We encourage you to be diligent and objective in your analysis, not cursory and subjective.

Specific projects include the planned RPLA facility, SaddleCreek and SaddleCrest and the development at the Rancho Mission Viejo. All projects will increase overall pollutant loads and receiving waters should be properly analyzed. We ask that your agency require the applicant to comply with this request and address critical concerns of the FTSP compliance and protection of precious water quality resources.

Gomez 2 – Response

As stated in Section 4.4.2 of the Draft Revised Subsequent EIR, no significant impacts to water quality would occur with implementation of Project Design Features and compliance with Standard County Conditions. Please also see Section 3.3.8 (Saddleback Canyons Conservancy 4 – Response) of this Response to Comments document.

3.4.2 Mr. And Mr. Michael Hodges

April 30, 2002

Hodges 1 – Comment

As a longtime resident of Orange County, my wife and I are strongly opposed to further residential growth in South County and cannot support a zone change to the Foothill/Trabuco Specific Plan. Mission Viejo has done enough already with the enormous amount of homes and apartments being developed off El Toro road between Live Oak and Marguerite.

Hodges 1 – Response

The comment is noted and will be forwarded on to the decision makers. No additional response is required.

3.4.3 Kathleen Stockwell

June 7, 2002

Stockwell 1 – Comment

My name is Kathleen Stockwell and I reside in Mission Viejo, Please include my entire comment in the official record of proceedings for this project.

Of major concern are the sensitive biological resources that are present at Saddleback Meadows, and in particular the proposed mitigation and related hydrological/water quality issues closely related to the preservation of those resources. The Riverside fairy shrimp (Streptocephalus woottoni), present at Saddleback Meadows, is a Federal endangered species with a USFWS recovery priority of 5C, indicating "that it is a species facing a high degree of threat and having a low potential for recovery" (USFWS Recovery Plan for Vernal Pools of Southern California, Sept. 1998, pg. 19). This extremely rare, beautiful, and wonderful species has very limited geographical distribution, existing only in Southern California. Another Branchiopod that exists in one of the Saddleback Meadows ephemeral pools, Cyzicus californicus (a "clam shrimp") is equally fascinating and beautiful, and is related to fossil clam shrimps that date back in the fossil record ca. 350 million years!

DRSEIR566 implies that the "pilot" mitigation proposed to artificially create "ephemeral ponds/vernal pools" will bring the direct and significant impact to the existing ephemeral pools and the Riverside fairy shrimp to a less than significant level. This assumption is based on insufficient scientific evidence, since ***this type of mitigation is "experimental in nature with many uncertainties"*** *(USFWS Biological Opinion for Saddleback Meadows, pg. 19). The Riverside fairy shrimp, as a highly endangered species having a low potential for recovery, deserves the highest level of protection where it exists, and it is not being afforded this protection by allowing experimental mitigation that has a high potential for failure.*

Stockwell 1 – Response

Please see Section 3.3.2 (Connor 19 – Response) of this Response to Comments document. Additionally, the proposed project has attempted to avoid impacts to ponds supporting fairy shrimp. Without human maintenance of the ponds, they would eventually breach and/or silt in. The long-term management of the ponds and creation of additional ponds provides for significant long-term protection.

Stockwell 2 – Comment

The "Implementation Plan/Rationale for Expecting Implementation Success" (Appendix I.2, Section VI. Pg. 9) cites as justification for this mitigation a "recent review of vernal pool rehabilitation and creation projects" which mentions:

- *Ephemeral ponds created in San Diego County where one obligate vernal pool plant (Pogogyne abramsii) was sustained 5-10 years adjacent to existing habitat.*
- *A Del Sol Reserve vernal pool project in Santa Barbara County that demonstrated "pools created and restored in 1986 are self-sustaining and support native vernal pool plant species".*

- *One vernal pool construction project in Folsom, California where density and composition of microinvertebrae populations, including "several" species of fairy shrimp, were similar to adjacent reference pools. (Rogers 1998).*

What justification do these few and poorly explained examples provide? *The first two give vernal pool plant restoration examples. Furthermore, upon examination of the Folsom project in Sacramento County, California (Aquatic Macroinvertebrate Occurrences and Population Trends in Constructed and Natural Vernal Pools in Folsom, California, D. Christopher Rogers, 1996):*

- *This project is geographically far removed from southern California, and cannot represent unique ecological parameters that exist here.*

- *The two kinds of fairy shrimp occurring in the pools at the Folsom project are different species with requirements that vary from the southern California Riverside Fairy Shrimp. For example, both of these species, the Vernal Pool Fairy Shrimp (Branchinecta lynchi) and the California Fairy Shrimp (Linderiella packardi), develop to maturity in less time than the Riverside Fairy Shrimp. The Riverside Fairy Shrimp needs 1-2 weeks to hatch and another 7-8 weeks to reach maturity. The span in which the right conditions can occur must cover several month, not just two. This strongly suggests that created pools that are* ***only required to hold rainwater for a minimum of 60 days*** *at depths required for the Riverside Fairy Shrimp will not be adequate for long term survival of the Riverside Fairy Shrimp. Ephemeral pools in which large numbers of Riverside Fairy Shrimp can successfully breed in Orange County are deep pools that persist for four to five months, or even longer.* ***"Because these constructed pools are mitigation for impacted vernal pools, they need to demonstrate that they are functioning ecologically like naturally occurring vernal pools to be considered adequate compensation".*** *This takes time, a minimum of 10 years, according to the USFWS, and should not be allowed as an experiment unless the original ephemeral pools and their watersheds are left entirely intact until success is proven.*

Stockwell 2 – Response

Please see Section 3.3.2 (Connor 19 – Response) of this Response to Comments document. The reference cited is relevant in that it shows that pools with sensitive resources, including other fairy shrimp species can be successfully created. More importantly, as noted in Section 3.3.2 (Connor 19 – Response), ponds supporting Riverside fairy shrimp have been successfully created. The standard will be to create ponds capable of supporting Riverside Fairy shrimp over the long-term, not the creation of vernal pools since vernal pools are not the sensitive resource being impacted.

Stockwell 3 – Comment

Why is it that only a five year monitoring program is mentioned in the EIR, when 10 years is required? Why is deferral of mitigation allowed in case of failure? This is not acceptable.

- *The Folsom project that is quoted in the EIR only presented the results of the first two years in a nine year monitoring program, which began in 1994.* ***What is the current status of its results, and how does this relate to such projects in Orange County?***

- *The Folsom project site contains 273 natural vernal pools on 246.0 hectares, where 37 pools were constructed. The high number of natural vernal pools alone points to a higher chance for success of the created pools, in my opinion. This project, although admirable, does not seem to be in itself adequate justification for experimental mitigation for an entirely different species of endangered fairy shrimp and a different set of ecological circumstances in Orange County, where such high numbers of natural vernal pools never occur in one complex.*

The USFWS Biological Opinion for Saddleback Meadows, pg. 13 and 18, state: "The 9 ponds at Saddleback Meadows represent 53 percent of the 17 remaining occupied pools/ponds, making it the largest fairy shrimp habitat complex found in Unit 2" (L.A. Basin-Orange Management Area). "Implementation of the proposed project...represents a 56 percent loss of fairy shrimp ponds, and a 68 percent loss of the pond basin area, onsite." ***Why is it deemed acceptable to gamble with perhaps the most valuable habitat complex for the Riverside Fairy Shrimp in Orange County?*** *Page 19 of this same Biological Opinion states that "..construction of an artificial impervious layer to retain water [in sandy soils] for a minimum of 60 days..has never been done successfully. It is obvious to me that there should be a more concentrated effort to acquire the Saddleback Meadows property and preserve it as it now is. It is a real treasure for Orange County and very important for the NCCP process as well, since it "****represents the only low elevation wildlife corridor/linkage between the Central and Southern Subregions of the Orange County NCCP planning areas."*** *(page 18) Much effort has gone into the NCCP, but it seems the endangered fairy shrimp species and their ephemeral/vernal pond habitats of Orange County were never an integral part of the NCCP planning as they should have been.* ***The proposed wildlife corridor as presented in DSEIR 566 is also inadequate,*** *being much too narrow and poorly designed. Other sensitive species certainly exist at Saddleback Meadows, such as the Catalina and Intermediate Mariposa Lily populations, which have not been adequately considered either. Two well known host plants for the endangered Quino checkerspot butterfly also exist on this site, and should be in the preservation plan since existence of the Quino in Orange County is still possible.*

Stockwell 3 – Response

The Biological Opinion (BO) for the proposed project requires a ten-year monitoring program for the ponds (see Section 4.8.4 and Appendix I of the Draft Revised Subsequent EIR). The ponds on-site currently supporting fairy shrimp were created in the same soils as proposed for in the restoration plan. Soils tests conducted by the project geologist indicate that appropriate soils are available on-site to create an impervious layer capable of holding water for in excess of 60 days. The proposed project has been analyzed within the context of the Natural Community Conservation Planning Program (NCCP) and provides for wildlife movement through the project (please see Section 3.2.1, USFWS/CDFG 4 - Response, of this Response to Comments document).

Please see Section 3.3.2 (Connor 20 – Response) of this Response to Comments document regarding the intermediate Mariposa lily.

No Quino checkerspot butterflies were observed on-site and none are anticipated to occur.

Stockwell 4 – Comment

DSEIR566 fails to adequately define, analyze, and show mitigation for the hydrological aspects of the project, my concern is especially related to the proposed ephemeral pool mitigation. Nuisance water and non-point source pollution appear to be directed into the natural drainage courses, and may seriously alter any chance for a successful mitigation.

It seems obvious that such a drastic change in the watershed caused by grading, etc. will alter that natural regime of the ephemeral ponds no matter what "mitigation" takes place, further placing them in jeopardy.

Stockwell 4 – Response

The mitigation for the Riverside fairy shrimp was developed through extensive discussions with USFWS. The hydrological design for the proposed project reflects these discussions with USFWS and the proposed mitigation basins are being carefully designed to provide appropriate hydrological conditions necessary for the shrimp to persist. With implementation of the mitigation measures, impacts to Riverside fairy shrimp would be less than significant.

Stockwell 5 – Comment

Will you please explain in specific detail how Basins 1,3,4,5, and 6 (shown directly below houses and slopes on Fig.4 of Appendix I.2) will be unaffected by changes in hydrology and water quality? I have observed the "mitigation" carried out at the Santiago Canyon Estates/Beazer project for the Riverside Fairy Shrimp, and it appears to be sadly inadequate for long term survival of this endangered species. It is directly below homes and slopes similar to the illustration in Fig. 4 mentioned above, has multiple rows of PVC irrigation pipe (made of a very toxic material that may leach into the rainwater?) in and around it (for what purpose?), and cement drainage structures of some kind that look very foreign to a so-called "ephemeral pond". The slopes directly above it are landscaped with non-native plants that may require chemicals. Will you please tell me where the "inoculent" of Riverside fairy shrimp/cysts originated that were put there? Is this questionable mitigation being used as a model for Saddleback Meadows? Please explain the status of the Santiago Canyon Estates "mitigation", and how it relates to Saddleback Meadows.

Stockwell 5 – Response

All of the proposed watershed areas for ponds on Saddleback Meadows will be planted only with native species, and no irrigation is proposed within the pond watersheds. The Santiago Canyon Estates project is not being used as a "model" for Saddleback Meadows, and a comparison of the two is not warranted.

Stockwell 6 – Comment

My last questions/comments are these:

Page 5 of the USFWS Biological Opinion states that the created ponds must demonstrate the ability to hold "water" for a minimum of 60 days. As I have stated above in more detail, a 60 day minimum is not long enough. Does the term "water" mean natural rainwater only? Professor Emeritus Clyde Ericksen has stated, "Attempts to maintain these pools, and thus their fairy shrimp populations, by keeping them full with tap water has proven useless. Tap water chloramines which kills living shrimps."

Why does the first sentence of point C (Schedule) under section VI of Appendix I.2, pg. 9, state that, "Grading is to be completed no later than December 31, 2000". Please explain?

The following should be incorporated into the project proposal as mitigation measures:

1. *A 10 year monitoring program for the ephemeral pool mitigation plan should be in place, not 5 years. No development impacts should be allowed to proceed in any of the nine existing occupied ephemeral pools or their watersheds until this 10 year period has proven that successful mitigation can occur.*

2. *The 60 day minimum requirement for created mitigation pools to hold rainwater at depths required for the Riverside Fairy Shrimp (Streptocephalus woottoni) should be increased to a period appropriate to the life cycle of this particular species.*

Stockwell 6 – Response

Sixty days of natural rainwater is the time necessary for the Riverside fairy shrimp to complete its life cycle. No tap water would be used; only natural runoff. The reference to completing grading by December 31, 2000 is incorrect. As noted above, ten years of monitoring is required for the Riverside fairy shrimp.

3.4.4 Andy Wing

June 23, 2002

Wing 1 – Comment

The question which occurs to me, having experienced weekly for several years severe eye irritation with each trip to Saddleback Valley, continually seen the great brown haze of smog, and read that the area ranks among the top as most polluted on the country, how ANY development of the area can be contemplated?

Wing 1 – Response

As stated in Section 4.6 of the Draft Revised Subsequent EIR, impacts to air quality would not be significant (with the exception of cumulative impacts), with incorporation of Standard County Conditions and mitigation measures.

Wing 2 – Comment

Anything more than "open space, habitat preservation, recreation", and agriculture should not be permitted because it will further exacerbate the already horrendous existing problems, including traffic.

Wing 2 – Response

As stated in Section 4.5 of the Draft Revised Subsequent EIR, impacts to traffic from implementation of the proposed project would not be significant with implementation of Project Design Features, Standard County Conditions and mitigation measures.

The commenter's opposition to the project is noted and will be forwarded on to the decision makers.

DRAFT ENVIRONMENTAL IMPACT REPORT

PROJECT: SADDLEBACK MEADOWS

DESCRIPTION: Pursuant to the California Environmental Quality Act (CEQA), the Orange County Planning & Development Services Department has prepared Environmental Impact Report No. 566 to evaluate the environmental impacts resulting from the proposed Saddleback Meadows project. The project proposes the phased development of 299 single-family residential units on a 229.2-acre site. The gross density proposed is 1.4 dwelling units per acre, with average lot sizes of 6,672 square feet and a minimum lot size of 5,000 square feet. Approximately 71 percent (158.6-acres) of the project site is proposed to remain in open space. In addition to the residential component, the project also proposes a wildlife movement corridor, regional riding & hiking trail connections and biological resource enhancement. Project implementation requires the approval of Zone Change (Foothill/Trabuco Specific Plan Amendment), Area Plan and Vesting Tentative Tract Map.

EIR 566 examines the potential impacts generated by the proposed project in relation to the following CEQA Checklist categories: Land Use & Planning; Geophysical; Hydrology & Drainage; Water Quality; Transportation/Circulation; Air Quality; Noise; Biological Resources; Aesthetics; Cultural/Scientific Resources; Recreation; Hazards; Public Services; and, Utilities & Service Systems. The proposal will result in unavoidable adverse impacts to air quality.

The purpose of this notice is to inform local residents, institutions and other interested parties about a TIME EXTENSION for the review of the Draft EIR. THE REVISED PUBLIC COMMENT PERIOD IS: APRIL 25TH, 2002 TO JUNE 24TH, 2002. Written comments on the Draft EIR must be submitted by June 24th, 2002, by 5:00 p.m. to: anager, OCPDS/Environmental Planning Services Division, 300 N. Flower St., Box 4048, Santa Ana, California 92702-4048.

Location: Easterly side of El Toro Road, approximately ½ mile south of the intersection of Santiago Canyon Road/El Toro and Live Oak Canyon Road, in east-central unincorporated Orange County.

REVIEWING LOCATIONS

COPIES OF THE DRAFT EIR ARE AVAILABLE FOR PUBLIC REVIEW AT THE FOLLOWING LOCATIONS:

County of Orange/Planning & Development Services Department/
Environmental Planning Services Division
Contacts: Bill Grieman 834-5550
Chuck Shoemaker 834-5550

ORANGE COUNTY BRANCH LIBRARIES:
25209 Marguerite Parkway, Mission Viejo
28192 Silverado Canyon Road, Silverado
24672 Raymond Avenue, El Toro
30902 La Promesa Drive, Rancho Santa Margarita
California State University, Fullerton, Library Documents Section
UC Irvine Main Library/Government Publications/Microforms Department

COPIES OF THE DRAFT EIR HAVE BEEN PROVIDED TO THE FOLLOWING GROUPS:

FOOTHILL/TRABUCO REVIEW BOARD MEMBERS: Adam Smith, Jeanne Porter, Robert Wilkes, Raymond Mills, & Stephen Nordeck
Hidden Ridge HOA, c/o Mr. Jerry Kacsir
rtola Hills HOA I, c/o Rinevol & Co.
ortola Hills HOA II, c/o Ms. Elizabeth Wallace
Canyon View Homeowners Association
Inter-Canyon League, c/o Bob Hunt
California Native Plant Society
National Audubon Society, Inc.

Re: Draft Revised Subsequent Environmental Impact Report (State Clearing House No. 19996121072) for the Saddleback Meadows Project, County of Orange, California

Dear Mr. Neely:

The U.S. Fish and Wildlife Service (Service) and the California Department of Fish and Game (Department), hereafter referred to as the Wildlife Agencies, have reviewed the Draft Revised Subsequent Environmental Impact Report (DEIR) for the construction of the Saddleback Meadows Project, in the County of Orange, California. The project proposes development of 299 single-family houses on a 229.2-acre site in the lower foothills of the Santa Ana Mountains in southern Orange County. The proposed project also includes two new paved access roads off of El Toro Road and an adjacent offsite 1.4 million-gallon water reservoir. The Wildlife Agencies have commented on various development proposals and environmental documents for this project since 1994. As we have stated in our previous comments, the proposed project poses significant unmitigated impacts to future Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP) reserve design for the Southern Subregion of Orange County.

Responsibilities of the Wildlife Agencies

The Department is identified as a Trustee Agency pursuant to the California Environmental Quality Act (CEQA) section 15386 and is responsible for the conservation, protection, and management of the State's biological resources. The Department is also responsible, pursuant to the California Endangered Species Act, California Fish and Game Code 2050 *et seq.*, for the protection of species listed by the State as endangered or threatened or identified as species of concern, and the habitats they require. The Department also manages the NCCP Program (California Fish and Game Code 2800 *et seq.*), a regional conservation planning effort, that includes southern Orange County.

The Service's primary mission is to work "with others to conserve, protect, and enhance fish, wildlife, and plants and their habitats for the continuing benefit of the American people." The

Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States. Specifically, we administer the Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*), and work in accordance with the provisions of the Fish and Wildlife Coordination Act (48 Stat. 401 as amended,16 U.S.C. 661 *et seq.*). Section 7 of the Act requires Federal agencies to consult with the Service should it be determined that their actions may affect federally listed threatened or endangered species. Take incidental to otherwise lawful activities can be permitted under the provisions of sections 7 (Federal consultations) or 10 (permits) of the Act.

As noted in the DEIR, the Service has completed formal consultation with the U.S. Army Corps of Engineers (Corps) and issued a biological opinion (FWS-OR-1023.8) on the Saddleback Meadows Project's effects on the federally endangered Riverside fairy shrimp (*Streptocephalus woottoni*, "fairy shrimp") and its designated critical habitat and designated critical habitat for the threatened coastal California gnatcatcher (*Polioptila californica californica*, "gnatcatcher"), in accordance with section 7 of the Act. To clarify, however, our biological opinion evaluated the 283-unit alternative, not the proposed 299-unit alternative discussed in the DEIR. If the 299-unit Alternative is pursued, reinitiation of consultation with the Corps would be required. Although impacts to federally listed species and their designated critical habitat have been addressed in the cited biological opinion for the Saddleback Meadows project, evaluation of impacts to wildlife movement for non-listed species in relation to development of an NCCP/HCP is outside the purview of section 7 of the Act.

Relationship of the Project to Regional Conservation Planning Efforts

The NCCP Act was approved in 1991 and established a program to provide for regional protection and perpetuation of natural wildlife diversity while allowing compatible land use and appropriate development growth. The program provides an alternative to "single-species" conservation via the formulation of regional, natural community-based habitat protection programs. The first NCCP/HCP projects in California focused on providing adequate conservation and mitigation for impacts to coastal sage scrub vegetation, the preferred plant community of the gnatcatcher.

Following the Federal listing of the gnatcatcher in 1993, the Service adopted a Special Rule for the gnatcatcher pursuant to section 4(d) of the Act incorporating the conservation and process guidelines established by the State under the NCCP Act. The guidelines set forth procedures for the creation of regional and subregional conservation plans. In accordance with the guidelines, jurisdictions enrolled in the NCCP planning program can authorize a limited amount of interim loss of coastal sage scrub during the planning period subject to six interim habitat loss provisions[1]. However, the interim habitat loss provisions are only applicable until adoption of a regional or

[1] The following mandatory findings must be met for a project to be approved pursuant to the interim habitat loss provisions of the Special 4(d) Rule: 1) The habitat loss does not cumulatively exceed the 5% guideline; 2) The habitat loss will not preclude connectivity between areas of high habitat values; 3) The habitat loss will not preclude or prevent the preparation of the subregional Natural Community Conservation Plan; 4) The habitat loss has been minimized and mitigated to the maximum extent practicable in accordance with the Conservation Guidelines; 5) The habitat loss will not appreciably reduce the likelihood of the survival and recovery of listed species in the wild; and 6) The habitat loss is incidental to otherwise lawful activities.

subregional conservation plan. In summary, per the NCCP program, conservation planning within enrolled jurisdictions may be governed by an adopted regional or subregional conservation plan, or is subject to the interim habitat loss provisions of the Special 4(d) Rule.

As an enrolled jurisdiction in the NCCP program, the County of Orange (County) has both an adopted subregional conservation plan that applies to its Central and Coastal subregions (the Orange County Central-Coastal NCCP/HCP) and is participating in development of the Southern Subregion NCCP/HCP. The County has committed to work with the Wildlife Agencies to ensure that projects within its jurisdiction do not prevent connectivity between areas of high habitat values or preclude reserve design options for the Southern Subregion NCCP/HCP.

Reserve Design Inconsistency

Our primary concern with the proposed project is the significant impact it poses to the major lower elevation wildlife movement corridor/linkage along the Santa Ana Mountain foothills of southern Orange County. Saddleback Meadows, together with the adjacent Saddle Creek and Live Oak properties, represents the only remaining unobstructed low elevation wildlife corridor/linkage between the Central and Southern Subregions of the Orange County NCCP/HCP planning areas. To highlight its importance, Orange County's Central-Coastal NCCP/HCP identifies this area as a key corridor/linkage between the subregions. The proposed development on Saddleback Meadows along the eastern and northern portions of the site as shown in Alternative 2 (the No Project, "Existing Entitlement" Alternative), Alternative 3 (the F/TSP EIR 531 Staff Alternative A), Alternative 5 (the Cluster/Single-Family/Multi-Family Residential Alternative), or Alternative 8 (the Reduced Residential Alternative) of the DEIR could substantially eliminate this corridor/linkage and, thereby, severely constrain movement of mule deer, coyote, mountain lion and other large mammals from O'Neill Regional Park in the Southern Subregion to the Central Subregion NCCP/HCP reserve. We raised similar concerns regarding the proposed development on the Saddle Creek property in our comments on the recently circulated DEIR- State Clearing House No. 199111120 (FWS-OR-1309.1).

Pursuant to the CEQA Guidelines (Section 15130), a revised DEIR should discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable and should review the impacts in light of past, present and future probable projects that could result in related impacts, including those outside of the control of the lead agency. However, this current, revised DEIR does not adequately address cumulative impacts to the low-elevation wildlife corridor/linkage through the Saddleback Meadows, Saddle Creek and Live Oak properties. Also, it appears that a comprehensive plan for maintaining a viable corridor/linkage through these properties has not been completed. For example, the Saddleback Meadows DEIR shows a northern wildlife corridor extending from Saddleback Meadows through the adjacent Saddle Creek property. However, the Saddle Creek DEIR does not show this corridor, which would be blocked by the residential development proposed in the DEIR. In addition, development on the Live Oak property could further limit wildlife movement between the subregions. Therefore, the Saddleback Meadows DEIR should evaluate cumulative impacts to wildlife movement in consideration of past development, the proposed development on the Saddle Creek and Live Oak properties and other probable developments, and demonstrate that the Saddleback Meadows

project will not preclude the retention of a viable low-elevation wildlife corridor/linkage connecting the Central and Southern Subregions through all three properties. We wish to work with the County and property owners to develop a comprehensive plan to accomplish this vital component of the Southern Subregion NCCP/HCP.

To address our concerns for Saddleback Meadows, the Wildlife Agencies recommend further consideration of Alternative 4 (F/TSP EIR 531 Staff Alternative B) of the DEIR as it would allow continued movement of wildlife through the area while still meeting the project's objective of "develop(ing) a single-family, rural community that balances residential development with protection of on-site sensitive resources and values of the surrounding community." Alternative 6 (the 44/178 Alternative) may be able to mitigate significant impacts to wildlife movement if remedial grading requirements can be limited within the corridor/linkage area.

Geotechnical

According to the DEIR, the site is characterized by several unfavorable geotechnical conditions including unstable landslides and presence of ground water that could compromise the site's ability to support the project. Mitigation would include the construction of canyon subdrains and back drains to minimize or eliminate the effects of ground water. The Final EIR (FEIR) should discuss how these changes would affect groundwater availability and timing for use by riparian vegetation in upper Aliso Creek.

Hydrology/Beneficial Uses

The Santa Ana Regional Water Quality Control Board has designated the existing biological beneficial uses of "warm freshwater habitat," "wildlife habitat," and "rare, threatened, or endangered species" for portions of Aliso Creek, including the reach downstream from the proposed Saddleback Meadows project. The Wildlife Agencies are concerned about the onsite and downstream effects the project-related changes in the surface flows may have on these beneficial uses and on the habitats and biological resources supported by Aliso Creek. In addition to modifications in peak flows resulting from an increase in impervious surface, we are concerned about changes in the velocity, volume, duration, and frequency of dry-weather and non-peak wet-weather flows. Even small changes in the flow regime often effect changes in the stream community that, over time, can seriously damage stream habitats. Increases in flows from impervious surfaces associated with urbanization can result in: 1) stream bed scouring and habitat degradation; 2) shoreline erosion and stream bank widening; 3) loss of aquatic species; and 4) decreased baseflow (USEPA 1999). Downstream sections of Aliso Creek are known to be sediment-deficient and have already been adversely affected by scour, erosion and subsequent habitat degradation. The Wildlife Agencies recommend that every effort be made to integrate measures to ensure full protection of the beneficial uses and biological resources of Aliso Creek. The development design and construction operations should minimize the modifications of dry and wet-weather flows and integrate onsite best management practices (BMPs) that would attenuate the flows to reduce impacts on the stream morphology and habitats onsite and downstream. Examples of BMPs to consider include appropriately sized grassy swales and vegetated detention basins. Proper design of structural BMPs will require analyses of the

sediment transport and hydrological regime of the headwaters of Aliso Creek. The project is located within Reach 1 of the *Aliso Creek Watershed Management Feasibility Study, Orange County, California* prepared for the Corps. We recommend this study be consulted to determine possible effects of the project on the Aliso Creek watershed.

Significance Criteria for Biological Resources

The thresholds of significance for biological resources provided in section 4.8.2 of the DEIR do not appear to be consistent with the CEQA definition of rare, threatened, and endangered species (see CEQA Guidelines, § 15380). In addition, The Department recommends that the significance criteria in the body of the DEIR be revised to be consistent with CEQA Sections 15064.7 and 15065, and Appendix G of the CEQA guidelines.

Annual Grasslands

The project proposes that mitigation requirements for cumulative impacts to raptor foraging habitat (consisting primarily of coastal sage scrub and grasslands) will be met in conjunction with the proposed coastal sage scrub habitat mitigation. The Department recommends mitigation measures be incorporated specifically for impacts to annual grassland. These areas provide foraging areas for raptors and small mammals and proposed impacts to a total of 103.7 acres on- and offsite should be considered significant. Appendix I.1 of the DEIR indicates that raptor species including Cooper's hawk (*Accipiter cooperii*), a state species of special concern (CSC), sharp-shinned hawk (*A. striatus*, CSC), red tailed hawk (*Buteo jamaicensis*) red shouldered hawk (*B. strianus*), and American kestrel (*Falco sparverius*) were observed during surveys of the project site, and other species including northern harrier (*Circus cyaneus*, CSC) and loggerhead shrike (*Lanius ludovicianus*, CSC) have at least a moderate potential of using the grasslands onsite for foraging. We therefore recommend that annual grassland mitigation at a 0.5:1 preservation-to-impact ratio in an offsite area with long-term conservation potential be included in the FEIR.

Intermediate Mariposa Lily

The DEIR states that impacts to intermediate mariposa lily (*Calochortus weeddii* var. *intermedius*) would not be significant. This species is listed by the California Native Plant Society as a "1B" plant (Plants rare, threatened, or endangered in California and elsewhere). Species included on List 1B must be fully considered under CEQA. The Department recommends that the FEIR include mitigation for impacts to this species (for example, see Rancho Potrero Leadership Academy EIR, County of Orange, 2001).

Cactus Wren

According to the DEIR, impacts to the cactus wren (*Campylorhynchus brunneicapillus couesi*) are not considered significant. As proposed in Appendix I.3 to the DEIR, the coastal sage scrub mitigation plan does not specifically include salvage or container stock planting of prickly-pear

(*Opuntia* spp.) required for cactus wren nesting and foraging. By providing suitable replacement habitat, a potentially significant impact to cactus wren may be mitigated. To provide replacement habitat for cactus wren impacted by implementation of the project, we recommend that the coastal sage scrub plant palette is revised to include a substantial amount of prickly-pear. This may be achieved by salvage of existing plant material followed by direct replanting within the mitigation area or by collecting pads prior to impact and rooting them in containers. In addition, we recommend that reference sites currently supporting cactus wren be chosen to provide an appropriate baseline for comparison.

Oak Woodland Mitigation Plan

Mitigation for oak woodland impacts is described on page 4.8-26 of the DEIR and we concur with the restoration approach in concept. However, unlike the coastal sage scrub mitigation plan, details of the oak woodland mitigation strategy are not adequately described in Appendix L3 such that the impacts can be shown to be mitigated below a level of significance. For example, the proposed locations for oak woodland restoration should be depicted and described. In addition, container sizes, understory species, and maintenance activities specific to the oak woodland restoration should be detailed.

The Wildlife Agencies appreciate the opportunity to review and comment on the DEIR. If you have any questions please contact Mr. David Zoutendyk of the Service at (760) 431-9440 or Mr. Brad Henderson of the Department at (310) 214-9950.

Sincerely,

Karen A. Evans

RE: Saddleback Meadows
SCH#: 1996121072

This is to acknowledge that the State Clearinghouse has received your environmental document for state review. The review period assigned by the State Clearinghouse is:

Review Start Date: April 26, 2002
Review End Date: June 10, 2002

We have distributed your document to the following agencies and departments:

California Highway Patrol
Caltrans, District 12
Department of Conservation
Department of Fish and Game, Region 5
Department of Forestry and Fire Protection
Department of Housing and Community Development
Department of Parks and Recreation
Department of Water Resources
Native American Heritage Commission
Office of Historic Preservation
Regional Water Quality Control Board, Region 9
Resources Agency
State Lands Commission

The State Clearinghouse will provide a closing letter with any state agency comments to your attention on the date following the close of the review period.

Thank you for your participation in the State Clearinghouse review process.

Dear Bill Grieman/Chuck Shoemaker:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on June 10, 2002, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

> "A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Terry Roberts

Subject: Saddleback Meadows

Dear Mr. Grieman ,

Thank you for the opportunity to review and comment on the Draft EIR dated April 2002 for **Saddleback Meadows.** The project is located on the eastern side of El Toro Road, one half mile from the Santiago Canyon/Live Oak Canyon Road junction.

The project consists of the development of 299 detached single family residences on 66.9 acres out of a total 222-acre site. The nearest State Routes are SR-241 and I-5.

Caltrans District 12 status is a reviewing agency on this project and has the following comments:

1. As indicated in the report, the proposed project will generate 3690 trips per day that mostly use El Toro Road. This report has not included west/south of El Toro beyond Santa Margarita Parkway towards I-5 interchange in the Traffic study section. We have concerns that this development will ultimately contribute to the cumulative impacts at El Toro Road/I-5.

2. We recommend that the project proponents work to coordinate their efforts with the City of Lake Forest and their project " The Arbor on El Toro Specific Plan" in terms of project phasing, filing a traffic management plan during construction, and avoiding impacts to El Toro Road and ultimately the I-5 during traffic peak periods.

3. Other than identifying the County Bikeway network, this project doesn't evaluate or stipulate the use of alternative modes of transportation, such as buses, to be incorporated into the development. Such alternatives would work to reduce future congestion in the region while at the same time help to improve the overall air quality.

4. The project proponents will insure that during construction all loads will be contained that may use state routes and that no net runoff increase will flow over, onto or under State Right of Way.

Please continue to keep us informed of this project and other future developments, which could potentially impact our transportation facilities. If you have any questions or need to contact us, please do not hesitate to call Maureen El Harake at (949) 724-2086.

Sincerely,

Robert F. Joseph, Chief

PUBLIC NOTICE
of Time Extension
DRAFT ENVIRONMENTAL IMPACT REPORT

RECEIVED
JUN 14 2002
STATE CLEARING HOUSE

PROJECT: SADDLEBACK MEADOWS SCH# 1996121072

DESCRIPTION: Pursuant to the California Environmental Quality Act (CEQA), the Orange County Planning & Development Services Department has prepared Environmental Impact Report No. 566 to evaluate the environmental impacts resulting from the proposed Saddleback Meadows project. The project proposes the phased development of 299 single-family residential units on a 229.2-acre site. The gross density proposed is 1.4 dwelling units per acre, with average lot sizes of 6,672 square feet and a minimum lot size of 5,000 square feet. Approximately 71 percent (158.6-acres) of the project site is proposed to remain in open space. In addition to the residential component, the project also proposes a wildlife movement corridor, regional riding & hiking trail connections and biological resource enhancement. Project implementation requires the approval of Zone Change (Foothill/Trabuco Specific Plan Amendment), Area Plan and Vesting Tentative Tract Map.

EIR 566 examines the potential impacts generated by the proposed project in relation to the following CEQA Checklist categories: Land Use & Planning; Geophysical; Hydrology & Drainage; Water Quality; Transportation/Circulation; Air Quality; Noise; Biological Resources; Aesthetics; Cultural/Scientific Resources; Recreation; Hazards; Public Services; and, Utilities & Service Systems. The proposal will result in unavoidable adverse impacts to air quality.

The purpose of this notice is to inform local residents, institutions and other interested parties about a TIME EXTENSION for the review of the Draft EIR. THE REVISED PUBLIC COMMENT PERIOD IS: APRIL 25TH, 2002 TO JUNE 24TH, 2002. Written comments on the Draft EIR must be submitted by June 24th, 2002, by 5:00 p.m. to: Manager, OCPDS/Environmental Planning Services Division, 300 N. Flower St., Box 4048, Santa Ana, California 92702-4048.

Location: Easterly side of El Toro Road, approximately ½ mile south of the intersection of Santiago Canyon Road/El Toro and Live Oak Canyon Road, in east-central unincorporated Orange County.

REVIEWING LOCATIONS

COPIES OF THE DRAFT EIR ARE AVAILABLE FOR PUBLIC REVIEW AT THE FOLLOWING LOCATIONS:

Dear Bill Grieman/Chuck Shoemaker:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on June 24, 2002, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

> "A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Terry Roberts

Subject: Saddleback Meadows

Dear Mr. Grieman

Thank you for the opportunity to review and comment on the Draft EIR dated April 2002 for **Saddleback Meadows.** The project is located on the eastern side of El Toro Road, one half mile from the Santiago Canyon/Live Oak Canyon Road junction.

The project consists of the development of 299 detached single family residences on 66.9 acres out of a total 222-acre site. The nearest State Routes are SR-241 and I-5.

Caltrans District 12 status is a reviewing agency on this project and has the following comments:

1. As indicated in the report, the proposed project will generate 3690 trips per day that mostly use El Toro Road. This report has not included west/south of El Toro beyond Santa Margarita Parkway towards I-5 interchange in the Traffic study section. We have concerns that this development will ultimately contribute to the cumulative impacts at El Toro Road/I-5.

2. We recommend that the project proponents work to coordinate their efforts with the City of Lake Forest and their project " The Arbor on El Toro Specific Plan" in terms of project phasing, filing a traffic management plan during construction, and avoiding impacts to El Toro Road and ultimately the I-5 during traffic peak periods.

3. Other than identifying the County Bikeway network, this project doesn't evaluate or stipulate the use of alternative modes of transportation, such as buses, to be incorporated into the development. Such alternatives would work to reduce future congestion in the region while at the same time help to improve the overall air quality.

4. The project proponents will insure that during construction all loads will be contained that may use state routes and that no net runoff increase will flow over, onto or under State Right of Way.

Please continue to keep us informed of this project and other future developments, which could potentially impact our transportation facilities. If you have any questions or need to contact us, please do not hesitate to call Maureen El Harake at (949) 724-2086.

RE: Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows

I have reviewed the cultural resources section of the DEIR and have the following comments:

1. The cultural resources section of the EIR does not accurately reflect the findings and recommendations provided in the cultural resources appendix. In some cases there are serious contradictions.

2. The cultural resources appendix indicates that this project is subject to a Corps of Engineers 404 permit and therefore the cultural resources are subject to the provisions of Section 106 of the National Historic Preservation Act. The EIR does not indicate this and the treatment of the archaeological sites is not in compliance with the Act as amended in 1999

3. The investigations to determine the significance/importance of the archaeological sites are inadequate. The excavation of three 1 X 1 meter units in CA-ORA-713 is not sufficient to determine the depth, nature, condition and extent of a site of this size. Since the site appears to be dispersed over a large area, remote sensing and/or geomorphological studies should be conducted to locate areas of the site that contain buried cultural deposits and features. The discovery of buried cultural deposits and features or human burials should not be done by bulldozer.

4. Likewise the determination that CA-ORA-715 is based on the excavation of four 1 X 1 meter units. This is not sufficient to determine the depth, nature, condition, and extent of this site and to determine that it is not "significant/important".

5. Pg. 4.10-12 of the EIS states that a final test excavation of site CA-ORA-1437 was undertaken in November 2001, but does not indicate the methods used or the results. There is no information to support the determination that the site is not "significant/important".

6. Pg. 4.10-14 – Project impacts: The statements regarding CA-ORA-710 are contradictory and raise doubts regarding whether the site is going to be preserved. If

5151 State University Drive, Los Angeles, CA 90032-8220 (323) 343-2446 FAX: (323) 343-2445 www.calstatela.edu
The California State University: Bakersfield, Channel Islands, Chico, Dominguez Hills, Fresno, Fullerton, Hayward, Humboldt, Long Beach, Los Angeles, Maritime Academy, Monterey Bay, Northridge, Pomona, Sacramento, San Bernardino, San Diego, San Francisco, San Jose, San Luis Obispo, San Marcos, Sonoma, Stanislaus

the sit is to be protected through site burial and preserved within a biological mitigation area, then why does the EIR state that data recovery would occur prior to ground disturbing activities. If the site is to be protected, why should there be ground-disturbing activities? In addition, site burial has to be done very carefully to ensure that the site will be protected. The standards/specifications for covering the site should be indicated.

7. CA-ORA-1257 has not been subsurface tested and should not be graded without further investigation.

8. CA-ORA-711 is considered to be significant/important. According to the DEIR, only a small fraction of the total site area was tested. Grading with monitoring as stated on pg. 4.10-14 is not adequate mitigation for the destruction of the site.

9. Pg. 4.10-20: The DEIR makes the assumption that the completion of a data recovery excavation program, (or even worse, monitoring during grading) constitutes a no adverse effect. This is not the case. The implementing regulations for Section 106 of the National Historic Preservation Act (36 CFR 800.5(a)(2)(iii) along with 800.5(a)(2)(I), as amended May 1999, acknowledge the reality that destruction of a site and recovery of its information and artifacts is adverse and no longer consider data recovery as sufficient mitigation to reduce the impacts to a level of insignificance.

10. Even if this project were not under the jurisdiction of the federal government, CEQA was patterned after the National Environmental Policy Act and the pertinent federal regulations. Therefore, to ignore the reality that the destruction of an archaeological site, including the destructive process of archaeological excavations, is a significant impact seems counter to the spirit and intent of CEQA.

11. According to CEQA: **When archaeological resources are involved, avoidance, or preservation in an undisturbed state is the preferable course of action.** Section 21083.2 then provides that preservation methods may include:
a. Planning construction to avoid archaeological sites
b. Deeding sites into permanent conservation easements
c. Capping or covering sites with a layer of soil before building on the sites.
d. Planning parks, greenspace, or other open space to incorporate archaeological sites.

When avoidance is not possible, then data recovery excavation may be the only feasible mitigation measure.

11. According to CEQA data recovery is the last resort after the lead agency considers all of the above preservation methods and determines that they are not possible or feasible. With the exception of CA-ORA-710 (but the EIR also implies that the site may be impacted – see above) the only mitigation measures that have been considered for the remaining sites to be impacted by the proposed project are data recovery excavation, or worse yet, grading with monitoring.

Based on the above comments, the DEIR is inadequate in that (1) There is not sufficient information to support the determinations that all of the sites to be impacted by the proposed project (except two) are not significant/important. (2) The DEIR fails to provide documentation that the CEQA recommended preservation alternatives to the total destruction of six of the seven archaeological sites to be impacted by the proposed project have been considered. The developer should be required to conduct a good faith examination of the feasibility of the preservation measures. They should be encouraged to incorporate one or more of the preservation measures and include the preservation plan in the EIR. If the determination is that none of the preservation measures are possible or feasible, the justification for this determination and documentation that serious consideration was given to preservation methods should be included in the EIR. (3) Grading and monitoring is not adequate mitigation for the destruction of a significant archaeological site.

If it is determined that data recovery excavation and destruction of the sites is the only feasible option, the investigations should be guided by a research design that follows the California Office of Historic Preservation Guidelines for Archaeological Research Designs (Preservation Planning Bulletin No. 5, February 1991. Dept. of Parks and Recreation, Office of Historic Preservation). The report documenting the excavations should follow the Office of Historic Preservation Guidelines for Archaeological Resource Management Reports (Preservation Planning Bulletin No. 5, December 1989).

If you have any questions or comments I can be reached at (323) 343-2445 or pmartz@calstatela.edu.

Sincerely,

Patricia Martz

Dear Mr. Shoemaker

Draft Revised Subsequent Environmental Impact Report (DRSEIR)
Saddleback Meadows

The South Coast Air Quality Management District (AQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated in the Final Environmental Impact Report.

Pursuant to Public Resources Code Section 21092.5, please provide the AQMD with written responses to all comments contained herein prior to the certification of the Final Environmental Impact Report. The AQMD would be happy to work with the Lead Agency to address these issues and any other questions that may arise. Please contact Charles Blankson, Ph.D., Transportation Specialist – CEQA Section, at (909) 396-3304 if you have any questions regarding these comments.

Sincerely

Mike A. Nazemi
Manager
Planning, Rule Development & Area Sources

Draft Revised Subsequent Environmental Impact Report (DRSEIR)
Saddleback Meadows

1. **Project Size**: In the Public Notice announcing the availability of the DRSEIR, it is stated that the proposed project will occupy an area measuring 229.2 acres and approximately 71 percent of this or 158.6 acres will be devoted to open space. In the Project Summary in the DRSEIR on page 1-3, it is stated that the proposed project will occupy 222 acres and 70 percent or 155.1 acres will be devoted to open space. It is not clear from the above statements whether the project area is 229.2 acres or 222 acres? Please provide accurate information on the size of the project area since it has implications for grading emissions and subsequently air quality.

2. **Emissions Inventory**: In Table 4.6.2 on page 4.6-7 of the DRSEIR, emissions data are provided for the years 2000 and 2010. While the 2010 forecasts are the same as those reported in the SCAQMD Final 1997 AQMP, the 2000 data is different. See Table B-6 on page III-B-18 of Appendix III of the SCAQMD Final 1997 AQMP. Please correct the discrepancy.

3. **URBEMIS2001**: It is reported in Appendix G of the DSEIR that the lead agency used URBEMIS7G to calculate project emissions. There are two points to be noted about this. The first is that both Appendix G and the SDEIR limit the discussion on construction activity impacts to fugitive dust and PM_{10} emissions. PM_{10} emissions are reported to be less than the PM_{10} significance threshold. However, as noted on page 4.6-12 of the DRSEIR, construction also entails the use of internal combustion engines in on-road and off-road mobile, semi-mobile and other diesel-powered equipment which generate emissions of NO_X, CO and also PM_{10}. There are also ROG emissions from paints and other architectural coatings. The lead agency fails to mention that the URBEMIS7G output table shows very large ROG construction emissions. At 1,171.19 pounds per day during the Summer, these are very significant emissions. The lead agency needs to address these high ROG emissions and propose measures to reduce them to less than the significance threshold in the Final SEIR. The second point is that URBEMIS2001 is currently available on ARB Webpage and has replaced URBEMIS7G as the model of choice and should be used to estimate project emissions. The lead agency is therefore encouraged to use URBEMIS200 which uses current emission factors and therefore reflects project emissions more accurately. In discussing the proposed project's air quality impacts, both construction and operational emissions as well as the corresponding significance thresholds should be presented in the main text of the Final SEIR. If construction ROG emissions still exceed the significance threshold, the lead agency should propose mitigation measures accordingly.

4. **Screening Tables**: The lead agency uses the Screening Table in the SCAQMD 1993 CEQA Air Quality Handbook (Table 6-2) to determine that construction-related equipment combustion emissions from the project will not be significant. See discussion on page 4.6-12 of the DRSEIR. Please note that although the screening tables were developed by the AQMD, the AQMD no longer supports the use of these tables in determining the significance of project emissions. This is because the mobile source emission factors used in computing the tables are from an old version of the California Air Resources Board EMFAC model.

RE: SCAG Clearinghouse No. I 20020232 Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows

Dear Mr. Grieman:

Thank you for submitting the **Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows** to SCAG for review and comment. As areawide clearinghouse for regionally significant projects, SCAG reviews the consistency of local plans, projects and programs with regional plans. This activity is based on SCAG's responsibilities as a regional planning organization pursuant to state and federal laws and regulations. Guidance provided by these reviews is intended to assist local agencies and project sponsors to take actions that contribute to the attainment of regional goals and policies.

We have reviewed the **Saddleback Meadows**, and have determined that the proposed Project is not regionally significant per SCAG Intergovernmental Review (IGR) Criteria and California Environmental Quality Act (CEQA) Guidelines (Section 15206). The proposed project is not a residential development of more than 500 units. Therefore, the proposed Project does not warrant comments at this time. Should there be a change in the scope of the proposed Project, we would appreciate the opportunity to review and comment at that time.

A description of the proposed Project was published in SCAG's **April 30, 2002** Intergovernmental Review Clearinghouse Report for public review and comment.

The project title and SCAG Clearinghouse number should be used in all correspondence with SCAG concerning this Project. Correspondence should be sent to the attention of the Clearinghouse Coordinator. If you have any questions, please contact me at (213) 236-1867. Thank you.

Sincerely,

JEFFREY M. SMITH, AICP

Subject: DEIR No. 566; Saddleback Meadows

To Whom It May Concern:

Thank you for forwarding the Draft Environmental Impact Report No. 556 for the proposed Saddleback Meadows Project. The Transportation Corridor Agencies (TCA) has reviewed the above-subject draft environmental document and would like to offer the following comment for your review:

- The DEIR identifies the intersection of Portola Parkway and the FTC-N as being impacted. The DEIR states, "The addition of one southbound left turn lane at the intersection of Portola Parkway (NS) at Foothill Transportation Corridor (EW) would be required for 2005 condition." Mitigation measure M 5-5 specifies that the project shall pay its fair share funding of this improvement. The fair share funding amount agreed to by the TCA must be submitted to the TCA prior to the issuance of any building permits for the project.

Should you have any questions regarding this letter, or the submission of payment, please contact me at (949) 754-3483.

Sincerely,

Macie Cleary-Milan

Re: Draft EIR Saddleback Meadows

Dear Sir(s):

Thank you for the opportunity to comment on the Draft EIR for the Saddleback Meadows project. In response to our review, we would like to offer the following:

Page 4.12-1, Section 4.12.1, Second paragraph. "61 fire stations" should read "59 fire stations"

Page 4.12-1, Section 4.12.1, Third paragraph, Third bullet. Remove "only available from a medic van" from the sentence. OCFA provides paramedic service both paramedic assessment and full paramedic services through a number of configurations in addition to the medic vans.

Page 4.12-2, Table 4.12.1, Fire Station Locations. Several things are wrong with this table.

- Fire Station 18 is 4.2 miles from the project not 1.5. The response time to the project for FS18 would be calculated at 8 minutes and 40 second using an average of 35 mph and 90 seconds of call processing and turnout time.
- Fire Station 16 is located 3.5 miles from the project and would calculate at 9 minutes and 30 seconds using the same formula as above with a two minute time period added for the volunteer personnel to get to the fire station. This station does NOT have paramedics or full time firefighters. It is staffed with volunteer firefighters only.
- Fire Station 45 is located 5.3 miles away with a response time calculation of 10 minutes and 30 seconds.
- Additionally, Fire Station 54 is located 2.8 miles from the project with a response time calculation of 6 minutes and 20 seconds.
- Fire Station 31 is located 3.7 miles away with a response time of 7 minutes and 50 seconds. This is the closest paramedic unit to the project.

Page 2 - Draft EIR-Saddleback Meadows - June 6, 2002

Page 4.12-2, Third paragraph. Change "average response time of six minutes" to "average response time of nine minutes".

Page 4.12-2, Forth paragraph. Replace the last sentence, "At this location three firefighters are on duty staffing either a paramedci assessment unit or a brush engine." With "At this location, 20 volunteer firefighters staff the engine when called upon to do so."

Page 4.12-3. First paragraph, last sentence. Should read 7 firefighters rather than 8 firefighters.

Page 4.12-9. Add new Condition SC12-16. Secured Fire Protection Agreement. "Prior to grading, the applicant shall enter into a Secured Fire Protection Agreement with the OCFA. The reason for the timing this agreement is that the service needs for the project increases at the point of grading and continues to increase as the project is built. Service agreements will need to be in place at this time.

As noted in Section 4.12.3, Cumulative Impact, the seven related projects in this area have an effect on the service delivery within the area. Additional staffing and/or equipment may be needed to meet this demand. This issue will be addressed within the Secured Fire Protection Agreement.

Page 5-9, Alternatives, Alternative 2 – No project Alternative, this project would have many issues with fuel modification both "onsite" and "offsite".

Page 5-38, Alternatives, Alternative 6 – 44/178 Alternative. It should be noted that the layout of the "Development Area" does not allow for secondary access for emergency vehicles and may require the project to acquire additional easements or other mitigation measures to insure that adequate access to the project is provided.

The project area is within the designated Special Fire Protection Area and is as a result a significant wildfire risk. These risks will require special mitigation measures an accordance with OCFA standards. All other standard conditions of development including access will also be applicable to the proposed project. Guidelines for these issues are available on the OCFA website at (http://www.ocfa.org/business/pandd/guidelin.htm).

If you have any additional questions or concerns regarding this project, please contact my officer at (714) 744-0484 or at genebegnell@ocfa.org.

Sincerely,

Gene F. Begnell
Battalion Chief, Strategic Services

Re: Comments of Trabuco Canyon Water District
Draft Revised Subsequent Environmental Impact, Report No. 566
Saddleback Meadows
Planning Application 980103, Zone Change (ZC) 98-3, Area Plan (AP) 98-2
Tentative Tract Map 15784, Vesting Tentative Tract Map 15230

Gentlemen:

Trabuco Canyon Water District (District) is in receipt of the Draft Revised Subsequent Environmental Impact Report No. 566 (DEIR 566) for the above-captioned project (Project). Based upon our review of the document, the following comments are submitted to the County of Orange (County) with regard to the Project and the environmental proceedings being undertaken by the County with respect to the Project. Please note that the District reserves its right to provide or submit additional or supplemental comments relative to the DEIR566 and any other or further documents provided or furnished by the County with respect to the Project or the environmental proceedings undertaken by the County with respect to the Project during the review period and/or public hearing process for this matter.

Request for Notices

Pursuant to the provisions of the California Environmental Quality Act (CEQA) and Public Resources Code Section 21091.1, the District hereby requests that copies of all notices and other documents mailed in relation to the above-referenced Project be furnished to the District. If there are any fees and charges required for the provision of such notices, please provide us with an invoice for such costs, and we will reimburse the appropriate County department. This

32003 Dove Canyon Drive, Trabuco Canyon, CA 92679 · 949/858-0277 · Fax: 949/858-3025
Mailing Address: P.O. Box 500, Trabuco Canyon, CA 92678
www.tcwd.ca.gov

request for notice specifically includes, but is not necessarily limited to, notices of all hearings, proposed actions to be taken with regard to the developmental process and, in particular, any Notice of Determination prepared, furnished or filed with regard to this Project.

Background Information

Our general legal counsel, Bowie, Arneson, Wiles & Giannone, provided written comments on behalf of the District on August 11, 1997 and supplemental comments on October 17, 1997, photocopies of which are attached hereto. We request that these letters be included as part of the record of proceedings for the environmental review of the Project, Including DEIR566.

As stated in the October 17, 1997 letter, there remains a "significant question as to whether the mitigation measure referenced includes and covers necessary master plan and in-tract water transmission and distribution facilities, and necessary master plan in-tract wastewater facilities." We again request that mitigation monitoring language, as required by Public Resources Code Section 21081(a)(1) and Section 21081.6, be incorporated within the final environmental impact report prepared for the Project.

Trabuco Canyon Water District further states that the District's Rules and Regulations require improvement agreements to be entered into in order for the District to approve tract maps and for the District to provide water and wastewater service to any property within its boundaries. The District previously requested of California Quartet to undertake negotiations relative to entering new improvement agreements relative to the Project. No response has been received by the District.

In addition to the above, a Sub-Area Master Plan must be prepared and financed by the developer to define needed facility improvements which include:

> Water: Pump stations, reservoir, pressure reducing valves and pipelines.
> Sewer: Local collection lines only. The project has already purchased regional wastewater collection, treatment and disposal capacity.

All fees and capacity charges must be reevaluated following completion of the Sub-Area Master Plan.

Sincerely,

Bruce Boner
General Manager

SUBJECT: Saddleback Meadows Draft EIR

Dear County Staff:

The City of Lake Forest has received the Draft Environmental Impact Report for the Saddleback Meadows development. Public Works staff has reviewed the Water Quality Technical Report, Appendix E and Traffic Study, Appendix F of the EIR and offers the attached comments. Development Services staff has reviewed the body of the EIR and offers the following comments;

1. Section 3.7 and Table 3-1 discuss related projects. Please confirm project 3, Los Angeles Athletic Club is the name of the self-storage facility located on the corner of Marguerite Parkway and El Toro Road. In addition, the Gateway Commercial Center Project located on the corner of Portola Parkway and El Toro Road, within the City of Lake Forest, should be considered in the EIR. Please see City staff for information on the approved project.

2. The applicant should be advised that the City of Lake Forest does not permit any off-site signage. Therefore, there shall be no advertising or directional signage placed within the City of Lake Forest or along streets within the City's jurisdiction.

We would like to continue to receive information and documents on the project. Please send all further correspondence to myself, Ms. Gayle Ackerman, AICP, Director of Development Services at 23161 Lake Center Drive, Suite 100, Lake Forest, CA 92630, telephone number (949) 461-3460.

Sincerely,
CITY OF LAKE FOREST

SUBJECT: REVIEW OF WATER QUALITY MANAGEMENT PLAN FOR THE SADDLEBACK MEADOWS DRAFT EIR

I have reviewed the Conceptual Water Quality Management Plan section of Saddleback Meadows EIR. The following are comments for the subject document.

1. In the Developed Conditions section of the Report, page 6, it states that "The permanent open space will dedicated to the County of Orange as a regional park and will be maintained by the County or a third-party conservation group". The report indicated that this open space area is 88.2 acres.

   - Has the County of Orange agreed to accept the open space area and the maintenance responsibility associated with it?
   - What impacts will this dedication have on the City if and when this area is annexed to the City of Lake Forest?
   - Will the public have access to this regional park?

   Please respond to these questions and provide additional information to clarify this item and its impact on the City of Lake Forest.

2. In the Developed Conditions section of the Report, Page 6, states that "Only lots 1 through 37 connect directly to an existing storm drain facility in El Toro Road". Please provide all required Hydrology and Hydraulic backup information to show that the existing facility has enough capacity to accommodate this portion of the development. Furthermore, provide detail information on the watershed that contributes to this existing facility on El Toro Road and the down stream impacts of this development.

3. Section 7 entitled "Monitoring, Inspection and Maintenance, page 12, Subsection (g) entitled "Common Area Catch Basin Inspection", the inspection and power wash of the screen for the stormceptor should be performed more than once per year. In fact,

the first few years after completion of this project, the inspection rate should be 3-4 times per year, or after a sizeable rainstorm. This rate of inspection will be needed until such time the newly planted vegetation/landscaping begin to contribute to the reduction of erosion. After that, the rate may be reduced 2-3 times per year to allow for continuos and proper clean screens for all stormceptors.

4. Same section as stated in item 3 above, page 12, subsection (h) entitled "Street Sweeping Private Streets and Parking Lots". Please be more specific in regards to statement "This procedure will be intensified around October 15th of each year..." In other words, is the street sweeping required twice a week or more? The term "intensified" needs to be clearly defined.

5. 75% of this area ultimately drains to Aliso Creek, which is an impaired water body and is under an enforcement action (California Water Code Section 13225) from the San Diego Regional Water Quality Control Board. What specific measures are to be undertaken by this development to eliminate pollutant runoff from entering the curb and gutter as required by the NPDES permit and in support of the enforcement action.

SUBJECT: Saddleback Meadows Traffic Impact Report

DATE: May 23, 2002

We have reviewed the *Saddleback Meadows Traffic Report* prepared by Urban Crossroads for the County of Orange. The following are comments for the subject document.

1. The following intersections are STOP sign controlled and should be analyzed utilizing the 2000 HCM: Santiago Canyon Rd./Modjeska Canyon Rd., Santiago Canyon Rd./Ridgeline Rd. and Santiago Canyon Rd./Live Oak Canyon Rd. The intersection analyses Tables should be updated to reflect the delay/LOS for each of these intersections under each scenario which was analyzed.

2. Although the intersection of El Toro Rd./Live Oak Canyon Rd. does meet a warrant for signalization under existing conditions, the HCM worksheets indicate that this intersection is currently operating at acceptable Levels of Service B during both the AM and PM peak hours. Therefore, further analyses should be completed to determine if signalization is needed based upon other factors such as accident data or safety concerns.

3. The volumes provided in the count data found in Appendix B do not match the northbound and southbound through volumes at the intersection of Portola Parkway and the Foothill Transportation Corridor Ramps under existing conditions as shown in Figures 2E and 2F. A discussion should be added on how the northbound and southbound existing through volumes were derived for the AM and PM peak hours.

4. On Table 2-2, the Level of Service at Portola Parkway/Glenn Ranch Road should be "B" and not "A".

5. The peak hour project volumes for the AM inbound and PM outbound movements at the project access point on El Toro Road, as shown in Exhibits 3-C and 3-D, do not equate to the projected trip generation provided in Table 3-2. The Figures and intersection analyses worksheets should be revised to reflect the correct numbers.

6. Table 3-5 should be revised to reflect the Level of Service on each road segment based upon the roadway capacity values found in Table 2-1.

7. On Table 4-4 the following Levels of Service should be corrected to reflect to following Levels of Service:

   El Toro/Valley Vista Way - PM peak hour - LOS B
   Saddleback Ranch/Glenn Ranch - PM peak hour - LOS B
   Portola Parkway/El Toro - AM peak hour - LOS D
   Portola Parkway/El Toro - PM peak hour - LOS C

8. It is unclear who is responsible for the Year 2005 improvement (Southbound Left Turn Lane) required at the study intersection of Portola Parkway/Foothill Transportation Corridor. This should be indicated in the study.

9. Table 4-6 should be corrected. The study intersection of El Toro Rd./Valley Vista Way should have a LOS value of E instead of D.

10. A discussion/table should be added to the traffic study regarding the project's impacts at each study intersection where the Level of Service is unacceptable and the project increases the ICU value, and where the intersection's operation is degraded to an unacceptable operation with the project. In addition, the proposed improvements, which would mitigate the project's impacts, should be shown along with additional improvements which are needed without the project for Year 2025 conditions. Responsibility of the improvements should also be provided.

11. Peak hour traffic volumes for some movements under the Year 2025 without the project scenario are decreasing when compared to volumes under the Year 2005 without the project scenario. The following intersections should be reviewed and changes made to the Figures and ICU worksheets or an explanation provided on why the volumes are decreasing in the Year 2025.

Santiago Canyon/Modjeska Canyon	Santiago Canyon/Ridgeline
El Toro/Live Oak Canyon	El Toro/Ridgeline
El Toro/Valley Vista	El Toro/Glenn Ranch
Saddleback Ranch / Glenn Ranch	Marguerite Parkway/El Toro
Portola Pkwy/Glenn Ranch	Portola Pkwy/Foothill Trans. Corr.
Portola Pkwy/El Toro	

12. Appendix J contains traffic signal warrants for the intersections of Santiago Canyon Rd./Modjeska Canyon Rd., Santiago Canyon Rd./Ridgeline and El Toro Rd./Live Oak Canyon Road under a variety of analyses conditions. The body of the report does not discuss why traffic signal warrants were applied or when (under what time-frame) the signal may be required. This should be included in the text of the report.

13. There is an existing bike path/trail, which runs along the eastside and parallel with El Toro Road. The main project access will intersect this bike path/trail. Provisions should be provided for signing the bike path/trail with the proper controls.

14. There is a discrepancy in the trip generation provided in a letter dated October 17, 2001 to Mr. Pike Oliver, California Quartet LTD, from Mr. Bill Lawson, Urban Crossroads, Inc regarding "Alternative Development Scenarios" for the *Saddleback Meadows* Alternatives. This letter should be revised so the trip generation data provided in the letter reflects the trip generation information indicated in Table 2 of the aforementioned letter.

City of Mission Viejo

Community Development Department

May 30, 2002

Frank McGill
Senior Planner
County of Orange
P.O. Box 4048
Santa Ana, CA 92702

SUBJECT: Zone Change ZC98-3 and Area Plan AP98-2 for Saddleback Meadows (aka Bridlewood) in the County of Orange

Dear Mr. McGill:

Thank you for the opportunity to review and comment on Zone Change ZC98-3 and Area Plan AP98-2 for Saddleback Meadows (aka Bridlewood) in the County of Orange. Of particular interest to the City of Mission Viejo are the transportation-related components of the Draft Revised Subsequent Environmental Impact Report (EIR 566) for the Saddleback Meadows project filed with the County of Orange. The City's comments are as follows:

1. Project Trip Generation:
The project traffic study identifies a residential trip distribution assumption wherein twenty-five percent of the daily traffic would enter/leave the project site, using El Toro Road north of the project entrance, and with twenty percent continuing along Santiago Canyon Road. Page 3-5 of the project traffic study states that "trip distribution patterns for this study are consistent with previous traffic studies and were reviewed by County staff prior to completion of this traffic analysis." The City of Mission Viejo continues to believe that the 25% assignment of traffic to El Toro Road, north of the project access, is high. The City of Mission Viejo recommends that the Draft EIR provide narrative discussion which explains the land uses or destinations that exist or are proposed north of the project site, which would cause one-quarter of the project's daily trips to use this segment of El Toro Road, versus using El Toro Road south of the project site to access freeways, major highways, and public facilities. The assumptions used in the project trip distribution would have a resultant impact on analyzed intersections south of the project entrance to El Toro Road, and, in particular, would increase Intersection Capacity Utilization (ICU) calculations if a greater percentage of project trips were assigned southerly along El Toro Road.

2. El Toro/Glenn Ranch Road Intersection:
The El Toro/Glenn Ranch Road intersection is a Measure M intersection that is fully assigned to the City of Mission Viejo. In compliance with countywide Measure M

200 Civic Center • Mission Viejo, California 92691
http://www.ci.mission-viejo.ca.us
949/470-3053
FAX 949/951-7176

requirements, the City of Mission Viejo must maintain this intersection at a Level of Service "D" or better.

The project traffic study identifies that the El Toro/Glenn Ranch Road intersection will maintain a Level of Service A through project buildout in Year 2005, but that the intersection is projected to operate at a Level of Service "E" in the pm peak period in Year 2025 buildout, with or without the project. The project traffic study further identifies that the completion of additional El Toro Road improvements, specifically, the addition of through lanes that increases El Toro Road's lane capacity from a two-lane to a four-lane facility, will allow this intersection to operate at a Level of Service "C" in the pm peak period, thus maintaining consistency with Measure M Growth Management Program level of service standards.

The City of Mission Viejo recognizes that the implementation of additional El Toro Road improvements is not necessitated by the Saddleback Meadows project, since project buildout, and associated levels of service standards, can be maintained at the El Toro/Glenn Ranch Road intersection with existing improvements. In conjunction with Measure M Interjurisdictional Planning Forums, the City of Mission Viejo will monitor the operation of El Toro Road and will work with the County of Orange, to allow for the implementation of the additional El Toro Road lane improvements in advance of any failing intersection performance at the El Toro/Glenn Ranch Road intersection.

On behalf of the City of Mission Viejo, I thank you for your consideration of our comments. If you have any questions, please feel free to call Elaine Lister or me at (949) 470-3053.

Sincerely,

Charles E. Wilson, AICP

RE: Saddelback Meadows Zone Change and Area Plan

Dear Mr. McGill:

Thank you for the opportunity to review and comment on the Zone Change (ZC) 98-3 and Area Plan (AP) 98-2 for the proposed Saddleback Meadows development. It is our understanding that the existing zoning allows for 705 manufactured homes, 1.7 acres of commercial, and 130 acres of open space. The proposed development will include 299 single-family detached dwelling units and 155 acres of open space.

The City of Rancho Santa Margarita has reviewed the Zone Change and Area Plan and has the following comments:

1. Saddleback Meadows Rural Character Statement Page 6 (graphics): It is not clear which direction the views from off-site are from.

2. Page 6-1: Grading Concept: Contour grading is discussed but there are not any graphics that show where cut and fill areas will occur.

Please include the City of Rancho Santa Margarita on your mailing list for review of any documents related to this project.

RE: Comments on Draft Revised Subsequent EIR 566 (SCH No. 1996121072) for Saddleback Meadows.

Dear Mr. Britton:

These comments are submitted on behalf of the Center for Biological Diversity ("Center"), a non-profit public interest membership organization dedicated to the preservation of native species and their habitats. On June 11, 2001 our Legal Assistant Susie Roe called the County of Orange Environmental Planning and Services Division requesting a copy of the EIR for the Saddleback Meadows Project, SCH No. 1996121072. Ms. Roe was told by staff that the EIR could only be sent via the authority of Mr. Bill Grieman, then on vacation. Ms. Roe left a voicemail for Mr. Grieman, who never returned the call. Today, June 24th, Ms. Roe called Mr. Grieman to check on the status of the request for the EIR, and was told that he was unsure when and if it could be sent because the comment period is now over. This is outrageous. First, the comment period is not "over" as it is not yet the close of business. Second, the Center has right to review the EIR regardless of whether the comment period is "over" or not. Third, the County of Orange Environmental Planning and Services Division should not be incapable of sending out a copy of an EIR while one staff member is on vacation. The actions of County staff have deprived the Center, our members and staff, and members of the public with an interest in protecting the biological resources of the Saddleback Meadows project site with an opportunity to comment on this project.

From reviewing the comments of the Sierra Club and others, it seems apparent that the Draft Supplemental EIR is deeply flawed, the environmental impacts of this project are unacceptable, and the mitigation proposed is entirely inadequate. The Center will submit further comments once we have received the EIR. The Center requests that the comment period be extended due to the County's

failure to timely release a copy of the EIR upon request. Should the deadline not be extended, the Center will still submit comments and strongly urges the County to consider them and respond fully in the Final EIR. As you know, the CEQA Amendments of 1994 make it clear that an organization exhausts its administrative remedies (and therefore preserves its right to judicial review of the project approval) by submitting comments at any time prior to the certification of the EIR. Pub. Resources Code § 21177(a),(b); *Galanta Vineyards v. Monterey Peninsula Water Management District* (6th Dist. 1997), 60 Cal. App.4th 1117-1121.

Thank you for your consideration of these comments. Please contact me at (909) 659-6053 x. 302 should you have any questions.

Sincerely,

Kassie Siegel

Re: *Draft Revised Subsequent Environmental Impact Report No. 566 for Saddleback Meadows 299-Unit Single Family Housing Project*

Dear Mr. Britton:

On behalf of the Vedanta Society of Southern California ("Vedanta"), we hereby submit our comments on "Draft Revised Subsequent Environmental Impact Report No. 566" ("DRSEIR 566" or the "DRSEIR") for the 299-unit single family housing project (the "299-Unit Project") proposed for the Saddleback Meadows property (the "Property"). Vedanta's specific comments on DRSEIR 566 are set forth in Exhibit "A" attached hereto and are incorporated herein by reference. We request that each of the comments set forth in Exhibit "A" receives a full and complete response pursuant to section 15088 of the State CEQA Guidelines.

We are particularly disappointed that, after having described the "44/178 Alternative" in detail in the letter which we sent to you on August 31, 2001, in response to the Notice of Preparation for DRSEIR 566, California Quartet's consultant, HDR, has chosen to address a *radically different* alternative under the guise of the "44/178 Alternative." In our letter, we clearly described the "44/178 Alternative" as dividing the Property into a 44-acre "Development Parcel" and a 178-acre "Conservation Parcel" with all residential dwelling units and related improvements being confined to the "Development Parcel." We stressed that the "Conservation Parcel" was to be permanently preserved in its natural condition as undeveloped and undisturbed open space, and that no development activities (*e.g.*, remedial

grading) were to be permitted outside the 44-acres of the "Development Parcel." However, in the DRSEIR, the "44/178 Alternative" is inexplicably presented as a 127-unit single family housing project.

As was disclosed by California Quartet's representatives during Vedanta's settlement negotiations with them and various County officials in 1998, a 127-unit alternative would require a development area of at least 75 acres and would entail massive remedial grading and a 50-foot loeffel wall that would destroy virtually all of the vernal ponds, oak trees, and sensitive habitat areas that would otherwise be preserved by the 44-acre development footprint that is the hallmark of the "44/178 Alternative" proposed by Vedanta.

We consider the unfair and distorted presentation of the "44/178 Alternative" that is contained in DRSEIR 566 to be so deceptive and misleading that it requires the DRSEIR to be redrafted and recirculated. Section 15088.5(a)(3) of the State CEQA Guidelines has clearly been triggered in this regard. Moreover, given the conclusory and deficient nature of many of the other sections of DRSEIR 566, recirculation is also required under section 15088.5(a)(4) of the State CEQA Guidelines.

What is required is a fair and honest evaluation of the merits of the "44/178 Alternative." As the County's own staff members proved in developing the 65-unit "Mathews Alternative" in April 1998, the "44/178 Alternative" would provide California Quartet with a feasible--albeit lower density--housing project which would preserve and protect the environmentally-sensitive resources on this unique "wildlife corridor" property. Regrettably, the County has so far allowed California Quartet's consultant to evade the state law requirements which mandate that this project alternative be adequately analyzed and reported on in the DRSEIR. We cannot believe that the County has allowed this blatant misconduct to occur and we hope that you will rectify it immediately.

In the interest of providing the decision-makers of the County of Orange and the members of the public with a complete and non-deceptive evaluation of the project alternatives, environmental impacts, and feasible mitigation measures associated with the 299-Unit Project, we respectfully request that DRSEIR 566 be revised and recirculated before any public hearings are scheduled on this matter.

Very truly yours,

Edmond M. Connor

Enclosure

EXHIBIT "A"

COMMENTS OF VEDANTA SOCIETY OF SOUTHERN CALIFORNIA ON DRAFT REVISED SUBSEQUENT ENVIRONMENTAL IMPACT REPORT NO. 566

1. Draft Revised Subsequent Environmental Impact Report No. 566 ("DRSEIR 566" or the "DRSEIR") fails to identify, analyze, and mitigate the impacts associated with the failure of the 299-unit single family housing project (the "299-Unit Project") to comply and be consistent with the goals, objectives, components, regulations, and guidelines of the Foothill/Trabuco Specific Plan (the "FTSP"). At page 4.1-12, the DRSEIR simply concludes that the 299-Unit Project "would be in substantial compliance with or consistent with the previously approved and Recorded Map 10692" and, therefore, as a result of the fact that the 705-unit manufactured housing project (the "705-Unit Project") described in Recorded Map 10692 was exempted--due to bankruptcy code concerns--from compliance with the FTSP, the 299-Unit Project should likewise be exempted. However, the DRSEIR fails to provide any legal or factual support for this conclusion. The FTSP provides an exemption for the development of the Saddleback Meadows property (the "Property") *only* if it is developed in accordance with Recorded Map 10692--*i.e.*, if the 705-Unit Project is developed. If any proposed development "deviates" from Recorded Map 10692, an amendment to the FTSP is required to "(1) determine an appropriate density cap for the property; (2) establish new development regulations for the Bridlewood Residential District; and (3) be consistent with all of the provisions of the Specific Plan." (FTSP at page III-20, para. 3.2(b).) By seeking to create an entirely new exemption from the FTSP for the Property, and by submitting an entirely new subdivision map for the Property, the developer has acknowledged that the 299-Unit Project deviates from Recorded Map 10692 and is not covered by the exemption from the FTSP provided for the 705-Unit Project. DRSEIR 566 incorrectly concludes that the 299-Unit Project is exempt from the FTSP because it "would be in substantial compliance with or consistent with previously approved and Recorded Map 10692." If the DRSEIR seeks to rely on this patently false conclusion, some attempt must be made to support it by providing a good faith comparison of the 705-Unit Project and the 299-Unit Project to prove that they are the same project. If they are essentially the same project, then the environmental analysis set forth in the DRSEIR is fatally flawed because the 299-Unit Project is portrayed as involving far fewer impacts.

2. DRSEIR 566 fails to identify, analyze, and mitigate the impacts--including the adverse precedent--associated with the creation of an entirely new exemption for the Property from the goals, objectives, components, regulations, and guidelines of the FTSP. If a new exemption is to be created, the DRSEIR should (a) identify all other projects, if any, which have received a similar exemption from the FTSP and (b) identify each of the goals, objectives, components, regulations, and

guidelines of the FTSP with which the 299-Unit Project is inconsistent, but will nonetheless be exempted from, including, but are not limited to, (a) the goals and objectives relating to rural character and resource preservation; (b) the resources overlay component relating to wildlife corridors, oak woodlands, tree management/preservation, and streambeds; (c) the Bridlewood Residential District Regulations; (d) landscaping regulations; (e) grading standards relating to the maximum height of manufactured slopes and the 70% "natural open space" requirement; (f) area plan submittal requirements; (g) grading, drainage and site planning guidelines; and (h) architectural guidelines.

3. DRSEIR 566 fails to properly identify, analyze, and mitigate the land use compatibility impacts of the 299-Unit Project on the Ramakrishna Monastery and St. Michael's Abbey. At page 4.1-13, under the heading "Level of Significance Before Mitigation," DRSEIR 566 concludes that "due to a natural space buffer, implementation of the proposed project would not result in significant land use compatibility impacts to the Rama Krishna Monastery or St. Michael's Abbey." However, at page 19, under the heading "Significant Impacts of the Project Prior to Mitigation," "Addendum PA980103 to Certified Final Subsequent Environmental Impact Report 566" ("Addendum No. 1") earlier concluded that the 299-Unit Project "would result in significant land use compatibility impacts to O'Neill Regional Park, the Ramakrishna Monastery, St. Michael's Abbey, and surrounding residential communities." Moreover, despite the incorporation of the identical "Project Design Features" which are proposed by DRSEIR 566, "Draft Environmental Impact Report No. 561" ("DEIR 561") concluded that the very similar 318-unit single family housing project which it analyzed would have a significant, *unavoidable*, adverse impact on land use compatibility with O'Neill Regional Park, the Ramakrishna Monastery, and St. Michael's Abbey. (DEIR 561 at page 8-1.) The DRSEIR fails to explain or reconcile these clearly inconsistent and contradictory conclusions.

4. DRSEIR 566 fails to properly identify, analyze, and mitigate the land use compatibility impacts of the 299-Unit Project on O'Neill Regional Park. At page 4.1-11, the DRSEIR concludes that the 299-Unit Project is "not incompatible" with O'Neill Regional Park. This conclusion is reached based on the fact that a portion of the Property is to be dedicated to the County of Orange (the "County") for incorporation into O'Neill Regional Park and that portion of the Property purportedly would cause O'Neill Regional Park to be "substantially buffered from the development by natural undisturbed, open space and topography." However, a comparison of the Open Space Plan for the 299-Unit Project (Figure 2.11) and any map or diagram indicating the surrounding property boundaries (*e.g.*, Figure 4.1.2, 2.3, or 2.6) reveals that the 299-Unit Project abuts a significant portion of the property boundary shared by the Property and O'Neill Regional Park. Indeed, the 299-Unit Project will require grading and fuel modification activities to be conducted in a portion of O'Neill Regional Park. (*See, e.g.*, Figure 4.2.5 (grading cannot conveniently stop at property boundary as indicated in Removal Area "C")

and 4.12.1.) Hence, not only does the DRSEIR fail to provide any factual support for its conclusion that the 299-Unit Project is "not incompatible" with O'Neill Regional Park, but it actually provides information demonstrating that this conclusion is obviously incorrect. Moreover, as noted in the previous paragraph, earlier environmental documents regarding the 299-Unit Project and the similar 318-Unit Project concluded that such projects did have significant land use compatibility impacts on O'Neill Regional Park, but DRSEIR 566 has not explained or reconciled these inconsistencies.

5. DRSEIR 566 fails to properly identify, analyze, and mitigate any of the environmental impacts which would result if title and possession of a significant portion of O'Neill Regional Park were to revert back to Vedanta due to any construction or other activities associated with the 299-Unit Project. In 1974, Vedanta granted the approximately 245 acres located immediately to the south of the Property, and the west and southwest of the Monastery, to the County so that the land could be made a part of O'Neill Regional Park and be permanently maintained as open space. The grant of this land contained several conditions subsequent pursuant to which the land would revert back to Vedanta in the event of a breach of any of those conditions. The conditions expressly prohibit any grading activities, the placement of any soils, and the removal of any trees, shrubs, or natural growth from the land gifted to the County. All of the grading maps in the DRSEIR attempt to show that no grading will be conducted in O'Neill Regional Park. For example, Figure 4.2.5 shows that when the limits of remedial grading--which generally trace the contours of the land and the outline of the geotechnical conditions which purportedly are to be remedied--reach the property line between the Property and O'Neill Regional Park, the limits of remedial grading miraculously make a sharp turn and follow precisely along the property line in order to stay out of O'Neill Regional Park. Clearly, this is not possible and, as currently designed, the 299-Unit Project requires certain grading--and also *fuel-modification* activities--to be conducted within the portion of O'Neill Regional Park which Vedanta gave to the County. Moreover, the 299-Unit Project provides for a storm drain to discharge into the natural drainage course which runs directly into O'Neill Regional Park. (*See* Figure 4.3.2.) Each of these constitutes a breach of the conditions subsequent to Vedanta's gift of land to the County and would cause such land to revert back to Vedanta. DRSEIR 566 should acknowledge this fact and identify, analyze, and mitigate the environmental impacts which would result therefrom. If the DRSEIR is going to continue to insist that no grading or other activities will be conducted within O'Neill Regional Park, then DRSEIR 566 should provide an explanation of how grading and all other activities will be excluded from O'Neill Regional Park.

6. DRSEIR 566 fails to properly identify, analyze, and mitigate the land use compatibility impacts of the 299-Unit Project on all surrounding residential areas. At page 4.1-10, the DRSEIR states that the 299-Unit Project "has a lower gross density than the surrounding area projects." However, in reaching this

conclusion, DRSEIR 566 relies solely upon two nearby projects which are located *outside* the FTSP--*i.e.*, Portola Hills and Hidden Hills/Hidden Ridge--while ignoring two nearby residential projects that are *within* the FTSP. (*See* Table 4.1.2.) DRSEIR 566 fails to acknowledge or analyze the fact that the "gross density" for the 299-Unit Project (1.3 dwelling units/acre) is double that of Santiago Canyon Estates (gross density of 0.66 dwelling units/acre) and four times that of the proposed Saddle Creek/Saddle Crest (gross density of .33 dwelling units/acre).

7. DRSEIR 566 fails to properly identify, analyze, and mitigate the impacts associated with the inconsistency between the 299-Unit Project and the Aliso Creek Corridor Specific Plan. At page 4.1-12, the DRSEIR concludes that the 299-Unit Project "would be in conformance with the Aliso Creek Corridor Specific Plan" and, therefore, makes no attempt to mitigate the impact of any inconsistency with such Specific Plan. However, at page 19, Addendum No. 1 concludes that the 299-Unit Project "would also conflict with policies of the Aliso Creek Corridor Specific Plan." DRSEIR 566 fails to explain or reconcile these inconsistent and contradictory conclusions.

8. DRSEIR 566 fails to properly identify, analyze, and mitigate the grading and other geophysical impacts associated with the 299-Unit Project. The impacts and mitigation measures which DRSEIR 566 fails to address, include, but are not limited to, the following:

   (a) The impacts which the grading activities for the 299-Unit Project will have on the Trabuco Canyon area and its residents based on how long it will take to complete the proposed grading. Although all previous environmental impact reports the County has prepared for the Property have likewise failed to fully address these impacts, they did, at least, concede in the "Geophysical Resources" subsection that, depending on the project, grading would take between 10 and 18 months to complete, based on an average daily grading quantity of 30,000 cubic yards. (*See* Addendum No. 1 at p. 21; "Final Subsequent Environmental Impact Report No. 566" ("FSEIR 566") at p.4-22; DEIR 561 at p.4-28.) The "Geophysical Resources" subsection of the DRSEIR, however, is strangely silent on this issue and the "Project Description" section (p. 2-16) now simply contains a single sentence and footnote stating that grading will require approximately 13 months to complete based on an average of 30,000 cubic yards per day and 21-work days per month. Not only is this estimate incorrect using the County's own numbers (a total of 9.25 million cubic yards of grading at an average of 30,000 cubic yard per day and 21-work days per month translates to 14.68 months of grading), but, as Vedanta and its consultants have repeatedly stated in connection with all previously proposed projects, an average of 30,000 cubic yards per day--especially for the remedial grading--is very unrealistic. Although

30,000 cubic yards per day may possibly be achieved for the 2.45 million cubic yards of conventional grading, a figure of 10,000 cubic yards per day is a much more reasonable assumption for the 6.8 million cubic yards of remedial grading that is proposed. Using these figures (and DRSEIR 566's estimate of 21-work days per month), grading would take longer than 36 months or 3 years to complete. The DRSEIR fails to justify its estimate regarding how long grading for the 299-Unit Project will take, and it also fails to address the impacts that conducting grading activities for that amount of time would have on Trabuco Canyon and its residents--including, but not limited to, the excessive noise, dust, and traffic delays associated with excavating and recompacting more than nine million cubic yards of soil which will remain exposed to the wind during dry seasons, and the rain during wet seasons, over the course of the several years it will take to complete all of the proposed rough grading.

(b) The impacts associated with the heavy ground water seepage into the excavations at the site which DRSEIR 566 anticipates will occur (p.4.2-18 mitigation measure M 2-20), including, but not limited to, (i) the impact of the discharge of collected ground water seepage, (ii) the impact of the interruption in subsurface ground water flow on downstream wells, and (iii) the impacts of the presence of the deep shear keys for buttress fills on the final ground water conditions. The DRSEIR also fails to address whether there is a potential for surfacing of ground water behind the effective subsurface dam created by the shear key of the buttress fill.

(c) The impact of buttress backcut failures. DRSEIR 566 projects a buttress backcut failure rate of 10 percent. (*See* DRSEIR 566 at p. 4.2-20, mitigation measure M 2-34.) However, due to the subsurface conditions typified by landslides within landslides, this 10 percent estimate is overly optimistic. Moreover, the effect of backcut failures on upstream and adjacent properties, regardless of the percentage of failures, are not addressed.

(d) The impact of new soil stability problems which will be created by increasing the amount of water that is discharged into the Property's natural drainage courses and the ground water table. (As stated in the "Hydrology" and "Water Quality" subsections of DRSEIR 566 daily nuisance and storm water runoff will be discharged into the Property's natural drainage courses.) In particular, (i) the increased erosion that will occur in the Property's natural drainage courses during storm flows due to the fact that the weak alluvial soils which are present in those courses will have been softened by the daily nuisance runoff that will be discharged into such drainage courses, (ii) the weakened support for existing landslides which will also result from the discharge of daily nuisance runoff and increased storm water runoff into the Property's natural

drainage courses, and (iii) the new instability problems which will be created by the ground water levels being raised by the infiltration of irrigation and other new sources of water.

(e) The special grading requirements which are necessary to perform the extremely deep fill that are proposed. Although the DRSEIR acknowledges that fill depths will exceed 50 feet and settlement associated with those fills of 4 to 6 inches can be expected (p. 4.2-20 mitigation measure M 2-33), fill depths of up to 130 feet will actually be required to construct the proposed shear keys for the buttress fills. Fills of such great depths require, *inter alia*, (i) additional evaluation that may necessitate compaction criteria well in excess of code minimums, (ii) special moisture conditioning of fill during compaction, and (iii) long-term settlement monitoring prior to building construction.

(f) Imposing a 100 percent performance bond to cover the possibility of the developer's failure to complete the extremely large amount of conventional and remedial grading required for the 299-Unit Project.

9. DRSEIR 566 fails to properly identify, analyze, and mitigate the hydrology impacts associated with the 299-Unit Project. The impacts which the DRSEIR fails to address, include, but are not limited to, the impacts of discharging daily nuisance water runoff and increased storm water runoff into the natural drainage courses of the Property. The natural drainage courses of the Property are dry for a majority of the year (only receiving water during storms). However, the daily nuisance water runoff from the 299-Unit Project will cause the drainage courses to be wet year-round and, therefore, more susceptible to, *inter alia*, erosion. Moreover, the character of the water being dumped into the natural drainage courses will change from slower-moving water carrying soil and debris to faster-moving water that has less soil and debris and, therefore, is prone to picking up soil and debris. DRSEIR 566 acknowledges that, by increasing the flows in the Property's natural drainage courses, the 299-Unit Project will have erosion and sedimentation impacts, but the DRSEIR fails to address any of these impacts. Instead, any analysis of this issue is improperly deferred until *after* the certification of DRSEIR 566--*i.e.*, until a point in the approval process where the public is not permitted an opportunity to review and comment on that analysis, and the County is not required to respond to any public comments.

10. DRSEIR 566 fails to identify, analyze, or mitigate any of the water quality impacts associated with the 299-Unit Project because the entire "Water Quality" subsection of the DRSEIR is based upon a conceptual water quality management plan for a *different* project. At page 4.4-1, the DRSEIR states that its "Water Quality" subsection "summarizes the findings and conclusions of the *Conceptual Water Quality Management Plan for Saddleback Meadows Proposed VTTM 15230 County of Orange, California*" which is included in the DRSEIR as

Appendix "E." However, as its complete title indicates, the "Conceptual Water Quality Management Plan for Saddleback Meadows Proposed VTTM 15230, Development Alternative for 283 Residential Home Sites, County of Orange, CA" which is found in Appendix "E" was prepared to address a different project--*i.e.*, the 283-unit single family housing project which is Alternative No. 8 in the DRSEIR. As such, the entire "Water Quality" subsection must be revised to correctly identify, analyze, and mitigate the water quality impacts of the 299-Unit Project as opposed to the 283-Unit Project which it currently addresses.

11. Assuming *arguendo* that the "Water Quality" subsection of DRSEIR 566 did address the 299-Unit Project, such subsection nonetheless fails to fully and properly identify, analyze, and mitigate the water quality impacts associated with the 299-Unit Project because, *inter alia*, it fails to fully describe how pollutants will be filtered from the daily nuisance and storm water runoff from the 299-Unit Project and what the impacts will be of discharging polluted runoff into the Property's natural drainage courses and O'Neill Regional Park, and the area's groundwater. The DRSEIR claims that a riverine system will be used to filter pollutants from the daily nuisance and storm water runoff from approximately 80 percent of the 299-Unit Project. (*See, e.g.*, p.4.4-13 at PDF 4-1.) In reliance on the riverine system, stormceptor filters will be installed on the storm drains serving the 20 percent of the Project which is located in the northeastern quadrant of the Property only. However, nowhere is it depicted or explained in DRSEIR 566 how flows from the 299-Unit Project will be directed into the riverine system. Indeed, Figure 4.3.2, entitled Proposed Drainage Improvements, shows that all of the runoff from the 299-Unit Project will be directed into the storm drain system and discharged into the Property's natural drainage courses, but the storm drains serving a majority of the 299-Unit Project will not have filters to reduce the amount of pollution in the runoff. The DRSEIR also acknowledges that the riverine system is designed to accommodate low flows only, but it fails to explain how any flows that exceed the capacity of the riverine system will be filtered for pollutants given that the storm drains collecting runoff from 80 percent of the Project will not have filters installed due to the existence of the riverine system. Moreover, the DRSEIR acknowledges that the filters that will be installed will not trap bacterial indicators or toxic constituents. (DRSEIR 566 at p. 4.4-11.) Instead, the DRSEIR relies upon 3,300 lineal feet of the Property's natural drainage courses to filter these pollutants. However, the DRSEIR does not in any way address the impacts that these pollutants will have on the Property's natural drainage courses--some of which flow into O'Neill Regional Park--and the area's groundwater.

12. DRSEIR 566 fails to properly identify, analyze, and mitigate the impacts the 299-Unit Project would have on the Natural Communities Conservation Plan ("NCCP") program and the County's ability to complete its Southern NCCP Subregion and to link the Southern and Central/Coastal NCCP Subregions. Previous environmental impact reports for the Property included four or more

pages of text addressing the NCCP and the impacts of the proposed projects on the NCCP. (*See, e.g.*, FSEIR 566 at pp. 4-127 -- 4-130, 4-144; DEIR 561 at pp. 4-123 -- 4-126, 4-139 -- 4-140.) The DRSEIR, however, contains less than one page of very cursory discussion regarding the NCCP and it fails in any way to address the impacts of the 299-Unit Project on the NCCP and the County's NCCP planning efforts. Moreover, DRSEIR 566 fails to, *inter alia*, (i) acknowledge that the United States Fish and Wildlife Service and the California Department of Fish and Game (collectively, the "Wildlife Agencies") have repeatedly informed the County that the Property provides a critical habitat corridor/linkage necessary for the completion of the NCCP Southern Subregion and (ii) identify the findings which the NCCP requires to be made with respect to the impacts the 299-Unit Project will have on the coastal sage scrub habitat located on the Property. The DRSEIR should be revised to include an appropriate and complete discussion of the impacts of the 299-Unit Project on the NCCP.

13. DRSEIR 566 fails to properly identify, analyze, and mitigate the impact of the 299-Unit Project on wildlife movement on the Property and throughout the NCCP Southern and Central/Coastal Subregions. The DRSEIR touts that the 299-Unit Project has been designed to incorporate a wildlife movement corridor that will permit wildlife to continue to travel safely across the Property. (*See, e.g.*, DRSEIR 566 at p. 4.8-27.) However, the DRSEIR fails to acknowledge that the Wildlife Agencies have previously informed the County that the wildlife corridor proposed as part of the 299-Unit Project does not "retain appropriate topography and habitat to ensure the continued function of the wildlife movement corridor/linkage that exists on Saddleback Meadows." (October 29, 1998 Letter from the Wildlife Agencies to the Orange County Board of Supervisors.) As such, the DRSEIR needs to be revised to contain an analysis of the adequacy of the proposed wildlife movement corridor/linkage and the impact of failing to provide an adequate corridor/linkage.

14. DRSEIR 566 fails to properly identify, analyze, and mitigate the biological resources impacts associated with the 299-Unit Project because, *inter alia*:

(a) The DRSEIR fails to properly identify the sensitivity of the intermediate mariposa lily (*calochortus weedii var. intermedius*) and based thereon erroneously concludes that there will be no significant impact of it requiring any mitigation. (*See* DRSEIR 566 at p. 4.8-21 and Appendix I.1 at p.17.) In Appendix I.1, the DRSEIR erroneously identifies the sensitivity of the intermediate mariposa lily as California Native Plant Society ("CNPS") List 4. (*See* Appendix I.1 at p. 9.) In the text, the DRSEIR correctly lists the intermediate mariposa lily as CNPS List 1B, but then proceeds to conclude that, due to its low sensitivity status, the impact of destroying all plants found on the Property is not significant. (*See* DRSEIR 566 at pp. 4.8-13, 4.8-21.) However, as explained in Appendix "C" to Appendix I.1 of the DRSEIR, the presence of the

intermediate mariposa lily on the CNPS List 1B means that it is "rare, threatened, or endangered in California and elsewhere and is eligible for state listing." Indeed, the only higher listing under the CNPS system is List 1A which includes only those plants that are presumed to be extinct. DRSEIR 566 needs to be revised to correct the inconsistency between its text and Appendix I.1 and, if it is going to maintain its conclusion that there will be no significant impacts on the intermediate mariposa lily, it need to provide facts to support such conclusion because, contrary to how the DRSEIR currently reads, the intermediate mariposa lily does not have a low sensitivity status.

(b) The DRSEIR erroneously concludes that the 299-Unit Project will not have a significant impact on the federally-listed endangered Riverside fairy shrimp because the impacts to it will be mitigated to a level of insignificance by the creation of several ephemeral ponds on the Property. However, as the Biological Opinion on the Saddleback Meadows Residential Development Project found in Appendix I.4 states at pages 19-20, creation of such ponds is experimental and has *never* been done successfully, especially with respect to the conditions found on the Property.

(c) Although one of the technical reports found in the appendices to DRSEIR 566 acknowledges that the Property has been designated as critical habitat for the Riverside fairy shrimp and the coastal California gnatcatcher pursuant to the U.S. Endangered Species Act, the text of the DRSEIR fails to acknowledge this fact. Neither the text of DRSEIR 566, nor any of the appendices thereto, address in any way the significance of this designation.

(d) The DRSEIR fails to properly and adequately mitigate the impacts the 299-Unit Project will have by destroying the hundreds of acres of oak woodlands, vernal ponds, coastal sage scrub habitat, and other biotic communities on the Property which are home to sensitive, threatened, or endangered flora and fauna. The mitigation DRSEIR 566 offers regarding these impacts fall far below that which is required by, *inter alia*, the FTSP, the NCCP, the state and federal endanger species legislation

15. DRSEIR 566 fails to properly identify, analyze, and mitigate the "Aesthetic/Visual" impacts associated with the 299-Unit Project. At page 4.9-22 through 4.9-23, the DRSEIR concludes that the 299-Unit Project will not have a significant aesthetic or visual impact prior to mitigation. However, at page 4-192, DEIR 561 concludes that, despite the use of many of the same contoured grading and viewshed screening techniques which are proposed for the 299-Unit Project, the 318-unit single family housing project which was the subject of DEIR 561 would nonetheless have *unavoidable* significant aesthetic and visual impacts (including night glare impacts) on the Ramakrishna Monastery, St. Michael's

Abbey, and O'Neill Regional Park. DRSEIR 566 fails to explain and reconcile these inconsistent and conflicting conclusions.

16. DRSEIR 566 fails to fully and properly identify and analyze the importance of the archaeological sites found on the Property. At page 4.10-19, the DRSEIR concludes that archaeological site CA-ORA-711 is the only site on the Property which is deemed to be important or significant. However, at page 104, Addendum No. 1 concludes that there are a total of four archeological sites on the Property which are deemed to be important or significant. Those sites are CA-ORA-710, CA-ORA-713, CA-ORA-715, and CA-ORA-1435H. DRSEIR 566 should have an analysis explaining and reconciling these inconsistent conclusions regarding the importance of certain of the archeological sites found on the Property.

17. DRSEIR 566 fails to properly identify, analyze, and mitigate the impacts associated with project "Hazards" as both the Initial Study and the Introduction to the DRSEIR (*see* page 1-4) indicated that it would. Indeed, the Initial Study identifies "Hazards" as one of six areas of potentially significant impacts which might result from the 299-Unit Project, but DRSEIR 566 fails to contain a section identifying and analyzing such impacts. All previous environmental documentation for the Property contained a separate section in which "Hazards" such as wildfire, emergency access, and wildlife interaction were all identified and analyzed. (*See* Addendum No. 1 at pp. 113-17; FSEIR 566 at pp. 4-203 -- 4-212, and DEIR 561 at pp. 4-219 -- 4-228.) Although the DRSEIR does address certain wildfire hazards and fuel modification requirements under the "Public Services--Fire Protection" subsection, it does not address any other hazards, such as the fact that the Project has only one main access road, which Addendum No. 1 identifies as an area of concern and which the Orange County Fire Authority proposed mitigation measures to specifically address. An analysis of the "Hazards" analyzed in the previous environmental documents for the Property should be conducted with respect to the 299-Unit Project.

18. DRSEIR 566 fails to properly describe the "44/178 Alternative" as initially proposed by Vedanta in October 1998 and again in the comments Vedanta submitted regarding the Notice of Preparation (the "NOP") for the DRSEIR. As proposed by Vedanta, although the developer would be free to develop the project of its choice on the 44-acre "Development Parcel," the 178-acre "Conservation Parcel" would be left in its undisturbed natural state--*i.e.*, no development activities of any kind would be conducted on such parcel, including, but not limited to, grading of any kind. However, as described in the DRSEIR, the "44/178 Alternative" allows for the development of 127 single-family housing units on the "Development Parcel" which, as Vedanta indicated in its comments on the NOP, can only be developed on such Parcel if a substantial amount of remedial grading and other construction activities are conducted on the "Conservation Parcel." Indeed, shortly after Vedanta proposed the "44/178

Alternative" in October 1998, the developer conceded that, in order to develop 127 single-family housing units on the "Development Parcel" it would have to grade at least 30 acres of the "Conservation Parcel"--which is not contemplated under the "44/178 Alternative" as proposed by Vedanta. Therefore, a new analysis of the "44/178 Alternative" should be conducted based upon a proper description of the alternative which identifies a range of units which can safely be accommodated within the "Development Parcel." This analysis should include, *inter alia*, an analysis of the geotechnical conditions to determine the greatest number of units that can be developed on the 44-acre "Development Parcel" with the least amount of rough grading. The grading study is of critical importance because it will not only address the economic feasibility of the "44/178 Alternative," but it also determines the nature and extent of the environmental resources which can be spared from the bulldozer's blade. As requested in Vedanta's comments on the NOP, this analysis should consider two versions of the "44/178 Alternative," one in which the developer is required to dedicate the 178-acre "Conservation Parcel" to the County (which has been the County's standard practice on all other major development projects approved during the past 25 years) and another in which the "Conservation Parcel" is purchased by a governmental entity (such as the United States Fish and Wildlife Service and the California Department of Fish and Game), a private entity, private person(s), or any combination thereof.

19. DRSEIR 566 fails to provide sufficient factual information about each of the proposed alternatives to allow for meaningful evaluation, analysis, and comparison with the 299-Unit Project. The DRSEIR provides very little factual information regarding the proposed alternatives and their environmental impacts. Instead, DRSEIR 566 simply makes very general and conclusory statements regarding whether each impact will be greater or less than the 299-Unit Project and each of the other alternatives. Very little factual information is provided which permits differential impacts to be quantified and meaningfully analyzed. For example, no information is provided to allow the number or acres of oak trees, vernal ponds, coastal sage scrub, or any of the other biological resources which are affected under each alternative to be compared with the 299-Unit Project. Similarly, the extent to which each of the alternatives comply with the various goals, objectives, components, regulations, and guidelines of the FTSP is not provided so as to allow a comparison of the alternatives with the 299-Unit Project. Indeed, the alternatives analysis in DRSEIR 566 is almost entirely devoid of any factual information which would support its conclusions regarding the relative impacts of the 299-Unit Project and each of the alternatives. Accordingly, an entirely new analysis of each of the alternatives is necessary to provide the factual information required to conduct a meaningful evaluation, analysis, and comparison of the alternatives with the 299-Unit Project. (Note: Although the DRSEIR provides grading quantities for many of the alternatives, it curiously fails to state a remedial grading quantity for the "44/178 Alternative" while nonetheless conceding that remedial grading will be required for that alternative.)

20. DRSEIR 566 fails to provide any factual information which supports its conclusion that, except for the "No Project Alternative," Alternative No. 8 is the environmentally superior alternative. Alternative 8 is a "reduced density alternative" which simply lowers the number of single family dwelling units by 16 units--*i.e.*, from 299 down to 283. In reaching this conclusion, the DRSEIR provides absolutely no explanation or factual support for how a 283-unit single family housing project--which has virtually the identical environmental impacts as the 299-Unit Project--could possibly be an environmentally superior alternative to Alternative 4 (a 100-unit single family housing project which leaves 85% of the Property as natural open space), Alternative 6 (the "44/178 Alternative"), or Alternative 7 (the "Acquisition Alternative" in which the entire property is purchased by a governmental entity, private entity, or private person(s) for preservation as permanent open space).

21. DRSEIR 566 fails to consider a residential housing alternative which complies with the goals, objectives, components, regulations, and guidelines of the FTSP, nor does it explain why such an alternative would be unacceptable. In its comments on the NOP, Vedanta specifically requested that the DRSEIR identify and analyze at least one reduced-density alternative which complies with all of the goals, objectives, components, regulations, and guidelines of the FTSP. Instead, in Alternative No. 8, the DRSEIR identifies and analyzes a reduced-density alternative that eliminates only 16 out of 299 dwelling units and which complies with virtually none of the goals, objectives, components, regulations, and guidelines of the FTSP. Indeed, DRSEIR 566 fails to provide any explanation for why an FTSP-compliant alternative was not considered.

Attention: Manager

Subject: Draft Environmental Impact Report – Saddleback Meadows.

This letter is not to be interpreted as a contractual commitment to serve the proposed project but only as an information service. Its intent is to notify you that the Southern California Gas Company has facilities in the area where the above named project is proposed. Gas service to the project could be served without any significant impact on the environment. Gas facility additions for the expansion would be in accordance with the company's policies and extension rules on file with the California Public Utilities Commission at the time contractual arrangements are made.

The availability of natural gas service, as set forth in this letter, is based upon present conditions of gas supply and regulatory policies. As a public utility, the Southern California Gas Company is under the jurisdiction of the California Public Utilities Commission. We can also be affected by actions of gas supply or the condition under which service is available, gas service will be provided in accordance with revised conditions.

Estimates of gas usage for non-residential and residential projects are developed on an individual basis and are obtained from the Commercial-Industrial/Residential Market Services Staff by calling (800) 427-2000. We have developed several programs, which are available upon request to provide assistance in selecting the most energy efficient appliances or systems for a particular project. If you desire further information on any of our energy conservation programs, please contact this office for assistance.

Sincerely,

Robert S. Warth

Re: Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows

After review of the cultural resources section of the DEIR, we, the Juaneño Band of Mission Indians ("tribe") are concerned about the protection of this land regarding both archaeological and anthropological impact. We feel that there has been an inadequate investigation into the significance/importance of the archaeological sites. The report indicates that there were three 1 x 1 meter units used to determine the archaeological significance /importance. This is an inadequate sampling of the area to make a determination for the size of this project. Also, we feel that the monitors should be from the local tribe. The practice of finding out of area monitors who do not understand the cultural significance of the local area needs to be corrected. There is also a concern for the wildlife corridor and endangered species, neither of which are adequately addressed.

There is not sufficient information to support the determinations made. The DEIR fails to provide documentation that the CEQA recommended preservation alternatives to the total destruction of archaeological sites to be impacted. The developer should be required to conduct a good faith examination of the feasibility of the preservation measures. They should be encouraged to incorporate one or more of the preservation measures and include the preservation plan in the EIR. Grading and monitoring is not adequate mitigation for the destruction of a significant archaeological site.

If it is determined that data recovery excavation and destruction of the sites is the only feasible option, the investigations should be guided by a research design that follows the California Office of Historic Preservation Guidelines for Archaeological Research Designs (Preservation Planning Bulletin No. 5, February 1991. Dept. of Parks and Recreation, Office of Historic Preservation). The report documenting the excavations should follow the Office of Historic Preservation Guidelines for Archaeological Resource Management Reports (Preservation Planning Bulletin No. 5, December 1989).

Sincerely,

Damien Shilo, Chairman

Re: Saddleback Meadows Revised SEIR No. 566

Dear Mr.Grieman:

I represent Rutter Development Corporation in connection with its entitlement and natural resources permitting efforts for the Saddle Crest and Saddle Creek residential development projects near the Saddleback Meadows project site. The southern boundary of the Saddle Creek project constitutes the northern border of the Saddleback Meadows project. Rutter Development supports the current proposed project and certainly sees it as preferable to the massive mobilehome park previously approved for the site. However, Rutter Development takes exception to Figures 4.8.2 and 4.8.4 in the Biological Resources section of the SEIR.

Figure 4.8.2 is labeled "Proposed NCCP Southern Subregional Planning Area," but it does more than simply delineate the subregional boundaries. The "reserve area" overlay on this exhibit has no basis in any approved or even proposed plan. Consequently, this exhibit should be replaced with one that simply shows the boundaries of the southern subregional planning area and overalys the project's boundaries. Similarly, Figure 4.8.4 is labeled "Proposed Regional Wildlife Movement Corridors" but there is no discussion regarding who is "proposing" the establishment of these corridors or for what species they are proposed to function as corridors. The "proposed" corridors in the exhibit do not correspond to the wildlife corridors shown in the adopted Foothill Trabuco Specific Plan or any other formally adopted or even proposed plan. Therefore, this exhibit should also be deleted, replaced or modified in the Final SEIR.

Thank you for the opportunity to comment on the draft SEIR for the Saddleback Meadows project. Please feel free to call if you have any questions or wish to discuss this matter.

Very truly yours,

Mark R. McGuire

ORANGE COUNTY
REGIONAL RECREATIONAL TRAILS
ADVISORY COMMITTEE

May 31, 2002

Thomas Mathews, Director
Planning and Development Services Department
300 North Flower Street, 3rd Floor
Santa Ana, CA 92703-5000

Subject: Saddleback Meadows Residential Project – Additional Trail Alignment

Dear Mr. Mathews:

As you know, the Regional Recreational Trails Advisory Committee (RRTAC) is a Board-appointed committee composed of equestrians, mountain bicyclists, and hikers. Recently, the RRTAC approved a motion to provide an additional riding and hiking trail through the proposed Saddleback Meadows project site.

The Committee was given a presentation regarding the subject project. Staff noted that the project is already proposing a local trail (referred to in this letter as "Trail A") along the main entry road extending west to east through the project. To provide a loop route we suggest an additional local trail ("Trail B"), to begin at Trail A and go north around the east side of St. Michael's Abbey. Trail B would then connect with the proposed Live Oak Plaza project site and connect to the Live Oak Canyon Regional Trail. **We also request an additional link from Trail B to the proposed Saddle Creek project at the north edge of the Saddleback Meadows project near the connection to Live Oak Plaza.** Mr. Jeff Dickman, County's Chief of Trail Planning, concurred with this concept.

The RRTAC hereby expresses its support for the additional local trail through the proposed Saddleback Meadows project ("Trail B"). We appreciate your department's efforts to provide this trail, and we would like to be kept informed of its progress.

Should you have any questions, please feel free to contact me at (714) 456-1157.

Sincerely,

Alice Sorenson
Chair, RRTAC

Re: Proposed Zone Change (ZC) 98-3 and Area Plan (AP) 98-2 for Saddleback Meadows

Dear Mr. McGill:

The Rural Canyons Conservation Fund, founded in 1983, advocates for the preservation of Orange County's unique inland rural canyon areas through a program of public education and participation in land use decisions affecting the area's unique and scenic natural resources.

We comment as follows on the above referenced proposals:

1. THE AREA PLAN APPLICATION IS INCOMPLETE.

The Foothill Trabuco Specific Plan (FTSP) lists certain informational items that must be provided when a proposed area plan is submitted. Several such items are missing from the subject proposal, including:

- a site-specific resources assessment by a qualified field biologist;
- a site-specific oak woodlands analysis;
- a site-specific wildlife corridor analysis;
- a hydrological analysis;
- detailed mapping of areas within 50 vertical feet or 200 horizontal feet of designated major ridgelines or rock outcroppings;
- a detailed viewshed analysis of the proposed development as viewed from scenic highways;

- a conceptual grading plan at a minimum scale of 1:40 clearly delineating existing and proposed contour elevations, the location and elevation of all building pads, access roads, driveways, slope percentages, heights of manufactured slopes, the total area of disturbance, area of the flat graded pad on each parcel, and the location of retaining and crib walls;

- clear delineation of the building lines for assessing setbacks;

- a consistency report evaluating the project's consistency with each of the regulations and guidelines contained in the FTSP; and,

- three-dimensional models of the site before and after proposed grading.

(FTSP III.G.2.0(e), pages III-90 through III-93.)

Because key information is missing from the application we received, we cannot fully assess the extent of non-compliance with the FTSP at this time, and therefore reserve the right to comment further if and when complete information becomes available.

2. THE PROPOSED SPOT AMENDMENT OF THE FOOTHILL TRABUCO SPECIFIC PLAN IMPROPERLY RENDERS THE FTSP INTERNALLY INCONSISTENT AND INEQUITABLE, AND IS THEREFORE INVALID ON ITS FACE.

State law requires that general and specific plans maintain internal consistency. However, the FTSP amendment proposed as part of this project renders the FTSP internally inconsistent. This inconsistency arises from the following language contained in the proposed spot amendment:

> "Any development shall be in compliance with every regulation of this District (BWR) *and shall be exempt from all of the Regulations and Guidelines included in this Specific Plan other than those provided for by this District.*" (Proposed Draft Ordinance, Exhibit 1, paragraph 3.4(c), italics added.)

This spot amendment conflicts with other general language within the FTSP:

> "This specific plan is adopted pursuant to regulations contained in the Orange County Zoning Code. It is specifically intended by such adoption that the development standards and provisions contained herein shall regulate *all development* within the Specific Plan area." (FTSP III.C.3.0, page III-1, emphasis added.)

> "It is uncertain whether this development cap can be achieved *since all development is required to be consistent with the Specific Plan regulations and guidelines.*" (FTSP II.D.3.0(b), page II-29, emphasis added.)

> "All development within the Specific Plan Area shall be required to be phased in a manner, which is consistent with the requirements of the Growth Management Plan (GMP) Element." (FTSP II.F.1.0(a), page II-43.)

> "For all development projects, a minimum of 50 percent of all shrubs to be planted should be native species." (FTSP IV.G.1.0(a), page IV-16.)

> "For all development projects, a minimum of 50 percent of all shrubs to be planted should be native species." (FTSP IV.G.1.0(a), page IV-16.)

Moreover, as will be shown below, the proposed development which the above spot amendment attempts to legitimize actually conflicts with and undermines the overarching goals and objectives for the Specific Plan area at the expense of the Specific Plan's integrity.

The proposed "wildcard" zoning also creates a class of unwarranted special privileges for this project's applicant, effectively denying other persons subject to the FTSP the equal protection of the law, in violation of the state and federal constitutions.

The proposed spot zoning amendment, therefore, is invalid on its face and thereby subject to nullification by the courts.

3. THE PROPOSED SPOT AMENDMENT OF THE FTSP IS BARRED BY THE FTSP ITSELF.

The FTSP explicitly provides how the Specific Plan may be amended to allow for development, as is now being proposed, that deviates from the recorded tract map for the Saddleback Meadows site:

> "If a development proposal on the aforementioned [Bridlewood, Lyon Ranch, Santiago Ranch, and Zadeh] sites deviates from these approvals and cannot be found to be in substantial compliance with these approvals, a Specific Plan Amendment shall be required for the individual site. Said Specific Plan Amendment *shall*: 1) determine an appropriate density cap for the property; 2) establish new Land Use District Regulations for the site; and 3) *be consistent with all of the provisions of the Specific Plan, as amended.*" (FTSP III.C.10.0(d), page III-4.)

> "Any development proposal, which deviates from the approved Saddleback Meadows Planned Community zoning and Recorded Tract 10692 and which cannot be found to be in substantial compliance with these approvals shall require a Specific Plan Amendment which *shall:* 1) determine an appropriate density cap for the property; 2) establish new development regulations for the Bridlewood Residential District; and 3) *be consistent with all of the provisions of the Specific Plan.*" (FTSP III.D.3.2.(b), page III-20, italics added.)

The proposed spot amendment exempting Saddleback Meadows from all but the revised district regulations clearly conflicts with the above requirements of the FTSP, which unequivocally mandate that the amended zoning regulations for Saddleback Meadows must be consistent with *all* of the provisions of the FTSP. Thus the proposed spot amendment is facially invalid, and, as will be shown below, the proposed area plan is in actual conflict with numerous of the FTSP's substantive requirements.

4. A SITE DEVELOPMENT OR USE PERMIT IS REQUIRED PRIOR TO ANY GRADING.

The proposed spot amendment explicitly allows issuance of a "preliminary grading permit" prior to approval of a site development or use permit. (Proposed Draft Ordinance, Exhibit 1, paragraph 3.4(d).) This flies directly in the face of the following general regulation of the FTSP:

> "Grading: Grading shall be permitted within the Specific Plan Area only upon approval of a site development permit or use permit by the Planning Commission. No grading permits shall be issued without the approval of a precise plan of development, i.e., site development permit or use permit." (FTSP III.C.6.1, page III-2.)

issued without the approval of a precise plan of development, i.e., site development permit or use permit." (FTSP III.C.6.1, page III-2.)

5. DEVELOPMENT DEPICTED ON THE PROPOSED AREA PLAN IMPROPERLY CONFLICTS WITH THE FTSP.

Since, as shown above, the proposed wildcard exemption from all of the FTSP's general substantive and procedural requirements is invalid, all of the FTSP's general provisions apply to this project. Unfortunately, the proposed development violates numerous of these provisions, including:

⇒"Rural Character/Forest Buffer: To preserve the rural character of the area and provide a buffer between urban development and the Cleveland National Forest." (FTSP I.C.1.0(a), "Goals and Objectives," page I-5.)

By any measure of the term, the proposed development, due to its extreme intensity and scale, is anything but "rural" in character. On the contrary, it is a conventional suburban housing tract, to be constructed after mass grading the site in the amount of 11.7 million cubic yards. At 5,000 square feet minimum, the lot sizes are far below the minimum ½ acre permitted in the adjacent FTSP areas, and the proposed average density of 1.35 dwelling units per acre vastly exceeds the prevailing minimum of 1 dwelling unit per 2 acres. The proposal includes manufactured slopes 120 feet high, contour elevation changes of 91 vertical feet, and retaining walls 40 feet high.

Characterizing such a proposal as "rural" can only be described as Orwellian. The submitted area plan application does include a "Rural Character Statement." However, this document merely sets forth general platitudes and idealized sketches on the subject, not specific to the proposed project, and not demonstrating how the concepts would actually be implemented. In the context of this project, "rural" must in large measure be defined in terms of *compliance* with the regulations and guidelines of the FTSP, which purport and serve to implement the general goal of *preserving* the area's rural character. Thus the subject proposal is rural to the extent of its compliance with the detailed requirements of the FTSP, and that compliance leaves much to be desired.

⇒"Except for those legal building sites existing at the time of Specific Plan adoption where compliance with this requirement would preclude development of a single residence on the existing building site, mapping shall identify a minimum corridor width (other than for the wildlife corridor parallel to Live Oak Canyon Road) at all locations of 400 feet measured perpendicular to the corridor's boundary." (FTSP II.C.2.2(c)(3), page II-11, underlining in original.)

The proposal fails to delineate a 400-foot-wide wildlife corridor through the project. The corridor mentioned in the text of the area plan actually diminishes to under 200 feet wide where it passes between the main spine road on the south and St. Michael's Abbey on the north.

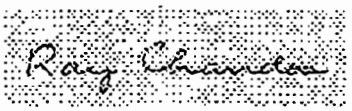
⇒"Development shall maintain a minimum 50-foot setback of all structures and barrier fencing from all corridors. Uses. within the setback zone shall be limited to low-intensity, residential-related activities such as recreation and private open space." (FTSP II.C.2.4(a), page II.14.)

The proposed wildlife corridor violates this setback requirement where it passes between the southern and northern clusters of housing units.

The proposed wildlife corridor violates this setback requirement where it passes between the southern and northern clusters of housing units.

Please include this letter in the official record of proceedings for this project. Thank you for the opportunity to comment.

Sincerely,



Ray Chandos

Re: Comments of Saddleback Canyons Conservancy on the Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows (DEIR), State Clearinghouse No. 1996121072

Dear Sir or Madam:

The Saddleback Canyons Conservancy is dedicated to protecting and enhancing the environment and quality of life in the Foothill/Trabuco Specific Plan (FTSP) area and surrounding areas of Orange County. The following comments are provided in response to the DEIR.

NONCOMPLIANCE WITH THE FTSP

The proposed project lies within the FTSP area. The proponents of the project have proposed a zone change (ZC 98-3) that would be required to amend the FTSP for the project ("Bridlewood Residential District"). Such an amendment to the FTSP would exempt the project from all regulations and guidelines in the FTSP other than those provided for by the Bridlewood Residential District.

Upholding the integrity of the FTSP is of utmost concern to the Saddleback Canyons Conservancy. The proposed project site serves as a transitional buffer between the suburban developments of Lake Forest and Mission Viejo to the rural canyons area. The project's proximity to the Cleveland National Forest (within 1 mile) speaks to the need for compliance to – not exemption from – the development guidelines set forth in the FTSP.

The proposed development violates the spirit and letter of the FTSP. The primary goals of the FTSP are to "preserve the rural character of the area and provide a buffer between urban development and the Cleveland National Forest." The project in no way conforms to such a goal. Indeed, 299 tract

homes on a mass-graded site is anything but "rural." It is time to stop suburban sprawl, say "no" to continued mass development, and "yes" to a preservation and conservation plan.

DESTRUCTION OF HABITAT AND INTERFERENCE WITH WILDLIFE CORRIDORS

The project site is within the Southern Orange County Natural Communities Conservation Plan (NCCP) and provides a critical wildlife connector between the Central and Southern NCCP subregions and the Cleveland National Forest. In addition, the site itself provides habitat for the federally endangered Riverside fairy shrimp, and the federally threatened coastal California gnatcatcher, among other special status species. In view of the fact that the County, the U.S. Fish and Wildlife Service, and the California Department of Fish and Game have initiated the Southern Subregion NCCP process and that preliminary reserve designs are scheduled for completion in July 2002, a revised environmental document should be prepared to incorporate this critical information.

FAILURE TO ADEQUATELY ANALYZE CUMULATIVE IMPACTS

The list of "related" projects is limited to a small area near the project and excludes other major projects in the NCCP Southern Subregion. Among the major projects that must be included in a revised cumulative analysis include but are not limited to the massive Rancho Mission Viejo project (14,000 homes and 427 acres of "urban activity"). Additionally, the DEIR fails to mention the Rancho Potrero Leadership Academy, which also lies within the FTSP area, for which the Board of Supervisors filed a Notice of Determination in December 2001. The cumulative analyses of land use and planning, geology and soils, hydrology and water quality, air quality, traffic and transportation, biological resources, public services and utilities, aesthetics and growth inducement must consider all foreseeable projects.

NONCOMPLIANCE WITH NEW WATER QUALITY REGULATIONS

Aliso Creek, adjacent to the project site, is listed as a Category I Priority Impaired Water Body in the EPA's National Water Quality Report (2000). New water quality regulations have recently been ordered against the County of Orange by the Regional Water Quality Control Board. These stricter regulations supplant the 1994 NPDES permit referenced in the DEIR, and were enacted due, in part, to the extremely impaired water quality existing in Aliso Creek. The DEIR fails to explain how the project can comply with these new water quality regulations.

LACK OF WATER TO SUPPORT THE DEVELOPMENT

The Orange County Register recently reported (May 18, 2002) that "drought conditions have dried up two wells that the Trabuco Canyon Water District relies on to supply Trabuco Canyon and Rancho Santa Margarita residents." The TCWD is seeking additional appropriative water rights from the State Water Resources Control Board. Yet, as reported in correspondence to me dated May 14, 2002 from the State Water Resources Control Board, further processing of the TCWD's request for

additional water rights is being held in abeyance until several senior priority applications in the watershed are processed. This water shortage should be recognized as an impediment to the advancement of any new development in the area served by the TCWD.

CONCLUSION

The project is out of compliance with the FTSP. The project is not rural. The project significantly and negatively impacts biological resources and wildlife corridors. The project site is adjacent to the impaired Aliso Creek. The water district has severe water shortage problems. An additional 299 homes adds to suburban sprawl and downstream negative environmental impacts. The project should not proceed. The site should be set aside as a preserved habitat/wildlife corridor, and protected as open space for generations to come.

Please incorporate this letter into the official record of proceedings for this project.

Very truly yours,

Subject: Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows—EIR 566

Dear Manager:

The Sierra Club appreciates the opportunity to comment upon the Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows—EIR 566 (DRSEIR). As strong supporters of protecting the ecological integrity and aesthetic value of the remaining open space in Orange County, our members are closely monitoring projects proposed for properties in the vicinity of the Cleveland National Forest. To facilitate this monitoring process, as well as to properly inform the general public and decision-makers, it is essential that all environmental assessment related to such projects be conducted in strict compliance with the provisions of CEQA and the CEQA Guidelines.

Unfortunately, as it is currently written, the DRSEIR does not adequately address significant issues related to the proposed Saddleback Meadows residential development and its effect on the local environment. These issues include those justifiably raised by a number of individuals in comments already provided to you; therefore, the Sierra Club wishes to incorporate into this letter, by reference, each of the following documents:

- Comments by Terrell Watt, AICP, submitted in a letter dated June 7, 2002, on behalf of the National Audubon Society, Endangered Habitats League, and Rural Canyons Conservation Fund
- Comments by Edmond M. Connor, submitted in a letter dated June 9, 2002, on behalf of the Vedanta Society of Southern California
- Comments by Ray Chandos, submitted in a letter to Frank McGill dated May 28, 2002, on behalf of the Rural Canyons Conservation Fund
- Comments by Patricia Martz, Ph.D., submitted in a letter dated June 10, 2002

Although the Sierra Club believes that *all* of the issues discussed in the above documents warrant full consideration and thorough analysis in a revised DRSEIR, two are of overarching significance to our members and deserve particular emphasis.

SIERRA CLUB

Suburban Sprawl

The significant negative impacts of the proposed Saddleback Meadows development are all attributable to the fact the project would further extend suburban-style development into the remaining wildlands of eastern Orange County. Attendant to such sprawl are the inevitable habitat destruction and fragmentation; watershed and water quality degradation; increases in vehicle miles traveled, traffic congestion, and air pollution; and deterioration of viewsheds and noisesheds. An adequate DRSEIR must honestly identify the true nature of the proposed Saddleback Meadows development as suburban sprawl, analyze the cumulative impacts of allowing similar sprawl-type projects to encroach upon remaining wildlands, and propose alternative locations for providing similar amounts of housing within the existing footprint of urban/suburban Orange County.

Benefits of Preservation

Although serious and ongoing consideration has been given to acquiring the Saddleback Meadows site for preservation in its natural state, only passing attention is given to acquisition in the DRSEIR. An adequate DRSEIR would thoroughly analyze the environmental *and* economic benefits of acquisition, potential sources of funding, and the relationship of acquisition to fulfilling the goals and objectives of all of the following: The Orange County General Plan, Foothill/Trabuco Specific Plan, Aliso Creek Corridor Specific Plan, and Central-Coastal Subregion Natural Community Conservation Planning/Habitat Conservation Plan.

The Sierra Club recommends that the DRSEIR be revised to properly address all issues raised in this letter, both directly and by reference, and recirculated for public comment.

Respectfully submitted,

Gail Prothero

Santa Ana, CA 92703-5000

Subject: Saddleback Meadows Residential Project – Additional Trail Alignment

Dear Tom:

Recently, the County's Regional Riding and Hiking Trails Advisory Committee (RRHTAC) that I serve on was given a presentation regarding the subject project. Staff noted that the project is already proposing a local trail (referred to in this letter as "Trail A") along the main entry road extending west to east through the project. To provide a loop route, the RRHTAC supported an additional local trail ("Trail B"), to begin at Trail A and go north around the east side of St. Michael's Abbey. Trail B would then connect with the proposed Live Oak Plaza project site and connect to the Live Oak Canyon Regional Trail.

Upon review, Trails4All would also like to offer our support for the additional local trails through the proposed Saddleback Meadows project, linking with Live Oak Plaza and the Saddle Creek projects. We appreciate your department's efforts to provide this trail, and we would like to be kept informed of its progress.

Should you have any questions, please feel free to contact me at (714) 834-3136.

Sincerely,

Jim Meyer,
Executive Director

Re: Comments on the Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows (DRSEIR), State Clearinghouse No. 1996121072

Manager

This comment letter on the Draft Revised Subsequent Environmental Impact Report ("DRSEIR") for the proposed Saddleback Meadows development project ("project') is submitted on behalf of National Audubon Society, Endangered Habitats League and Rural Canyons Conservation Fund ("the commenting groups"). These comments provide a detailed and explicit outline of the problems and inadequacies presented by: (1) the project itself, including its geological impacts and impacts to the habitat of several endangered and sensitive species; (2) the DRSEIR, including fatal deficiencies under the California Environmental Quality Act ("CEQA") (Pub. Res. Code §§ 21000 et seq.) and the CEQA Guidelines (14 Cal. Code Regs. §§ 15000 et seq.); and (3) the project's inconsistency with the County General Plan.[1]

[1] This comment letter was prepared by Terrell Watt, Planning Consultants, with assistance from legal counsel to the commenting groups. Terrell Watt has over twenty years of land use and environmental planning experience. She has expertise in conservation planning, "smart growth" development projects, CEQA and NEPA, NCCPs/HCPs and government reorganization projects. Her recent projects include: (1) development of conservation plans for the Central Coast under a grant from the David and Lucile Packard Foundation; (3) project management of a Sphere of Influence Study for Marin County; (3) consulting on a habitat conservation planning program for the City of Livermore, partially funded with a grant from the California Department of Fish and Game; and (4) project management of the Los Angeles Infill Working Group Project under a grant from Caltrans. The latter is a joint effort by the State Department of Housing and Community Development, the City and County of Los Angeles and Environment Now. A current resume for Ms. Watt is attached.

A summary of the DRSEIR's major defects follows:

Inadequate Project Description: The DRSEIR's project description remains incomplete and, therefore, inadequate. Specifically, the project description lacks important details about the project that are critical to an adequate analysis of project-related and cumulative impacts. Such details include, but are not limited to: (1) fundamental engineering aspects of the project related to mass grading and the probable need for export of unsuitable cut and importation of suitable fill; (2) a detailed description and proposed uses of open space; (3) the complete Project Design Feature that includes the final drainage plan; (4) proposed home size and total development contemplated, including accessory structures and paving; (5) hazards and hazards-related project features, such as possible presence of on-site contamination; among other information about the project. Without this information, the evaluation of impacts cannot be complete.

Inadequate Project Setting: The DRSEIR fails to describe key elements of the project setting adequately and completely. Such elements include, but are not limited to: (1) key general plan policies and regional policies relating to habitat planning, in particular the Southern Orange County Natural Communities Conservation Plan (NCCP); and (2) a list of cumulative projects, geographic study area for the cumulative analysis or plan based approach to cumulative impacts. This information is critical to the analysis of project-related and cumulative impacts.

Failure to Identify or Analyze the Full Extent of Significant Environmental Impacts: The DRSEIR is riddled with conclusions unsupported by facts and analysis on the significance of environmental impacts. Specifically the DRSEIR concludes, based on improperly deferred mitigation measures and mitigation measures of unproven efficacy, that all potentially significant impacts except cumulative air quality will be reduced to less than significant with mitigation. Insufficient evidence is provided to support the conclusion that *all but one* impact will be less than significant after mitigation.

Inadequate Cumulative Impacts Analyses: The DRSEIR's cumulative impacts section is non-existent. The DRSEIR fails to provide a complete list of cumulative projects or to outline a plan based approach to the cumulative analysis. The list of "related" projects is limited to a small area near the project and excludes other major projects in the NCCP Southern Subregion. Brief, conclusory statements are made concerning cumulative impacts throughout the DRSEIR. Moreover, the DRSEIR fails to consider feasible mitigation for the project's incremental contribution to cumulative impacts. Notwithstanding this complete lack of analysis, the DRSEIR concludes that all cumulative impacts will be less than significant with the exception of cumulative air quality.

Inadequate Growth-Inducing Impacts Analysis: The DRSEIR's growth-inducing impacts section is likewise inadequate. For example, the DRSEIR fails to analyze the potentially significant growth-inducing impacts associated with the extension of utilities and roads, and the placement of a water tank and access road beyond the project site. The DRSEIR

offers no analysis or even recognition of the precedent-setting effect the proposed project would have on development in the area, and development on sites where the topography and presence of biological habitat and wildlife corridors should limit such projects.

Inappropriate Deferral of Feasible Mitigation Measures: The DRSEIR improperly defers mitigation measures. Many of the deferred mitigation measures, including measures related to drainage and hazards mitigation, are relied upon to reduce significant impacts without any supporting facts or analysis.

Failure to Analyze a Reasonable Range of Alternatives: The DRSEIR includes numerous alternatives, but fails to analyze an alternative that fully mitigates for on- and off-site impacts. Moreover, the DRSEIR fails to properly identify the environmentally superior alternative, after the no-project alternatives, as Alternative 4.

These and other major defects in the DRSEIR described below render the document inadequate as a basis for informed decision-making and legally deficient under CEQA and the planning and zoning law. The County should give no further consideration to the project until an EIR is prepared and circulated that fully complies with CEQA and the CEQA Guidelines.

CONSIDERATION OF THE PROJECT IS PREMATURE

The County, the U.S. Fish and Wildlife Service and the Department of Fish and Game have initiated the Southern Subregion NCCP process. Preliminary reserve designs are scheduled for completion in July 2002. The project site is within the Southern Subregion and provides a critical wildlife connector between the Central and Southern NCCP subregions and the Cleveland National Forest. In addition, the site itself provides habitat for a number of special status species.

The NCCP reserve design(s) will suggest where development should and should not occur based on biological resources. This new information is fundamental to a determination of whether all or a portion of the project site should be included in a "reserve," or alternatively in a development area. A revised environmental document must include this information.

BACKGROUND AND PROJECT CONTEXT

The property is located in the lower, southeastern foothills of the Santa Ana Mountains and is currently used for horse and cattle grazing. The site's topography is hilly with several steep slopes and ravines. Soils on site are highly erodable. Aliso Creek is located nears the western site boundary and generally follows El Toro Road. Drainage from the site flows to the west into Aliso Creek, which drains into the Pacific Ocean at Aliso Beach, and Oso Creek, a tributary of Trabuco and San Juan Creeks, and south to O'Neill Regional Park. DRSEIR at page 4.2-2. The site provides an essential low elevation wildlife corridor between the Central and Southern NCCP areas and the Cleveland National Forest. Such a low elevation corridor is needed for gnatcatchers and other species. The site also supports important wetlands that provide habitat for Riverside fairy shrimp and western spade foot toad.

Under the proposed project, a gated community of 299 single-family residential lots would be built on approximately 222 acres. The total developed area would be approximately 66.9 acres and the total open space would be on approximately 155.1 acres. Only a portion of the area, approximately 83.25 acres would be in "natural resource preservation area." However, this area is subject to remedial grading and biological enhancement activities, thereby potentially degrading the resources even within this "natural resource preservation area." DRSEIR at page 2-16. Massive grading is needed to accommodate the project on this site. Grading would involve 70%+ of the site. It is still unclear to what extent remedial grading will extend beyond the area illustrated in the preliminary grading plan.

In summary, the site plan can best be characterized as "suburban sprawl," with roads and units extending across the entire site, thereby fragmenting the open space areas and extending into wildlands and interfering with wildlife corridors. This pattern of development would severely impact biological resource values on- and off-site and impede wildlife migration.

ANALYSIS

I. THE DRSEIR IS INADEQUATE UNDER CEQA.

The DRSEIR is deeply flawed under CEQA. An EIR must provide enough analysis and detail about environmental impacts to enable decision-makers to make intelligent judgments in light of the environmental consequences of their decisions. See CEQA Guidelines § 15151; Kings County Farm Bureau v. City of Hanford, 221 Cal.App.3d 692 (1990). Under the law, the lead agency must make a good faith effort to fully disclose the environmental impacts of the project. This requirement cannot be met unless the project is adequately described and existing setting information is complete. See County of Inyo v. City of Los Angeles, 71 Cal.App.3d 185, 199 (1977). Both the public and decision-makers need to fully understand the implications of the choices presented by the project, mitigation measures, and alternatives. See Laurel Heights Improvement Ass'n v. Regents of University of California (Laurel Heights I), 6 Cal.4th 1112, 1123 (1988). The DRSEIR fails to provide sufficient information to enable informed decision-making by the County, the public, and the permitting agencies. Much important information remains improperly omitted or deferred until a later date in violation of CEQA; what information is provided remains vague and flawed.

The DRSEIR is a construction level EIR and therefore would allow for the issuance of a rough grading permit. Many of the most significant impacts are irreversible after rough grading has occurred. Thus, detailed information concerning project level impacts must be provided at this stage of project consideration so that the public, agencies and County decision-makers can fully understand the impacts of the proposed project and alternatives. Deferral of information concerning project-related and cumulative impacts, mitigation measures and alternatives is improper and unacceptable given the types of activities that will result from the approval of the project at this stage.

A. The DRSEIR Fails to Describe the Project Adequately.

The DRSEIR fails to describe the project and its setting accurately and completely. It omits key project features that have the potential to result in significant impacts.

The CEQA Guidelines define "project" as "the whole of an action, which has a potential for resulting in a physical change in the environment, directly or ultimately . . .." CEQA Guidelines § 15378. Among other components, an EIR's project description must contain a "general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals if any and supporting public service facilities." CEQA Guidelines § 15124(c). As the Court of Appeal has noted, "The defined project and not some other project must be the EIR's bona fide subject." County of Inyo, 71 Cal.App.3d at 185. An accurate and complete project description is indispensable because, "[a] curtailed or distorted project description may stultify the objectives of the reporting process. Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal . . . and weigh other alternatives in the balance. An accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR." Id. at 192.

The DRSEIR also fails to provide an adequate description of the setting for the project. Such a failure is fatal under CEQA. CEQA and the CEQA Guidelines mandate that an EIR include a description of "the physical environmental conditions in the vicinity of the project . . . from both a local and a regional perspective . . . Knowledge of the regional setting is critical to the assessment of environmental impacts." CEQA Guidelines §§ 15125(a) and (c). This requirement derives from the principle that without an adequate description of the project's local and regional context, the EIR, and thus the decision-makers and the public who rely on the EIR, cannot accurately assess the potentially significant impacts of the proposed project.

The DRSEIR for the project is inadequate. It fails to describe key aspects of the proposed project with the potential to result in significant environmental impacts. Additionally, it fails to describe accurately and completely the environmental setting impacted by the project. Accordingly, potentially significant environmental impacts cannot be adequately analyzed or addressed by the DRSEIR and, for this reason, the DRSEIR is fatally deficient under CEQA.

1. **The DRSEIR Fails to Describe Adequately the Source and Placement of Cut and Fill Material and the Extent of Grading Required to Accommodate Roads and Dwelling Units.**

Massive earthwork will be required to prepare the site for access roads and houses. More than ½ of the site (126 acres) has slopes in excess of 26% with about 32 acres with slopes exceeding 50%. Preliminary estimates in the DRSEIR are that about 2.45 million cubic yards of conventional excavation (cut) and an equal amount of fill will be required. In addition, about 6.8 million cubic yards of remedial grading are required. The DRSEIR states that cut and fill (including several areas exceeding 50 feet in depth) will be balanced on site. However, the DRSEIR and geotechnical report present information that indicates on-site materials may not be suitable to support the project without imported materials. See DRSEIR at page 4.2-11. Moreover, mitigation measures M 2-14 and M 2-15 suggests that off-site borrow materials will be needed and on-site material removed:

> M 2-14 Any objectionable material, as determined by the Soil Engineer, shall be subject to relocation in deeper fill areas or removal off-site. DRSEIR at page 4.2-18
>
> M 2-15 All borrow sites shall be approved by the Soil Engineer/Geologist prior to on-site delivery. This will permit the timely allocation of such available materials for use on the project site.

To the extent that exportation of cut and importation of fill will be required to implement the project, this information must be provided. Related impacts to air quality, off-site grading and stockpiling and traffic, among other issues must be disclosed and analyzed in a revised environmental document.

Although the DRSEIR fails to provide adequate information concerning proposed cuts and fills in terms of their location and extent, the document does refer to fills in excess of 50 feet in height. The DRSEIR provides virtually no information regarding the source and placement of cut and fill material, the full extent of grading required to accommodate roads and dwelling units, and the phasing of the cut and fill operation. Without this information, the DRSEIR environmental impacts analysis does not and cannot analyze the impacts of transporting such a significant amount of fill to the project site in terms of increased traffic and air pollutants, or the impacts of the cutting and filling itself, including impacts to air quality, open space, habitat, and special status species. Without an accurate and complete description of the proposed site grading and fill, the DRSEIR cannot adequately analyze environmental impacts or comment on the proposed project's consistency with the County's General Plan and grading ordinance.

A revised environmental document should include clear graphics that show cross sections where cuts and fills will exceed 50 feet. In addition, a revised environmental document must identify the sources of fill that are suitable to support the proposed development. Additional information

must be provided concerning the suitability of on-site material for fill if the DRSEIR continues to assume that cut and fill will balance on-site.

2. The DRSEIR Fails to Describe Adequately the "Open Space" Areas.

The DRSEIR fails to provide a complete description of the "open space" areas of the proposed project. Little or no information is provided regarding, among other aspects: the extent of grading to the open space; to what degree the open space will be altered from its present natural condition; the uses to which the open space will be put and the extent of those uses, including trails and recreation; and, the presence and location in the open space of utility lines, access roads and other services.

The lack of a complete description in the DRSEIR of alteration to, and ultimate uses of the open space areas renders any analysis of either project-related or cumulative impacts thoroughly inadequate. A revised description of any alteration to the open space and the uses proposed for the open space land, including the proposed water reservoir, must be completed. Once a complete description has been obtained, the DRSEIR's analysis of the environmental impacts to biological resources, geology, and air quality, among others, must be revised.

3. The DRSEIR Fails to Describe Adequately the Project's Master Drainage Concept and Project Features Directed as Maintaining Water Quality.

The DRSEIR fails to adequately describe the project's drainage concept and project features purportedly directed at maintaining water quality. Specifically, the DRSEIR's environmental impacts analysis concerning hydrology states that the "Project Design Feature" to mitigate drainage impacts is "being prepared in consultation with USACE." DRSEIR at page 4.3-7. Thus, the complete master drainage concept is not included in the DRSEIR for public, decision-maker and agency review. Although a final description of the master drainage concept is still being developed, the DRSEIR nonetheless concludes that no significant impacts associated with drainage will occur . In part, this is correct: no significant impacts can be identified based on such an inadequate project description. Without a complete description of the necessary drainage facilities, the DRSEIR fails under CEQA because impacts to water quality, biological resources, habitat, special status species, and human safety cannot be assessed. Once a complete description has been obtained, a revised impacts analysis must be completed.

The DRSEIR continues to describe other aspects of the project intended to mitigate water quality impacts:

"The remainder of the project site (the northerly development area) does not have sufficient room to accommodate the land-intensive requirements of the riverine system. Therefore, runoff from the balance of the developed portion of the project site would be primarily cleansed through stormceptors prior to discharge into natural drainage courses. Stormceptors trap trash, sediment,

and oils. They would also trap phosphorus that is attached to the sediment. However, they have no known effect on bacterial indicators or toxic constituents, both of which are constituents of concern for Aliso Creek. Removal of bacterial indicators would occur as the runoff continues through 3,300 linear feet of natural before reaching Aliso Creek. As part of the final design, ponds and swales would be incorporated to the maximum extent feasible in the development area within many small-scale features, such as, medians, parkways, and other developed open space in order to maximize the opportunity for removal of bacterial indicators and toxic constituents prior to outletting in the natural drainages." DRSEIR at page 4.4-12.

This paragraph suggests that:

> Key elements of the project that are critical to reducing significant impacts to drainage and water quality have not been designed. Therefore, the project description lacks key information to support both an adequate analysis of impacts and to support a conclusion that project impacts will be less than significant.
>
> Mitigation may not be sufficient to address impacts associated with bacterial indicators or toxic constituents.

A revised environmental document, based on a complete description of drainage and water quality features and feasible mitigation measures must be completed.

4. The DRSEIR Fails to Describe Adequately the Characteristics of Residential Uses

The DRSEIR lacks a complete description of proposed uses at the project site. Specifically, the DRSEIR fails to describe key aspects of the proposed residential project including, but not limited to: the size of the houses; their lot coverage; paving for roads driveways and parking lots; and accessory uses, such as swimming pools and storage. Without an adequate description of home size, lot coverage, and accessory uses, significant environmental impacts to aesthetics and water quality, among other impacts, cannot be identified or assessed and suitable mitigation measures cannot be proposed. To the extent this information is not available, a worst-case estimate of total site soft and hard cover must be developed and used to determine the extent of environmental impacts associated with site coverage. Without a clear understanding of how much land is to be covered by development, potentially significant environmental impacts to drainage, water quality, habitat, and special status species, among others, and the creation of geologic and flooding hazards cannot be identified, let alone assessed.

5. The DRSEIR Fails to Describe Adequately the Proposed Project's Construction Activities and Phasing.

The project description provides a cursory description of construction phasing and activities.

Among the information that is not sufficient is information about the extent and duration of grading activities. Without a description of these activities and phasing and the assumptions underlying the air quality estimates, the DRSEIR cannot adequately identify and analyze environmental impacts to air and water quality, among others, due to truck traffic and emissions, construction noise and dust. An EIR for a project such as this must include a description of the construction period activities, including, but not limited to: phasing; types of equipment; construction employment; staging areas, borrow sites and spoils disposal sites, among other details of the construction that could result in impacts. A revised environmental document must be prepared that includes this information and revised impact analyses as warranted based on the information.

6. The DRSEIR Fails to Describe the Project Site's Biological Resources and Habitats Adequately.

The DRSEIR fails to adequately describe biological resources on- and off-site. The document contains inadequate information concerning on-site biological resources, including oak woodlands, aquatic resources, raptor nesting locations and wildlife corridors, and fails to provide any description of biological resources within an adequate cumulative study area, which at a minimum, should include the entire Southern Subregion and Central NCCP areas.

Finally, the relationship of the project site to the Southern Orange County NCCP is not described or analyzed. There is a Figure in the DRSEIR, which illustrates a proposed Southern reserve, but the DRSEIR fails to state how this related to the proposed project. See Figure 4.8-2. Clarification is needed concerning the Southern NCCP process and its implications for this project. Without the inclusion of these, and other, key details of the on- and off-site biological regime, the DRSEIR cannot adequately analyze project-related and cumulative impacts.

7. The DRSEIR Fails to Describe Project Inconsistencies with Applicable Plans.

A number of plans are applicable to the project site including, but not limited to:

The Orange County General Plan

The Foothill/Trabuco Specific Plan

Aliso Creek Corridor Specific Plan

The Central-Coastal Subregion Natural Community Conservation Planning/Habitat Conservation Plan (NCCP/HCP)

The DRSEIR provides a very cursory policy consistency review in the Land Use section and the biological resources sections. The consistency review does not include a table of key policies and

"findings" as to project consistency with these policies. It appears that the section omits several key policy inconsistencies, including the following:

Orange County General Plan

The Orange County General Plan Resources Element includes several policies concerning protection of natural resources as follows:

Goal 1: Protect wildlife and vegetation resources and promote development that preserves these resources.

Goal 3: Manage and utilize wisely the County's landform resources.

Objective 3.1: To minimize to the extent feasible the disruption of significant natural landforms in Orange County.

Policy 1. To identify and preserve the significant wildlife and vegetation habitats of the County.

Policy 5. To protect the unique variety of significant landforms in Orange County through environmental review procedures and community and corridor planning activities.

The project as proposed appears to conflict with these overarching goals, objectives and policies of the Orange County General Plan. A revised analysis of project consistency with applicable General Plan policies must be included in a revised and recirculated environmental document.

The Foothill/Trabuco Specific Plan

The Foothill/Trabuco Specific Plan calls for preservation of significant landform, biological, cultural and scenic resources on-site. According to the DRSEIR's alternatives analysis, only Alternative 4 is consistent with the Specific Plan requirements. Also according to the DRSEIR, "[t]he proposed project would be in substantial compliance with or consistent with the previously approved and Recorded Map 10692 with respect to proposed residential gross density and providing for the provision of a substantial increase in open space and the presence of a wildlife corridor as outlined in the F/TSP." DRSEIR at page 4.1-12. However, the proposed project would amend the F/TSP. DRSEIR at page 4.1-12. Nowhere in the DRSEIR are the proposed amendments to the F/TSP outlined.

The proposed project is inconsistent with the F/TSP in other major respects, including, but not limited to its failure to provide information required by the F/TSP (see Letter submitted by Rural Canyons Conservation Fund, dated May 28, 2002, hereby incorporated by reference).

The Central-Coastal Subregion Natural Community Conservation Planning/Habitat Conservation Plan (NCCP/HCP)

Figure 4.8.2 indicates that the entire project site is located within an NCCP "reserve area." The DRSEIR fails to point this out or to analyze the implications of this for the project.

A significant theme of all of these plans is the protection of key wildlife corridors in the area. It is clear from the project site plan that minimal provisions will be made for continued wildlife movement and those species that attempt to traverse the on-site corridor will be subject to significant additional constraints including: modified topography, new road corridors, presence of new residents in the area, increased noise and lighting as well as residential units in the path of the Northern Corridor. See Figure 8.4.4. The project will have significant impacts on wildlife migration that must be identified in the environmental document and called out as inconsistencies with applicable policies in the above-listed Plans. To the extent that wildlife corridors are assumed on adjacent privately owned properties, the revised environmental document should explain how these corridors would be maintained and not destroyed by cumulative development projects.

B. The DRSEIR's Analysis of Environmental Impacts Is Inadequate.

The DRSEIR's analysis of environmental impacts fails to provide the necessary facts and analysis to allow the County and the public to make an informed decision. Without such detail, the DRSEIR is deficient under CEQA. The role of the EIR is to make manifest a fundamental goal of CEQA: to "inform the public and responsible officials of the environmental consequences of their decisions before they are made." Laurel Heights I, 6 Cal.4th at 1123. To do this, an EIR must contain facts and analysis, not merely bare conclusions. See Citizens of Goleta Valley v. Board of Supervisors, 52 Cal.3d 553, 568 (1990). Any conclusion regarding the significance of an environmental impact not based on analysis of the relevant facts fails to achieve CEQA's informational goal.

As set forth below, the DRSEIR is riddled with conclusory statements regarding environmental impacts, unsupported by facts and necessary analysis. Furthermore, the DRSEIR attempts to defer analysis of environmental impacts to a later date. As discussed below, such deferral is not an option. CEQA mandates that environmental impacts be identified and analyzed in the EIR, not at a later date. See Sundstom v. County of Mendocino, 202 Cal.App.3d 296 (1988) (holding that a negative declaration was invalid when county approved a project while postponing the resolution of uncertainties regarding environmental impacts to a later date).

1. The DRSEIR Fails to Analyze Impacts to Biological Resources Adequately.

The DRSEIR's biological impacts analysis is inadequate in numerous respects, including, but not limited to:

Underestimation of project-related impacts to biological resources: The DRSEIR fails to adequately characterize the extent of project-related impacts to biological resources: First, the uses and management of the open spaces on the project-site are not sufficiently defined and "locked-in" to ensure that biological resources located in these areas will not be impacted. For example, if there are recreational uses in the open space areas, wildlife may not use these migration corridors. In addition, impacts could be associated with the public and private landscaping plans, which are not required to be prepared until after project approval and EIR certification. See SC 8-7 and SC 8-8. No criteria are specified in the DRSEIR for these plans. Moreover, because the full extent of grading and importation of fill/exportation of cut is not disclosed, there are likely to be additional impacts to biological resources on- and off-site that are not described in the DRSEIR. If recreation and other uses are to be prohibited in the open space areas, a revised DRSEIR must state how these restrictions will be enforced and cite examples where similar restrictions have been effective (e.g. more effective than "fencing," which is a proposed mitigation measure).

Deferral of analysis and mitigation: The DRSEIR improperly defers surveys for trees that host nesting raptors. Trees on the project site that provide nesting should be identified prior to certification of the EIR and protection provided as required under the federal MTBA. DRSEIR at page 4.8-22.

Insufficient evidence to support a conclusion that indirect effects would be insignificant. The DRSEIR's conclusion that indirect effects are insignificant is not supported by evidence. The proposed site plan results in a pattern of development (roads and houses) that fragments the property, extends to adjacent undeveloped lands and has an extensive edge. Moreover, the project would introduce lighting, noise and residents in a wildlife area – the effects of which are not adequately disclosed or analyzed in the DRSEIR. Mitigation measures recommend "fencing" adjacent to undisturbed areas of open space. DRSEIR at page 4.8-32. Not only could such fencing result in additional impacts (e.g. impeding wildlife migration), but there is no evidence such fencing will effectively protect open space areas from trespass by children, pets and the like. Additional evidence must be provided in a revised environmental document to support the conclusion that these indirect effects are not significant, particularly where there are a number of alternative projects that would significant avoid these impacts (e.g. Alternatives 4 and 7).

Insufficient evidence is provided that mitigation measures will be effective. The DRSEIR does not provide sufficient evidence that proposed mitigation measures will actually mitigate impacts to less than significant levels. First, the DRSEIR implies that the biological resource mitigation plan has the blessing of the resource agencies:

"The biological resource mitigation plan has been reviewed by the effectual regulatory agencies and a biological opinion has been issued by USFWS. The biological resource mitigation plan mitigates project related impacts to wetland/riparian habitats, sensitive upland habitats and wildlife movement..." DRSEIR at page 4.8-23

Yet, there are no letters in the DRSEIR which document that these agencies have agreed that the biological resource mitigation plan will adequately mitigate project related impacts to biological resources. Furthermore, the referenced biological opinion purports only to "transmit[] our biological opinion based on our review of the proposed Saddleback Meadows Residential Development Project located in Orange County, California and its effects on the federally endangered Riverside fairy shrimp (*Streptocephalus woottoni*, "fairy shrimp") and its designated critical habitat, and designated critical habitat for the threatened coastal California gnatcatcher (*Polioptila californica californica*, "gnatcatcher"), in accordance with section 7 of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*)." (Biological Opinion, dated October 26, 2001, at page 1.) I.e., this biological opinion is confined to assessing the project's effects on two species, only, and their designated critical habitats, under the federal Endangered Species Act, not CEQA. If these agencies have not signed off on the adequacy of the biological resource plan under CEQA, the DRSEIR should not leave the impression that they have done so. A revised DRSEIR must include information from the agencies concerning the adequacy of the biological resources plan so that the public and the decision-makers are fully informed about the likely changes these agencies will require in order to issue permits for the project (such changes may include additional mitigation or reconfiguration of the site plan).

The letters previously submitted by the wildlife agencies on prior project environmental documents raise significant concerns about the project's impacts on biological resources. Specifically, the October 29th letter states:

"Our biologists' professional opinion is that neither of the two previously submitted preferred projects (318 DU and 705 DU) nor the 299 DU Contingency Plan retain appropriate topography and habitat to ensure the continued function of the wildlife movement corridor/linkage that exists on Saddleback Meadows. As currently proposed, the 299 DU Contingency Plan development "footprint" would severely constrain wildlife movement from O'Neill Regional Park (i.e. southern NCCP planning area) to the Central NCCP reserve and Cleveland National Forest and is not acceptable." October 29, 1998 letter at page 2. See Letters from the wildlife agencies dated October 29, 1998 and August 8, 1997, hereby attached as attachments 2 and 3 and incorporated herein by reference.

Second, the DRSEIR assumes that Project Features and mitigation measures will reduce project-related impacts to biological resources to less than significant levels. Such measures include highly experimental elements such as creation of new ponds and relocation of species (fairy shrimp) the possible failure of which is explicitly anticipated by the cited biological opinion No documentation is provided about projects that have successfully used these techniques.

Third, the DRSEIR makes clear that drainage and water quality mitigation "features" are not yet completely designed. Questions remain whether the proposed system will maintain water quality, particularly with respect to bacterial indicators and toxic constituents. DRSEIR at page 4.4-1. Yet, the DRSEIR contains no mention of, or analysis concerning the potentially significant project-related and cumulative impacts of bacterial and toxic constituents on species in the creek

system downstream of the project site. This analysis must be included in a revised environmental document. Nor does the DRSEIR explain how the project can comply with new water quality regulations recently ordered against the County of Orange by the Regional Water Quality Control Board (CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD SAN DIEGO REGION ORDER NO. R9-2002-0001 NPDES NO. CAS0108740 WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES OF URBAN RUNOFF FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE WATERSHEDS OF THE COUNTY OF ORANGE, THE INCORPORATED CITIES OF ORANGE COUNTY, AND THE ORANGE COUNTY FLOOD CONTROL DISTRICT WITHIN THE SAN DIEGO REGION), February 13, 2001.) These stricter regulations supplant the 1994 NPDES permit referenced in the DSEIR, and were enacted due, in part, to the extremely impaired water quality existing in Aliso Creek, adjacent to the project, resulting in numerous beach closures at Aliso Beach.

Fourth, the DRSEIR clearly relies on the long-term maintenance of wildlife corridors on adjacent privately owned properties, some of which are planned for future development. Yet, there is no description of how these corridors would be protected from development, and no analysis of the cumulative impact of future developments that could interfere with essential corridors.

Finally, the DRSEIR fails to state how the project will comply with the NCCP/Coastal Sage Scrub agreement. This information must be included in a revised DRSEIR.

Inadequate cumulative analysis. Similar to other cumulative discussions in the DRSEIR, the biological resource section cumulative "analysis" is nonexistent. The brief discussion concludes that "...all identified related projects in the region would have to mitigate biological impacts to less than significant." DRSEIR at page 4.8-22. This statement is not sufficient to support a finding that there would be no cumulatively significant impacts to biological resources in the region. A revised discussion must identify cumulative projects and their collective impacts (by species, habitat and acreage), disclose the mitigation measures that would be required, provide evidence that the mitigation would be effective and document the conclusion that there would be no significant cumulative impacts.

Failure to identify potential inconsistencies with applicable plans and policies. The preliminary reserve design for the Southern Subregion NCCP, Figure 4.8-2, appears to include the site in the reserve. Not only does the DRSEIR fail to discuss the fact that the Southern Subregion NCCP is underway, with updated reserve designs due in July 2002, the DRSEIR fails to disclose that the site is identified as part of the reserve on Figure 4.8-2. A revised environmental document must discuss how the NCCP process applies to the proposed project. Specifically, since the Board of Supervisors agreed to participate in the NCCP process in 1993, can the Board properly take action on this project in advance of the NCCP process reaching major milestones concerning proposed reserve design or even more advanced outcomes? What is the relevance of the site being shown as part of the "reserve" in Figure 4.8-2?

2. The DRSEIR Fails to Disclose and Analyze Impacts to Geology and Soils Adequately.

The DRSEIR is deficient in its analysis of geologic impacts. As noted above, the project description and the DRSEIR as a whole provide little information regarding the massive grading and fill required to actualize this proposed project. The extent of cut and fill also appears to underestimate what could be required to accommodate the project as proposed. It is not clear from the DRSEIR whether importation and exportation of fill will be necessary. If necessary, no analysis is provided of the additional impacts of such activities, including, but not limited to: traffic associated with hauling materials, direct impacts to borrow and spoils sites, air quality implications and the like. A revised analysis must include evidence that supports the DRSEIR's assertion that grading will balance on site, or in the alternatives, the true extent of project-related impacts must be disclosed. Also, clearer graphics showing the extent and location of cuts and fills must be included in a revised document so that the public and decision-makers can fully appreciate the impacts of this project on the topography.

3. The DRSEIR's Analysis of Air Quality Impacts Is Incomplete.

The Air Quality section states:

"A reasonable reduction percentage through the implementation of an aggressive transportation system management (TSM) would achieve a measurable reduction when applied to such a large baseline emissions level. If the air quality impact from mobile source emissions is to be maintained at an acceptable level, a viable TSM program is an imperative strategy toward achieving that end."

The discussion fails to discuss the fact that a leading contributor to emissions, and the least likely land use configuration to successfully result in TSM program trip reductions is suburban sprawl – the land use configuration proposed by the project. No discussion is included in the DRSEIR about meaningful ways to address air quality in terms of major policy changes to how the County uses and develops land (e.g. the County could refocus its efforts to accommodate new housing in "infill" areas, and the like). No TSM mitigation measure is included for the project, because the type of land use proposed by the project is not conducive to TSM programs. In light of the fact the County is located within a non-attainment basin, the County should evaluate bolder land use policy measures to address air quality emissions. Such measures (alternatives such as locating housing in infill areas) should be discussed in the DRSEIR.

The DRSEIR appears to understate the impacts on air quality that will be generated both by project construction and by the built project itself. As noted above, the DRSEIR fails to adequately describe construction activities and phasing, and fails to analyze potential air quality impacts associated with hauling cut and fill on-and off-site. Therefore, the DRSEIR fails to analyze and disclose the potentially significant impacts associated with these activities. As stated above, additional information concerning the suitability of on-site soils as fill for the project must

be provided if the DRSEIR is going to assume that cut and fill will balance on-site. Alternatively, a revised environmental document must analyze the impacts associated with exportation of unsuitable cut material and importation of suitable fill material. This analysis must include disclosure of both 1) where the materials will be disposed of and 2) locations for imported fill.

The other major deficiency in the analysis is the lack of any meaningful analysis of cumulative air quality impacts. A revised environmental document must include such an analysis (e.g. other construction projects in the area generating air pollutants; etc.).

4. The DRSEIR Fails to Analyze Hazards Adequately.

The DRSEIR defers analysis of potential on-site contamination. Specifically, the potential for on-site contamination is deferred until prior to recordation of the subdivision map. See SC 2-13 at page 4.2-16 of the DRSEIR. At a minimum, the results of a phase I site assessment should be included in a revised environmental document.

5. The DRSEIR Fails to Analyze Land Use and Planning Impacts Adequately.

The DRSEIR fails to describe all relevant policies and plans, and fails to evaluate the consistency of the project with each policy. Each relevant County and other agency policy, general plan policy, regulation, guideline or standard should be summarized in a table, noting whether the project is consistent with the applicable provision and what must be done to reconcile the two where they are inconsistent. Instead, the DRSEIR fails to identify key County policies and fails to discuss the applicable policies and regulations of other agencies (e.g., policies of the U.S. Fish and Wildlife Service and the Regional Water Quality Control Board, among others). A revised environmental document must include this analysis.

6. The DRSEIR Fails to Analyze Impacts to Traffic Adequately.

The DRSEIR fails to disclose that the project's proposed land use pattern would not support sound transportation management practices because of its location, low density and contribution to the suburban sprawl pattern in Orange County. As a result, the project will perpetuate the exclusive use of automobiles for transportation, the very practice that has contributed to the traffic and air quality problems that are so acute in the County.

The Air Quality section states:

"A reasonable reduction percentage through the implementation of an aggressive transportation system management (TSM) would achieve a measurable reduction when applied to such a large baseline emissions level. If the air quality impact from mobile source emissions is to be maintained at an acceptable level, a viable TSM program is an imperative strategy toward

achieving that end."

No TSM mitigation measure is included for the project because the type of land use proposed by the project is not conducive to TSM programs. The DRSEIR should disclose this fact and acknowledge the poor pattern of land uses represented by this and other projects in the area, will continue to frustrate the County's progress toward acceptable traffic flows and clean air quality. A revised environmental document should discuss alternatives to the general plan land uses in the area – and explore the potential for transferring these planned units to infill sites.

Finally, the DRSEIR fails to adequately analyze cumulative traffic impacts including how projects of this type are likely to frustrate the County's attempts at a meaningful TSM program. The geographic study area for the analysis of cumulative projects is artificially small in size, and fails to provide a sufficiently large study area for many impacts, including traffic, air quality and biological resources. See Table 3.1, Related projects. Moreover, there is no information provided on construction period traffic for even these related projects; information which must be provided and included in a revised cumulative analysis for traffic and air quality. The study area for the revised analysis should extend at least to the likely areas where new residents in the proposed project and related projects are employed. No such information is included in the DRSEIR. Thus, it is unclear how the study area was selected. Information concerning where new residents in these areas work and therefore commute, must be developed and used to form the basis for the new analysis of traffic and transit impacts.

7. The DRSEIR Fails to Analyze Adequately Impacts to Hydrology, Drainage and Water Quality.

Pollution carried by storm water and urban runoff is the largest source of contamination to surface water both in California and nationwide. Construction sites, in particular, have been identified as significant dischargers of polluted storm water, involving high concentrations of silt and turbidity, as well as oil and grease, trash, sewage, and other chemicals used in construction activities and equipment maintenance. Despite this well-known and well-documented problem, the DRSEIR fails to adequately describe construction activities and on-site and off-site drainage "improvements," both of which could impact the water quality of the area. See concerns raised above about the inadequate and incomplete description of the project drainage and water quality features.

The DRSEIR concludes that there will be no significant drainage impacts after mitigation because of a highly engineered system of storm drains, catch basins, inlet/outlet structures, energy dissipators and slope drains to "control project drainage." DRSEIR at page 4.3-7. A "riverine water quality filtration system" is proposed next to the road to "cleanse low flow urban runoff." DRSEIR at page 4.3-7. There is no evidence in the DRSEIR that confirms this combination of features will mitigate for the impacts associated with the introduction of impervious surfaces, the complete alteration of the on-site drainage system and redirection of the natural drainages. No examples of successful projects that are similar in features are provided in the DRSEIR.

Moreover, there is no discussion of what kind of long-term maintenance and monitoring will be needed to maintain this highly engineered system. The DRSEIR merely states that the "structural and non-structural BMPs would be owned, operated and maintained by the home owner's association (HOA) or community services district." DRSEIR at page 4.4-12. Specific information about the drainage and water quality features and how they will be maintained and monitored over the long-term (including information about the cost of maintenance and monitoring) is essential to determine: first, whether the extent of drainage alterations is an acceptable project feature; and second, whether the proposed system of drainage features will actually be a viable system over the long-term, and effectively mitigate significant impacts to the natural drainage system. Specific information about the Riverine system, and the fact that the northerly development area does not have sufficient room to continue this system, suggests that the proposed project features may fall short of ensuring water quality is not adversely impacted by the project. DRSEIR at page 4.4-11.

The revised document should include examples of projects that incorporated similar features and have been demonstrated to result in effectively addressing drainage and water quality impacts. Absent this information, the conclusion reached in the DRSEIR that "[u]pon implementation of the Project Design Features and compliance with the Standard County Conditions, water quality impacts would be mitigated to a less than significant level," is not supported by evidence.

Finally, the significance of project-related impacts requires that the analysis of cumulative impacts to drainage and water quality be extensive. The DRSEIR fails to complete any analysis of these admittedly significant cumulative impacts, yet concludes that as a result of "required mitigation," cumulative impacts would not be significant. DRSEIR at pages 4.3-7 and 4.4-13.

C. The DRSEIR Fails to Analyze Cumulative Impacts Adequately.

The DRSEIR utterly fails to analyze cumulative impacts in the manner or to the degree required by CEQA. The CEQA Guidelines define cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." CEQA Guidelines § 15355(a). "[I]ndividual effects may be changes resulting from a single project or a number of separate projects." Id.

A legally adequate cumulative impacts analysis views a particular project over time and must consider the impact of the project combined with other projects causing related impacts, including past, present, and probable future projects. CEQA Guidelines 15130(b)(1). Projects currently under environmental review unequivocally qualify as reasonably probable future projects to be considered in a cumulative impacts analysis. See San Franciscans for Reasonable Growth v. City and County of San Francisco, 151 Cal.App.3d 61, 74 & n. 13 (1984). In addition, projects anticipated beyond the near future should be analyzed for their cumulative effect if they are reasonably foreseeable. See Bozung v. Local Agency Formation Comm'n, 13 Cal.3d 263, 284 (1975). Alternatively, an EIR may utilize:

> A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or areawide conditions contributing to the cumulative impact.

CEQA Guidelines § 15130(b)(1)(B). Any such planning document shall be referenced and made available to the public at a location specified by the lead agency. Id.

The discussion of cumulative impacts must include a summary of the expected environmental effects to be produced by those projects, a reasonable analysis of the cumulative impacts, and full consideration of all feasible mitigation measures that could reduce or avoid any significant cumulative effects of a proposed project. See CEQA Guidelines §§ 15126.4(a)(1) and 15130(b)(3).

The cumulative impacts concept recognizes that "[t]he full environmental impact of a proposed . . . action cannot be gauged in a vacuum." Whitman v. Board of Supervisors, 88 Cal.App.3d 397, 408 (1097). The requirement of a cumulative impacts analysis of a project's regional impacts is considered a "vital provision" of CEQA. Bozung, 13 Cal.3d at 283. Moreover, an EIR must examine not only the anticipated cumulative impacts, but also reasonable options for mitigating or avoiding the project's contribution to significant cumulative impacts. CEQA Guidelines § 15130(b)(3). The DRSEIR does not come close to meeting these requirements for the reasons described below.

1. The DRSEIR's Cumulative Impacts Analysis' Geographic Study Area Is Too Small and Thus Inadequate Under CEQA.

The DRSEIR considers a geographic study area far to small to reveal the true nature of the proposed project's cumulative impacts and, thus, is deficient under CEQA. The analysis of cumulative impacts appears to be based on a short list of "related" projects in the immediate area of the project. See Table 3.1 and Figure 3.2.

Among the major projects that must be included in a revised cumulative analysis include but are not limited to the massive Mission Viejo project and other projects in the Southern Subregion NCCP area. In September of 2001, the Mission Viejo Company filed an application for development of its land. As such, the cumulative analyses of land use and planning, geology and soils, hydrology and water quality, air quality, traffic and transportation, biological resources, public services and utilities, aesthetics and growth inducement must consider this potentially massive foreseeable project.

Furthermore, the document does not provide even minimal information regarding other projects within the Southern Orange County NCCP Study area. Analysis of these additional projects is

particularly important given the project's location in the Southern Orange County Natural Community Conservation Program Study area.

Although the DRSEIR concludes that the project's cumulative impacts, with the exception of air quality, will not be significant, such a conclusion cannot be supported in light of the inadequacy of the geographic study area. The DRSEIR's failure to consider the 14,000 home Rancho Mission Viejo Project alone renders its scope inadequate. The DRSEIR must also acknowledge and analyze the project's significant cumulative impact on the existing severely "impacted" water quality in adjacent Aliso Creek. This failure to consider regional or area wide cumulative impacts is fatal under CEQA and, as such, the document must be revised.

2. The DRSEIR Fails to Analyze any of the Cumulative Impacts Adequately.

In addition to relying on a far too small geographic study area, the level of analysis in the DRSEIR's cumulative impacts analysis is far too cursory. An EIR must include objective measurements of a cumulative impact when such data are available or can be produced by further study and are necessary to ensure disclosure of the impact. See Kings County, 221 Cal.App.3d at 729. Despite this mandate, the DRSEIR fails to analyze adequately a number of cumulative impacts, including, but not limited to, impacts to biological resources, water quality and drainage, and aesthetics, among others.

For example, with regard to cumulative water quality impacts, the DRSEIR states that "Ultimate development planned in the watershed in conjunction with the proposed project would potentially impact both surface and groundwater quality. Without controls, both short-term construction-related and long-term impacts due to pollutants in urban runoff could substantially impact water quality." DRSEIR at page 4.4-13. Despite this finding and despite the project's location in the watershed streams, the DRSEIR concludes that: "...as with the proposed project, related projects would be required to mitigate impacts to water quality to less than significant levels." Id. The DRSEIR fails to adequately summarize any information that would support the conclusion, and offers no supporting analysis itself. A revised environmental document must include analysis of cumulative impacts in order to support the conclusions throughout the DRSEIR that cumulative impacts will be reduced to less than significant levels. Statements such as: "cumulative projects are required to mitigate their impacts, therefore they will," are insufficient to support findings that all cumulative impacts, except air quality, will be less than significant.

Moreover, none of the cumulative impact discussions provide quantified information concerning cumulative project impacts, including, but not limited to: acres of habitat types directly/indirectly impacted by development or total construction trips. This information must be provided in revised cumulative analyses in a revised environmental document. Without such information, there is insufficient evidence to support the DRSEIR's conclusion that cumulative impacts to biological resources, traffic and water quality, among other impacts, will be insignificant. A revised document must also specify mitigation measures for cumulative impacts. Currently, the

DRSEIR includes conclusory statements in each section concerning potentially significant cumulative impacts. In each case, "required mitigation" is assumed to reduce significant cumulative impacts to less than significant levels. For example, the biology section contains the following statement concerning cumulative impacts:

"However, as with the proposed project, all identified related projects within the region would have to mitigate biological project impacts to less than significant." DRSEIR at page 4.8-22.

This conclusory statement provides no evidence that cumulative impacts to biological impacts will or can in fact be mitigated, nor is there any legal requirement that "all proposed projects" mitigate biological project impacts to less than significant. CEQA requires only that such impacts be mitigated to the extent feasible, which may not be to a less than significant level. See also DRSEIR at pages 4.1-12 (cumulative loss of open space would be adverse, but not significant); 4.4-13 (ultimate development in the watershed would potentially impact both surface and groundwater quality, but such impacts would be required to be mitigated to less than significant levels); 4.12-4, and other cumulative sections throughout the DRSEIR.

Finally, as described above, the DRSEIR fails to explore the full range of mitigation measures that could potentially reduce cumulative impacts below a level of significance. An EIR must examine reasonable options for mitigating or avoiding the project's contribution to cumulative impacts. See CEQA Guidelines § 15130(b)(3).

D. The DRSEIR's Discussion of Growth-Inducing Impacts is Inadequate Under CEQA.

The DRSEIR must consider the growth-inducing potential of the project in this undeveloped area. CEQA requires that an EIR include a "detailed statement" setting forth the growth-inducing impacts of the proposed project. See Public Resources Code § 21100(b)(5); City of Antioch v. City Council of Pittsburg, 187 Cal.App.3d 1325, 1337 (1986). The statement must "[d]iscuss the ways in which the proposed project could foster economic growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment." CEQA Guidelines § 15126.2(d). It must also discuss how a project may "encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively" or "remove obstacles to population growth." Id.

The DRSEIR's brief growth-inducing section concludes that the project is consistent with growth management policies of SCAG's RCP and would not extend or serve beyond the project boundaries. There is no analysis of whether the extension of roads and services on-site, and the development of a water tank and access road off-site, would facilitate growth on adjacent properties. Nor does the discussion reach any conclusion as to whether the project is or is not growth inducing as required by CEQA. The DRSEIR fails to address the potential for the off-site water tank to support development on adjacent, currently undeveloped parcels. In addition, wastewater pipes would be extended on site. The DRSEIR fails to describe the potential for these

pipes to support development beyond the project site. A revised environmental document must include an adequate analysis of the project's potential for growth inducement.

Finally, the DRSEIR fails to consider the precedent set by approval of this project. Specifically, the project interprets the general plan and other County plan policies to allow this development. No information is provided on the status of "permitted" development under the applicable plans for the area including the site and beyond. Figure 4.1.3, Foothill/Trabuco Specific Plan Land Use Designations, indicates development potential on a number of presently undeveloped properties that are contiguous to the project site. No information is provided in the DRSEIR concerning the status of development within the Specific Plan (e.g. the current statistical summary). It is clear that the development of the project site could have a growth inducing effect on these adjacent properties. Overall, the DRSEIR provides little evidence that the improvements to infrastructure it will involve and the precedent it will set will not induce growth to adjacent undeveloped properties.

In addition, the DRSEIR must analyze the potentially eviscerating effect of all other undeveloped sites within the Foothill Trabuco Specific Plan area seeking to follow the precedent of spot-amending the Specific Plan to explicitly exempt proposed development from all of the regulations and guidelines of the Specific Plan.

A revised growth inducing analysis must be prepared and include the status of development permitted on adjacent properties under all applicable plan and policies. This analysis should inform a revised analysis of cumulative impacts, including, but not limited to the long-term sustainability of an adequate wildlife corridor system.

E. The DRSEIR Improperly Attempts to Defer Mitigation to a Later Date, Fails to Identify Feasible Mitigation Measures, and Relies on Inadequate Mitigation Measures.

CEQA requires that mitigation measures be identified and analyzed. "The purpose of an environmental impact report is . . . to list ways in which the significant effects of such a project might be minimized . . . ." Pub. Res. Code § 21061. The Supreme Court has described the mitigation and alternative sections of the EIR as the "core" of the document. Citizens of Goleta Valley v. Board of Supervisors, 52 Cal. 3d 553 (1990). As explained below, the DRSEIR's identification and analysis of mitigation measures, like its analysis throughout, is thoroughly inadequate. An EIR is inadequate if it fails to suggest mitigation measures, or if its suggested mitigation measures are so undefined that it is impossible to evaluate their effectiveness. See San Franciscans for Reasonable Growth v. City and County of San Francisco, 151 Cal.App.3d 61, 79 (1984). Moreover, an EIR may not use the inadequacy of its impacts review to avoid mitigation: "The agency should not be allowed to hide behind its own failure to collect data." Sundstrom v. County of Mendocino, 202 Cal.App.3d 296, 361 (1988). Nor may the agency use vague mitigation measures to avoid disclosing impacts. See Stanislaus Natural Heritage Project v. County of Stanislaus, 48 Cal.App.4th 182, 195 (1996). Lastly, the formulation of mitigation

measures may not properly be deferred until after Project approval; rather, "[m]itigation measures must be fully enforceable through permit conditions, agreements, or legally binding instruments." 14 CCR § 15126.4 (a). In the present case, the DRSEIR does not come close to satisfying these basic CEQA requirements regarding impact mitigation. Most egregiously, it attempts to defer discussion and development of suitable mitigation measures until after the certification of the environmental document and the conclusion of public review.

1. The DRSEIR Improperly Defers Mitigation.

The DRSEIR impermissibly concludes that all of the project's environmental impacts, with the exception of cumulative air quality, will be mitigated below a level of significance, while at the same time deferring necessary analysis of mitigation measures. DRSEIR at page 9-1. Under CEQA, an EIR may conclude that impacts are insignificant only if it provides an adequate analysis of the magnitude of the impacts and the degree to which they will be mitigated. See Sundstrom, 202 Cal.App.3d at 306-07. Thus, if an agency fails to investigate a potential impact, its finding of insignificance simply will not stand. Id. Further, CEQA generally requires that all mitigation measures be adopted simultaneously with, or prior to, project approval. An agency may defer preparation of a plan for mitigation only when the agency commits itself and/or the project proponent to satisfying specified performance standards that will ensure the avoidance of any significant effects. Id.

In the present case, the DRSEIR violates CEQA by deferring critical analyses of project impacts and necessary mitigation. The following is a non-exhaustive list of the project design features and mitigation measures that the DRSEIR improperly defers to a later date:

a. PDF 3-1. A master drainage concept has been incorporated into project design to mitigate hydrology impacts to existing OCFCDs requirements and standards...This Project Design Feature is being prepared in consultation with USACE.
b. M 4-1. The applicant shall have the option to research off-site water quality improvements to determine the technical and economic feasibility of implementing improvements that have regional water quality benefits and can also mitigate project-related impacts...
c. PDF 4-9. The storm drain system shall be designed to mimic natural drainage patterns as closely as possible. Emphasis added.
d. As part of final design, ponds and swales would be incorporated to the maximum extent feasible...DRSEIR at page 4.4-12.

The DRSEIR's failure to adequately analyze the potentially significant effects of the project, and to design proper mitigation measures prior to project approval, renders the document inadequate and vulnerable to legal challenge. With the DRSEIR in its current form, decision-makers, the

public and permitting agencies cannot evaluate the advisability of project approval. Too little is known, and too much is entirely unknown, about the project's environmental impacts.

2. The DRSEIR Fails to Identify Feasible Mitigation Measures.

The DRSEIR's consideration of mitigation is inadequate because it fails to identify several feasible measures that could reduce or eliminate identified significant impacts. Mitigation is defined by CEQA as including:

> (a) Avoiding the impact altogether by not taking a certain action or parts of an action.
> (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
> (c) Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.
> (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
> (e) Compensating for the impact by replacing or providing substitute resources or environments.

CEQA Guidelines § 15370. The DRSEIR fails to consider measures, which could mitigate in the fashion described above significant impacts in several resource categories, including, but not limited to, biology, geologic hazards, hydrology and water quality, among others.

Furthermore, the DRSEIR improperly concludes that all impacts except cumulative air quality, are mitigated to below a level of significance based either on deferred mitigation measures, as discussed above, incomplete and "future" project features, or on mitigation measures of unproven efficacy. These determinations are not supported by substantial evidence. A partial list of impacts that should be identified as significant and unavoidable in a revised environmental document include, but are not limited to the following:

Project impacts to biological resources: There is insufficient information in the DRSEIR to establish the efficacy of proposed mitigation measures including wildlife corridors and replacement ponds, and to support a finding that the impacts to biological resources will be less than significant with mitigation. Moreover, the applicant has not secured all of the necessary permits for the project and the agencies have not signed off on the adequacy of the proposed measures. Even with such agency approvals, significant impacts may remain. For these reasons, and because a feasible project alternative is proposed that would significantly reduce impacts to resources (Alt. 4), a revised environmental document should identify project related impacts to biological resources as significant and unavoidable.

Cumulative impacts to biological resources. In the USFWS biological opinion, the Service

states under cumulative impacts:

"At this time, we do not have adequate information to fully evaluate the potential impacts of the Saddlecreek/Saddlecrest Residential Development Project, Whispering Hills Development Project, and the Capistrano Valley Water District Pipeline Project on designated critical habitat for the gnatcatcher." Biological Opinion at page 23.

Another major project in the Southern NCCP area, the Mission Viejo Project, implicates some of the same species and habitats as the proposed project. Based on: 1) the significant amount of habitat loss involved with these development projects in combination with properties surrounding the project site "planned" for development; 2) the lack of information concerning the efficacy of proposed mitigation measures; and 3) the lack of information concerning mitigation measures for cumulative projects, a revised environmental document should identify cumulative impacts to biological resources as a cumulatively significant and unavoidable impact.

Project-related aesthetic impacts: The DRSEIR finds that impacts to aesthetic and visual resources would be less than significant. DRSEIR at page 4.9-23. In support of this finding, the text of the document states:

"The proposed project would not have a substantial negative aesthetic effect. As depicted in the visual simulations, Saddleback Meadows would be low-density and rural in character and would not conflict with the surrounding environment..." DRSEIR at page 4.9-23.

The project is not "rural in character." Figure 2.9, Conceptual Streetscape, clearly illustrates a project that is suburban in character. Lot sizes averaging 6,672 square feet clearly represent urban/suburban development densities. The protection of fragmented areas of the project site in open space does not "transform" this suburban development into "rural" character. Based on Appendix G of the CEQA Guidelines, the transformation of this site from undeveloped to suburban in the midst of wildlife habitat would constitute a substantial degradation of the existing visual character of the site and its surroundings. Therefore, this impact should be identified as significant and unavoidable as clearly demonstrated by the visual simulations (Compare figures 4.8.4 and 4.9.1, and see Figures 4.9.4, 4.9.5, and 4.9.9, among other exhibits in the DRSEIR, which demonstrate the significant change in character of the site and surrounding area with development as proposed.)

Cumulative Aesthetic Impacts. Figure 2.6 and 4.1.3 clearly indicate that other properties in the project area are designated for development. Cumulative development in the area should have been analyzed and mitigation measures proposed to ensure that the area's visual resources are not further degraded by planned development. Since no cumulative analysis was undertaken, and no cumulative mitigation measures are proposed, the potential for cumulatively significant and unavoidable aesthetic and visual impacts should be identified in a revised environmental document.

Other impacts that should be identified as significant and unavoidable in a revised environmental document include, but are not limited to: plan and policy inconsistencies; landform alteration; project-related and cumulative drainage and water quality impacts; cumulative traffic impacts; and cumulative impacts to public services and utilities. Growth inducement should also be identified as a significant adverse result of the project. The DRSEIR does not include sufficient evidence to identify these and other impacts as less than significant after mitigation.

F. The DRSEIR Does Not Adequately Discuss Alternatives to the Proposed Project.

Although the alternatives section of the DRSEIR describes a number of alternatives, this section continues to fall short of the standard set by CEQA. Under CEQA, an EIR must analyze a reasonable range of alternatives to the project, or to the location of the project, that would feasibly attain most of the basic objectives while avoiding or substantially lessening the project's significant impacts. See Pub. Res. Code § 21100(b)(4); CEQA Guidelines § 15126.6(a); Citizens for Quality Growth v. City of Mount Shasta, 198 Cal.App.3d 433, 443-45 (1988). As stated in Laurel Heights I, "Without meaningful analysis of alternatives in the EIR, neither the courts nor the public can fulfill their proper roles in the CEQA process . . . [Courts will not] countenance a result that would require blind trust by the public, especially in light of CEQA's fundamental goal that the public be fully informed as to the consequences of action by their public officials." 47 Cal.3d 376, 404 (1988). The DRSEIR's discussion of alternatives fails to meet these standards.

First, none of the development alternatives are "transparently" based on a comprehensive constraints map that identifies areas of high resource values and areas that should be avoided based on County plan policies. However, one of the alternatives, Alternative 4 – F/TSP EIR 531 Staff Alternative B, appears to avoid substantially more of the impacts than the proposed project and the other development alternatives. Alternative 7 – Acquisition Alternative, would protect key on-site resources because the site would be acquired rather than developed. Because of the resource values represented on the site, the site's sensitive location and its topography, all development alternatives, including Alternatives 4 and 6 would result in substantial grading of sensitive areas, impacts to water quality and biological resources and other significant impacts. A revised analysis should include an alternative based on a site constraints map, which represents current information about high value resources.

Second, the DRSEIR fails to describe an alternative location for the project housing. Therefore, no off-site alternative was evaluated. No information is contained in the DRSEIR concerning the potential for in-fill housing within the County, including on sites assembled by the applicant within incorporated and unincorporated areas to accommodate the units proposed by the project. Such sites should include "infill" sites with reuse, redevelopment and additional development potential (e.g. under performing shopping centers and other underutilized/vacant sites). The explanation in the DRSEIR concerning such sites is not supported by a methodology, analysis or facts. Moreover, the DRSEIR applied criteria to alternative sites that is unreasonably constrained. According to the DRSEIR:

"It is speculative, but unlikely that the project applicant could assemble other contiguous properties within the area to accommodate the number and type or[f] residences proposed for the project. Moreover, if such properties were identified and acquired by the applicant, the properties would likely have resources and environmental constraints similar to Saddleback Meadows. Development of the proposed project at an alternative location, therefore, is unlikely to be economically viable and would probably not reduce environmental impacts in comparison to the proposed project." DRSEIR at page 5-3.

Off-site alternatives to accommodate housing in the County should not be limited to contiguous properties. Recently, the Planning Center completed an analysis of where development could be accommodated in Orange County. See LA Times, June 17, 2001 article. The study concluded that there are sufficient underutilized shopping center sites to accommodate significant development demand. Based on this information and a reasonable methodology for off-site locations, a revised analysis must describe specifically the methodology used to determine that alternative sites do not exist.

Third, the DRSEIR fails to identify appropriate environmentally superior alternatives as required by CEQA. Specifically, the DRSEIR fails to identify Alternative 4 as the environmentally superior development alternative. See Table 5.7, which clearly indicates that Alternative 4 is the superior development alternative and meets the applicant's objectives. The DRSEIR improperly identifies Alternative 8 as the environmentally superior alternative of the "non-no project alternatives." DRSEIR at page 5-47. This section of the DRSEIR must be revised to report the appropriate environmentally superior alternative based on the facts contained in the DRSEIR. Moreover, because Alternative 4 has fewer impacts than the proposed project, and meets project objectives, facts must be presented that this alternative is infeasible if it is rejected in favor of another development alternative.

Finally, the DRSEIR fails to adequately analyze the feasibility of Alternative 7 – Acquisition Alternative. No information is provided concerning interest expressed by agencies and other conservation organizations to purchase the property and whether the applicant is a "willing seller." This information is critical to the County's consideration of the project and must be provided in a revised analysis. Moreover, this section should identify potential funding sources for purchase of the property, including Proposition 40 funding and the possibility of funding under the NCCP program if the site is upheld as important for inclusion in a reserve. The DRSEIR's statement that this alternative would not meet project objectives assumes that the County cannot develop an aggressive infill program as part of its housing element to provide for needed housing in the County. Information about the feasibility of meeting housing needs without relying on parcels that contain sensitive biological and environmental resources must be included in a revised analysis.

II. THE PROJECT MUST BE DISAPPROVED OR THE DRSEIR MUST AGAIN BE REVISED AND RECIRCULATED.

The serious inadequacies of the DRSEIR are symptomatic of fundamental deficiencies in the project itself. Only a project as deeply flawed as this would fail to result in an adequate revised DEIR after the extensive and highly detailed comments provided by the groups and many others on the first DEIR. The enormous mass grading and placement of fill on erosion-prone soils required for the project seriously call into question the suitability of the site for residential development. The project would wreak unnecessary havoc on the habitat and corridors of several sensitive and endangered species, including the gnatcatcher. For these reasons, the project application should be denied as inadequate and infeasible.

In the alternative and at a minimum, the County may not approve the project unless the DRSEIR is again revised and recirculated to fully disclose and analyze the project's impacts and a proper range of alternatives. Given the multiple inadequacies discussed above, this DRSEIR cannot properly form the basis of a final EIR. CEQA and the CEQA Guidelines require recirculation of a draft EIR where, as here, the document is so fundamentally inadequate in nature that meaningful public review and comment are precluded. See CEQA Guidelines § 15088.5.

CONCLUSION

As set forth above, the DRSEIR suffers from numerous deficiencies, many of which would independently render it inadequate under CEQA. Taken as a whole, the deficiencies of the DRSEIR are so pervasive as to necessitate further extensive revision of the document– and recirculated for public comment. National Audubon Society, Endangered Habitats League and Rural Canyons Conservation Fund respectfully request that the County deny the project at this time. The project should not be reconsidered until a legally adequate EIR is prepared.

Very truly yours,

USC GRADUATE SCHOOL OF URBAN AND REGIONAL PLANNING
Masters degree in City and Regional Planning

STANFORD UNIVERSITY
Bachelors degree in Urban Studies

RECENT PROJECTS

- Santa Clara County Parks and Recreation Department: Currently working with 2M Associates, Inc., to assist the Department to develop a Countywide Strategic Plan primarily directed at managing and improving existing parks and recreation facilities. Work effort includes: 1) working with the Advisory Committee to develop the Strategic Plan and draft action plans, including a resource management plan, and 2) facilitating public workshops related to Plan development. Reference: Lisa Killough, Assistant Director, (408) 355-2219.

- Santa Clara County Land Trust: Assisted the Land Trust to develop an agricultural conservation strategy for agricultural lands adjacent to Gilroy and Morgan Hill (a willing seller/agricultural easement program). Reference: Nancy Richardson, Executive Director, (408) 224-0114.

- David and Lucile Packard Foundation - Conserving California Landscapes Initiative Grant: Developed a Conservation Plan for the Central Coast of California, including Monterey, Santa Cruz and Santa Clara counties. The Plan identifies "no regrets" acquisition parcels based on habitat, agricultural and scenic values and identifies long-term conservation strategies. Reference: Bill Leahy, The Nature Conservancy, (415) 777-0487.

- Mid-Peninsula Regional Open Space District: Currently working with 2M Associates, Inc., to assist the District in its proposed boundary change to include San Mateo Coast within its jurisdiction. The work effort includes: 1) facilitating meetings of the Advisory Committee, and 2) development of a project description for the area including acquisition and management policies, preparation of the Local Agency Formation Commission annexation applications, and responsibility for the LAFCO process. Reference: Craig Britton, General Manager (650) 691-1200.

- City of Livermore Habitat Conservation Plan: Advised the City on the development of a Memorandum of Agreement with the USFWS and CDFG for the completion of a regional HCP. Obtained a Section 6 Grant for the City's effort. Reference: Marc Roberts, Community Development Director, (925) 373-5200.

- Bay Conservation and Development Commission (BCDC): Assisted in the development of a revised San Francisco Bay Plan that will result in (1) additional piers being removed to create new public open spaces and bay views, (2) new land uses in return for new public plazas in conjunction with development, and (3) public access within and around piers. Reference: Jeff Blanchfield, Director of Planning.

- Infill Working Group: Assisted Environment Now to launch an "Infill Working Group," including representatives of the development community, the State Department of Housing and Community Development and Caltrans to develop a model infill assessment methodology. The work efforts includes facilitation of the Infill Working Group monthly meetings. Funding provided by an Environmental Equity grant from Caltrans, and matching funding from Environment Now and the City and County of Los Angeles. Reference: Dave Myerson, Environment Now (310) 829-5568.

- Marin Local Agency Formation Commission: Assisted in the review of Sphere's of Influences (SOI's) in response to the Hertzberg amendments to the Cortese-Knox-Hertberg Local Government Reorganization Act. Currently working on the Southern Marin Sphere of Influence report, which includes a public agency and community outreach component. Reference: Peter Banning, Executive Officer (415) 446-4409.

- Monterey County Planning: Currently assisting local community groups in Monterey County to promote policies that are supportive of "smart growth" and resource conservation in the County General Plan update. The effort includes significant community outreach and agency coordination. Reference: Jean Driscoll, Resources Law Group.

- City of Livermore: Assisted the City in preparing general plan amendments, and a specific plan for the South Livermore Valley "winecountry." The plans were developed collaboratively with members of the community and landowners. The plan includes: (1) fees and dedication requirements in return for limited, clustered new development; (2) development of a model conservation easement; (3) transfer of development rights to protect open space; and (4) protection of up to 10,000 acres of agricultural lands beyond an urban growth boundary. The effort also resulted in the launching of a land trust and a voter approved urban growth boundary.

- Silicon Valley Conservation Council: Assisted in the passage of a local measure to raise funding for open space in the region. Headed up the campaign and public outreach effort, which will raise $8 million per year for open space acquisition and management. The Council includes representatives of the Silicon Valley Manufacturing Group, Cisco Systems, Greenbelt Alliance, the Santa Clara County Land Trust and Santa Clara County Open Space Authority, The Nature Conservancy, among other groups.

- The Nature Conservancy and Sierra Los Tulares Land Trust: Currently assisting these organizations to develop a conservation plan for Tulare County and to develop strategies for agricultural and habitat land conservation. Reference: Alex Mas, TNC (415) 777-0487.

- Endangered Habitats League: Provide ongoing assistance reviewing and commenting on general plan updates and environmental documents for Orange, San Bernadino, San Diego and Riverside counties. Assisting in the development of a transfer of development rights concept to address rural property rights issues in San Diego County. Reference: Dan Silver, Director (323-654-1456).

- Cambria Pine Forest Committee: Prepared a "white paper" on alternative organizational structures and funding sources for the management of the remaining stands of native Monterey Pine forest in San Luis Obispo County. Reference: Paul Cylinder, Jones and Stokes (916)373-7000.

Re: Comments on the Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows (DEIR), State Clearinghouse No. 1996121072

Dear Sir or Madam:

My wife and I are members of The Saddleback Canyons Conservancy which is dedicated to protecting and enhancing the environment and quality of life in the Foothill/Trabuco Specific Plan (FTSP) area and surrounding areas of Orange County; however, we submit these comments as residents and members of the concerned general public.

Compliance with the FTSP:

The FTSP was chartered by the Orange County Board of Supervisors to assure the "rural character of the area and preserve, forever, open space." The current request for exemption to the FTSP is not in keeping with the spirit or letter of the plan. Furthermore, such exemptions only serve those who would gain financially by such exemptions and do not serve the intended constituents, area residents or the planned protection envisioned by the plan.

We find this request inappropriate, unfair and a blatant disregard for the development guidelines that all residents must comply with. It is no coincidence the new project cannot comply with FTSP guidelines; it is simply too destructive. Just because a project cannot comply does not warrant exemption; it is simply inappropriate planning, and that planning process must be revisited.

Cumulative impacts:

As you know this is not the only project currently being considered for this area. Unfortunately, each project is only evaluated with regard to itself and not for its cumulative impact on the environment. Water quality is a key component of this certain degradation and to ignore such cumulative impacts is not only a dereliction of duty and responsibility but an error in favor of an exception for a special interest project.

We encourage you to be diligent and objective in your analysis, not cursory and subjective.

Specific projects include the planned RPLA facility, SaddleCreek and SaddleCrest and the development at the Rancho Mission Viejo. All projects will increase overall pollutant loads and receiving waters should be properly analyzed. We ask that your agency require the applicant to comply with this request and address critical concerns of FTSP compliance and protection of precious water quality resources.

Sincerely,

Richard and Patti Gomez

RE: EIR 566
Saddleback Meadows

As a longtime resident of Orange County, my wife and I are strongly opposed to further residential growth in South County and cannot support a Zone Change to the Foothill/Trabuco Specific Plan. Mission Viejo has done enough already with the enormous amount of homes and apartments being developed off of El Toro road between Live Oak and Marguerite.

Sincerely,

Mr. & Mrs. Michael Hodges

RE: Comments on Draft Revised Subsequent EIR 566 (State Clearinghouse No. 1996121072) for Saddleback Meadows.

Dear Mr. Grieman:

My name is Kathleen Stockwell and I reside in Mission Viejo. **Please include my entire comment in the official record of proceedings for this project.**

Of major concern are the sensitive biological resources that are present at Saddleback Meadows, and in particular the proposed mitigation and related hydrological/water quality issues closely related to the preservation of these resources. The Riverside fairy shrimp (Streptocephalus woottoni), present at Saddleback Meadows, is a Federal endangered species with a USFWS recovery priority of 5C, indicating "that it is a species facing a high degree of threat and having a low potential for recovery" (USFWS Recovery Plan for Vernal Pools of Southern California, Sept. 1998, pg. 19). This extremely rare, beautiful, and wonderful species has very limited geographic distribution, existing only in southern California. Another Branchiopod that exists in one of the Saddleback Meadows ephemeral pools, Cyzicus californicus (a "clam"shrimp) is equally fascinating and beautiful, and is related to fossil clam shrimps that date back in the fossil record ca. 350 million years!

DRSEIR566 implies that the "pilot" mitigation proposed to artificially create "ephemeral ponds/vernal pools" will bring the direct and significant impact to the existing ephemeral pools and the Riverside fairy shrimp to a less than significant level. This assumption is based on insufficient scientific evidence, since **this type of mitigation is "experimental in nature with many uncertainties"** (USFWS Biological Opinion for Saddleback Meadows, pg.19). The Riverside fairy shrimp, as a highly endangered species having a low potential for recovery, deserves the highest level of protection where it exists, and it is not being afforded this protection by allowing experimental mitigation that has a high potential for failure.

The "Implementation Plan/Rationale for Expecting Implementation Success" (Appendix I.2, section VI. pg.9) cites as justification for this mitigation a "recent review of vernal pool rehabilitation and creation projects" which mentions:

*Ephemeral ponds created in San Diego County where **one obligate vernal pool plant** (Pogogyne abramsii) was sustained 5-10 years adjacent to existing habitat.

*A Del Sol Reserve vernal pool project in Santa Barbara County that demonstrated "pools created and restored in 1986 are self-sustaining and **support native vernal pool plant species".**

***One vernal pool construction project in Folsom, California** where density and composition of macroinvertebrate populations, including "several" species of fairy shrimp, were similar to adjacent reference pools. (Rogers 1998).

What justification do these few and poorly explained examples provide? The first two give vernal pool **plant** restoration as examples. Furthermore, upon examination of the Folsom project in Sacramento County, California (Aquatic Macroinvertebrate Occurrences and Population Trends in Constructed and Natural Vernal Pools in Folsom, California, D. Christopher Rogers, 1996) :

*This project is geographically far removed from southern California, and cannot represent unique ecological parameters that exist here.

*The two kinds of fairy shrimp occurring in the pools at the Folsom project are different species with requirements that vary from the southern California Riverside Fairy Shrimp. For example, both of these species, the Vernal Pool Fairy Shrimp (Branchinecta lynchi) and the California Fairy Shrimp Linderiella packardi), develop to maturity in less time than the Riverside Fairy Shrimp. The Riverside Fairy Shrimp needs 1-2 weeks to hatch and another 7-8 weeks to reach maturity. The span in which the right conditions can occur must cover several months, not just two. This strongly suggests that created pools that are **only required to hold rainwater for a minimum of 60 days** at depths required for the Riverside Fairy Shrimp will not be adequate for long term survival of the Riverside Fairy Shrimp. Ephemeral pools in which large numbers of Riverside Fairy Shrimp can successfully breed in Orange County are deep pools that persist for four to five months, or even longer. The paper presented by D. Christopher Rogers on the Folsom project states that, **"Because these constructed pools are mitigation for impacted vernal pools, they need to demonstrate that they are functioning ecologically like naturally occurring vernal pools to be considered adequate compensation".** This takes time, a minimum of 10 years according to the USFWS, and should not be allowed as an experiment unless the original ephemeral pools and their watersheds are left entirely intact until success is proven.

Why is it that only a five year monitoring program is mentioned in the EIR, when 10 years is required? Why is deferral of mitigation allowed in case of failure? This is not acceptable.

* The Folsom project that is quoted in the EIR only presented results of the first two years in a nine year monitoring program, which began in 1994. **What is the current status of its results, and how does this relate to such projects in Orange County?**

*The Folsom project site contains 273 natural vernal pools on 246.9 hectares, where 37 pools were constructed. The high number of natural vernal pools alone points to a higher chance for success of the created pools, in my opinion. This project, although admirable, does not seem to be in itself adequate justification for experimental mitigation for an entirely different species of endangered fairy shrimp and a different set of ecological circumstances in Orange County, where such high numbers of natural vernal pools never occur in one complex.

The USFWS Biological Opinion for Saddleback Meadows, pg. 13 and 18, state: "**The 9 ponds at Saddleback Meadows represent 53 percent of the 17 remaining occupied pools/ponds, making it the largest fairy shrimp habitat complex found in Unit 2**" (L.A. Basin-Orange Management Area). "Implementation of the proposed project ...represents a 56 percent loss of fairy shrimp ponds, and a 68 percent loss of the pond basin area, onsite." **Why is it deemed acceptable to gamble with perhaps the most valuable habitat complex for the Riverside Fairy Shrimp in Orange County?** Page 19 of this same Biological Opinion states that "..construction of an artificial impervious layer to retain water [in sandy soils] for a minimum of 60 days..**has never been done successfully**. It is obvious to me that there should be a more concentrated effort to acquire the Saddleback Meadows property and preserve it as it now is. It is a real treasure for Orange County, and very important for the NCCP process as well, since it **"represents the only low elevation wildlife corridor /linkage between the Central and Southern Subregionsof the Orange County NCCP planning areas."** (pg. 18) Much effort has gone into the NCCP, but it seems the endangered fairy shrimp species and their ephemeral/vernal pool habitats of Orange County were never an integral part of the NCCP planning as they should have been. **The proposed wildlife corridor as presented in DSEIR566 is also inadequate,** being much too narrow and poorly designed. Other sensitive species certainly exist at Saddleback Meadows, such as the Catalina and Intermediate Mariposa Lily populations, which have not been adequately considered either. Two well known host plants for the endangered Quino checkerspot butterfly also exist on this site, and should be in the preservation plan since existence of the Quino in Orange County is still possible.

DSEIR566 fails to adequately define, analyze, and show mitigation for the hydrological aspects of the project, my concern is especially related to the proposed ephemeral pool

mitigation. Nuisance water and non-point source pollution appear to be directed into the natural drainage courses, and may seriously alter any chance for a successful mitigation. It seems obvious that such a drastic change in the watershed caused by grading, etc.will alter the natural regime of the ephemeral ponds no matter what "mitigation" takes place, further placing them in jeopardy.

Will you please explain in specific detail how Basins 1,3,4,5,and 6 (shown directly below houses and slopes on Fig.4 of Appendix I.2) will be unaffected by changes in hydrology and water quality? I have observed the "mitigation" carried out at the Santiago Canyon Estates/Beazer project for the Riverside Fairy Shrimp, and it appears to be sadly inadequate for long term survival of this endangered species. It is directly below homes and slopes similar to the illustration in Fig. 4 mentioned above, has multiple rows of PVC irrigation pipe (made of a very toxic material that may leach into the rainwater?) in and around it (for what purpose?), and cement drainage structures of some kind that look very foreign to a so-called "ephemeral pond". The slopes directly above it are landscaped with non-native plants that may require chemicals. **Will you please tell me where the "inoculent" of Riverside fairy shrimp/cysts originated that were put there? Is this questionable mitigation being used as a model for Saddleback Meadows? Please explain the status of the Santiago Canyon Estates "mitigation", and how it relates to Saddleback Meadows.**

My last questions/comments are these:

Page 5 of the USFWS Biological Opinion states that the created ponds must demonstrate the ability to hold **"water"** for a minimum of 60 days. As I have stated above in more detail, a 60 day minimum is not long enough. **Does the term "water" mean natural rainwater only?** Professor Emeritus Clyde Ericksen has stated, "Attempts to maintain these pools, and thus their fairy shrimp populations, by keeping them full with tap water has proven useless. Tap water contains chloramines which kills living shrimps."

Why does the first sentence of point C (Schedule) under section VI of Appendix I.2, pg.9, state that, "Grading is to be completed no later than December 31, 2000". Please explain?

The following should be incorporated into the project proposal as mitigation measures :

1) **A 10 year monitoring program for the ephemeral pool mitigation plan should be in place**, not 5 years. **No** development impacts should be allowed to proceed in any of the nine existing occupied ephemeral pools or their watersheds until this 10 year period has proven that successful mitigation can occur.

2) The **60 day minimum requirement** for created mitigation pools to hold rainwater at depths required for the Riverside Fairy Shrimp (Streptocephalus woottoni) **should be increased to a period appropriate to the life cycle of this particular species.**

Thank you for including and responding to my comments.

Sincerely,

K. Stockwell

The question which occurs to me, having experienced weekly for several years severe eye irritation with each trip to Saddleback Valley, continually seen the great brown haze of smog, and read that the area ranks among the top as most polluted in the country, how ANY development of the area can be contemplated?

Anything more than "open space, habitat preservation, recreation", and agriculture should not be permitted because it will further exacerbate the already horrendous existing problems, including traffic.

APPENDIX B

STREAMBED ALTERATION ALTERATION AGREEMENT

STATE OF CALIFORNIA - THE RESOURCES AGENCY GRAY DAVIS, *Governor*

DEPARTMENT OF FISH AND GAME

South Coast Region (Region 5)
Habitat Conservation Planning
4949 Viewridge Avenue
San Diego, California 92123
Tel. No. (858) 467-4201/02
(858) 467-4299

December 4, 2001

California Quartet
c/o TPG Management, Inc.
ATTN: Pike Oliver
3341 Norris Avenue
Sacramento, CA 95821

Dear: Mr. Oliver

Enclosed is your copy of Streambed Alteration Agreement **5-178-99**. If you agree with the conditions/measures set forth in the agreement, please make a copy, then sign and return both copies to our office for signature. Send the copies to Brad Henderson; Department of Fish and Game; Post Office Box 1879; Redondo Beach, CA 90278. Written notice of your intent to commence project activities needs to be provided to the Department at least five days in advance of commencing project activities.

The California Fish and Game Code requires that you notify the Department in writing within 14 days of receipt of this Proposal as to its acceptability. If you do not respond within this time period you will lose your right to request binding arbitration. For minor changes we suggest you contact the person responsible for writing your agreement prior to sending the written response.

Please be advised the Department cannot execute (sign) your Streambed Alteration Agreement without your:

- CEQA (California Environmental Quality Act) document,
- certified Notice of Determination (NOD),
- CEQA Findings (if applicable), and
- proof of payment of CEQA document filing fee, or filing of De Minimis Fee Exemption

If these documents were not included with the Streambed Alteration notification package, please provide copies of these documents when you return the Agreement to the Department for the Department's signature. If the lead agency determined that the project is exempt from CEQA analysis and public comment, please provide a copy of the Notice of Exemption or other appropriate documentation. Also, be advised that this Agreement is subject to change upon receipt and review of your CEQA documents.

If you have any questions regarding the proposed conditions please contact me at (310) 214-9950.

Thank you for your cooperation in this matter.

Brad Henderson
Environmental Scientist
Habitat Conservation Planning, Region 5

Enclosure: SAA #5-178-99 CC (via Fax): Mike McCollum; Barry Jones; Joe LaCava

CALIFORNIA DEPARTMENT OF FISH AND GAME
4949 Viewridge Avenue
San Diego, California 92123

Notification No. 5-178-99
Page 1 of 9

December 4, 2001

AGREEMENT REGARDING PROPOSED STREAM OR LAKE ALTERATION

THIS AGREEMENT, entered into between the State of California, Department of Fish and Game, hereinafter called the Department, and Pike Oliver, 3341 Norris Avenue Sacramento, CA 95821, hereinafter called the Operator, is as follows:

WHEREAS, pursuant to Section 1603 of California Fish and Game Code, the Operator, on the 15th day of June, 1999, notified the Department that they intend to divert or obstruct the natural flow of, or change the bed, channel, or bank of, or use material from the streambeds of, the following waters: Aliso Creek, unnamed tributaries and impoundment (Pond A); unnamed tributary drainages to Oso Creek, unincorporated Orange County, California, Section 4, Township 6 South; Range 7 West, SBBM.

WHEREAS, the Department (represented by Brad Henderson during a site visit on the eighth day of March, 2001) has determined that such operations may substantially adversely affect those existing fish and wildlife resources within the Aliso Creek and Oso Creek and tributaries thereto within the project site and the vicinity of the site, specifically identified as follows: invertebrates: Riverside fairy shrimp (*Streptocephalus woottoni*); amphibians: western spadefoot toad (*Scaphiopus hammondii*), California treefrog (*Hyla cadaverina*), western toad (*Bufo boreas*), California slender salamander (*Batrachoseps attenuatus*); reptiles: orange-throated whiptail (*Cnemidophorus hyperythrus beldingi*), western fence lizard (*Sceloporus occidentalis*), southern alligator lizard (*Gerrhonotus multicarinatus*), western skink (*Eumeces skiltonianus*), gopher snake (*Pituophis melanoleucus*) ; birds: yellow-breasted chat (*Icteria virens*), western yellow warbler (*Dendroica petechia brewsteri*), song sparrow (*Melospiza melopdia*), Cooper's hawk (*Accipiter cooperii*), Nuttall's woodpecker (*Picoides nuttallii*), bushtit (*Psaltriparus minimus*), spotted towhee (*Pipilo maculatus*); mammals: desert cottontail (*Sylvilagus auduboni*), California ground squirrel (*Spermophilus beecheyi*), bobcat (*Lynx rufus*), mule deer (*Odocoileus hemionus*), and coyote (*Canis latrans*) ; riparian vegetation which provides habitat for those species: western sycamore (*Platanus racemosa*) willows (*Salix* spp.), mule fat (*Baccharis salicifolia*), mugwort (*Artimesia douglasiana*), laurel sumac (*Malosma laurina*), coast live oak (*Quercus agrifolia*), Mexican elderberry (*Sambucus mexicana*), and all other aquatic and riparian wildlife resources in the area.

THEREFORE, the Department hereby proposes measures to protect fish and wildlife resources during the Operator's work. The Operator hereby agrees to accept the following measures/conditions as part of the proposed work.

If the Operator's work changes from that stated in the notification specified above, this Agreement is no longer valid and a new notification shall be submitted to the Department of Fish and Game. Failure to comply with the provisions of this Agreement and with other pertinent code sections, including but not limited to Fish and Game Code Sections 5650, 5652, 5937, and 5948, may result in prosecution.

Nothing in this Agreement authorizes the Operator to trespass on any land or property, nor does it relieve the Operator of responsibility for compliance with applicable federal, state,

or local laws or ordinances. A consummated Agreement does not constitute Department of Fish and Game endorsement of the proposed operation, or assure the Department's concurrence with permits required from other agencies.

This Agreement becomes effective on the date of Department's signature and terminates December 31, 2004 for project construction only. This Agreement shall remain in effect for that time necessary to satisfy the terms/conditions of this Agreement.

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

1. The following provisions constitute the limit of activities agreed to and resolved by this Agreement. The signing of this Agreement does not imply that the Operator is precluded from doing other activities at the site. However, activities not specifically agreed to and resolved by this Agreement shall be subject to separate notification pursuant to Fish and Game Code Sections 1600 et seq.

Project Description

2. Saddleback Meadows is a 222-acre site located in an unincorporated area of southeastern Orange County approximately 16 miles inland from the Pacific Ocean within the foothills of the Santa Ana Mountains. The parcel is situated on the northeastern side of Santiago Canyon Road, approximately 1,000 feet south of its intersection with Live Oak Canyon Road (S-19) in the Foothill-Trabuco area. Aliso Creek runs north and south along the western boundary of the site, and drains the central and western portion of the site. Streams in the southeastern portion of the site are tributary to Oso Creek. Residential communities are located to the south and west, pasture land is located to the east, and Saint Michael's Abbey is located to the north. The project site supports 8.47 acres of Department jurisdictional streams, including 0.34 acre of impounded intermittent ponds, 4.32 acres of wetland/riparian vegetation, and 3.58 acres of streambeds. The proposed project would impact approximately 3.78 acres of Department jurisdiction, including 0.11 acre of intermittent Pond A, 2.22 acres of wetland vegetation (1.51 acres of mule fat scrub, 0.61 acre of oak woodland, and 0.10 acre of sycamore woodland), and 1.45 acres of ephemeral streambeds traversing upland habitats.

The Operator proposes to alter the streambeds and impoundments to develop 283 single-family residential lots, roads, and recreational trails on approximately 121.8 acres of the property. An additional 28.2 acres will be impacted by remedial grading and shall be revegetated with coastal sage scrub vegetation. The Operator will avoid portions of Drainages (i.e., jurisdictional streams) 5, 10, 14, 15, and 16 and associated oak woodlands near the center of the property as identified in Figure 3 of the *Jurisdictional Delineation of the Saddleback Meadows Property in Orange County* dated March 2000 prepared by Chambers Group, Inc. The remedial grading areas occurring within proposed open space will be recontoured to preconstruction elevations, revegetated and preserved as open space. The remaining remedial grading areas will be landscaped for fuel management purposes. A total of approximately 159 acres of the property's 222 acres will be dedicated in permanent open space, including 90 acres dedicated to the County of Orange as an extension of O'Neill Regional Park. Manufactured slopes extending outside of the fuel modification zones will be revegetated with native vegetation and dedicated as open space.

3. The agreed work includes activities associated with No. 2 above. Specific work areas are described in the documents submitted by the Operator, including the Notification of Lake or

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

Streambed Alteration dated June 15, 1999, the revised Conceptual Mitigation and Monitoring Plan for CDFG Jurisdictional Areas dated May 21, 2001 prepared by Helix Environmental Planning, Inc., the Draft Biological Resources Technical Report dated June 1999 prepared by Chambers Group, Inc., the Biological Assessment dated July 6, 2000 prepared by Helix Environmental Planning, Inc., the Jurisdictional Delineation dated March 2000 prepared by Chambers Group, Inc., and the Addendum to Certified Final Subsequent Environmental Impact Report 566 dated August 1998. The project shall be implemented as proposed in the aforementioned documents unless directed differently by this agreement.

4. The Operator shall not impact more than 3.78 acres of jurisdictional streams. Disturbance to streambeds or removal of vegetation beyond the 3.78-acre jurisdictional area to be impacted, as described in the documents referenced in Condition Number 3, will require additional mitigation at an acreage ratio of 5:1. The form of additional mitigation, if necessary, shall be determined by the Department and may include on- or off-site riparian/wetland habitat creation, enhancement, or preservation.

Mitigation

5. Mitigation for project impacts has been proposed in the Saddleback Meadows Conceptual Mitigation and Monitoring Plan for CDFG Jurisdictional Areas dated May 21, 2001 prepared by Helix Environmental Planning, Inc. (Mitigation Plan). The Operator shall submit a revised Saddleback Meadows Conceptual Mitigation and Monitoring Plan reflecting recent project changes (reduction of impacts) to the proposed project and mitigation measures within 60 days of executing this agreement. Specific locations for the off-site creation and/or protection of riparian habitat and ephemeral streams shall be described in the revised Mitigation and Monitoring Plan.

6. The Operator shall mitigate for the loss of 0.11 acre of intermittent ponds at a 3:1 ratio, or a total of 0.33 acre. A total of 0.82acres of intermittent ponds will be created, 0.49 acre in excess of the 3:1 ratio. The excess intermittent pond mitigation totaling 0.49 acre shall apply toward mitigation for impacts to mule fat scrub. Impacts to 2.22 acres of wetland vegetation (1.51 acres of mule fat scrub, 0.61 acre of oak woodland, and 0.10 acre of sycamore woodland) will be mitigated at a 3:1 ratio with the on-site creation of 2.74 acres of wetlands, the off-site creation of 2.25 acres of riparian habitat, the off-site preservation and enhancement of 1.18 acres of riparian habitat, and the aforementioned 0.49-acre credit from the creation of intermittent ponds.

Creation of ponds and streambeds and the surrounding wetland vegetation on site requires the excavation, grading, and contouring in disturbed upland areas or areas disturbed by remedial grading to form basins or streambeds, and revegetating the margin of these areas with riparian cuttings, container stock, and seeds of native understory species. The depth and shape of the constructed basins will be based on the contours of the existing ponds. In addition, soils from the bottom of the existing ponds will be collected prior to impacts and the collected soils will be used to innoculate the created ponds. Approximately 0.86 acre of mule fat scrub will be created around the pond margins. Additional mitigation measures include relocation and monitoring of western spadefoot toad, and the installation of fencing to deter vandalism and other disturbance of the mitigation sites. The fencing around the ponds will be maintained until mitigation success criteria have been met and will be of a 5-strand rounded wire design.

Creation and enhancement of riparian and oak woodland habitat off site is proposed on the Hidden Ranch property. If the Hidden Ranch mitigation bank is not available for use, the

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

Operator may propose alternate locations subject to approval by the Department. The final location(s) and site-specific mitigation measures shall be described in the revised Mitigation Plan.

Impacts to 1.45 acres of CDFG-jurisdictional streambeds will be mitigated on site by the creation of streambeds within areas proposed for remedial grading previously supporting streambeds (0.44 acre), and off site by purchase of 1.01 acre of existing streambeds at the Hidden Ranch Mitigation Bank or other location acceptable to the Department. Impacts will be mitigated at a 1:1 ratio for a total of 1.45 acres to be purchased.

7. All mitigation areas shall be protected in perpetuity under a conservation easement prior to initiation of project-related streambed impacts. The format of the conservation easement shall be approved by the Department's legal advisor prior to the conveyance of the easement. The 1.01-acre streambed(s) shall also be purchased and protected in perpetuity under an approved conservation easement prior to project-related streambed impacts.

8. The Operator will be responsible for financing pre-grading plan hydrological testing, installation, maintenance, and monitoring of the habitat creation and enhancement areas. In order to ensure the success of mitigation, the Operator will enter into a five-year, secured agreement to cover the projected cost to install, monitor, and report on the mitigation. The Operator shall submit a draft of the bond and/or letter of credit with an itemized cost list to the Department for approval at least 60 days prior to impacting jurisdictional streams. The operator shall submit the final bond and/or letter of credit for the amount approved by the Department within 20 days of receiving approval of the draft bond/and or letter of credit. Either of the following options would satisfy the security requirement:

(Option A) The agreement shall be in the form of a 120 percent letter of credit in favor of the Department for mitigation costs within the entire 8.44-acre area to be created or enhanced.

(Option B) The agreement shall be in the form of: (1) a 120 percent bond or letter of credit in favor of the Corps and/or Service for mitigation costs associated with Corps jurisdiction; and (2) a 120 percent letter of credit in favor of the Department for mitigation costs associated with the remaining acreage (i.e., Department jurisdiction) such that the entire 8.44-acre area to be created or enhanced is covered by both secured agreements.

9. Grading of the mitigation areas is to be completed no later than December 31, 2004. Planting and then seeding shall occur between November 15 and February 15 to take advantage of winter rains. Since irrigation will be provided for the container stock, planting (but not seeding) may occur into early spring. Container stock will be installed no later than April 30; cuttings will be installed no later than February 1, and seed will be planted no later than December 31.

10. Grading associated with providing adequate hydrology for habitat creation or riparian revegetation on the project site and at the Hidden Ranch site shall not impact nesting birds. Therefore, grading shall not take place in vegetated areas from March 1 to September 15 to avoid impacts to nesting birds. Alternately, an independent qualified biologist may perform a nesting bird survey no more than three days prior to grading. The results of the nesting bird survey, including site conditions and a list of all vertebrate species observed, shall be provided to the Department for concurrence prior to grading. If active nests are observed, the operator shall provide a buffer zone of at least 100 feet (300 feet for raptors) until the young have fledged, are no longer being fed by the parents, have left the nest, and will no longer be impacted by the project.

11. Grading associated with providing adequate hydrology for riparian revegetation on the project

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

site or at the Hidden Ranch mitigation site shall not impact any California Species of Special Concern. The day before grading, an independent qualified biologist shall perform a survey for Coast Range California newt (*Taricha torosa torosa*) in reaches of the Creek and adjacent areas to be disturbed by excavation, deposition of overburden, or staging of vehicles to ensure that the grading or other activities do not impact individuals. Any individuals encountered shall be relocated at least 1/4 mile upstream from the disturbance in areas of suitable habitat. Relocated individuals shall be dispersed and not released in a single area.

12. Mitigation site preparation shall be carried out pursuant to condition nos. 22-26; 28-31; and 33-39 below.

13. Plant material (seeds, container plants and cuttings) to be used for the revegetation effort will be derived from on-site material at each site. On-site material is anticipated to be adapted to the site conditions and exhibit local genotypes.

14. Pond basins 1, 2, 5 and 8, as identified in Figure 4 of the *revised Conceptual Mitigation and Monitoring Plan for CDFG Jurisdictional Areas* dated May 21, 2001 prepared by Helix Environmental Planning, Inc., shall be constructed concurrently with grading. A grading plan will be developed for all the new ponds based on their position in the watershed, and the contours of the existing ponds. The new ponds will mimic as closely as possible the depths and areas of the existing ponds. Soils at the proposed sites shall be tested for permeability characteristics prior to initiation of pond construction. Rough grading contours will be deep enough to allow for the application of a surface soil layer removed from the existing ponds. Only non-vegetative erosion control measures may be used in areas with native vegetation. Such erosion control measures may include sandbags, soil binders, waterbars, trenches, or dissipators. These measures preclude the introduction of non-native weedy species into the seed bank of areas with native vegetation. Drainage and sedimentation control devices shall be routinely cleaned, maintained, and repaired prior to and during the rainy season for three years following completion of project grading. All repairs to these systems will be immediately executed to minimize erosion problems. Garbage and debris will be removed from all areas of the mitigation site. Dead or downed wood will not be removed.

15. After finish grading of the relocation ponds, the upper 24 inches of soils from existing ponds proposed to be impacted will be collected and spread over the bottom of the relocation ponds in two layers. The top layer shall be 1" deeper than the cracks in the soil and the second layer will be the remaining depth to 24". Initial grading of the mitigation site must include over excavation to allow for placement of the salvaged soil. Relocation ponds must also support a sufficient prey base population. If ponds do not support sufficient algal populations they will be inoculated with resources from the original ponds.

16. Western spadefoot toad individuals to be impacted shall be relocated and dispersed within all of the created ponds.

17. The operator shall retain an independent qualified biologist to survey all of the pond basins on site to be impacted to identify western spadefoot toad activity. Surveys to identify tadpoles shall begin the first week of January or following the first one-inch or greater rain event, and will be repeated as necessary to monitor their development. An estimate of the total larval population for each pond and total density for all of the impacted ponds shall be recorded and provided to the Department in monitoring reports. The biologist shall attempt to capture approximately 25% of the western spadefoot tadpoles present in each impacted pond prior to metamorphosis. The tadpoles shall be relocated by netting the individuals, placing them in containers with pond water, and quickly moving the containers to each designated translocation pond. Once the water in the containers has equilibrated to the same temperature as the translocation pond, the tadpoles shall

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

be carefully released into the pond. An estimate of the number of tadpoles captured and released into each translocation pond shall be recorded and provided to the Department in monitoring reports. Because western spadefoot toad are episodic breeders, larvae may not be present for collection during the first year. If spadefoot toad larvae are not present during the first year, spadefoot toadlets shall be collected from the preserved ponds as described in Condition 18 below.

18. The juvenile western spadefoot toad relocation shall occur at each impacted pond during the peak day of metamorphosis and the day immediately following. Spadefoot toadlets (recently metamorphosed juveniles) will be relocated from all impacted ponds supporting spadefoot toad into the ponds created in advance of construction. The toadlets shall be relocated prior to leaving the ponds by netting the individuals, placing them in containers with pond water, and moving the containers to the translocation pond. Once the water in the containers has equilibrated to the same temperature as the translocation pond, the toadlets shall be carefully released into the pond. An effort shall be made to remove all the toadlets from the ponds to be impacted. An estimate of the number of toadlets captured from each impacted pond and released into each created pond shall be recorded and provided to the Department in monitoring reports. If toadlets are unavailable for collection during the first year due to low precipitation, the Operator shall collect and relocate approximately 25% of the toadlets from the site's preserved ponds during at least one subsequent year.

19. Maintenance/ monitoring methods and performance criteria for revegetation are provided on pages 18-23 of the Mitigation Plan. A mule fat scrub reference site shall be designated with the concurrence of the Department. Mule fat scrub shall achieve a native cover of 80% by the third year after planting, 90% by the fourth year after planting, and 100% by the fifth year after planting. Native species diversity of the planted mule fat scrub will be 60%, 70%, and 80% of the designated reference site in years three, four, and five, respectively. In planted oak and sycamore woodland habitats, the mitigation sites shall achieve a native cover of 40% by the third year after planting, 55% by the fourth year after planting, and 65% by the fifth year after planting. The planted oaks shall achieve at least 50% survivorship by the end of the fifth year. Replacement plants shall be monitored with the same survival and growth requirements for 5 years after planting.

20. Monitoring of the spadefoot toad relocation sites shall include annual bimonthly surveys for tadpoles in the translocation ponds between January 1 and June 1. An estimate of the number of tadpoles in each translocation pond shall be recorded, along with an estimate of tadpole density for all of the translocation ponds. Because the spadefoot toad is reported to become reproductively mature within two to three years, the identification of tadpoles at the relocation sites during years three through five following the initial relocation may indicate the successful breeding of the relocated individuals. The success criteria will be the natural reproduction of spadefoot toad at the relocation sites, indicated by the presence of tadpoles in the relocation ponds. If spadefoot toad tadpoles are observed in each of the relocation ponds (i.e., Ponds 1, 2, 5, and 8) at any time during the monitoring period beginning the second year after the ponds have been created, filled with water, and stocked with spadefoot tadpoles, the translocation effort shall be deemed successful.

21. An annual report shall be submitted to the Department by January 1 of each year for five years after planting. This report shall include: (1) a list of names, titles, and companies of all persons who prepared the content of the annual report and participated in monitoring activities for that year; (2) a copy of the agreement and any attachments including Special Conditions and subsequent Letters of Modification; (2) an analysis of all qualitative and quantitative monitoring data including spadefoot toad monitoring results; (3) copies of all monitoring photographs; and (4) maps identifying monitoring areas, transects, planting zones, and so forth as appropriate. Remedial recommendations, if necessary, shall be made in the annual reports as well as a

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

summary of whether or not the mitigation is meeting the success criteria for the appropriate year. Monitoring and performance criteria will be tied to implementation. The first annual monitoring event will occur in June after the first full growing season. Annual technical monitoring reports shall be submitted to the Department by the end of August of each year to ensure that there is adequate time remaining in the dry season to implement any necessary contingency measures.

Specific Work Conditions to Protect Fish and Wildlife Resources

22. Riparian/wetland habitat and ponds to be retained in open space shall be protected from construction disturbance through construction fencing and silt fencing or other erosion protection devices around the construction limits to prevent the flow of sediment into the ponds.

23. The removal of vegetation within any streams from March 1 to September 15 must avoid impacts to nesting birds. If vegetation must be cleared within this period, an independent qualified biologist may perform a nesting bird survey no more than three days prior to grading. The results of the nesting bird survey, including site conditions and a list of all vertebrate species observed, shall be provided to the Department for concurrence prior to grading. If active nests are observed, the operator shall provide a buffer zone of at least 100 feet (300 feet for raptors) until the young have fledged, are no longer being fed by the parents, have left the nest, and will no longer be impacted by the project.

24. In areas outside of the mass grading footprint, access to the work site shall be via existing roads, access ramps and previously disturbed areas. Vehicles shall not cross streams at any time to gain access to the work site.

25. No equipment shall be operated in ponded or flowing areas.

26. Disturbance or removal of vegetation shall not exceed the limits approved by the Department.

27. Installation of bridges, culverts, or other structures shall be such that water flow is not impaired. Bottoms of temporary culverts shall be placed at stream channel grade; bottoms of permanent culverts shall be placed at or below stream channel grade.

28. Preparation shall be made so that runoff from steep, erodible surfaces will be diverted into stable areas with little erosion potential. Frequent water checks shall be placed on dirt roads, cat tracks, or other work trails to control erosion.

29. Water containing mud, silt or other pollutants from aggregate washing or other activities shall not be allowed to enter a lake or flowing stream or placed in locations that may be subjected to high storm flows.

30. Structures and associated materials not designed to withstand high seasonal flows shall be removed to areas above the high water mark before such flows occur.

31. Staging/storage areas for equipment and materials shall be located outside of the stream.

32. If a stream's low flow channel, bed or banks/lake bed or banks have been altered, these shall be returned as nearly as possible to their original configuration and width, without creating future erosion problems.

33. Spoil sites shall not be located within a stream/lake, where spoil shall be washed back into a stream/lake, or where it will cover aquatic or riparian vegetation.

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

34. Materials associated with project related activities shall be prevented from contaminating the soil and/or entering the waters of the state. These materials include (but are not limited to) the following: raw cement/concrete or washings thereof; asphalt; paint or other coating material; oil or other petroleum products; or any other substances which could be hazardous to aquatic life. These materials, placed within or where they may enter any stream, by the Operator or any party working under contract, or with the permission of the Operator, shall be removed immediately.

35. No debris, soil, silt, sand, bark, slash, sawdust, rubbish, cement or concrete or washings thereof, oil or petroleum products or other organic or earthen material from any construction, or associated activity of whatever nature shall be allowed to enter into or placed where it may be washed by rainfall or runoff into, waters of the State. When operations are completed, any excess materials or debris shall be removed from the work area. No rubbish shall be deposited within 150 feet of the high water mark of any stream or lake.

36. The Operator shall comply with all litter and pollution laws. All contractors, subcontractors and employees shall also obey these laws and it shall be the responsibility of the operator to ensure compliance.

37. No equipment maintenance shall be done within or near any stream channel where petroleum products or other pollutants from the equipment may enter these areas under any flow.

38. The Operator will submit final grading plans to the Department for approval prior to initiating impacts. Avoidance areas will be clearly delineated on the grading plans.

39. The Operator shall request an extension of this agreement prior to its termination. Extensions may be granted for up to 12 months prior to the date of termination of the agreement and are subject to Departmental approval. The extension request and fees shall be submitted to the Department's South Coast Regional Office at the above address. If the Operator fails to request the extension prior to the agreement's termination then the Operator shall submit a new notification with fees and required information to the Department. Any activities conducted under an expired agreement is a violation of Fish and Game Code Section 1600 et. seq. The Operator may request up to a maximum of one extension of this agreement.

40. The Operator shall **provide a copy of this** Agreement **to all contractors, subcontractors, and the Operator's project supervisors. Copies of the** Agreement **shall be readily available at work sites at all times during periods of active work** and must be presented to any Department personnel, or personnel from another agency upon demand.

41. The Department reserves the right to enter the project site and mitigation areas at any time to ensure compliance with terms/conditions of this Agreement.

42. The Operator **shall** notify the Department, **in writing, at least five (5) days prior to initiation of construction (project) activities and at least five (5) days prior to completion of construction (project) activities.**

43. It is understood the Department has entered into this Streambed Alteration Agreement for purposes of establishing protective features for fish and wildlife. The decision to proceed with the project is the sole responsibility of the Operator, and is not required by this agreement. **It is further agreed all liability and/or incurred cost related to or arising out of the Operator's project and the fish and wildlife protective conditions of this agreement, remain the sole responsibility of the Operator.** The Operator agrees to hold harmless the State of California and the Department of Fish and Game against any related claim made by any party or parties for

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

personal injury or any other damages.

44. The Department reserves the right to suspend or cancel this Agreement for other reasons, including but not limited to the following

a. The Department determines that the information provided by the Operator in support of the Notification/Agreement is incomplete or inaccurate;
b. The Department obtains new information that was not known to it in preparing the terms and conditions of the Agreement;
c. The project or project activities as described in the Notification/Agreement have changed;
d. The conditions affecting fish and wildlife resources change or the Department determines that project activities will result in a substantial adverse effect on the environment.

45. Before any suspension or cancellation of the Agreement, the Department will notify the Operator in writing of the circumstances which the Department believes warrant suspension or cancellation. The Operator will have seven (7) working days from the date of receipt of this notification to respond in writing to the circumstances described in the Department's notification. During the seven (7) day response period, the Operator shall immediately cease any project activities which the Department specified in its notification. The Operator shall not continue the specified activities until that time when the Department notifies the Operator in writing that adequate methods and/or measures have been identified and agreed upon to mitigate or eliminate the significant adverse effect.

5 July 2002

Mr. Thomas Mathews
Planning and Environmental Services
County of Orange
P.O. Box 4048
Santa Ana, CA 92702

Dear Tom,

It's been almost a decade since we last crossed paths, and it's hardly a surprise that again we touch bases regarding an issue related to NCCP. Developers of the Saddleback Meadows property adjacent to El Toro Road asked me to visit their property and to convey to you my observations in reference to a letter jointly signed by staff of the U. S. Fish and Wildlife Service and California Department of Fish and Game (to Tim Neely, dated 26 June 2002). The landowner's concern involves the contention by the agencies that the proposed project will sever landscape linkages between reserved lands in "lower elevation Santa Ana Mountain foothills," thereby compromising the persistence of key (but not state or federal listed) species, and in turn compromising the goals of NCCP. The immediate concern is attenuated by a long history of negotiations over this property, previously agreed upon mitigations, and (apparently) full resolution of listed species issues.

As chief architect of the original guidelines for NCCP, I must admit to being heartened by the wildlife agencies' general approach to multiple species planning, which calls not just for reserve designs to meet the habitat needs of imperiled species, but goes further to add landscape connectivity that can be necessary to sustain certain more abundant and wide ranging species, which can play important roles in ecosystem function. Ultimately, conservation of species at risk requires protection of all of the constituent elements of their habitats, including species not equally so imperiled. Unfortunately for this developer, the regulatory approach of providing connectivity to more common species is being applied on the Saddleback Meadows property without any clear benefit to species of concern, either common or imperiled.

Any extant wildlife corridor through Saddleback Meadows currently must be funneling dispersing animals from the extensive open spaces of O'Neill Regional Park and the Cleveland National Forest toward busy El Toro Road and the small (and degraded) low elevation coastal sage scrub patches beyond, or to O'Neill Park from the National Forest, a route that is redundant with available reserve lands. While those sage patches north and east of the Foothill Transportation Corridor have habitat value for California Gnatcatcher, which can fly between them, they have little value and make no sense in planning for larger mammals -- deer have access to much superior open spaces to the north and east, mountain lions should hardly be encouraged into small natural spaces in already suburbanized Orange County, and coyotes, they will find their ways to those patches with or without the proposed development. The fates of gnatcatcher and other coastal sage-dependent species in this lower elevation corner of Orange County's two NCCP's are already sealed. The proposed project will make no difference. The local fates of large mammals are not going to be dependent on engineered habitat stringers and pathways within suburban development, but on the wildlands of O'Neill Regional Park, Whiting Ranch Wilderness Park, and National Forest lands beyond.

This observation begs the biological rationale for the corridors map presented in the draft EIR (figure 4.8.4) referenced on page 3 of the agency letter. A more nonsensical map would be hard to conjure up. Two of four named "corridors," central and southern, show connections between open space reserves (to the east) west through a transportation gauntlet to essentially dead-ended habitat remnants. The other two "corridors," northern and eastern, are not corridors in any application of the term. They are open space habitat; in fact reserves, not corridors.

The purpose of a wildlife corridor is to facilitate the dispersal or movement of organisms between reserve land units that otherwise would be isolated. In 1993, my colleagues and I on the scientific review panel to NCCP called on land planners to include such corridors where necessary to connect reserves. This is not, however, such a circumstance.

At lower elevations northeast of the foothill Transportation the gnatcatcher will fly between remnant patches of coastal sage scrub without corridors and despite extant land barriers. Reserved lands are continuous at higher elevations; animal dispersal will not require corridors. In between and around currently proposed Saddleback Meadows development, anticipated open space set asides should contribute to local and regional species conservation, facilitate dispersal of many species known to successfully inhabit mosaics of developed land, and provide important ecosystem services, such as controlling local hydrodynamics and stabilizing soils. What Saddleback Meadows developers cannot

offer the Orange County NCCPs is a wildlife corridor where one simply does not and cannot exist.

It is my best professional judgement that the agencies's call for a low elevation wildlife corridor across the Saddleback Meadows property is not warranted and should be rejected. If I can be of any further assistance please feel free to contact me at (775) 784-1303.

Sincerely,

Dennis D. Murphy, PhD.
Professor and Program Director

EXHIBITS

1. Riverine exhibit (cross section)

I. PURPOSE

The goal of the Saddleback Meadows Water Quality Management Plan (WQMP) is to reduce pollutants and/or specific sources of pollution which affect or may affect the project property as well as the downstream properties in its development. Such reductions should result in cleaner water in onsite runoff, storm water and incidental flows, including those flows emptying towards offsite facilities and features downstream.

When implemented, the pollution control measures proposed by the WQMP will create cleaner water runoff associated with development in compliance with all applicable water quality ordinances and laws. These laws include, but are not limited to, San Diego Region, California State Regional Water Quality Control Board directives; the County of Orange's NPDES Drainage Area Management Plan (DAMP); and the Clean Water Act of the United States of America.

II. EXISTING CONDITIONS

A. Saddleback Meadows

Saddleback Meadows is located primarily within the Aliso Creek Watershed area. Its hillside topography is incised with drainage courses that mainly drain west to Aliso Creek. Aliso Creek is located just west of the project's western flank. Some remaining courses drain south to Oso Creek. Oso Creek is located south of the project's southeast boundary.

The vacant, 222.2 acre project site comprises hillside topography covered with native grasses and dirt trails. Remnants related to agricultural and ranching uses employed since the 1930's include an abandoned, worn out wooden house, corrals, an overgrown olive orchard and eight stock ponds. The remainder of the site is covered by coastal sage scrub, chapparel and oak woodland. The property has been heavily grazed for the past several decades. This is evident as the native vegetation has been replaced by grasslands on over 50% of the property. Significant portions of the property are also covered by artichoke thistle, another indicator of overgrazing. Accordingly, evidence on the property indicates poor hydrologic conditions with high stormwater runoff and highly erosive overland flow. Over the past several years, numerous highly incised drainage courses have been cut into the natural rolling topography. During low flow conditions, for example a 2-year storm event, peak discharges are 30% higher than in its pre-grazing natural state.

An east-west running ridgeline located in the southern portion of the property rises up from the west (elevation 1,200') and extends east approximately 3,000 LF. This ridge spans two thirds of the east-west width of Saddleback Meadows. The ridgeline then turns north-northeast, continuing to rise and extending 2,200 LF towards the northeast property corner. Existing site elevations exceeding 1,600' are typical at the northern portion of the east property line.

In general, storm water runoff flows drain to the west across the property, eventually emptying into Aliso Creek. In the project's area, Aliso Creek flows parallel to and at the **west side** of existing El Toro Road. Existing El Toro Road, in this same area, forms the western boundary of Saddleback Meadows.

Existing storm drain facilities on the **east side** of El Toro Road picks up water runoff from the project site and conveys it westerly under El Toro Road, to outlets discharging into Aliso Creek. These existing storm drain facilities are maintained by the County of Orange. They are:

- The J01 facility per the J01-701-15 storm drain improvements approved by the County of Orange located north of the project's spine road intersection with El Toro Road.
- The Line "B", 24" RCP storm drain line per J01-701-15 plans (described directly above) located south of the project's spine road intersection with El Toro Road.
- Lines "A", "B" and "C", 24" RCP storm drain lines per the improvement plans for Tract 12724, County of Orange, located at the southern most entry street (existing Valley Vista Street) intersection with El Toro Road.

However, some stormwater runoff flows at the eastern two thirds of the southern portion of the property surface drain to the south property line, then southerly across natural vegetation of the adjacent property and empties into Oso Creek. Oso Creek runs as close as 200 LF from Saddleback Meadow's southern boundary.

B. Regional

Down stream to this project there is drainage from the newer projects which are tributary to the Aliso Creek which is a natural water course. Recently, the Regional Water Quality Board has issued a new directive to clean the high bacteria count (Coliform) from the Creek. The Board's goal is to make Aliso Creek Beach safe for swimming.

III. DEVELOPED CONDITIONS

A. Saddleback Meadows

Residential development for up to 299 single-family homes is proposed in two project areas. 173 residential lots are proposed in the southwest quadrant of the project, 70 residential lots are proposed for the southeasterly quadrant and the remaining 56 residential lots are located in the northeasterly quadrant. While stabilization of the existing land slides and conventional mass grading will disturb approximately 71% of the entire project site, approximately 69% of the property will be placed into permanent open space.

Table 1

Summary of Proposed Land Uses

Land Use	Area (acres)	Portion of Site
Single-Family Residential Lots (299)	47.9	21.5%
Streets (private)	19.0	8.5%
Regional Park *	83.25	37.6%
Biological Open Space Easement**	11.65	5.2%
Restricted Scenic Preservation Easement***	60.2	27.2%
Total	**222.0**	**100%**

*Regional Park, as required by the County of Orange, excludes manufactured slopes and fuel modification areas. Regional Park may include areas subject to remedial grading and biological enhancement.

** Biological Open Space Easement includes biologically restored manufactured slopes outside fuel modification areas.

*** Restricted Scenic Preservation Easement included fuel modification areas owned and maintained by homeowner's association/community management district.

Table 2

Summary of Grading Disturbance

Land Use	Area (acres)	Portion of Site
Single-Family Residential Lots (299)+ Roads	66.9	30%
Manufactured Slopes	63.2	28%
Remedial Grading*	27.9	13%
Undisturbed Areas **	64.0	29%
Total	**222.0**	**100%**

* Landfill stabilization beyond the limits of the conventional mass grading
** Undisturbed areas may include Fuel Modification Zones and may be subject to biological enhancement; i..e., annual grasslands replaced with Coastal Sage Scrub or Oak Woodlands as discussed in the Biological Technical Report

Open space areas are proposed for both the project's northwest quadrant and significant areas along the project's eastern and southern flanks. The permanent open space will be dedicated to the County of Orange as a regional park and will be maintained by the County or a third-party conservation group. Maintenance of the permanent open space will be funded by a permanent endowment created by the developer.

Saddleback Meadows will be served by urban type drainage systems. Drainage systems will conform to County of Orange Flood Control District standards, and basically comprised of paved street gutters, catch basins, and underground concrete pipes.

Storm drain improvements for the southwest development area will drain westerly into existing Orange County maintained storm drains at the west-southwest project boundary where the main storm drain and low-flow channel will cross. Only Lots 1 through 37 connect directly to an existing storm drain facility in El Toro Road. Storm drain improvements for the northeastern development area, in general, will drain easterly and outlet into the project's open space area located in the north central portion of the project. Drainage flows through the open space and collects in a tributary which drains westerly about 2,000 feet before draining into Aliso Creek. Aliso Creek continues another 600 feet before emptying into the existing J01 storm drain facility inlet located north of the El Toro Road/Spine road intersection.

The Storm drain outlets have been carefully located so that they discharge into natural channels in order to replicate natural flow patterns as closely as possible. In some cases, this has resulted in multiple outlets; for example, the drainage system in the northwest development area.

B. Regional

The project is located within the boundaries of two primary watershed areas:

Aliso Creek Approximately 75% of the site *is within the Aliso Creek Watershed.* Aliso Creek is located west of the project site. The natural creek is located along the eastside of El Toro Road but crosses under the roadway near the project's entrance, continuing southwesterly along the west side of El Toro Road. The creek flows through natural open space and urban development and outlets at the ocean at Aliso Creek Beach. Aliso Creek's watershed encompasses 23,000 acres, and includes natural open space, rural and urban development, agriculture and ranching, regional parks and other recreational facilities. There are a number of street crossings over Aliso Creek which have been built as the result of newer or existing developments downstream. Saddleback Meadows represents less than 1% of the Aliso Creek watershed.

Oso Creek The remaining 25% of the site located on the southeasterly portion of the project is part of the Oso Creek watershed. Flows from the project

drain offsite through natural drainages. The natural drainages converge and flow into a concrete storm drain system that runs in a southwesterly direction though Tract 12724 (Hidden Ridge residential development). The system outlets onto a concrete energy dissipator and then into the natural drainage course of Oso Creek. The creek drains into the Upper Oso Reservoir. Overflows from the reservoir continue westerly eventually draining into San Juan Creek which outlets into the Pacific Ocean at Doheney State Beach.

A small area at the extreme eastern portion of the site drains into the Trabuco Creek watershed.

IV. BEST MANAGEMENT PRACTICES (BMP'S)

A. Introduction

In order to reduce, control, prevent, remove or eliminate pollution, BMPs will be proposed, implemented and followed for development of Saddleback Meadows. BMPs are construction devices, procedures, rules or methods that will be used to control predictable pollutant runoff associated with the development of Saddleback Meadows.

B. BMP Highlights for Saddleback Meadows

The Saddleback Meadows BMP's have been chosen based on local industry standards and the existing constraints on the property. The site plan for Saddleback Meadows has been carefully designed to minimize the impact to the natural topography and vegetation. The proposed development area is the minimum area possible which accommodates the project's 299 Single Family Residential lots. This reduces the opportunity to use structural BMPs that require larger areas (created wetlands, basins) within the development area. Sensitive biological habitat also prevents locating such facilities within the open space areas. The structural BMP's therefore have been designed to take advantage of excess space for created wetlands and basins and in-line solutions where space is not available.

Saddleback Meadows BMP's will include the following.

1. **Restore Natural Watershed** – The portion of the property that will not be disturbed by grading, approximately 30%, will be restored by cessation of cattle grazing. Furthermore, the annual grasslands and artichoke thistle will be replaced with coastal sage scrub and oak woodlands. Existing disturbed coastal sage scrub will be enhanced. All of these actions will reduce stormwater runoff by up to 30%. This will also significantly reduce erosion potential and should eliminate the erosion that is currently plaguing the property. The remaining 40% of the property that will be placed into permanent open space will be revegetated with coastal sage scrub and oak woodlands ensuring that these disturbed areas are stabilized.

2. **Minimize Impervious Areas** – The project has been designed to minimize impervious areas through the use of larger lots (5,000 square foot minimum, nearly 6,700 square foot average) and narrower private streets. This will limit impervious areas to less than 17% of the property.

3. **Storm Drain System** – The storm drain system has been designed to mimic natural drainage patterns as closely as possible. Storm drain outlets will be provided to return runoff into each natural drainage that intersects the development area. This serves the dual purpose of ensuring that the natural drainages are receiving no more runoff than they can accommodate and ensuring that natural riparian habitat continue to receive an adequate supply of water. Appropriate energy dissipaters will be installed at each outlet to reduce flows to non-erosive velocities.

4. **Riverine System** – The southwest and southeast quadrants of development, approximately 80% of the residential lots and streets, will be served by a riverine system designed to provide a natural cleansing of the urban run-off. Incidental and low flows produced by the completed project will be filtered by the riverine system. The riverine system will collect low flows at strategically located catch basins. Underground pipes will then convey the low flows to a vegetated swale. This swale is located parallel to and along the north side of the project's spine road attached exhibit provides the detail and cross section of the proposed Riverine system. The swale design will filter pollutants from low flows. It will also allow dissipation of a portion of the flows through percolation and evaporation. The downstream terminus of the riverine system is a 1200' long by 60' wide earthen and vegetated detention basin) located just north of the spine road and 700' east of the El Toro Road/spine road intersection. The effectiveness of the Riverines generally depend on the length and the amount of vegetation within the Riverines along the path. The typical vegetation within the Riverine system include PlatanusRacemosa, Schinus Molle, Baccharis Sacfolia, Juncus Mexicanus, Scripus Californicus.

5. **Stormceptors** – Stormceptors are in-line storm drain devices designed to separate sediment and oil from low-flow runoff flowing through underground storm drain pipes. The trapped sediment and oil is then removed during routine maintenance and disposed of at an approved landfill. All storm drain pipe flows within the northeastern quadrant, the remaining 20% of the development, will pass through strategically located Stormceptors prior to discharging into project open space areas. The Stormceptors will be able to remove up to 80% of the total sediment load (TDS). The Stormceptors will also remove free oil from stormwater during normal flow conditions. It should be noted that the stormceptor will retain trapped pollutants during peak stormflows.

6. **Erosion and Sedimentation Control** – The Saddleback Meadows erosion and sedimentation control plan will be prepared and implemented in order to achieve the following two primary goals:

a. Soil erosion shall be minimized by keeping soil stabilized as long as possible.

b. Runoff from remaining disturbed areas shall be directed to locations where sediments will be removed prior to discharge into water courses.

Installation of temporary sediment basins, sand bag debris dams and temporary sand bag sediment catchment areas at catch basins during construction, are examples of ways the goal outlined in paragraph (b) directly above will be achieved by implementation of project BMP's.

7. **Monitoring, Inspection and Maintenance** – Structural BMPs will be monitored periodically and maintained sufficiently for their effectiveness. BMPs, such as the Stormceptors and the riverine system, will be privately maintained by the homeowner's association. A detailed plan for maintenance, inspection and for assessing the effectiveness of the BMPs including testing, will be included in the project's final WQMP and SWPPP. The final plans will be submitted to the applicable County departments and regional jurisdictions for their review and approval prior to issuance of the project grading permit. It is anticipated that the maintenance responsibilities will entail the following:

a. **Homeowners/Tenant Education**

California Quartet or its' assigns will insure that all homeowners will be given a copy of the recorded CC&R's which will contain a section outlining the environmental awareness education materials. The Master HOA will establish requirements for the implementation of a community awareness program that informs home buyers of the impacts of dumping oil, paints, solvents or other potentially harmful chemicals into the storm drain; the proper use and management of fertilizers, pesticides and herbicides in home landscaping and gardening practices; the impacts of littering and improper watering. Environmental awareness education materials, shall be provided to all members of the Master HOA periodically thereafter.

b. **Activity Restrictions**

Within the Master CC&R's prepared by California Quartet or its assigns, language will be included to identify surface water quality protection required by the Master HOA. Surface water quality activities shall also be conducted in conformance with the Water Quality Management Plan as it relates to the handling and disposal of contaminants. The following language provides additional direction for controlling activities that may affect the environment of the project and/or surrounding areas.

PROPOSED LANGUAGE

POLLUTANT RUNOFF
The Master HOA and its members shall comply with plans for the regulation and control of pollutant run-off by using "Best Management Practices" in accordance with the residential provisions of the California and Orange County Storm Water Best Management Practices Handbook, which include the following:

The Master HOA shall periodically provide to their members environmental awareness education materials made available by the local municipalities. These materials will describe the use of chemicals (including household types) that should be limited to the Covered Property with no discharge of specified wastes via hosing or other direct discharge to gutter, catch basins, settling basins and storm drains. The materials shall also provide a description of fertilizer and pesticide usage guidelines consistent with County Management Guidelines for Use of Fertilizers and Pesticides.

The Master HOA shall establish trash management and litter control procedures aimed at reducing pollution of drainage water.

The Master HOA shall have any drainage systems, streets and catch basins on property they maintain inspected and cleaned, and any streets and parking areas they maintain swept prior to the storm season (no later than October 15th of each year).

The Master HOA shall implement irrigation and landscaping practices which will include provision of water sensors, programmable irrigation times, grouping of plants with similar water requirements in order to reduce excess irrigation runoff and to promote surface filtration. The Master HOA shall maintain erosion control devices on the property they maintain until adequate vegetation coverage has been achieved following establishment of the landscape plantings.

c. **Common Area Landscape Management**

Management programs will be designed and established by the Master HOA, who will own and maintain all common areas within the project site. These programs will include how to mitigate the potential dangers of fertilizer and pesticide usage. Ongoing maintenance will be consistent with the County Water Conservation Resolution (Ordinance. No. 3802) and the State of California Model Water-Efficient Landscape Ordinance. Fertilizer and Pesticide usage

shall be consistent with County Management Guidelines for use of Fertilizers and Pesticides.

d. **BMP Maintenance**

As indicated above, the CC&R's identify the Master HOA as being responsible for implementation of each applicable non-structural BMP as well as scheduling cleaning of all applicable structural BMP facilities and will be responsible for inspection and maintenance activities in landscape areas. Debris and other water pollutants will be controlled, contained and disposed of in a proper manner by the Master HOA. California Quartet or its' assigns will be responsible for maintenance during construction.

e. **Common Area Litter Control**

The Master HOA will be required to implement trash management and litter control procedures in the common areas aimed at reducing pollution of drainage water. The Master HOA may contract with their landscape maintenance firm to provide this service during regularly scheduled maintenance, which should consist of litter patrol, emptying of trash receptacles in common areas, and noting trash disposal violations by homeowners and reporting the violations to the Master HOA for investigation.

f. **Employee Training**

An employee training/education program will be established as it would apply to future employees, contractors of the Master HOA, and volunteers to inform and train employees engaged in maintenance activities regarding the impact of dumping oil, paints, solvents or other potentially harmful chemicals into storm drain; the proper use of fertilizers and pesticides in landscaping maintenance practices; and the impacts of littering and improper water disposal. In addition, California Quartet or its' assigns will make available training and education materials to their contractors and subcontractors and their employees during construction.

g. **Common Area Catch Basin Inspection**

The proposed storm drain mainline along with its catch basins and the stormceptor shall be constructed by California Quartet or its' assigns and maintained and cleaned by the Maintenance Landscape Company hired by the Master HOA. This will be done on a regular basis and prior to the storm season, no later than October 15th of each year. The Master HOA will maintain all catch basins on-site.

California Quartet or its' assigns will be responsible for on-site inspection and maintenance during construction.

The proposed stormceptor will have the following maintenance performed by the HOA:

- Annual inspection and power wash of the screen.
- Inspection of the unit after the first major seasonal storm.
- Removal of captured pollutants by a vac truck when the sump becomes 2/3 to ¾ full.
- Remove and replace oil and grease sorbents when fully discolored/coated with oil.

h. **Street Sweeping Private Streets and Parking Lots**

The Master HOA shall have all private streets and parking lots vacuum swept on a weekly basis. This procedure will be intensified around October 15th of each year prior to the "first flush" storm.

8. **Routine Structural BMP's** – Structural BMP's shall be installed initially by California Quartet or its' assigns, the developer, through the construction and development of the project, for instance; slope planting and irrigation systems shall be designed by licensed landscape architects and installed by qualified contractors to specifications and standards of the County of Orange.

a. **Filtration**

This BMP is considered a "routine" BMP and will be implemented through the provisions of a grassy swale. This grassy swale will be located on the north side of the project spine road. Low flow, dry weather, nuisance flows will be directed to the grassy swale areas for "polishing" prior to being discharged downstream.

The proposed riverine system/grassy swale will have the following maintenance performed by the HOA.

- Vegetation within the grassy swale shall be monitored monthly to identify and remove any dead or dying material. Vegetation removed shall be replaced in a timely manner to ensure the continued effectiveness of the grassy swale.

- The grassy swale shall be inspected monthly for trash and debris. Any trash and debris shall be removed and disposed of properly. The density of the vegetation shall be monitored monthly to ensure that the grassy swale contains adequate material to "polish" the runoff flows. Any areas found to be deficient shall be planted with the appropriate material.

- The vegetation shall be monitored twice yearly to ensure that the growth and condition of the plant materials are consistent with the approved fuel modification program.

- The grasses shall be mowed or weed whipped (depending on the type of grass) on a monthly basis during the dry weather months. All grass clippings shall be disposed of properly.

b. **Common Area Efficient Irrigation**

As a part of the design of all common area landscape irrigation, implementation of the County Water Conservation Resolution including, but not limited to, such provisions as water sensors, programmable irrigation times (for short cycles), etc., will be used. Such common areas will be maintained by the Master HOA.

c. **Common Area Runoff - Minimizing Landscape Design**

As a part of the design of all common area landscape areas, similar planting material with similar water requirements will be used in order to reduce excess irrigation runoff and promote surface filtration. Such common areas will be maintained by the Master HOA.

d. **Energy Disapators**

Energy disapators will be installed per the approved storm drain plans and maintained by the Master HOA.

e. **Catch Basin Stenciling**

As a part of the final civil engineering drawings, it will be required by California Quartet or its' assigns to stencil on all catch basins, where applicable in paved areas, the words, "No Dumping - Drains to Ocean." This will be done in a location that can be clearly seen by all and will be routinely inspected and restenciled as required.

9. **BMP Selection Criteria** – BMP selection for Saddleback Meadows will be refined during the preparation of the project's grading and drainage plans. Final selection will be made in accordance with two major objectives of the WQMP. These two WQMP objectives are:

   a. To identify the sources of pollution that affects the quality of storm water discharges from the project construction sites.

   b. To identify, assign and implement control measures and management practices to reduce pollutants in the storm water discharges before and after the completion of construction activities.

   The final analysis and design of the BMP's will meet or exceed the minimum standard BMPs set forth by County of Orange and State of California Water Quality Regulations, Permits and Guidelines.

10. **Standard Conditions** – In addition to this Conceptual Plan, implementation of the project will be controlled by the County of Orange through compliance with the conditions of approval for the Tentative Tract Map. The following will be part of those conditions:

    a. Potential for the proposed project to impact the site's hydrology shall be reduced to a level of insignificance through engineering and construction techniques incorporated into the project in a manner meeting the approval of the Manager, PDS/subdivision and Grading Services Division, County of Orange.

    b. Prior to issuance of a grading permit, a Water Quality Management Plan specially identifying Best Management Practices that will be used onsite to control predictable pollutant runoff shall be prepared and approved by the County of Orange.

    c. Prior to issuance of any grading permits, the applicant shall submit evidence to the Manager, PDS/Subdivision and Grading Services Division, County of Orange, that the applicant has obtained coverage under the NPDES statewide General Stormwater Permit from the State Water Resources Control Board.

IV. SUMMARY

Saddleback Meadows WQMP, when implemented, will achieve the primary objectives of applicable governmental storm water permits and water quality management for construction activities in that it will:

A. Reduce excessive erosion potential

B. Minimize excessive sedimentation.

C. Prevent materials used at construction sites from causing on-site or offsite contamination.

D. Prevent non-storm water discharges from the project's construction activities.

E. Install appropriate measures to reduce impacts on downstream waterways from the completed project, and provide a commitment that these measures will be maintained.

F. Establish maintenance commitments on post-construction sites.

There are standard conditions of approval and Mitigation Measures that this project will have to comply with during the development process. These conditions are part of the Tentative Tract Map conditions and below are a few of these measures. Overall, these Mitigation Measures will ensure that all the above goals will be achieved.

Following are the standard County of Orange Mitigation Measures:

A. Potential for the proposed project to impact the site's hydrology shall be reduced to a level of insignificance through engineering and construction techniques incorporated into the project in a manner meeting the approval of the Manager, PDS/subdivision and Grading Services Division.

B. Prior to issuance of a grading permit, a Water Quality Management Plan specially identifying Best Management Practices that will be used onsite to control predictable pollutant runoff shall be prepared and approved by the County of Orange.

C. Prior to issuance of any grading permits, the applicant shall submit evidence to the Manager, PDS/Subdivision and Grading Services Division, that the applicant has obtained coverage under the NPDES statewide General Stormwater Permit from the State Water Resources Control Board.

During the planning phase of this project, the following items have been incorporated into the project plans to minimize the impact from the development:

A. Preservation of natural topography, existing drainage and existing vegetation to the extent possible.

B. Reduction of the paved area by means of narrower streets to the extent allowed by the local jurisdiction.

C. Use of existing vegetation and creation of new standards vegetated area to promote infiltration.

D. The street lay out and storm drain systems have been designed for easy maintenance and cleaning.

By: _____ Deputy

Public Resource Code 21092.3

The notices required pursuant to Sections 21080.4 and 21092 for an environmental impact report shall be posted in the office of the County Clerk of each county *** in which the project will be located and shall remain posted for a period of 30 days. The notice required pursuant to Section 21092 for a negative a negative declaration shall be so posted for a period of 20 days, unless otherwise required by law to be posted for 30 days. The County Clerk shall post notices within 24 hours of receipt.

Public Resources Code 21152

All notices filed pursuant to this section shall be available for public inspection, and shall be posted ***within 24 hours of receipt in the office of the County Clerk. Each notice shall remain posted for a period of 30 days.
***Thereafter, the clerk shall return the notice to the local lead agency ***within a notation of the period it was posted. The local lead agency shall retain the notice for not less than nine months.

NOTICE OF PREPARATION

POSTED
AUG 02 2001
GARY L. GRANVILLE, Clerk-Recorder
By _____ DEPUTY

DATE. August 2, 2001

SUBJECT: Notice Of Intent To Prepare
Draft Environmental Impact Report # 566

Project Title: Saddleback Meadows

Applicant: California Quartet/TPG

The Orange County Planning & Development Services Department has conducted an Initial Study for the subject project and has determined that an Environmental Impact Report is necessary. The County of Orange will be the Lead Agency for the subject project and will prepare the EIR In order for the concerns of your agency to be incorporated into the Draft EIR, we need to know the views of your agency as to the scope and content of the environmental information relevant to your agency's statutory responsibilities in connection with the proposed project. Your agency must consider the EIR prepared by the County of Orange when considering your permit or approval for the project. The project description, location, and an analysis indicating the probable enviornmental effects of the proposed action are contained in the attached materials Interested individuals and groups are also invited to comment on the scope of the anticipated EIR.

Pursuant to Section 21080.4 of CEQA, your response must be sent as soon as possible but *not later than 30 days after receipt of this notice.*

All parties that have submitted their names and mailing addresses will be notified if any significant changes in the proposed project occur. If you wish to be placed on the mailing list, please submit your name and mailing address to the contact person at the address below. If you have need of additional information, contact Bill Grieman of the Environmental Planning Services Division at 834-5550. The mailing address is Planning & Development Services Department, P O Box 4048, Santa Ana, CA 92702-4048.

RHCB/RA FORMS OCT 1997

PUBLIC NOTICE

NOTICE OF INTENT TO PREPARE ENVIRONMENTAL IMPACT REPORT NO. 566

Pursuant to Public Resources Code Section 21165, the County of Orange is the Lead Agency responsible for preparing an environmental impact report (EIR) addressing potential impacts associated with the proposed Saddleback Meadows project, located approximately 1/2 mile southerly of the El Toro Road/Live Oak Canyon Road intersection in the Foothill Trabuco Specific Plan area of unincorporated Orange County. The project proposes the phased development of 299 single-family residential units on a 229.2-acre site. The gross density proposed is 1.4 dwelling units per acre, with average lot sizes of 6,672 square feet and a minimum lot size of 5,000 square feet. Approximately 71 percent (158.6-acres) of the project site is proposed to remain in open space. In addition to the residential component, the project also proposes a wildlife movement corridor, regional riding & hiking trail connections, and biological resource enhancement. The proposed project will also comply with the urban stormwater runoff requirements of the California Regional Water Quality Control Board, and water quality infiltration basins have been incorporated into the project design. Project implementation requires the approval of a Zone Change (Foothill/Trabuco Specific Plan Amendment), Area Plan and Vesting Tentative Tract Map.

At a minimum, EIR 566 will examine the potential impacts generated by the proposed Project in relation to the following CEQA Checklist categories: Land Use & Planning; Geophysical, Hydrology & Drainage; Water Quality; Transportation/Circulation; Air Quality; Noise; Biological Resources; Aesthetics; Cultural/Scientific Resources; Recreation; Hazards; Public Services; and, Utilities and Service Systems. A more complete description of EIR requirements is included in the Notice of Preparation.

I. INTRODUCTION/BACKGROUND

Pursuant to Public Resources Code Section 21165, the County of Orange is the Lead Agency responsible for preparing an Environmental Impact Report (EIR) addressing potential impacts associated with the proposed Saddleback Meadows project, located approximately 1/2-mile from the El Toro Road/Live Oak Canyon Road intersection in the Foothill/Trabuco Specific Plan area of unincorporated Orange County. In accordance with the California Environmental Quality Act (CEQA) and its Guidelines, an Initial Study has been prepared for the proposed project. Based on the analysis conducted for the Initial Study (see Section VII of this document), it has been determined that the proposed project could result in significant environmental impacts and the preparation of a Subsequent EIR will be required. According to Section 15162 of the *CEQA Guidelines*, a Subsequent EIR is required when subsequent changes are proposed in the project which will require important revisions to the previous EIR due to the involvement of new significant environmental impacts not considered in the previous EIR.

CEQA documentation prepared for the project to date is summarized as follows:

- **EIR 059:** In August 1978, the Board of Supervisors of Orange County adopted General Plan Amendment 78-1 for the Saddleback Meadows property. Final EIR 059 was prepared and certified in conjunction with the general plan amendment.
- **EIR 203:** In January 1980, the Board of Supervisors adopted Ordinance Number 3177, which placed the property in the PC "Planned Community" District. Final EIR 203 was prepared and certified in conjunction with the Ordinance.
- **EIR 561:** EIR 561 was prepared and circulated in February 1996 for 318 detached single family dwelling units on a 222.2 acre site. On July 30, 1996, the Orange County (County) Planning Commission recommended that the Board of Supervisors certify the EIR, which, on October 22, 1996, the Board failed to do.
- **Subsequent EIR 566:** Subsequent EIR 566 for the Saddleback Meadows project was prepared and circulated in May 1997 and was certified by the County Planning Commission on December 3, 1997. The County Board of Supervisors failed to grant an appeal of this action on February 24, 1998.
- **Subsequent EIR 566 Addendum No. 1:** Addendum No. 1 was prepared in July 1998. The project evaluated by Addendum No. 1 included 299 detached single family dwelling units on 222.2 acres. The Addendum was approved by the Planning Commission on October 7, 1998 and by the Board of Supervisors on December 8, 1998.
- **Subsequent EIR 566 Addendum No. 2:** Addendum No. 2 was prepared in March 2001 to evaluate and document any potential changes in the environmental effects or

baseline conditions since the preparation of Addendum No. 1. The project evaluated by Addendum No 2 was identical to Addendum No. 1 (299 detached single-family dwelling units) and included updated traffic and biological resources impact studies. On May 9, 2001, the Planning Commission failed to approve Addendum No. 2 and recommended preparation of a new EIR for the 299-lot project. This recommendation was upheld by the Board of Supervisors on May 22, 2001.

II. PROJECT DESCRIPTION

The project proposes the phased development of 299-detached single-family residential units on a 222.2-acre site, located on the easterly side of El Toro Road (see Exhibits 1, 2,and 3). The gross residential density is 1.4 du/ac, with average lot sizes of 6,672 square feet and a minimum lot size of 5,000 square feet. Approximately 71 percent (158.6 acres) of the project site is proposed to remain in open space.

In addition to the residential component, the project also proposes a wildlife movement corridor, regional riding/hiking trail connections, and biological resource enhancement. The proposed project will also comply with the urban stormwater runoff requirements of the California Regional Water Quality Control Board, and water quality infiltration basins have been added to the project features. Project implementation requires the approval of a Zone Change (Foothill/Trabuco Special Plan Amendment), Area Plan and Vesting Tentative Tract Map.

The proposed project represents a complete revision and redesign of previously approved and recorded Tract 10692. As a result of a directive from the Orange County Planning Commission in January 1995, the original project was revised in consideration of changed circumstances and new information of environmental significance not previously considered in EIR 078. The current project design is a result of numerous meetings with interested citizens, resource agencies and adjacent property owners from 1995 to the present.

The project site is located within the Foothill/Trabuco Specific Plan and the Aliso Creek Corridor Specific Plan, approximately 1/2-mile southerly of the El Toro Road/Live Oak Canyon Road intersection. Implementation of the proposed project would directly effect 149.0-acres of the project site, or 65 percent, including remedial grading. In addition to on-site grading, 2.04-acres of offsite area would be effected for access road construction and remedial grading.

HDR

Exhibit 3
Illustrative Site Plan
Saddleback Meadows

A total of 8.6 million cubic yards of grading would be required to implement the project. The following table outlines a comparison between the current and previously submitted project:

Recorded/Proposed Project Comparison

Features	Proposed Project	Previously Approved Recorded Tract 10692
Dwelling Units	299	705
Minimum Lot Size	5,000 sf	3,200 sf
Gross Density	1 4 du/ac	3 03 du/ac
% Open Space	71%	31%
Wildlife Corridor	Yes	No

III. SUMMARY OF POTENTIALLY SIGNIFICANT IMPACTS

Based on the Initial Study prepared for the proposed project (see Section VIII), project implementation could result in significant impacts to one or more of the following:

- Air quality
- Biological resources
- Aesthetics
- Cultural/scientific resources
- Recreation
- Hazards

It is anticipated that with the implementation of appropriate mitigation measures, impact for the following environmental resources will be less than significant: land use and planning, geophysical, hydrology and drainage, water quality, noise, public services and utilities. The Initial Study concludes that less than significant or no impact will result to: agricultural resources, population and housing, transportation, and mineral resources.

IV. ALTERNATIVES TO BE EVALUATED IN THE DRAFT EIR

In accordance with Section 15126.6 of the *CEQA Guidelines*, the EIR will define and evaluate project alternatives that have the potential to meet the primary objectives of the proposed project and reduce any significant environmental impacts of the project. The lead agency has determined that the following alternatives to the proposed project are reasonable alternatives

to be discussed in the EIR:

- **No Development Alternative:** This alternative would leave the proposed site in its existing condition
- **No Project Alternative:** This alternative would not allow any change from existing entitlements on the project site for 705 manufactured units.
- **F/TSP EIR 531 Staff Alternative A:** This alternative would allow 150 units with a minimum lot size of 20,000 square feet.
- **F/TSP EIR 531 Staff Alternative B:** This alternative would reduce the number of dwelling units on the project site to no more than 100 on approximately 30 acres.
- **Cluster/Single Family/Multi Family Residential Alternative:** This alternative would feature 318 detached and attached dwelling units, within a reduced development impact area (110.5 acres).
- **44/178 Alternative:** This alternative would allow 127 single-family units on a 44-acre "Development Parcel." The alternative would also feature a 178-acre "Conservation Area" parcel
- **Acquisition Alternative:** This alternative would involve the County and adjacent landowners purchasing the property from the developer. Subsequent to acquisition, the property would be placed in a permanent open space reserve.
- **Golf Course Alternative:** This alternative would feature an 18 hole target style golf course on 150-acres, avoiding sensitive habitat areas wherever possible. Alternative may also include a small lodge/hotel and conference retreat center and resort casitas linked to the conference center.

V. MANDATORY FINDINGS

As required by CEQA, mandatory findings are determined to be made by the lead agency to determine not only whether an EIR must be prepared, but also to identify the effects to be analyzed in the document.

a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?

Potential significant effect. Based on previously prepared studies, several sensitive species exist within the proposed project site. The proposed project has the potential of significantly affecting the range of wildlife that may currently use this property as a wildlife movement corridor.

b) Does the project have the potential to achieve the short-term environmental goals to the disadvantage of the long-term environmental goals?

Potential significant effect. The project has the potential to permanently impact existing biological, aesthetic and cultural resources that are unique to this area.

c) Does the project have possible environmental effects which are individually limited but cumulatively considerable? ("cumulatively considerable" means that the incremental effects of an individual project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)

Potential significant effect. The proposed project could have significant cumulative effects on the air quality, and biological resources of the area.

d) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Less than significant with mitigation. Project implementation could have substantial adverse effects on human beings in terms air quality and geotechnical hazards.

VI. DETERMINATION

Based on the Initial Study, the proposed project may have a significant effect on the environment that has not been analyzed in a previous CEQA document. Preparation of an EIR is therefore required. The following environmental topics will be addressed in the EIR:

- Land Use & Planning
- Geophysical
- Hydrology and Drainage
- Water Quality/Water Quality
- Transportation/Circulation
- Biological Resources
- Aesthetics
- Cultural/Scientific Resources
- Recreation
- Hazards

- Air Quality
- Noise
- Public Services
- Utilities & Service Systems

ENVIRONMENTAL ANALYSIS CHECKLIST

Project Number: PA 980103

ISSUES & SUPPORTING DATA SOURCES:	Potential Significant Effect	Less than Significant w/ Mitigation	Less than Significant Impact	No Impact
1. LAND USE & PLANNING. Would the project:				
a) Conflict with general plan designation or zoning?	☐	☒	☐	☐
b) Conflict with applicable environmental plans or policies of agencies with jurisdiction over the project?	☐	☒	☐	☐
c) Disrupt or divide the physical arrangement of an established community (e g low income, minority)?	☐	☐	☐	☒
d) Conflict with adjacent, existing or planned land uses?	☐	☒	☐	☐
2. AGRICULTURE. Would project:				
a) Convert Farmlands listed as "Prime", "Unique" or of "Statewide Importance " as shown on the State Farmland Mapping and Monitoring Program, to non-agricultural use?	☐	☐	☐	☒
b) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use?	☐	☐	☐	☒
3. POPULATION & HOUSING. Would project:				
a) Cumulatively exceed adopted regional or local population projections?	☐	☐	☐	☒
b) Induce substantial growth in an area directly or indirectly through project in an undeveloped area or extension of major infrastructure?	☐	☐	☐	☒
c) Displace existing housing affecting a substantial number of people?	☐	☐	☐	☒
4. GEOPHYSICAL. Would project result in or expose people to impacts involving:				
a) Local fault rupture?	☐	☐	☒	☐
b) Seismicity ground shaking or liquefaction?	☐	☒	☐	☐
c) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☒
d) Landslides or mudslides?	☐	☒	☐	☐
e) Erosion, changes in topography or unstable soil conditions from excavation, grading or fill?	☐	☒	☐	☐
f) Subsidence of the land?	☐	☒	☐	☐
g) Expansive soils?	☐	☒	☐	☐
h) Unique geologic or physical features?	☐	☒	☐	☐
5. HYDROLOGY&DRAINAGE. Would the project:				
a) Substantially alter the existing drainage pattern of the site or area, including the alteration of the course of a stream or river, in manner which would result in				
i) substantial erosion or siltation on- or off-site?	☐	☒	☐	☐
ii) a substantial increase in the rate or amount of surface runoff in manner which would result in flooding on- or off-site?	☐	☒	☐	☐
b) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	☐	☒	☐	☐
c) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	☐	☐	☐	☒
d) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam, or inundation by seiche, tsunami, or mudflow?	☐	☐	☐	☒

ISSUES & SUPPORTING DATA SOURCES:	Potential Significant Effect	Less than Significant w/ Mitigation	Less than Significant Impact	No Impact
6. WATER QUALITY. Would the project:				
a) Violate any water quality standards or waste discharge requirements?	☐	☒	☐	☐
b) Substantially deplete groundwater supplies or interfere with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of a local groundwater table level?	☐	☐	☒	☐
c) Otherwise substantially degrade water quality?	☐	☒	☐	☐
7. TRANSPORTATION/CIRCULATION. Would the project result in:				
a) Increased vehicle trips or traffic congestion beyond adopted policies and/or forecasts?	☐	☐	☒	☐
b) Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?	☐	☐	☒	☐
c) Safety hazards from design features (e g sharp curves or dangerous intersections) or incompatible uses (e g farm equipment)?	☐	☐	☒	☐
d) Inadequate emergency access or access to nearby uses?	☐	☐	☒	☐
e) Insufficient parking capacity on-site or off-site?	☐	☐	☒	☐
f) Hazards or barriers for pedestrians or bicyclists?	☐	☐	☒	☐
g) Conflicts with adopted policies supporting alternative transportation (e g bus turnouts, bicycle racks)?	☐	☐	☒	☐
h) Rail, waterborne or air traffic impacts?	☐	☐	☐	☒
i) Change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	☐	☐	☐	☒
8. AIR QUALITY. Would the project:				
a) Exceed any SCAQMD standard or contribute to air quality deterioration beyond projections of SCAQMD?	☒	☐	☐	☐
b) Expose sensitive population groups to pollutants in excess of acceptable levels?	☐	☒	☐	☐
c) Alter air movement, moisture, or temperature, or cause any change in climate?	☐	☐	☐	☒
d) Create objectionable odors affecting a substantial number of people?	☐	☐	☐	☒
9. NOISE. Would the project:				
a) Increase existing noise levels?	☐	☒	☐	☐
b) Expose people to noise levels exceeding adopted County standards?	☐	☒	☐	☐
c) If located within an airport land use plan or, where such plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels?	☐	☐	☒	☐
10. BIOLOGICAL RESOURCES. Would the project impact:				
a) Endangered, threatened or rare species or their habitats (including but not limited to plants, fish, insects animals and birds)?	☒	☐	☐	☐
b) Locally designated species (e g. heritage trees)?	☒	☐	☐	☐
c) Locally designated natural communities (e g. oak forest, coastal habitat, etc)?	☒	☐	☐	☐
d) Wetland habitat (e.g. marsh, riparian and vernal pool)?	☐	☒	☐	☐
e) Wildlife dispersal or migration corridors?	☐	☒	☐	☐
f) Adopted or proposed conservation plans and policies (e g. Natural Community Conservation Plan or Resource Management Plan)?	☒	☐	☐	☐
11. AESTHETICS. Would the project:				
a) Affect a scenic vista or view open to the public?	☒	☐	☐	☐
b) Affect a designated scenic highway?	☒	☐	☐	☐
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	☒	☐	☐	☐
d) Create light or glare beyond the physical limits of the project site?	☐	☒	☐	☐

ISSUES & SUPPORTING DATA SOURCES:	Potential Significant Effect	Less than Significant w/ Mitigation	Less than Significant Impact	No Impact
12. CULTURAL/SCIENTIFIC RESOURCES, Would the project·				
a) Disturb archaeo or paleo resources?	☒	☐	☐	☐
b) Affect historical resources?	☒	☐	☐	☐
c) Have the potential to cause a physical change which would affect unique ethnic cultural values?	☒	☐	☐	☐
13. RECREATION. Would project:				
a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☒	☐	☐
b) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☒	☐	☐
c) Conflict with adopted recreational plans or policies?	☒	☐	☐	☐
14. MINERAL RESOURCES. Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☒
15. HAZARDS. Would the project:				
a) Create a hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☐	☒
b) Create a hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☐	☒
c) Exposure of people to existing sources of health hazards?	☐	☐	☐	☒
d) For a project located within an airport land use plan or, where such plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☒	☐
e) For a project within the vicinity of private airstrip, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☒	☐
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☒
g) Expose people or structures to a significant risk or loss injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	☒	☐	☐	☐
16. PUBLIC SERVICES. Would project result in need(s) for new/altered government facilities/services in:				
a) Fire protection?	☐	☒	☐	☐
b) Police protection?	☐	☒	☐	☐
c) Schools?	☐	☒	☐	☐
d) Maintenance of public facilities, including roads?	☐	☒	☐	☐
e) Other government services?	☐	☒	☐	☐
17. UTILITIES & SERVICE SYSTEMS. Would project result in needs for new or substantial alterations in·				
a) Power or natural gas?	☐	☒	☐	☐
b) Communications systems?	☐	☒	☐	☐
c) Local or regional water treatment or distribution facilities?	☐	☒	☐	☐
d) Sewer or septic tanks?	☐	☒	☐	☐
e) Solid waste disposal?	☐	☒	☐	☐

ISSUES & SUPPORTING DATA SOURCES:	Potential Significant Effect	Less than Significant w/ Mitigation	Less than Significant Impact	No Impact
MANDATORY FINDINGS				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife population to drop below self sustaining levels threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?	☒	☐	☐	☐
b) Does the project have the potential to achieve the short-term environmental goals to the disadvantage of the long-term environmental goals?	☒	☐	☐	☐
c) Does the project have possible environmental effects which are individually limited but cumulatively considerable? ("cumulatively considerable" means that the incremental effects of an individual project are considerable when viewed in connection with the effects of past projects, the effects of other current projects and the effects of probable future projects)	☒	☐	☐	☐
d) Does project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly	☐	☒	☐	☐

DETERMINATION:

Based upon the evidence in light of the whole record documented in the attached environmental checklist explanation, cited incorporations and attachments, I find that the proposed project:

COULD NOT have a significant effect on the environment, and a negative declaration (ND) will be prepared pursuant to CEQA Guidelines Article 6, 15070 through 15075. ☐

COULD have a significant effect on the environment, there will not be a significant effect in this case because the mitigation measures have been added to the project. A negative declaration (ND) will be prepared pursuant to CEQA Guidelines Article 6, 15070 through 15075 ☐

MAY have a significant effect on the environment which has not been analyzed previously Therefore, an environmental impact report (EIR) is required ☒

NOTE All referenced and/or incorporated documents may be reviewed by appointment only, at the County of Orange Planning & Development Services Department, 300 N Flower Street Santa Ana, California, unless otherwise specified An appointment can be made by contacting the CEQA Contact Person identified above.

VIII. ENVIRONMENTAL ANALYSIS AND EXPLANATION OF CHECKLIST REPONSES

This Initial Study has been conducted pursuant to Section 15060 of the *CEQA Guidelines* and the County of Orange CEQA procedures. The following discussion provides information to substantiate the responses in the foregoing Orange County Environmental Analysis Checklist. For each environmental category, the discussion is outlined to address the: (1) existing setting; (2) potential impacts; and (3) scope of the EIR discussion. The scope of the EIR will be refined, as appropriate, upon completion of the public scoping process including input from responsible agencies and the public.

As encouraged by CEQA, source references used to substantiate the checklist are referenced following each topical area. A list of references in included at the end of the checklist summary on this Initial Study in Section IX.

1. LAND USE & PLANNING

Source References (see Section IX): 3, 7, 8

Existing Setting

The project site is situated within the Foothill/Trabuco Specific Plan (F/TSP) planning area. The 6,500 acres of the F/TSP area are situated within the foothills of the Santa Ana Mountains and are characterized by abundant natural and scenic resources, and primarily low-density residential and open space land uses. The project site is currently undeveloped; however, it has been used for agriculture and cattle grazing since the 1940's.

The entire 222.2-acre Saddleback Meadows project site is currently zoned S "Specific Plan" (Foothill/Trabuco Specific Plan) with an SR "Sign Restriction" overlay district. The Specific Plan designation for the site is BWR "Bridlewood Residential" District. The BWR District was established within the F/TSP, adopted December 1991, to recognize the existing zoning and tract map approvals for the Bridlewood/Saddleback Meadows property. The General Plan Land Use Element (LUE) designation for the project site is 1B "Suburban Residential" (0.5 to 18 dwelling units per acre).

Surrounding land uses include: (1) St. Michael's Abbey, Cooks Corner, natural open space, Cleveland National Forest, Live Oak Plaza, Santiago Canyon Estates, and low density residential to the north; (2) Hidden Hills/Hidden Ridge developments, Painted Trails development, O'Neill Regional Park, and the Ramakrishna Monastery to the south; (3) low density residential, a church, and natural open space to the east; and (4) Portola Hills and Foothill Ranch communities, and Aliso

Creek to the west.

Potential Impacts

Potential impacts which may result if the project is developed include: the introduction of 299 detached single-family residential units and related major infrastructure improvements into an area previously used primarily for open space and agricultural uses, and potential conflicts with existing surrounding land uses. Implementation of the proposed project would result in construction of only 45 percent of the units allowed by the current zoning and General Plan land use designations.

The circumstances regarding surrounding land uses have changed since the previous EIRs were certified and the original project was approved. When EIRs 059 and 078 were certified, the vicinity of the project, with the exceptions of St. Michael's Abbey and the Ramakrishna Monastery, was characterized by an undeveloped, predominantly natural environment. The project site, although disturbed by farming and cattle grazing activities, was dominated by grasslands, coastal sage scrub, and oak woodlands. The closest urban development was approximately four miles south of the site near the El Toro/Trabuco Road intersection. The project vicinity has become more urban since the original approvals with residential developments to the north, west, and south. It is now characterized by major residential development, including the Portola Hills Planned Community, the Hidden Ridge project and Foothill Ranch. With the changes that have taken place since the original project was approved, there is a question of the project's compatibility with surrounding uses.

Scope of EIR Discussion

The land use section of the EIR will include a detailed discussion of the following:

- The project's consistency with the General Plan and F/TSP.
- Project consistency with applicable regional plans.
- Potential land use compatibility conflicts with surrounding land uses.
- Recommendation of mitigation measures to reduce or avoid significant land-use related impacts.
- Identification of unavoidable and cumulative land use impacts.

2. AGRICULTURE

Source References (see Section IX): 1, 7, 8

Existing Setting

Orange County has historically been a rural community supported by an agricultural economy. During the 1960's and 1970's, the County experienced a sharp decline in agriculture production as the urban development grew. Growth projections through 2000 indicate the continued urbanization of Orange County. In 1965, the Williamson Act was adopted in response to the increasing pressures on agricultural land. Under the Williamson Act, agricultural land can be held within agricultural preserves in order to protect these lands from urban development.

The project site is largely undeveloped. Portions of the site have historically been used for cattle grazing. The project site is not located in an area identified as important farmland as classified by the Department of Conservation, Farmland Mapping and Monitoring Program. The project site is designated as "other lands," which is defined as "land which does not meet the criteria of any other category including low-density rural developments, wetlands, dense brush and timberlands...."

Potential Impacts

Development of the proposed project will not convert farmlands listed as Prime Unique, or of Statewide Importance to non-agricultural uses. Moreover, none of the property is bound by a Williamson Act Contract as an agricultural preserve. Implementation of the proposed project will eliminate the existing use of portions of the site for cattle grazing. On a County-wide basis, the number of acres lost to this use is considered minimal and incremental, and less than significant.

Scope of EIR Discussion

The potential impact of the proposed project on agricultural resources is determined to be less than significant. This topical area will not be addressed in the EIR.

3. POPULATION & HOUSING

Source References (see Section IX): 2, 6, 7, 8

Existing Setting

The County of Orange General Plan Housing Element, adopted September 14, 1993, outlines specific goals, policies and programs to facilitate development of housing in unincorporated

areas. For analytical purposes, the region has been broken into units called Regional Statistical Areas (RSAs). The project site is located in RSA C-43. As of 1999, RSA C-43 had a population of 190,000 with a 2000 projection of 212,700. The total population for Orange County is 2,846,289 (2000). Projected population for the County in 2010 is 3,105,300. The eastern and southern areas of the County, including RSA C-43, are expected to realize the largest populations gains. Subsequently, new development reflects this trend and approximately 57 percent of residential construction will be in south County. The average household size in unincorporated Orange County in 1999 was 2.58.

Potential Impacts

Approximately 299 single-family housing units will be constructed under the proposed project, which would result in an increase of approximately 771 new residents for the County. This compares to the approved 705 manufactured homes, which would result in approximately 1,819 new residents. The proposed project is not expected to cumulatively exceed adopted regional or local population projections, in fact, a reduction in the number of planned residential units would occur.

Infrastructure to serve the proposed project will only be extended to meet the needs of the development. Capacities will not be upgraded beyond what is needed to meet the development of the area in accordance with the adopted F/TSP. The project, therefore, will not be growth inducing.

Project implementation will not displace existing, occupied housing.

Scope of EIR Discussion

The potential impact of the proposed project on population and housing is determined to be less than significant. This topical area will not be addressed in the EIR.

4. GEOPHYSICAL

Source references (see Section IX): 4, 7, 8

Existing Setting

The proposed project site is located within the Canada De Los Alisos in the low coastal foothills of the Santa Ana Mountains These hills are part of the Peninsular Ranges Geomorphic Province and are generally underlain by sedimentary bedrock of Tertiary age. Ridges, ravines, and gullies form the dominant physiographic features, provide moderate to high topographic relief. Elevations above mean sea level range from approximately 1,000 to 1,550 feet. Natural slope gradients range from nearly level along some ridge crests and valley bottoms to 1:1 (horizontal:vertical) within deeply incised gullies. The site drains generally toward the west and southwest into Aliso Creek and Oso Creek tributaries of San Juan Creek.

Approximately 43 percent of the project site is in the 0 to 25 percent slope category, 43 percent is in the 26 to 50 percent slope category and 14 percent of the project site has slopes exceeding 50 percent.

On-site bedrock consists of a thick sequence of interbedded, fine- to course-grained sandstone and siltstone. Ancient to active landslides underlie much of the project area. Recent and older alluvial deposits are confined to the major gullies and Aliso Creek drainage. Topsoil and colluvium mantel the bedrock and landslides throughout most of the site. Fill soils underlie areas where man-made features, such as roads and berms associated with livestock ponds, were constructed.

The closest, major active fault is the Whittier-Elsinore Fault Zone, located approximately eight miles to the northeast of the F/TSP area. The Aliso Fault, located along the F/TSP southwest boundary is classified as potentially active, but considered to have a low potential for activity within the F/TSP area. The likelihood of surface faulting within the F/TSP area is considered minimal. The primary seismic hazard potentially affecting the project site, as well as most other sites in southern California, is ground shaking due to an earthquake on a major regional fault.

Potential Impacts

Potential impacts which may result if the project is developed include substantial short-term changes of the site's landforms and topographical features particularly during grading activities. In the long-term, the project proposes site reconfiguration to reflect the site's natural land form features, and related impacts on the soil stability of the site. During

construction, erosion and siltation of soils may also occur. The proposed project will also introduce new structures and residents into the seismically active, southern California area.

Grading activities on the project site could result in sediment being carried into the Aliso Creek Corridor and downstream ultimately to Aliso Beach.

Scope of EIR Discussion

Various geotechnical studies have been prepared for the proposed project. The geophysical section of the EIR will document the findings and recommendation of the technical reports, which will be included as an appendix to the Draft EIR. The EIR discussion will include the following:

- Proposed grading in areas previously designated for preserved open space areas.
- Identification of soil and geologic characteristics and limitations of the project site, including soil stability, earthquake potential and known geologic hazards, including landslides, mudslides, ground failures and similar hazards for the entire site.
- Identification of the seismic features of the site, including the potential exposure of people or property to environmental impacts of the proposed project associated with earthquakes, liquefaction or similar hazards.
- The potential environmental impacts of the proposed project on the existing site topography and unique geologic or physical features.
- Mitigation measures necessary to reduce geophysical impacts to a level of insignificance.
- Identification of unavoidable and cumulative geophysical impacts.

5. HYDROLOGY & DRAINAGE

Source references (see Section IX): 4, 7, 8

Existing Setting

There are three major drainage areas within the F/TSP area: Aliso Creek Drainage, Oso Creek Drainage, and Trabuco Creek Drainage. The proposed project site is within the Aliso Creek and Oso Creek Drainage areas. Approximately 75 percent of the project site drains into Aliso Creek, with the remaining 25 percent draining into Oso Creek. The on-site project drainage has not been modified and remains in a natural state; however, embankments were

constructed across several minor tributaries in order to impound water, presumably to provide watering holes for the cattle. As many as eight ponds have been identified on-site; however, one of the ponds has breached and another pond has been completely filled with silt. In addition, some improvements have been made to sections of Aliso Creek, adjacent to the site, including a major man-made drainage channel. This channel passes from the proposed site to the westerly side of El Toro Road.

The area of Aliso Creek Corridor is classified as Floodplain FP-2 by the Federal Emergency Management Agency (FEMA).

Potential Impacts

Potential impacts which may result if the project is implemented include changes in absorption rates, alteration of the project site's existing landform, subsequently altering the existing flow of water onto, through, around and off the project site. During construction the disruption of soils may also affect the content of site run-off into the watershed area of Aliso Creek. Groundwater levels and quality, including absorption rates, may be affected by the proposed project. Potential impacts include pollutant discharges into Aliso Creek. The National Pollution Discharge Elimination System (NPDES) is a regulatory program required by the Clean Water Act and administered by OCEMA, which addresses water quality issues.

Scope of EIR Discussion

Various hydrology studies have been prepared for the proposed project. The hydrology and drainage section of the EIR will document the findings and recommendations of the technical report, which will also be included as an appendix to the Draft EIR. The EIR discussion will include the following:

- Identification and quantification of the current surface water and groundwater drainage patterns and water flows within, and adjacent to, the project site.
- Identification and quantification of the portion of the project site or off-site area that will be impacted by proposed project currently located within FEMA's FP-2 floodplain designation.
- Identification and quantification of the current surface water and groundwater quality within, and adjacent to, the project site, including existing on-site discharges into drainage channels.
- Identification of significant changes in the course or direction of water movements.
- Identification of changes in absorption rates, drainage patterns, or the rate and amount of surface water run-off.

- Identification of changes in erosion or changes in siltation which may modify the channel of Aliso Creek.
- Identification of changes in the amount of surface water as a result of any proposed storm drain retarding basins.
- Identification of changes in the quantity or quality of groundwater.
- Identification of the potential environmental impacts of the proposed project on wind or water erosion of soils, on-site or off-site.
- Identification of alterations to the course, flow or magnitude of flood waters, and resultant exposure of people or property to flood hazards.
- Recommendation of mitigation measures necessary to reduce project impacts to a level of insignificance, including the development of Best Management Practices (BMP) for compliance with the Clean Water Act.
- Identification of unavoidable and cumulative water resource impacts.

6. WATER QUALITY

Source references (see Section IX): 4, 7, 8

Existing Setting

Water pollution control is regulated in California by the State Water Resources Control Board (SWRCB) and nine California Regional Water Quality Control Boards (RWQCBs). Each of the nine regional boards is required to adopt a Water Quality Control Plan or Basin Plan, which recognizes and reflects regional differences in existing water quality, the beneficial uses of the Region's ground and surface waters, and local water quality conditions and problems. The project site is located within the San Diego Basin and subject to the policies in the Water Quality Control Plan for that basin.

Based on information included in the EIR for the F/TSP, groundwater quality within each of the three drainage basins (Aliso Creek, Oso Creek, and Trabuco Creek) is of poor quality.

The discharge of pollutants into water is regulated by the state through the NPDES program. The County of Orange has adopted the Drainage Area Master Plan (DAMP) to satisfy the requirements of the NPDES program. Structural and non-structural Best Management Practices are required to control possible pollutant discharges to surface water.

Potential Impacts

Grading and construction activities will potentially result in short-term water quality impacts including increased erosion and sediment contribution to surface water. Improper handling of construction materials and/or equipment could result in accidental spills that could adversely affect water quality. Potential long-term water quality impacts include the addition of pollutants typical of urban runoff (such as pesticides, fertilizers, vehicle hydrocarbons, greases, oil, plastics, and litter) and the increase of on-site activities.

Scope of EIR Discussion

Various water quality studies have been prepared for the proposed project. The water quality section of the EIR will document the findings and recommendations of the technical reports, which will also be included as an appendix to the Draft EIR. The EIR discussion will include the following:

- Overview of existing groundwater quality, beneficial uses and regulatory environment.
- Identification of potential project impacts and pollutant sources that could affect surface or groundwater quality.
- Recommendation of mitigation measures to reduce or avoid significant water quality impacts, including the identification of structural and non-structural Best Management Practices.
- Identification of unavoidable and cumulative water quality impacts.

7. TRANSPORTATION/CIRCULATION

Source references (see Section IX): 4, 7

Existing Setting

The existing roadways that will serve the proposed project is El Toro Road and Valley Vista Way, located within the Hidden Ridge/Hidden Hills Community. The site's interior is natural and has no road access.

El Toro Road is classified as a Major Arterial Highway south of Live Oak Canyon Road in Orange County's Master Plan of Arterial Highways (MPAH).

Potential Impacts

The proposed project will generate additional vehicle trips that will contribute to local traffic particularly on El Toro Road. Traffic will also contribute to peak hour intersection traffic.

Scope of EIR Discussion

A transportation and circulation study is being prepared for the proposed project. The transportation and circulation section of the EIR will document the findings and recommendations of the technical report, which will also be included as an appendix to the Draft EIR. The EIR discussion will include the following:

- An inventory of existing area-wide conditions including current traffic volumes, roadway capacities and levels of service.
- Assessment of project related and cumulative impacts on area roadways and intersection operation and levels of service.
- Identification and analysis of the existing ingress and egress to the project site, its potential internal circulation and parking problems associated with the proposed development.
- Identification of existing impacts to equestrians, motor vehicles, bicyclists and/or pedestrians.
- Evaluation of the need for El Toro Road to be a primary arterial versus a major arterial.
- Identification of increases in demand for public transit services with special attention to relationship with low income housing for senior citizens and any potential conflicts

with planned roadway widenings or extensions.

- Identification of specific potential internal circulation problems and potential traffic hazards to motor vehicles, bicyclists and/or pedestrians which may result from the proposed project.
- Recommendation of mitigation measures necessary to reduce project traffic and circulation impacts to a level of insignificance
- Identification of unavoidable and cumulative impacts to transportation and circulation resources.

8. AIR QUALITY

Source references (see Section IX): 7, 8

Existing Setting

The project site is located within the South Coast Air Basin (SCAB), which is generally characterized by poor air quality. SCAB falls under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). In conjunction with the Southern California Association of Governments (SCAG), SCAQMD is responsible for formulating and implementing air pollution controls. In 1997, SCAQMD's Air Quality Management Plan was adopted establishing a comprehensive air pollution control program leading to attainment of state and federal air quality standards. State and federal air quality standards are often exceeded within SCAB.

Potential Impacts

Potential impacts which may result if the project is developed include: generation of both short-term and long-term air quality impacts, both individually and cumulatively. Construction related emissions will be associated with the vehicle emissions of heavy construction equipment and fugitive dust from grading and other soil disturbance. The primary contribution to long-term emissions will result from vehicle emissions and increased trips generated by the project. Increased air emissions may also result in impacts on sensitive receptors in the project vicinity including St. Michael's Abbey and the Hillside Montessori School, and the exposure of persons to locally elevated levels of air pollution. Implementation of the project will not alter air movement, moisture, temperature, or cause a change in the climate. Moreover, there are no proposed land uses that will have the potential to create objectionable odors.

Scope of EIR Discussion

A project specific air quality study is being prepared for the proposed project. The air quality section of the EIR will document the findings and recommendations of the technical report, which will also be included as an appendix to the Draft EIR. The EIR discussion will include the following:

- Identification of the existing air quality environment of the project site in the local and regional context.
- Identification of air quality impacts associated with construction of the proposed project.
- Assessment of the proposed project's consistency with the SCAQMD's Air Quality Management Plan (AQMP).
- Identification and quantification of long-term air quality impacts resulting from development of the proposed project.
- Identification and analysis of the potential sensitive receptors which may be exposed to pollutants in excess of acceptable levels.
- Recommendation of mitigation measures to reduce or avoid air quality impacts.
- Identification of unavoidable and cumulative air quality impacts.

9. NOISE

Source references (see Section IX): 4, 7, 8

Existing Setting

The project area is located in a relatively remote portion of eastern Orange County and partially developed with low-density single-family residences. The project site is primarily in its natural state with noise generated by existing land uses and vehicular trips is minor. Existing noise levels are primarily associated with traffic noise generated along primary roadways. The F/TSP stipulates a noise standard for the area that is more stringent than the more urban areas of the County. Mitigation measures for the F/TSP require that residential lots and dwellings be attenuated so as not to exceed an exterior standard of 60 dB CNEL (compared to the 65 dB County standard) and interior standard of 45 dB CNEL. The project is adjacent to El Toro Road, a major access road to O'Neill Regional Park.

Potential Impacts

Construction activities will involve heavy equipment and generate noise levels in excess of ambient levels in the project area. Long-term noise impacts will primarily be associated with an increase in vehicle trips and an incremental increase in traffic noise within the area.

Scope of EIR Discussion

A project-specific noise analysis is being prepared for the proposed project. The noise section of the EIR will document the findings of the technical report, which will also be included as an appendix to the Draft EIR. The EIR discussion will include the following:

- Analysis of short-term construction related noise impacts
- Identification of nearby sensitive receptors, both human and noiser sensitive biotic communities.
- Analysis of stationary noise impacts and mobile source noise impacts on project vicinity residents and identified sensitive receptors. Evaluation of noise impacts in terms of ambient traffic or aircraft noise impacts on adjacent noise sensitive uses.
- Conformance requirements of project development with the Orange County General Plan Noise Element, and local and state regulations.
- Recommendation of mitigation measures necessary to reduce noise impacts to a level of insignificance.
- Identification of unavoidable and cumulative noise impacts.

10. BIOLOGICAL RESOURCES

Source References (see Section IX): 4, 7, 8

Existing Setting

The proposed project site is largely undeveloped, and annual grasslands cover over 50 percent of the site. Five types of native vegetation occur on the project site: Venturan-Diegan costal sage scrub, coast live oak woodland, southern mixed chaparral, southern sycamore riparian woodland, and mulefat scrub. Portions of the Venturan-Diegan costal sage scrub are disturbed. Agricultural land and ephemeral ponds also occur on the site.

Within these habitats, the following two sensitive plants were determined to potentially occur on the project site: Catalina mariposa lily (*Calochortus catalinae*) and intermediate mariposa lily (*Calochortus weedii* var. *intermedius*). There are known wildlife corridors within the project site. In addition, the following endangered, threatened, or rare animal species could occur within the project vicinity: Riverside fairy shrimp (*Streptocephalus woottoni*), western spadefoot toad (*Spea hammondi*), coastal whiptail (*Cnemidophorus tigris multiscutatus*), orange throat whiptail (*Cnemidophorus hyperythrus beldingi*), Cooper's hawk (*Accipter cooperii*), coastal cactus wren (*Campylorhynchus brunneicapillus*), loggerhead shrike (*Lanius ludovicianus*), southern California rufous-crowned sparrow (*Aimophila rucieps canescens*), and coastal California gnatcatcher (*Poplioptila californica*).

In addition, the project site is located within the watershed area of Aliso Creek Corridor. The Aliso Creek Corridor, which is located adjacent to the project site, is identified as a "blue line" stream by the United States Geologic Survey (USGS).

Potential Impacts

Grading and construction of the developed area will impact existing vegetation and potentially result in direct and indirect impacts to some of the sensitive plant and animal species identified that may occur in the area (as listed above). The project will also impact some coast live oaks. The proposed project also will potentially impact wildlife corridors and wetlands and related habitat resources.

Scope of EIR Discussion

Various project-specific biological assessments have been prepared for the proposed project. The biological resources section of the EIR will document the findings of the technical reports, which will also be included as an appendix to the Draft EIR. The EIR discussion will include the following:

- General biological survey for wildlife and plant species with emphasis on potential habitat for sensitive species.
- Discussion of wildlife corridors.
- A detailed discussion of the proposed project's impacts to the Riverside fairy shrimp, including mitigation measures to avoid or reduce impacts.
- Assessment of the project's impacts on unique, sensitive, aesthetically significant, rare, threatened, or endangered flora and fauna within the project site, including oak tree groves and coastal sage scrub.
- Identification of impacts which might result from the removal of existing and intermittent ponds and the associated habitat for sensitive species, including the Riverside fairy shrimp, from the project site and off-site areas contiguous to project site.
- Recommendation of mitigation measures necessary to reduce all identified biological resource impacts to a level of insignificance.
- Identification of unavoidable and cumulative biological resource impacts.

11. AESTHETICS

Source references (see Section IX): 3

Existing Setting

The F/TSP area is recognized as an area characterized by visual resources unique to the County. Features that significantly contribute to the visual character of the area are identified in the F/TSP as: topography, natural vegetation, natural watercourses, and vistas and viewscape corridors. The F/TSP identifies public viewpoints based on relative visibility, significance or view corridors and/or important vistas. Additionally, per the County's Master Plan of Arterial Highways, El Toro Road is designated as a Scenic Highway.
The proposed project site is primarily in a natural state.

Potential Impacts

Potential aesthetic impacts which may result if the project is developed include the construction of slopes and retaining walls, and a significant alteration in the appearance of the site from offsite vantage points, including El Toro Road, which is designated a Scenic Highway. Aesthetic impacts are especially pronounced from the existing uses southerly and westerly of the project site.

Potential light and glare impacts which may result if the project is approved include increased levels of exterior lighting and illumination, having the potential for adverse impacts upon residential neighborhoods and sensitive biotic communities.

Scope of EIR Discussion

The aesthetics section of the EIR will include viewshed impact simulations and also include the following analysis:

- Identify existing scenic vistas and views open to the public across the project site. Assess the obstruction of any scenic vista or view open to the public or the creation of any aesthetically offensive site open to public view.
- Complete a line of sight analysis of the project from El Toro Road, Hidden Ridge; Portola Hills, St. Michaels Abbey, Ramakrishna Monastery, and O'Neill Regional Park.
- Assess the current aesthetic importance of the project site and the aesthetic impact of the proposed project to other developments in the project vicinity.
- Evaluate and compare the potential aesthetic impacts associated with implementing the existing zoning and those associated with the proposed project. The narrative of this topical discussion must be supplemented by detailed simulation models of both the General Plan and the project.
- Recommendation of mitigation measures necessary to reduce aesthetic impacts to a level of insignificance.
- Identify of unavoidable and cumulative aesthetic impacts.

12. CULTURAL/SCIENTIFIC RESOURCES

Source references (see Section IX): 3, 7

Existing Setting

The project site is located within an area that is sensitive for cultural resources. Previously conducted cultural resources reports were prepared which indicated that there are prehistoric and historic sites recorded within the project boundaries. In addition, the project site is also located within an area with high potential to produce significant paleontological resources.

Potential Impacts

Grading could potentially result in alteration of or damage to significant archaeological, historical and/or paleontological resources on the project site.

Scope of EIR Discussion

Site-specific cultural resources reports have been conducted for the project site. The cultural resources section of the EIR will document the findings and recommendations of the technical reports, which will also be included as an appendix to the Draft EIR. The EIR discussion will include the following:

- Inventory existing significant archaeological and/or historical sites, structures, objects, or buildings located on the project site.
- Inventory potential paleontological sites.
- Evaluation of potential significant impacts to archaeological or historical sites, structures, objects, or buildings
- Recommendation of mitigation measures necessary to reduce identified cultural/scientific resources to a level of insignificance.
- Identification of unavoidable and cumulative cultural/scientific resource impacts.

13. RECREATION

Source references (see Section IX): 7

Existing Setting

There are no existing recreation or public open space uses located on the project site. However, the proposed project site is located between O'Neill and Whiting Ranch/Limestone Regional Parks. A proposed trail is designated within the project site by the Orange County General Plan Recreation Element Master Plan of Regional Riding and Hiking trails.

Potential Impacts

The project represents a potential conflict with adopted recreational plans and policies, including the Aliso Creek Corridor Specific Plan, the General Plan Recreation Element and the Foothill/Trabuco Specific Plan.

Scope of EIR Discussion

The recreation section of the EIR will include a detailed discussion of the following:

- Identification of all currently planned recreational opportunities within the project site and the surrounding vicinity.
- Assessment of the impact of the proposed project on the quality and quantity of existing recreation opportunities.
- Evaluation and comparisons of the potential recreation impacts associated with implementing the existing zoning designations and those associated with the proposed project.
- Identification of mitigation measures necessary to reduce recreation impacts to a level of insignificance.
- Identification of unavoidable and cumulative recreation impacts.

14. MINERAL RESOURCES

Source references (see Section IX): 4, 7

Existing Setting

No known mineral resource exist on the project site. The project site is not designated as a know or potential mineral deposit by the state (mineral resource mapping as required under the Surface Mining and Reclamation Act) or the County of Orange.

Potential Impacts

The proposed project site is not located in an area identified as a mineral resource area, including mineral resources and energy resources. Implementation of the proposed project, therefore, will not result in the loss of availability of a known mineral resource that would be of future value to the region or the residents of the state. No locally important mineral resources are known to be present on or beneath the project site and implementation of the proposed project will not result in the loss of these minerals.

Scope of EIR Discussion

The proposed project will not result in a significant impact to mineral resources. This topical area will not be addressed in the EIR.

15. HAZARDS

Source references (see Section IX): 7, 8

Existing Setting

The project site is located close to the Cleveland National Forest, an area that is subject to high wild land fire hazards. When in operation, the site may also have been subject to hazards related to the flight operations at the El Toro Marine Corp Air Station (MCAS). The MCAS has been closed, and the facilities are currently being proposed for development of an international airport. No other sources of health hazards are known to exist within the project area.

Potential Impacts

Development of the project will introduce residents to a high fire hazard area. Development

and operation of a regional airport at MCAS could also expose residents to safety and accident hazards related to future flights from that airport. The project will not involve the use, storage or handling of hazardous materials.

Scope of EIR Discussion

The hazards section of the EIR will include a detailed discussion of the following:

- Identification of the current fire hazards, both on-site and within the project site vicinity
- Identification of any existing emergency response plans for the project site and potential impacts of the project on such plans.
- Disclosure of the status and environmental findings related to potential hazards of the proposed international airport as the former MCAS site.
- Recommendation of mitigation measures necessary to avoid or reduce hazards to a level of insignificance.
- Identification of unavoidable and cumulative hazard impacts.

16. PUBLIC SERVICES

Source references (see Section IX): 7, 8

Existing Setting

The project site is undeveloped open space with limited use for cattle grazing. The project site is served by the following major public services:

- Fire and emergency services are provided by the Orange County Fire Authority. Station No. 42 located at 19150 Ridgeline Road, is approximately ½ mile from the project site, and provides primary response.
- Police protection is provided by the Orange County Sheriff-Coroner's Department. The Department's headquarters located at 550 N. Flower Street in Santa Ana. Patrol cars are in the vicinity of the project site on a regular basis patrolling the area, rather than being dispatched from a particular substation.
- Saddleback Unified School District, serving grades K-12 provides school services for the project area.

- Orange County Public Library serves the project site and vicinity. The closest library to the site is the Rancho Santa Margarita Branch Library located at 30902 La Promesa in Ranch Santa Margarita.

Potential Impacts

Implementation of the proposed project will introduce approximately 299 single-family dwelling units to the area. This increase may result in the need for additional fire and emergency medical and police personnel and equipment in order to service the project site and vicinity. Therefore, the proposed project may have a potential significant impact related to the ability of fire and police to provide adequate level of service. The proposed project will generate additional elementary, intermediate, and high school students. As stated above, the project site is located within the Saddleback Valley Unified School District, which is at maximum capacity. The introduction of new students into the already crowded district may result in a significant impact. Implementation of the project will also incrementally increase the demand for library services.

Scope of EIR Discussion

The services section of the EIR will provide a detailed discussion of the following:

- Evaluation of existing fire and police service levels and capacities and the adequacy of these providers to serve the proposed project including: personnel and equipment, availability, and response times.
- Assessment of project impacts related to Saddleback Valley Unified School District.
- Identification and assessment of impacts in the local library system.
- Recommendation of mitigation measures necessary to avoid or reduce public services impacts to a level of insignificance.
- Identification of unavoidable and cumulative public services impacts.

17. UTILITIES & SERVICE SYSTEMS

Source references (see Section IX) 7, 8

Existing Setting

The project site is undeveloped open space with limited use for cattle grazing. The project site is served by the following major public utilities and service systems:

- Southern California Edison (SCE) – electrical service
- Southern California Gas (SCG) Company – natural gas
- Trabuco Canyon Water District – sewer and water service
- Waste Management of Orange County – solid waste

Potential Impacts

The proposed development of approximately 299 single-family dwelling units will incrementally increase service requirements for electricity, gas, sewer, water, and solid waste.

Scope of EIR Discussion

The utilities and services sections of the EIR will include a detailed discussion of the following:

- Assessment of the adequacy and capacity of public utilities and service systems to serve the proposed project site.
- Demonstration of compliance with County requirements to reduce impacts to landfills.
- Recommendation of mitigation measures necessary to avoid or reduce all identified public utility and service system impacts to a level of insignificance.
- Identification of unavoidable and cumulative public services impacts.

I. INTRODUCTION

This document comprises the Response to Comments volume of the Final Environmental Impact Report (FEIR) No. 566 for Saddleback Meadows (Recorded Tract Map No. 10692/GA 960048. The purpose of this document is to:

> Respond to all comments of environmental significance received by the County of Orange relative to the Draft Environmental Impact Report (DEIR) No. 566, State Clearinghouse Number 96121072; and incorporate revisions and minor additions into the DEIR based upon public and agency comments.

Several of the comment letters received on the DEIR have stated that certain mitigation measures contained in the DEIR defer or put off actual mitigation requirements to a future time, beyond the certification of the Final EIR. Although a grading permit application was the initiating action which resulted in the determination that DEIR 566 be prepared, grading is only one of the issues being evaluated in the CEQA document. The CEQA document will consider the entire action, which in this case, is the development of a 705-unit manufactured housing subdivision and a small commercial site on the project site. Certification of the Final EIR by the Orange County Planning Commission, if acted on, signifies that the environmental effects of the proposed project have been adequately evaluated and considered, and in no way, authorizes the issuance of a grading permit which would allow commencement of onsite grading activities. Rather, once the final DEIR has been certified, the actual grading plans for the proposed project will be subjected to a thorough geotechnical and grading design plan check process. This process will require submittal of 40 scale grading plans for the entire grading operation being proposed, along with a detailed geotechnical report which will evaluate several factors including slope stability, remedial grading methods, sub-grade requirements and inspection information. The grading plans, the content of which is currently unknown, must meet all County of Orange procedural and substantive grading code requirements, and all conditions and mitigation measures tied to the grading permit must be satisfied, prior to issuance of the grading permit.

Several of the mitigation measures contained in DEIR 566, primarily standard condition (SC) mitigation measures, mandate the completion of a mitigation activity *prior to the issuance of any grading permit.* Standard Conditions or mitigation measures have been developed and adopted by the County of Orange Planning and Development Services Department, and are included, as required, in all CEQA documents prepared by the department. Completion of the specific activities addressed by these mitigation measures, at this stage of the planning process, would be premature. Should any *prior to any grading permit* related mitigation measure result in the generation of significant new information and new significant impacts not previously addressed by the Final EIR, a new CEQA document would be triggered and a new CEQA process will be initiated.

A. PUBLIC REVIEW PROCESS

The DEIR was distributed to various public agencies, citizens groups and interested individuals on June 27, 1997 and comments were received for a period of 45 days with the State Clearinghouse, Office of Planning and Research responsible for the coordination of

State of California Agency comments. The comment period closed August 12, 1997, with a total of 18 comment letters received.

In accordance with Section 15132 of the State CEQA Guidelines, a list of the persons, organizations and public agencies making comments on the DEIR is indicated in the matrix contained in this document. Comments / testimony and associated responses have been retyped and correspondingly numbered in sequential order. Copies of all actual DEIR comment letters are contained in Appendix A. of this document. Each comment is retyped as it appears in the actual letter including typographical errors. Responses follow each comment.

B. ORGANIZATION OF COMMENTS AND RESPONSES

Section 15088 of the CEQA Guidelines requires the County of Orange as the Lead Agency to evaluate comments on environmental issues received from public agencies, groups, and persons and to prepare written responses to comments received.

The following response to comments sections are included in this document:

1. Matrix of Agencies and Interested Persons Commenting on the DEIR
2. Responses to Written Comments
3. Letters Received from Commenting Agencies and Persons

In accordance with Public Resources Code 21092.5 (a) and the CEQA Guidelines, the Response to Comments document will be circulated to commenting public agencies, organizations, and individuals, a minimum of 10 days prior to certification of the Final EIR

II. CORRECTIONS AND ADDITIONS TO THE DRAFT EIR

II. CORRECTIONS AND ADDITIONS TO THE DRAFT EIR

This "*Corrections and Additions to the Draft EIR*" section contains revisions to information contained in the Draft EIR based on: (1) additional or revised information required to prepare a response to a specific comment, (2) updated information which has become out-of-date as a result of the passage of time, and/or (3) typographical errors.

1. Page I-1, Paragraph and Page 4-41, paragraph 4: Change the spelling of *effect* to *affect.*

2. Page 4-126, paragraph 3: Delete the sentence that states, *No amphibians were observed during the surveys of the site,* and add *the Western spadefoot toad was observed onsite in two of the ephemeral ponds.*

3. Page 4-123, Paragraph 2: Add the phrase *Southern Orange County Subregion* to follow NCCP.

4. Page 4-126, Paragraph 3: Add the following sentence: *The western spadefoot toad, Pacific treefrog and the western toad are expected to distributed across the project site and the surrounding area.*

5. Page 4-126 - Reptiles: Change the spelling of orangethroat whiptail to *orange throated whiptail.*

6. Page 4-130, Paragraph 1: Add the following statement: *The Cleveland National Forest is not a participant in the Orange County NCCP Southern subregion.*

7. Page 4-152, Paragraph 4: Add the following mitigation measure: *Prior to the issuance of any grading permit, the applicant shall provide proof that the project site has been currently surveyed for coastal California gnatcatcher, in accordance with the United States Fish and Wildlife Service protocol, to the satisfaction of the manager, PDS/Subdivision and the Administrator, Planning and Zoning.*

8. Page 4-130, Paragraph 3: Change central subregion to *central-coastal subregion.*

9. Page 4-136, Exhibit 53: Please refer to revised Exhibit 53, at the end on Section II.

10. Page 4-137, Paragraph 3: Add the following statement: *The western spadefoot toad is a California state species of concern.*

11. Page 4-139, Paragraph 2: Add San Bernardino County to the distribution list.

12. Page 4-153, Paragraph 4: Add the following mitigation measure: *Prior to the issuance of any grading permit, the applicant shall provide proof that the project site has been currently surveyed for the Quino checkerspot, in accordance with the survey protocol requirements of the United States Fish and Wildlife Service, to the satisfaction of the*

manager, PDS/Subdivision and the Administrator, Planning and Zoning.

13. Page 4-412, Table 27: Change the scientific name of the Northern harrier to *Cirous cyaneus.*

14. Page 4-52, Paragraph 7: Replace the third sentence with the following: *The proposed project is expected to generate approximately 8.340 trip-ends per day with 540 vehicles per hour in the AM peak hour and 825 vehicles per hour during the PM peak hour.*

15. Page 4-234, Paragraph 4: Add the following mitigation measure:

Prior to undertaking construction of the project, the applicant shall enter into an improvement agreement with the District to provide for the design, construction, installation, dedication and funding of all necessary master plan and in-tract storage facilities or, alternatively, pay the district's in-lieu water storage fees, as required under the district's rules and regulating and the tract map approval for Tract No. 10692.

16. Page 4-234, Paragraph 4: Add the following mitigation measure:

Prior to undertaking construction of the project, the applicant shall enter into an improvement agreement with the district to provide for the design, construction, installation, dedication and funding of all necessary master plan and in-tract storage facilities or, alternatively, pay the district's in-lieu water storage fees, as required under the district's rules and regulating and the tract map approval for Tract No. 10692.

17. Page 2-2, Environmental Procedures: Add the following bullet to the section: City of Lake Forest Community Development Department, April 23, 1997.

18. Page 4-214, Table 33: Replace Table 33 with the following table;

Table 33
PROJECT RELATED STUDENT GENERATION

Grade	Units	Student Generation Factor	Student Generation
K-6	705	0.2264	160
7-8	705	0.0566	40
9-12	705	0.0755	54
Total	**705**	**0.3585**	**254**

19. Page 4-210, Paragraph 4: Add the following sentence: *Currently, students in this general area are assigned to Portola Hills Elementary, Rancho Santa Margarita Intermediate and*

either El Toro or Trabuco Hills High School. All of these schools are filled to capacity and either do have now or will have by fall 1997, added a number of relocatable buildings to house enrollment exceeding the capacity of their original construction.

20. Page 4-1 through 4-235: All *should* wording contained within mitigation measures is changed to *shall.*

21. Page 2-7, Table 3: Change Ordinance 3486 to Ordinance 3468.

22. Page 4-39, Exhibit 22: Exhibit 22 is revised to include storm drain reference numbers. Please see revised Exhibit 22 at the end of Section II.

23. Page 4-94, Paragraph 2: The first sentence should read, *The bulk of the proposed project's impact will derive from the approximately 8,340 daily trips that will be generated at full site buildout.*

24. Page 4-155, Mitigation Measure 7-8: the following mitigation measure is added to the draft EIR: *All biological resource mitigation measures shall be monitored for compliance with applicable resource agency requirements and established success criteria, to the satisfaction of the manager PDS/Subdivisions and the Administrator Planning and Zoning.*

25. Page 4-158, Mitigation Measure 7-15: Change the working *should* to *shall.*

26. Page 4-174, Mitigation Measure 8-4: Add the following: *The applicant shall provide a fair share contribution to the Trabuco Canyon Water District for the purposes of water tank landscape screening.*

III-B. RESPONSE TO WRITTEN COMMENTS

III-B. RESPONSE TO WRITTEN TESTIMONY

Section III-B of this document contains Responses to Comments received on the Draft EIR during the Public Review period. Letters are arranged according to the dates received. Comments that present information which are not related to the environmental effects of the proposed project or the Draft EIR itself are noted, and will be referred to the appropriate decision-maker for consideration for consideration. Actual letters are contained in Appendix A. of this document.

COMMENTS AND RESPONSES - Robert A. Hamilton, June 29, 1997

RAH-1

Comment

On behalf of the Orange County Chapter of the California Native Plant Society (CNPS), and on my own behalf as a wildlife biologist, I offer the following comments on Draft Subsequent EIR No. 566. My knowledge of the CEQA review process, as it applies to biological resources in Orange County and the region, derives from over eight years' experience as a full-time biological consultant based in Orange County. During this time, I have prepared numerous biological technical reports for CEQA documentation covering large and small projects throughout Orange County and elsewhere in the region. I've certainly never encountered a situation where a project, once denied because of its incompatibility with applicable planning and zoning laws, was resubmitted in a form that actually flaunts the law more flagrantly than it did the first time around. I know better than to inquire about the circumstances under which such a ridiculous situation has come to be, or to spend much time actually considering the new development scheme.

Response

The comment states the qualifications of the commentator and his opinion relative to the consistency of the proposed project with applicable planning and zoning laws. A detailed discussion of the relationship between the recorded tract map and existing zoning and planning laws is contained in Section 4.1.3 of the DEIR on page 4-11.

RAH-2

Comment

On 29 February 1996, I submitted a letter to the County of Orange (County) commenting on DEIR No. 561, which covered the applicant's previously proposed project on this same site. This letter contained 26 comments (many more, actually, but that's the number that were responded to in any form). Most of my comments addressed the DEIR's factual errors and internal inconsistencies. I also suggested a number or realistic solutions to problems that I identified.

I have just completed a review of the responses prepared by the applicant/County in response

to my previous letter, and now remember afresh that most of my direct questions and comments were sidestepped, ignored, vaguely acknowledged, or responded to in a manner that obfuscated the comment's intent. This, combined with the fact that the new project makes no pretense of complying with planning and zoning laws, or the concerns of this community, indicates to me that the applicant/County has no meaningful interest in my thoughts or opinions.

I'm sure this is a common reaction of citizens who commented on the previous DEIR, but I find the situation particularly confounding, as the County recently selected me to serve on the 37,000-acre Nature Reserve of Orange County's Technical Advisory Committee. According to the 23 May 1997 appointment letter that I received from Executive ?Director Tim Neely, this committee will "serve as advisors to the Board of Directors on issues relating to monitoring , management and science." These are precisely the types of issues that I have commented on with regard to this project. I can't be an ignorant gadfly and a trusted scientific advisor simultaneously, so I ask the County to make up its mind

Response

The referenced letter dated February 29, 1996 which was directed at DEIR 561, was apportioned into 26 distinct comments for the purpose of preparing concise responses. Each comment was individually responded to and, in general, directed the commentator to the location in DEIR 561 where the information requested was located

RAH-3

Comment

Finally, I ask at least one County planner to review the responses that the applicant's consultants gave to my previous comments on this project; these were given with your approval and under your agency's name. If the goal of the Environmental & Project Planning Services Division is to completely frustrate the few citizens who take the time to read and comment on your EIRs, and to thus subvert the California Environmental Quality Act, you have succeeded.

Response

This comment is directed at DEIR 561 for a conventional subdivision of 318 single family dwellings (SFDs). The preparation of the previous Response to Comments Document was extensively reviewed and/or revised by staff of the Orange County Planning and Development Services Department, Environmental & Project Planning Division staff. All responses to comments contained in the referenced document were prepared in accordance with the requirements of CEQA and the CEQA Guidelines.

RAH-4

Comment

If the County is interested in taking a step in a more productive direction, I suggest that you spend a few dollars having an outside biological consultant review biological assessments *and* responses to comments prepared for major EIRs. For documents prepared by biologists based outside of Orange County, the reviewing firm should be based within Orange County, as consultants based elsewhere often display limited knowledge of the status and distribution of plant and animal species in Orange County. This simple and relatively cheap process would greatly improve the quality and credibility of the County environmental documents; it is a fairly common practice for CEQA lead agencies statewide.

Response

The comment indicating that biological firms based outside of the County have less credibility and knowledge than those based within the county is without basis. In fact, many of the firms and individuals involved with developing the Orange County NCCP are not based in the County. The Planning and Development Services Department does not require second party review practices.

COMMENTS AND RESPONSES - TRANSPORTATION CORRIDOR AGENCIES
Steve Letterly, Director, July 16, 1997

TCA-1

Comment

Thank you for providing the Transportation Corridor Agencies (TCA) with the opportunity to review and comment on the subject Draft EIR. Staff has reviewed the Draft EIR and has no comments at this time. If you have any questions regarding this correspondence, please contact Laura Coley Eisenberg of my staff at (714) 513-3482.

Response

The comment is noted. No response is required.

COMMENTS AND RESPONSES - STATE OF CALIFORNIA, BUSINESS AND TRANSPORTATION AGENCY, DEPARTMENT OF TRANSPORTATION/Robert F. Joseph, Chief, July 17, 1997

CAL-1

Comment

Thank you for the opportunity to review and comment on the Draft Environmental Impact Report for Saddleback Meadows. The proposed project is for the phased development of 705 manufactured single family housing units and a 1.5 acre, neighborhood commercial center and associated infrastructure. The project site is located within the Foothill/Trabuco Specific Plan and the Aliso Creek Corridor approximately ½ mile south of the El Toro Road/Live Oak Canyon Road intersection. Caltrans District 12 is a reviewing agency and has no comment at this time.

Please continue to keep us informed of future developments which could potentially impact our State Transportation Facilities If you have any questions, or need to contact us, please call Aileen Kennedy on (714) 724-2239.

Response

The comment is noted No response is required.

COMMENTS AND RESPONSES - SFC CONSULTANTS/Saundra F. Jacobs, REA, Principal, August 5, 1997

SFC-1

Comment

I want to thank you and Bill Grieman again for providing for me, not only the previous EIR's for Saddleback Meadows, but for providing a desk and room for me to review these documents in your office.

While I intend to provide the County with my comments to Draft EIR 566, I would like a reasonable period of time to review the current Phase I grading plans which area referenced in the Draft EIR. My objective would be to determine whether the Draft EIR adequately addresses the impacts associated with the proposed grading shown on the grading plans. Unfortunately, I have been informed that the grading plans, which are the subject of the grading permit application, are not currently on file at the County for me to review at this time. I was able to review an older version of the grading plans that Bill Grieman had available. However, I have been told that I can make separate arrangements with the applicant to obtain a copy of the current grading plans, but that would take additional time and money that I had not planned on spending. Under the circumstances, I would ask that I be provided with an extension of time to submit comments on the Draft EIR, after I have had a chance to review the grading plans, which I hope will be made available at the County shortly.

I am requesting a three-week extension to the September 12, 1997 deadline, to review not only the grading plan, but also to review the files to the Zone Changes previously approved by the County. I have asked the Clerk of the Board to pull files for the following Zone Change Applications: ZC 79-24, ZC 82-63 and ZC 84-3, and I have received a call back from Beverly at the Clerk of the Board, indicating that these files should be available for my review sometime this week.

Please let me know whether you office will be able to accommodate my request for the three-week time extension to submit comments on the Draft EIR. The August 12 deadline is coming on too fast for me to be able to complete my review of all the necessary documents, particularly the grading plans, so I hope that you will be able to grant me the extra time I have requested. Please call me with your response.

Response

Although a grading plan application is the initiating activity which resulted in the determination that DEIR 566 be prepared, grading is only one of the issues being evaluated in the CEQA document. The County's CEQA action will consider the entire action, which in this case, is the development of a 705 unit manufactured housing subdivision and a small retail site on the project site.

Sufficient detailed grading and related geotechnical information is available in DEIR 566, including information incorporated by reference from DEIR 561, prepared for the previous 318 unit proposal, in Section 4.2 of the DEIR, beginning on page 4-33. The information is based upon extensive geotechnical investigations conducted for the project site, which are contained in the Appendices for DEIR 566 and DEIR 561.

The geotechnical information contained in DEIR 566 meets standard practices of the County of Orange, which requires sufficient grading information for a planning decision. The planning level of detail includes the location of landslides, faults and other geotechnical hazards, the types of soil, and proposed grading concepts, including post grading topography, being proposed.

Standard 40 scale grading plans and accompanying more detailed geotechnical review documents and detailed hydrology reports will be reviewed and approved by the Subdivision and Grading Services Division, in consultation with various other divisions of the County including Environmental and Project Planning Services Division, prior to issuance of a grading permit. If significant new impacts, not previously addressed, are discovered at that time, a new CEQA document will be required.

COMMENTS AND RESPONSES - CONNOR, CULVER, BLAKE & GRIFFIN, LLP.
Edmond M. Connor, August 6, 1997

CCBG-1

Comment

As you know, August 12, 1997 is the current deadline for submitting comments on Draft EIR 566, the subsequent environmental impact report which has been prepared in connection with the grading permit application submitted by the developer of the Saddleback Meadows project. Our firm has been asked to submit comments on the Draft EIR on behalf of the Vedanta Society of Southern California (the "Society") which owns and maintains the Ramakrishna Monastery adjacent to the project site. However, due to an unusual set of circumstances, we find ourselves unable to submit comments prior to the August 12 deadline because critically important documents that we and our consultants need to analyze in assessing the adequacy of Draft EIR 566 have not been made available for public review.

The problem that we have encountered is that we have not been able to gain access to the developer's grading plans which are the *sine qua non* of the grading permit application process. Without such plan, no permit can be issues. Moreover, without access to the grading plans themselves, it is impossible to comment on the adequacy of Draft EIR 566 which, as stated in the Initial Study, was prepared for the express purpose of evaluating the environmental effects associated with the grading permit application.

Indeed, without being able to review the grading plans, neither our firm, nor the geotechnical consultants which have been engaged on behalf of the Society, can determine whether Draft EIR 566 properly evaluates the impacts, and adequately addresses the mitigation measures, associated with the proposed grading of the Saddleback Meadows property. Thus, the Society is effectively stymied in its ability to submit adequate comments on the Draft EIR by the August 12 deadline.

Last Friday, during a meeting with Messrs. McGill and de Mayo at the County offices, I asked if I could obtain copies of the grading plans, but I was informed that the County had returned the plans to the developer and no longer had a set available for public review. I was also told that, if I wanted to obtain a copy of the grading plans, I would have to contact the developer directly and make arrangements to pay for copies of the plans to be made. Although my office promptly contacted the developer's agent, TPG Management, immediately following my meeting at the County, and then, first thing Monday morning, messengered a check to TPG to comply with its demand that we pay *in advance* for the cost of copying the plans, several days have gone by; and we still have not received any plans as of this writing. I am surprised that it would take more than three days to run blue lines of the grading plan, but, be that as it may, we still do not have them and the August 12 deadline for submitting comments is coming on fast. Under these circumstances, therefore, I would respectfully request that the Society ;be granted a minimum of 30-day extension of time to submit its comments on Draft EIR 566.

Actually, I think the proper thing to do in light of the fact that the grading plans have not been available for public review at *any* time during the 45-day comment period for Draft EIR 566 is to circulate a *new* public notice setting a *new* deadline for submitting comments on the Draft EIR. The new time period for submitting comments should not start running until the grading plans are made available for public review at the County.

Response

Please refer to Response to Comment SFC-1 and the letter from Mr. Tom Mathews, Director, County of Orange Planning and the Development Services Department, to Mr. Edmond N. Connor, dated August 12, 1997 (Appendix B). The letter explains that although the grading application (960048) is the initiating activity which resulted in the determination that DEIR 566 be prepared, the County's CEQA action will consider all of the components of the proposed project. In addition, the letter indicates that the DEIR contains sufficient detailed grading and geotechnical information which meets standard County practices for a planning decision. Due to the special interest of the Vedanta Society, the County agreed to respond to comments from the Vedanta Society provided they were received no later than 4:00pm on August 22, 1997.

CCBG-2

Comment

What should *also* be made available for review and copying at the County is the soils engineer's geotechnical review and copying at the County is the soils engineer's geotechnical review of the 40-scale grading plans which the Orange County Grading Code requires be submitted *before* any grading permit can be issued. Indeed, without the soils "specs" providing details regarding proposed buttresses, shear keys, back cuts, etc., it is difficult to understand the grading plans. Moreover, it is virtually *impossible* to assess feasible mitigation measures for known geotechnical hazards without having access to the grading plan review prepared by the soils engineer of record.

Please let me know whether the grading plan review by G.A. Nicoll & Associates is available for public review and copying. As ;you may be aware, Draft EIR 566 specifically states that a grading plan review will be prepared "to accompany the grading permit application." (See Appendix D, p. 4, paragraph 4.) If, as I suspect, Nicoll's grading plan review is *not* available for review and copying, then this would be yet another reason for re-noticing the public comment period on Draft EIR 566. In fact, if the grading plan review has not been prepared or is unavailable for public review, this would raise serious questions as to the legal adequacy of Draft EIR 566.

Response

Please refer to response to comment CCBG-1

CCBG-3

Comment

I do not wish to criticize the County for what appears to have been a problem created by the developer in not making critical documents available for review, but the fact remains that neither the Society, nor any other "interested party" or member of the public, has been dealt a "fair hand" in being required to submit comments on Draft EIR 566 without being allowed reasonable and timely access to the documents which are the "very heart and soul" of the grading permit application, i.e., the grading plans and the grading plan review. I would greatly appreciate it if your office would rectify this problem by (1) making copies of the grading plans and the grading plan review available for public review at the County as soon as possible and (2) providing public notice to all interested persons that a new 45-day time period to submit comments on Draft EIR 566 has been established. If your office is not inclined to provide all members of the public with such an extension of time, then, at the minimum, I would ask that the Society be provided with the 30-day extension which I have requested.

As a final note, I would ask that my name and address be placed on whatever public notice lists area being maintained by the County in connection with the Saddleback Meadows project and any planning approvals and matters relating thereto. Please add me as an "interested party" on all mailing lists so that I can receive public notice, information, and reports regarding any and all aspects of the Saddleback Meadows property or project. Thank you for your courtesy and cooperation in this regard.

Response

Please refer to comment CCBG-2.

COMMENTS AND RESPONSES - THE GAS COMPANY, August 7, 1997

TGC-1

Comment

This letter is not to be interpreted as a contractual commitment to serve the proposed project, but only an information service. Its intent is to notify you that the Southern California Gas Company has facilities in the area where the above named project is proposed. Gas service to the project could be served from an existing main as shown on the attached atlas sheet without any significant impact on the environment. The service will be in accordance with the company's policies and extension rules on file with the California Public Utilities Commission at the time contractual arrangements are made.

The availability of natural gas service as set forth in this letter, is based upon present conditions of gas supply and regulatory policies. As a public utility, the Southern California Gas Company is under the jurisdiction of federal regulatory agencies. Should these agencies take any action which affects gas supply or the condition under which service is available, gas service will be provided in accordance with revised conditions.

Residential (System Area Average) Yearly

Single-family	750 therms/year/dwelling unit
Multi-family units	475 therms/year/dwelling unit

These averages are based on total gas consumption in residential units served by Southern California Gas Company and it should not be implied that any particular home, apartment or tract or homes will use these amounts of energy.

We have developed several programs which are available, upon request, to provide assistance in selecting the most energy; efficient appliances or systems for a particular project. If you desire further information on any of our energy programs, please contact this office at 1(800)427-2000, for assistance.

Response

Section 4.13 of the DEIR, beginning on page 4-223, contains an evaluation of the impact of the proposed project on existing utilities and service systems, including natural gas. The ability of The Gas Company to serve the proposed project, based on current conditions and regulatory policy is noted.

COMMENTS AND RESPONSES - CONNOR, CULVER, BLAKE & GRIFFIN, LLP.
Edmond M. Connor, August 8, 1997

CCBG.2-1

Comment

This will confirm this afternoon's telephone conversation during which you kindly agreed to provide my client, the Vedanta Society of Southern California (the "Society") with an extension of time, to and including next Friday, August 15, 1997, within which to submit comments on Draft EIR 566. You explained that you had consulted with John Buzas and had concluded that, since various County personnel were unavailable to make a final decision on the requests set forth in my August 6 letter to Messrs. Brantley and Greiman, a three-day extension of time seemed to be an appropriate "stop-gap" remedy under the circumstances.

I understand that, when the appropriate personnel are available at the county next week, I will receive a definitive answer to the requests set forth in my August 6 letter. I certainly appreciate receiving the three-day extension, but my firm and the Society's geotechnical consultants still need more time to review the grading plans and the grading plan review before any of us will be in a position to submit comments on Draft EIR 566. Although the public review provisions of CEQA and the State CEQA Guidelines would suggest that we should not have been required to do so, we have already been compelled to make separate arrangements with, and to pay money to the developer's agent to obtain the right to review the grading plans for which a grading permit is being sought.

However, even if we were willing to pay additional money for the right to gain access to the grading plan review by the soils engineer of record, we could not do so because that report has not even been completed as of this date. Of course, Appendix D to Draft EIR 566 expressly states that a geotechnical review of 40-scale grading plans will be prepared to accompany the grading permit application, but, for whatever reason, the grading plan review has not been finalized and is not available for any member of the public to even see it, much less study it in detail. That really puts the Society, and all other members of the public, at a tremendous disadvantage in being able to adequately comment on the Draft EIR.

Response

Please refer to response to comment SFC-1.

CCBG.2-2

Comment

As I explained to you in my earlier phone message, section 15146 of the State CEQA Guidelines requires that the degree of specificity to be found in Draft EIR 566 must be commensurate with the stage of development that is being evaluated. in other words, since the construction of grading improvements is being analyzed in conjunction with a grading

permit application, the *specific* details of the grading, and the impacts and mitigation measures associated therewith, must be addressed in the Draft EIR. Moreover, under section 15147 of the CEQA Guidelines, all technical data, maps, plans, etc, which are necessary to make a "full assessment" of the environmental impacts of the project must be set forth in the appendices to the Draft EIR, and such appendices "shall be *readily available* for public examination." (Emphasis added.)

The California courts have not hesitated to enforce the above requirements by striking down EIRs which have omitted important technical information, even if the information was found to be available from other sources. As stated by; our own Fourth District Court of Appeal, "whatever is required to be considered in an EIR *must be in that formal report*; what any official might have known from other writings or oral presentations cannot supply what is lacking *in the report." (See, Santiago County Water District v. County of Orange* (1981) 118 Cal.App.3d.818,831; *San Joaguin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713,727.)

As the above authorities indicate, both the grading plans and grading plan review should have been (10 set forth in the Appendices to Draft EIR 566 and (2) readily available to all members of the public during the entire 45-day comment period. Since the County will not issue any grading permit to the developer without the grading plans and the grading plan review having been approved by County staff, these documents should not have been *excluded* from the CEQA review process. However, since these documents were, in fact, omitted form Draft EIR 566 and have been available at the County for public review, I think it only fair that the county take quick action to correct these problems.

My proposal would be that the County request the developer to (1) complete the grading plans and the grading plan review and submit them to County staff as soon as possible and (2) revise Draft EIR 566 to not only include these documents as part of the Appendices, but also to adequately address them in Volume I of the EIR. Once the grading plans and grading plan review have been make "readily available" for public review, then a new 45-day period for submitting comments on Draft EIR 566 should be re-noticed.

Again, I apologize for burdening you with this issue in Ben de Mayo's absence, but I sincerely believe, Nick, that fundamental fairness, not to mention the strict dictates of the State CEQA Guidelines, requires the County to remedy the problems which have occurred as a result of the grading plans and grading plan review not having been available for public review prior to the expiration of the comment period on Draft EIR 566. The problems are easily corrected as I have suggested above, and I hope the County will do just that. Thank you for your courtesy and cooperation in doing what you can to make that a reality.

Response

Please refer to response to comment CCBG-1.

COMMENTS AND RESPONSES - U.S. FISH & WILDLIFE SERVICE
Gail C. Kobvetich, Field Supervisor, USFWS, Ron Rempel, NCCP Program Manager, California Department of Fish and Game, August 8, 1997

USFWS-1

Comment

The U.S. Fish and Wildlife Service (Service) and California Department of Fish and Game (Department) Natural Community conservation Planning (NCCP) program staffs (i.e., "the Wildlife Agencies") have reviewed the above DSEIR. The project is located within the Southern Subregion Orange County NCCP Planning Area, near the border with the NCCP Central Subregion. The preferred project proposed the phased development of 705 manufactured, single-family residential units on a 222.9-acre site near the intersection of El Toro Road and Live Oak Canyon Road, impacting a total of about 191 acres on site and 20 acres off site. About 14% of the project site is proposed to reamin as open space.

Biological resources on site include about 65 acres of coastal sage scrub (CSS), 14 acres of oak woodland, and about four acres of wetland vegetation communities. The federally endagered Riverside fairy shrimp *(Streptocephalus woottoni)* is known to occur whithin at least seven wetlands (identified in the DSEIR as "ephemeral ponds") spread throughout the site. Several plant and animal species considered sensitive by the Wildlife Agencies occur (e.g., cactus wren *[Camphylorhynchus brunneicapillus]*) or may occur. The coastal California gnatcatcher (Polloptila californica californica) here after "gnatcatcher", a federally threatended species, is likely to occur on site based on the presence of CSS and gnatcatcher-occupied CSS in surrounding areas. The Quino checkerspot butterfly (Euphydras editha quino), a federally endangered species, may occur as well.

Response

Comment noted. The comment reiterates information contained in the DEIR. No response is required.

USFWS-2

Comment

Along with the No Project/No Development Alternative ("Alternative 1") required by the California Environmental Quality Act (CEQA), there are four other alternatives presented in the DSEIR. Alternative '1' would avoid any adverse environmental impacts to the project site. Alternative '2' proposes 150 housing units with a minimum lot size of 20,000 feet, disturbing more than 138 acres this would result in elimination of oak woodlands, CSS, and ephemeral ponds of which some rare and sensitive species are obligate residents. Noise decigbel levels would increase and possiblyu affect wildlife in adjacent O'Neill regional Park. Alternative '3' proposes 100 single family units on a 31.7 acre portion of the site. This alternative avoids about 191 acres of habitat, therby appearing to allow connection between open space areas

north, south, and east of the project site. However, this project laternative will impact two ephemeral ponds and CSS habitat. Alternative '4' proposes 299 housing units, distrubing abourt 165 acres. A wildlife corridor, narrowing to 400 feet in width and going up a nearly vertical slope, is proposed to be bisected by a road. Alternative '5' proposed 318 housing units within a development area of 113 acres, leaving about 100 acres in open space. the wildlife corridor would be the same as for Alternative '4' except that the minimum width would be about 700 feet. The proposed project appears to conflict with the earlier-adopted Foothill-Trabuco and Aliso Creek Corridor Specific Plans and also fails to describe adequate project design for maintaining corridor integrity of the Orange County NCCP Reserves. In evaluating alternatives 2-5, Alternative '3' would have the least environmental impact, but would nonetheless, substantially impact wildlife corridor integrity between subregional NCCP reserve areas in Orange County.

Response

Comment noted. The comment reiterates information contained in the DEIR relating to alternatives and their effect on biological resources and wildlife movement. No response is required.

USFWS-3

Comment

The Wildlife Agencies have formally commented at different stages of the proposed project. We have also met with the project applicant and their consultants, including a meeting at the project site on May 20, 1996. On June 29, 1994, the Service wrote aletter stating that project approval must be deferred until the Southern Subregiona NCCP was finalized. In 1996, both agencies commented on the DEIR (No. 561). The Service letter stated that the location of this development within and adjacent to occupied habitat of rare species could compromise the NCCP reserve and its ability to function as a wildlife corridor through the direct and indirect impact of habitat destruction, fragmentation, noise, and lighting Our comments were based upon a project alternative, similar to Alternative four, which provided more open space than the proposed preferred alternative presented in this DSEIR.

In general, the DSEIR does not adequately describe the biological resources of the project area. The document only describes and anlyzes impacts of the different alternatives in a superficial manner. Referring to our joint Wildlife Agency letter of January 30, 1997, responding to the Notice of Preparation, at least eight of our requested infomation items were completely or partially ignored, without explanation. Available data were not identified.. Further, the Initial Study (p. 17) states that the scope of the EIR discussion will provide a "detailed discussion" and "[A] re-inventory of the existing unique, sensitive ... flora and fauna within the project site..." Also to be provided was "[A} detailed analysis of the project's impacts to wildlife movement, including mitigation measures to avoid or reduce those imacts." Neither of these items was adequately accomplished.

Response

Individual letters were received from both the California Department of Fish and Game and the U.S. Fish and Wildlife Services on the previous DEIR (561) on March 25, 1996. DEIR 566 incorporates DEIR 561 by reference, including the analysis of alternatives. DEIR contains an in-depth analysis of the effect of the proposed project and a range of alternatives on biological resources and wildlife movement As promulgated by the CEQA Statute and the CEQA Guidelines, the level of detail of analysis of identified alternatives in the DEIR is more cursory than for the proposed project. Section 3.2 of the DEIR, on page 3-8 outlines the unique characteristics of a recorded tract map and the inability to alter physical design features of the recorded tract map to mitigate impacts. Section 4.7.3 of the DEIR, beginning on page 4-143, documents the unavoidable adverse impacts associated with the proposed project, with mitigation measures outlined in Section 4.7.6 of the DEIR, beginning on page 4-137. Unavoidable adverse impacts, following the implementation of identified mitigation measures, are listed on page 4-154. Certification of the Final EIR will require preparation of a Statement of Overriding Considerations.

USFWS-4

Comment

The Wildlife Agencies offer the following specific information and recommendations to assist the County and the project applicant in planning for the preservation of sensitive wildlife species, habitats, and wildlife corridors within the proposed project area, and as a meanms to assist you in complying with pertinent statutes. Page numbers refer to the DSEIR unless otherwise noted.

1-1, paragraph 2 and 4-41, paragraph 4. Both of these statements should read as "affect."

Response

The comment is noted. Please see Correction and Additions to the DEIR, contained in Section II.

USFWS-5

Comment

4-41, exhibits 21, 22, 53. Interference with existing hydrology on site is shown with the construction of the preferred alternative. Impacts to "ephemeral ponds" not directly within the project footprint would also occur. Analyze these impacts further.

Response

A detailed analysis of project related impacts to onsite habitat, including ephemeral ponds, is contained in Section 4.7 3, beginning on page 4-143 of the DEIR. In addition, a detailed

analysis of project related impacts to hydrology is contained in Section 4.3 of the DEIR, beginning on page 4-33 of the DEIR.

USFWS-6

Comment

4-43, last paragraph. The Wildlife Agencies disagree with the conclusions that there would be "... no unavoidable adverse impacts to surface or groundwater hydrology" and the water quality impacts would be "... to less than significant levels" since current hydrological conditions support the existence of these areas. Implementation of the preferred alternative, including alteration of drainage patterns, would result in the direct loss of a minimum of seven ephemeral ponds on site.

Response

Surface and groundwater hydrology and water quality are evaluated in detail in Section 4.3 of the DEIR. Historical research has determined that the onsite ephemeral ponds were artificially created to support cattle grazing activities and are not directly dependant on surface or groundwater hydrology. The DEIR states, in Section 4.7.3 on page 4-145, that 0.6 acres of the 0 8 acres of ponds, or 7 of the 8 ephemeral ponds, would be directly impacted by implementation of the proposed project.

USFWS- 7

Comment

4-110. The noise impact analysis is cursory and needs to refer to appropriate literature attributing impact to avian populations due to noise. Also, in the cases of "major airport runways" the analysis is biased by not considering adjacent land use changes in the context of the distribution of the coastal California gnatcatcher.

Response

As stated in the noise analysis, in Section 4.6 of the DEIR, noise levels in the vicinity of the project are not expected to appreciably increase as a result of project implementation. Typical noise increases within 100 feet of major highways are calculated to be 1 decibel. In addition, the conversion of MCAS El Toro to a civilian airport would result in reduced noise contours as compared to those shown in the DSEIR on Page 4-105. Earlier surveys prepared for DEIR 561, did not identify any gnatcatchers onsite.

USFWS-8

Comment

4-119, paragraph 2. There was no Service protocol for presence/absence of gnatcatchers in 1993 and 1994.

Response

The comment relating to gnatcatcher survey protocol is incorrect. Gnatcatcher surveys were conducted in 1993 and 1994 to applicable survey protocol in place at the time of the actual survey. These surveys did not identify any gnatcatchers onsite. Paragraph 2 on page 4-119 clearly states that additional surveys for gnatcatchers have not been conducted to current USFWS protocol, which were not established until May, 1997. Gnatcatcher surveys are required prior to the issuance of any grading permit. See Section II, Corrections and Additions to the DEIR in this Document.

USFWS-9

Comment

4-122, exhibit 50. Western spadefoot toad *(Scaphiopus hammondi)* is identified in the exhibit (and on page 4-137) as occurring on site; however, the discussion about amphibians on page 4-126 states that "[N]o amphibians were observed during the surveys of the site." Correct this discrepancy.

Response

The comment is correct and acknowledged. The Western spadefoot toad was observed onsite in two of the ephemeral ponds. Please see Section II of this document, Corrections and Additions to the DEIR.

USFWS-10

Comment

4-123, paragraph 2. Add that the NCCP refers to the Southern Orange County Subregion to distinguish this planning effort from other ongoing and completed efforts.

Response

The comment is noted. A discussion of the southern Orange County subregion will be incorporated into the discussion of the NCCP. Please refer to Section II of this document, Corrections and Additions to the DEIR.

USFWS-11

Comment

4-125, "Ephemeral Ponds." The Wildlife Agencies disagree with the assertion that "all of the ephemeral ponds were artificially created a number of years ago..." Given the geological conditions of frequent landslides in the area, these wetlands could have been "slump" or "slope" ponds that underwent human modification at a later time. These types of wetlands

are known in both Orange and San Diego counties. Further information is needed in the DSEIR regarding the origin of these wetlands in the context of the proposed impacts.

As identified by Marie Simovich, Ph.D , a consultant for the former applicant, some of the on site wetlands contain a high diversity of aquatic invertebrates, strongly suggestive of the normal nautral origin of these wetlands. Known to occur in at least some ponds with Riverside fairy shrimp and western spadefoot are cladocerans (e.g., e.g., *Daphnia*, 2 or 3 species likely), copepods, ostracods (seed shrimp), and clam shrimp (*Cyzicus californicus)*. Clam shrimp have a restricted distrubtion in coastal southern California. Further information is needed in the DSEIR regarding aquatic invertebrates in the context of the proposed impacts.

Response

Please see response to comment number USFWS-6. The ephemeral ponds have been located on the project site for many years, and used as a water supply associated with livestock grazing. Please refer to the discussion of ephemeral ponds on Page 4-125 of the DEIR.

USFWS-12

Comment

4-126, Invertebrates, last sentence. the DSEIR states that "[H]undreds of additional invertebrates are expected to use the site." No date are provided to support this statement. The Wildlife Agencies presume that this statement refers to the expected number of species, not the number of individuals. Please qualify and support the statement.

Response

Please refer to Appendix H of the DEIR for a discussion and listing of onsite identified invertebrates. The "Hundreds" statement refers to the number of invertebrate species expected to occur onsite, although not completely quantifiable.

USFWS-13

Comment

4-126, Amphibians. The last sentence erroneously implies that the distribution of amphibians is restricted to steep slopes. No data are provided to support this statement. The likely widespread distribution on stie of western spadefoot toad, Pacific tgreefrog (*Hyla regilla*), and western toad (*Bufo boreas*) needs to be noted and discussed. Please revise the discussion.

Response

The comment is acknowledged. The DEIR text is hereby revised to reflect this comment.

Please see Section II of this document, Corrections and Additions to the DEIR

USFWS-14

Comment

4-126, Reptiles. The correct name is the orange-throated whiptail lizard. Please correct this name throughout the document (e.g., 4-138, -147).

Response

The comment is correct and acknowledged and hereby incorporated into the DEIR. Please refer to Section II of this document, Corrections and Additions to the DEIR.

USFWS-15

Comment

4-130, paragraph 1. The DSEIR states that the "[Southern] subregion will incorporate public lands of the Cleveland National Forest (CNF)." We suggest that this statement be removed or properly qualified since no additinal conservation benefits would occur unless the U.S. Forest Service (USFS) is a signatory to an NCCP agreement. The USFS is not participating in the Orange County Central/Coastal NCCP and has not indicated that it wishes to be a "participating landowner" in the Southern Subregion. The DSEIR should not presume that future CNF managment activities will be compatible with an NCCP.

Response

The comment is noted. The referenced statement pertaining to the Cleveland National Forest was intended to indicate the availability of habitat for NCCP and other related species. Please see Section II of this document, Corrections and Additions to the DEIR.

USFWS-16

Comment

4-130, paragraph 2. The DSEIR states that the gnatcatcher is not found onsite. Surveys to current Service protocol were not done. The last gnatcatcher surveys were done in 1994. Surveys should be conducted according the Service protocol ot determine the baseline status for the species. The results of these surveys will be needed to assess impacts, including the number of gnatcatchers subject to "take," in accordance with the Intra-Service Biological Opinion for the 4(d) rule.

Response

The comment restates information contained within the DEIR. As part of the County of

Orange approval process for Grading Application 960048, conditions of approval will be developed which will require the completion of current gnatcatcher surveys, conducted to current USFWS protocol, prior to the issuance of a grading permit. Please refer to Section II, Corrections and Additions to the DEIR, for an additional mitigation measure which requires the gnatcatcher survey prior to the issuance of a grading permit.

USFWS-17

Comment

4-130, paragraph 3. The correct name is the Central-Coastal Subregion.

Response

The comment is noted and the correction is hereby incorporated into the DEIR. Please refer to Section II of this document, Corrections and Additions to the DEIR.

USFWS-18

Comment

4-130, paragraph 4. The DSEIR refers to the "disturbed nature of the site" in the context of fulfilling wildlife corridor "needs in the area." No additional information is provided to support this assertion. The existing landscape linkages and documented presence of mountain lion (*Felis concolor*), mule deer (*Odocoileus hemionus*), and coyote (*Canis latrans*), all of which would use a wildlife corridor within the project area, needs to be noted and discussed. Mountain lion movement through the area was not disclosed in the DSEIR. This study was undertaken by Paul Beier, Ph.D. and reported in the scientific literature. For further explanation of our request that these data be disclosed and discussed in the context of this proposed project, refer to item number eight in our joint wildlife agency letter of January 30, 1997.

Response

The statement in the DEIR relating to the disturbed nature of the site is correct and is discussed in detail in Sections 3.0 and 4.0 of the document The statement in the DEIR indicates that the listed onsite conditions contribute to the conclusion that an onsite wildlife movement corridor would not *entirely fulfill wildlife corridor needs in the area.* However, it should be noted that EIR No. 553 for the Central-Coastal Subregional Natural Communities Conservation Planning (NCCP)/Habitat Conservation Plan (HCP) which was certified by the Orange County Board of Supervisors on April 16, 1996 identifies the area in the vicinity of the project site as one of the two primary wildlife linkages connecting the Central-Coastal NCCP/HCP and South NCCP study area (See Exhibit No. 11 attached).

In addition, the working group for the South Subregional NCCP program, which includes the project biological consultants, California Department of Fish and Game, U.S. Fish and

Wildlife Service, and others, has determined that the Saddleback Meadows site and surrounding vacant lands in their existing condition are extremely important in providing regional wildlife movement and use connections to the Central subarea of the Central-Coastal NCCP/HCP. This determination was based largely on mountain lion studies conducted by Dr. Paul Beier and large mammal studies conducted by Doug Padley for the Foothill-Trabuco Specific Plan together with the fact that the proposed project area is located immediately adjacent to the Central-Coastal reserve system within the Aliso Creek Corridor portion of whiting Ranch Regional Park and the Southern California Edison parcel. These areas were included in the reserve system to ensure that regional connectivity is maintained between the two subregions.

USFWS-19

Comment

4-131, exhibit 51. This exhibit is difficult to interpret since it was originally a color map of larger size. For example, gnatcatchers and cactus wrens are noted in the legend but are invisible on the exhibit. We suggest that the exhibit be redone to show only relevant information.

Response

Exhibit 51, entitled *Proposed NCCP Southern Subregional Planning* Area, depicts the boundary of the planning area and several biological features related to the NCCP Planning effort. The scale of the exhibit does not allow every detail to be shown in an 11x17 format.

USFWS-20

Comment

4-133, paragraph 3 The DSEIR says that "The fragmented nature of much of the coastal sage scrub onsite makes it low quality." However, the current gnatcatcher status is unknown and most wildlife surveys were out of date, having been conducted in 1993 and 1994. The paragraph continues by stating that the steep slopes support the highest diversity of animal species, but no data are provided to support this statement.

Response

The statement in the DEIR is correct. The highest quality and least fragmented coastal sage scrub plant communities, and the highest CSS related animal species diversity, are located on the steepest portions of the project site. The DEIR includes mitigation measures which require updated gnatcatcher surveys to be completed prior to the issuance of any grading permit.

USFWS-21

Comment

4-133, paragraph 3. The site also contains a habitat linkage, also qualifying it as at least "intermediate value" according the Evaluation Logic Flow Chart.

Response

The comment restates information contained within the DEIR. No response necessary.

USFWS-22

Comment

4-136, exhibit 53. One pond identified as a "potential mitigation area" is in the project footprint of the preferred alternative, as shown on exhibits 18 and 22. Since this area would be under housing and infrastructure and no longer in its present condition, please correct this discrepancy.

Response

The limit of development line shown in exhibit 53, in the vicinity of the subject pond, is shown in the wrong location. Exhibit 7, Site Plan shows the correct relationship of the proposed grading limits to the pond proposed for preservation. Please see Corrections and Additions to the DEIR, revised Exhibit 53.

USFWS-23

Comment

4-137, paragraph 3. The western spadefoot toad is a California State Species of Concern.

Response

The comment is noted. Please refer to Section II of this document, Corrections and Additions to the DEIR.

USFWS-24

Comment

4-137, -139, and -148 state that the site "must be considered occupied by gnatcatcher until proven otherwise." This is inconsistent with the statement on 4-130 that the gnatcatcher is not found on site. Correct and clarify this discussion.

Response

The statement is correct, given the fact that current gnatcatcher surveys have not been conducted in accordance with USFWS protocol. The onsite habitat must be considered occupied, until such time as a current survey, conducted to USFWS protocol standards prove otherwise. The statement indicating that no gnatcatchers have been identified onsite refers to the surveys completed in 1993 and 1994. The DEIR also contains a mitigation measure which requires an updated gnatcather survey and compliance with any protocol conditions prior to the issuance of any grading permit. Please see Section II of this document, Corrections and Additions to the DEIR.

USFWS-25

Comment

4-139. The distribution information for the gnatcatcher is incomplete. The species occurs in portions of Ventura, eastern Los Angeles, and San Bernardino Counties. The assertion regarding limited slope characteristics is not valid. Gnatcatchers occur on steep slopes, using them for nesting, foraging, and movement.

Response

The comment is noted. Please see Section II of this document, Corrections and Additions to the DEIR. The DEIR contains mitigation measures which require updated gnatcather surveys prior to the issuance of any grading permit.

USFWS-26

Comment

4-140. The wildlife agencies disagree that focused surveys for the Quino checkerspot butterfly are not warranted. The limited surveys accomplished do not support the assertion that the probability of occurrence is "low." Appropriate habitat (CSS, chaparral, and grassland) exists within the project site. Surveys consistent with the Service 1997 protocol should be completed.

Response

Required surveys for the Quino checkerspot butterfly, conducted to USFWS protocol are acknowledged, and will be conditioned as a requirement prior to issuance of a grading permit. Please see Section II of this document, Corrections and Additions to the DEIR.

USFWS-27

Comment

4-141. The correct scientific name for the northern harrier is *Circus cyaneus.* It is properly referred to as a raptor. The accepted common name for *Agelaius tricolor* is the tricolored blackbird. The "C2 (category two)" category was discontinued by the Service in February 1996. The gnatcatcher is a California State Species of Concern.

Response

The comments are noted. Please refer to Section II of the document, Corrections and Additions to the DEIR.

USFWS-28

Comment

4-144. There is no analysis of connectivity loss in this discussion of the project in relation to the NCCP Findings. However, 4-148 states that "[T]he project, as currently proposed, may hinder or preclude the preparation of the southern subregional preserve [sic], due to restricted wildlife movement " Further on page 4-130, paragraph 3 it says, "the project site occupies a linkage area between the Central and Southern NCCP Subregional preserves [sic], where a wildlife corridor is needed." Please clarify and further analyze this crucial issue. We suggest explanatory text with an exhibit or exhibits specifically rendered

Response

The comment is noted. Project related impacts to wildlife movement and connectivity are discussed throughout Section 4.7 of the DEIR. The statement listed on page 4-144 of the DEIR pertaining to connectivity is part of a listing of NCCP findings that must be satisfied prior to allowance of interim take of coastal sage scrub habitat. This information has been provided in the DEIR to outline requirements in the event that interim take is required. Impacts to wildlife movement have been identified as unavoidable adverse impacts in the DEIR.

USFWS-29

4-145, "Ephemeral Ponds." The use of acreage by itself is inappropriate since it does not sufficiently disclose the impacts of the preferred alternative. The wildlife agencies suggest that the number of ponds also be used as a measure of impact. From the diagrams in the DSEIR, it appears that seven of the eight ponds identified as supporting Riverside fairy shrimp would be directly within the project footprint. The other pond would be subject to edge effects and adverse impacts to water quality. This impact is not apparent when only the acreage figure is considered

Response

The comment is noted. Please see response to USFWS-6. Impacts to ephemeral ponds have been identified in the DEIR as unavoidable and adverse.

USFWS-30

Comment

4-147, Western spadefoot toad. The DSEIR states that the population is small in size. However, no data are provided to support his statement such as the results of a scientifically valid population survey. In the absence of data, we suggest that the statement be eliminated.

Response

Previous onsite surveys have found that the Western spadefoot toad is of limited distribution and population size.

USFWS-31

Comment

4-148, Wildlife Movement. The statement "It can not [sic] be assumed that wildlife would be able to move through the project site..." should be further explained. Further explanation is needed since it is known that there would be the virtual elimination of wildlife and their movements in a high density residential development as the preferred alternative proposes.

Response

The referenced statement backs up the statement that implementation of the project site would directly impact wildlife movement. Even though some wildlife may move through the proposed project, without a recognizable wildlife movement corridor, it cannot be assumed that any wildlife will move thorough the proposed project. Due to the physical design of the proposed project. Wildlife movement impacts have been cited in the DEIR as unavoidable adverse impacts.

USFWS-32

Comment

4-151, -152, Conceptual Mitigation Program. The last sentence on 4-151 states that the program was developed based on input from the wildlife agencies. Regarding the mitigation ratios presented, the DSEIR provides no rationale to support these ratios. Further, the position of the Wildlife Agencies is that the ratios are unjustified and inappropriately low in relation to the proposed impacts, given other mitigation agreements.

Response

The mitigation ratios are have been based upon the level of impact to habitat types, the relative quality of onsite habitat and other similar mitigation projects in the vicinity of the proposed project. It should be noted that any habitat mitigation requirement will need to be accomplished offsite, due to the recorded nature of the tract map.

USFWS-33

Comment

6-3, table 39 The "no project" alternative states that there would be a continuation of

grazing impacts. Include that this is a discretionary landowner activity, otherwise unrelated to the proposed project.

Response

The No Project alternative is included in compliance with CEQA Statutes and Guidelines Implementation of the No Project alternative, assumes that the project site would continue to exist in its current condition, open space utilized for livestock grazing.

USFWS-34

Comment

6-4, paragraph 1. The DSEIR states that "[o]going degradation of onsite biological resources related to cattle grazing operations would continue to occur." This degradation should be further described. For example, on our May 20, 1996 site visit, Wildlife Agency representatives observed cattle within some of the onsite wetlands. We also observed apparently free-ranging horses nearby. Further discussion of the presence of livestock and horses is needed in relation to impacts to Riverside fairy shrimp, other invertebrate species, and CSS. Crushing of fairy shrimp "cysts" and adverse changes to water quality are likely to occur within ponds subject to use by cows and horses. Literature references showing CSS impacts due to grazing should also be referred to and discusses.

Response

Livestock grazing has been ongoing onsite for several decades, and the current condition of onsite vegetation is directly related to this ongoing activity. Onsite ephemeral ponds have also been in place for several decades and are a direct result of livestock grazing activities. These conditions are discussed in Sections 2.0. 3.0 and 4.7 of DEIR 566.

USFWS-35

Comment

6-4, and continuing. The discussion of biological resources impacts is cursory, allowing extremely limited comparison opportunity among the alternatives. A detailed matrix chart of alternatives versus type and amount of habitat impact (e.g., CSS, Riverside fairy shrimp) would help to synthesize the data. However, it appears that alternative three, the 100 unit alternative on 32 acres, would directly avoid seven of the eight ponds occupied by Riverside fairy shrimp, most of the loss of CSS habitat, as well as minimize impacts to wildlife movement

Response

DEIR 566 assumes worst case scenarios with regard to biological resources although the document relies upon previous surveys, i.e. 1993 and 1994, the DEIR assumes the presence of various species habitat on the project site. Impact analysis contained within the Alternatives Section of the DEIR, is less detailed than for the analysis of the proposed project, and along with the detailed site plans provided for each alternative, allows for a specific comparison of biological impacts The comment relating to Alternative three is correct and is acknowledged.

USFWS-36

Comment

8-1. The Inventory of Unavoidable Adverse Impacts should include the amount of CSS loss and the likely "take" of gnatcatchers.

Response

The discussion on Page 8-1 of the DEIR, includes the direct loss of coastal sage scrub. Please see response to comment USFWS-24, and Section II of this document, Corrections and Additions to the DEIR.

USFWS-37

Comment

Appendix C, Notice of Preparation (NOP), page 3. Note that our joint Wildlife Agency NOP commented about "plant/Animal Life."

Response

The comment has been noted

USFWS-38

Comment

Appendices D (conceptual Wetland Mitigation Plan) and E (Conceptual Upland Mitigation Plan) were missing from Appendix "H", the Biological resources Assessment prepared by Sweetwater Environmental Biologists, Inc. The Assessment is a draft, dated March 20, 1997. If an updated version is available, include it in the revised DSEIR.

Response

Appendix H does not include a Conceptual Wetlands Mitigation Plan or a conceptual Upland Mitigation Plan. These documents were associated with the project evaluated in DEIR 561.

USFWS-39

Comment

In conclusion, the DSEIR is inadequate. Major revisions and additions are needed, including completion of updated field surveys and a literature search. for example, the gnatcatcher discussion should include a description and analysis of the regional distribution of CSS, gnatcatcher, and cactus wrens, in relation to the project area. Vegetation maps and species locations in both digitized and hardcover format are available from the County of Orange.

The Wildlife Agencies anticipate that the issues discussed above will be included and addressed in any additional CEQA documents and be presented to the Wildlife Agencies for review and comment. Until the impact assessment and mitigation recommendations are revised to respond to our concerns, the Wildlife Agencies recommend against certification of the DSEIR as currently proposed.

Response

Please see response to comments USFWS-1 through USFWS-38

USFWS-40

Comment

The Wildlife Agencies appreciate working with the County on NCCP conservation planning issues. Lands within the proposed project area are important in conservation planning for the Southern Subregion NCCP Reserve in Orange County. An improperly implemented project would permanently destroy the integrity of the linkage between the Subregional reserves. If you have any questions or comments please contact Liam H. Davis, NCCP Associate Wildlife Biologist (Department) at 619-467-4207 or Robert Hames, Fish and Wildlife Biologist (Service) at 760-431-9440.

Response

The comment is noted. Please see response to comments USFWS-1 through USFWS-38.

COMMENTS AND RESPONSES - CITY OF MISSION VIEJO
Karen Steele Verlaan, Senior Planner, August 11, 1996

CMV-1

Comment

The City of Mission Viejo is in receipt of the subject Draft EIR and understands the project as proposed to consist of phased development of 705 manufactured single family housing units and a 1.5 acre, neighborhood commercial center and associated infrastructure, on a 222.23 acre site on the easterly site of El Toro Road in the unincorporated territory of the County of Orange. The gross residential density is 3.17 dwelling units per acre, with minimum lot sizes of 2,630 square feet. Fourteen (14%) percent of the project site is proposed to remain in undisturbed, natural open space and 57.6% of the site will remain in total open space. In addition to the residential component, the project also proposed eight private park sites, regional riding/hiking trail connections, and a construction of a water tank site dedicated to and accepted b, the Trabuco Canyon Water District. Project implementation requires approval of grading plan. The grading permit application (GA960048), the project subject of this Draft Environmental Impact Report, is based on Tract 10692, which was recorded December 16, 1988.

The project site is located within the Foothill/Trabuco Specific Plan and the Aliso Creek Corridor Specific Plan, and is located approximately one-half mile south of the El Toro Road/Live Oak Canyon Road intersection. Implementation of the proposed project would directly effect 191.39 acres of the project site, including remedial grading and fuel modification requirements and 19 77 acres offsite, for a total impact area of 211.16 acres.

A total of 2.6 million cubic yards of conventional grading and 8.9 million cubic yards of remedial grading would be required to implement the project.

Response

The comment is noted and restates information contained within the DEIR. No response is required.

CMV-2

Comment

The City of Mission Viejo has the following comments on DEIR 566 for the Saddleback Meadows Project·

General Comments
The city of Mission Viejo is concerned with the numerous unavoidable adverse impacts of the subject project. These impacts are as follows:

1. Gross land use compatibility with (1) O'Neill regional Park, (2) the Ramakrishna Monastery;, and (3) St. Michael's Abbey;

2. Major landform alteration /modification including cut and fill slopes up to 120 ft. in height;

3. Loss of 154.13 acres of onsite habitat and reduction of native habitats and sensitive and non-sensitive species dependent on those habitats, including (1) southern sycamore woodland, (2) coast live oak woodland, (3) coastal sage scrub, (4) mulefat scrub, and (5) ephemeral ponds;

4. Project and cumulative contribution to regional adverse air quality conditions, since the project is located in a non-attainment area with incremental increase in air pollution as a result of vehicle emissions;

5 Increased traffic and urban activity resulting in increased noise in the area:

6. Loss of Riverside fairy shrimp habitat (ephemeral ponds) and individuals, a federally listed endangered species; and

7. Urban landform visual impacts to (1) O'Neill Regional Park, (2) Ramakrishna Monastery, and (3) St. Michael's Abbey.

Response

The comment is noted and restates impact information quantified and analyzed in the DEIR. Please refer to Section 8.0 of the DEIR, Inventory of Unavoidable Adverse Impacts.

CMV-3

Comment

Transportation Comments

1. DEIR Transportation Analysis·

There appears to be a major discrepancy in the Draft EIR's discussion and analysis of the transportation/circulation impacts resulting from the proposed project. This discrepancy needs to be reconciled and corrected in a revised Draft EIR document.

As background, transportation/circulation impacts are summarized and presented in Volume 1 of Draft EIR 566. The basis of the Volume 1 discussion is stated to be a project-specific traffic study that is referenced and included in Volume 3 of Draft EIR· Appendix F.

Volume 1 states that the proposed project will generate 6,220 trip ends per day, with 345 vehicles per hour during the AM peak hour and 635 vehicles per hour during the PM peak hour. In contrast, the traffic study appendix states that the proposed ;project will generate

8,340 trip-ends per day, with 540 vehicles per hour during the AM peak hour and 825 vehicles per hour during the PM peak hour. This represents a difference of (1) more that thirty percent on a daily basis; (2) more than fifty percent for the AM peak hour analysis; and (3) thirty percent for the PM peak hour analysis.

This inconsistency is carried forth into the specific tables and exhibits of the respective document, where average Daily Traffic forecasts from Existing through Year 2000 to buildout differ between the two documents. For example, page 4-56 of Volume 1 states that the project ADT's along El Toro Road in the vicinity of the site do not exceed 30,000 vehicles per day. However, the traffic study in Appendix F Volume 3, identified that segments of El Toro Road do exceed 30,000 trips per day easterly of the Foothill Transportation Corridor.

Also, even though there is inconsistency between the two volumes on reported ADT and peak hour trips, the Intersection Capacity Utilization (ICU) and Levels of Service (LOS) calculations seem to be similar between the two documents. A Revised Draft EIR needs to explain which trip generation was used for the ICU Levels of Service calculations, and the DEIR analysis needs to be carefully reviewed to accurately present the transportation impacts of the proposed ;project. In particular, the City of Mission Viejo will be reviewing the specific impact of project trips on the El Toro Road/Glenn Ranch Road intersection and the Marguerite Parkway/El Toro Road intersection, to determine any potential impacts and require any mitigation to maintain a Level Service "D" performance standard, as required by the Measure M Growth Management Program.

Response

The comment is noted. During the preparation of the DEIR, numerous meetings were held between the County of Orange, Traffic Engineering Division and the project applicant to discuss the trip generation rate for manufactured housing, since it is not a standardized land use resulting in a typical trip generation factor. The statement in Section 4.4.3 of the DEIR, on Page 4-52, under *Traffic Impact Modeling* is a typographical error, based on an outdated generation rate, and should read as follows: *The proposed project is projected to generate approximately 8,340 trip-ends per day with 540 vehicles per hour during the AM peak hour and 825 vehicles per hour during the PM peak hour.* Please refer to Section II of this document, Corrections and Additions to the DEIR. All other traffic impact assessment data is consistent with the actual technical traffic study contained in Appendix F of the DEIR.

CMV-4

Comment

2. Project Trip Generation:
The project traffic study identifies a residential trip distribution assumption wherein twenty-five percent of the daily traffic would enter/leave the project site using El Toro Road north of the project entrance, and twenty percent continuing along Santiago Canyon Road. The city of Mission Viejo believes this assignment is high. Please clarify the land uses that exist or are proposed north of the project site that would cause one-quarter of the project daily trips to

use this segment of El Toro Road, versus using El Toro Road south of the project site to access freeways, major highways, and public facilities. A review of the Draft EIR school assumptions, for example, shows that school attendance is programmed for facilities located in Mission Viejo, Rancho Santa Margarita, and Trabuco Canyon.

The assumptions used in the project trip distribution would have a resultant impact on analyzed intersections south of the project entrance to El Toro Road, and in particular would increase Intersection Capacity Utilization (ICU) calculations if a greater percentage of project trips were assigned southerly along El Toro Road.

Response

The distribution of project related traffic generation onto the surrounding circulation system is based on a variety of factors including existing travel patterns near residential areas and has been reviewed and approved by the County of Orange, Traffic Engineering Division. As this is a planning document the distribution is of necessity and the study assumes that the majority of traffic will be oriented to the south/west of the site.

CMV-5

Comment

3. El Toro Road:
El Toro Road is classified as a Major Arterial Highway on the Orange County Master Plan of Arterial Highways (MPAH). A Major Arterial is defined as a six-lane highway with a divided median The City of Mission Viejo is currently preparing improvement plans to construct El Toro Road to its master plan configuration of a *six-lane, Major Arterial facility*

Although not specifically stated, the Draft EIR seems to indicate that El Toro Road should be reclassified from a six-lane facility to a four-lane facility, The City of Mission Viejo offers the following comments:

a. The reclassification of El Toro Road from a six-lane Major Arterial to a four-lane Primary Arterial requires the County of Orange to process and MPAH amendment, with the amendment ultimately being approved by the Orange County Transportation Authority (OCTA) board of directors.

It is the City's understanding that such an amendment has not yet been filed with OCTA. Please clarify how the timing of the El Toro Road MPAH reclassification, if proposed by the County of Orange, juxtaposes with the approval of Saddleback Meadows project application(s). Since the DEIR serves as an environmental assessment for the Saddleback Meadows recorded tract map, please clarify whether the right-of-way for El Toro Road has already been reserved for an ultimate six-lane or four-lane facility.

b. The OCTA MPAH guidance manual identified that a multi-jurisdictional, cooperative process will be pursued with any MPAH amendment that affects more than one jurisdiction.

In conjunction with that process, technical data will be prepared and reviewed by Growth Management Area (GMA) forums to determine whether there is consensus on the proposed amendment. Also in conjunction with that process, and environmental assessment of the MPAH amendment must be completed.

Recognizing that the Saddleback Meadows DEIR is being processed in advance of a requested MPAH amendment, a multi-jurisdictional consensus of the El Toro Road reclassification has not yet been achieved. Technical issues may surface through the MPAH cooperative study process that have not yet been identified in the Saddleback Meadows DEIR. Further, inconsistencies on project daily traffic volumes are already present in the Draft EIR. The City of Mission Viejo recommends that the transportation analysis in the Saddleback Meadows DEIR should *not* serve as the environmental documentation for the MPAH reclassification of El Toro Road, unless agreed to by representatives of the cooperative study process.

c. The City of Mission Viejo continues to retain El Toro Road, within its jurisdictional boundaries, as a six-lane Major Arterial facility. The jurisdictional boundary between the City of Mission Viejo and the County of Orange generally lies immediately east of the Glenn Ranch Road intersection at El Toro Road.

Response

Year 2020 projected traffic conditions, with the implementation of all circulation system improvements outlined in the DEIR, indicate that El Toro Road, widened to four through travel lanes north of the Foothill Transportation Corridor would result in all intersections with El Toro Road operating at level of service D or better. It is understood that redesignation of El Toro Road from a Major Arterial (6 lanes) to a Primary Arterial (4 lanes) requires an amendment to the MPAH. This amendment has not been filed by the County to date. Certification of this EIR as well will not preclude the ability to construct El Toro Road to its MPAH designation.

CMV-6

Comment

4. Glenn Ranch Road/El Toro Road Intersection Improvements:
In reviewing the Intersection Capacity Utilization (ICU) projections for the Glenn Ranch Road/El Toro Road intersection, the City of Mission Viejo is concerned that the Glenn Ranch Road/El Toro Road intersection could become a bottleneck as one transitions, north to south, from a four-lane facility to a six-lane facility. This intersection must be guaranteed for maximum feasible improvement to insure that Level of Service "D" performance standard is maintained, in compliance with Measure M Growth Management Program requirements.

The County of Orange will need to be an active participant in the maximum feasible improvement to the Glenn Ranch Road intersection, since:

a The DEIR identifies that seventy-percent (75%) of the project trips will use this intersection, and the intersection will experience Levels of Service F sometime between Year 2000 and Year 2020 performance unless roadway improvements are appropriately phased. The timing of El Toro Road improvements is important because the project traffic study identifies that El Toro Road can remain a two-lane facility through project build-out.

b. The County of Orange will be deeded a 7.710 acre parcel for open space purposes from the Mission Viejo Company. This parcel (a portion of Parcel 4 of PM 89-115) is located south of El Toro Road and immediately west of the Glenn Ranch Road intersection (see attached Exhibit). The City of Mission Viejo will require that appropriate rights-of-way be secured along the open space parcel frontage to achieve a major arterial cross-section and intersection improvements to Glenn Ranch Road that meet projected traffic demand.

Response

The comment is noted

CMV-7

Comment

5 El Toro Road Mitigation Measure AM4-16:
Mitigation Measure AM4-16 states that "north of the Foothill Transportation Corridor, El Toro Road can accommodate projected traffic volumes with the proposed project on four travel lanes divided by a raised to striped median. Implementation of a full Major Arterial cross-section is not needed to serve future traffic volumes. This alternative section represents a modification of the typical cross-section for a Primary Arterial. Appropriate transitions would be required between this cross-section and other modified cross-sections along El Toro Road south of Glenn Ranch Road."

As identified above, the City of Mission Viejo is improving El Toro Road as a six-lane facility from the FTC to Glenn Ranch Road, consistent with its MPAH arterial designation. The City of Mission Viejo recommends that Mitigation Measure AM4-16 include reference that the City of Mission Viejo review and participate in the County of Orange's development if improvement plans for El Toro Road, to insure that·

- El Toro Road is phased and constructed to achieve a roadway cross-section that effectively transitions to the proposed interim two-lane facility;

- El Toro Road can transition from a six-lane facility in the City of Mission Viejo to a four-lane facility in county unincorporated area, while achieving a Level of Service "D" performance standard at the Glenn Ranch Road/El Toro Road intersection through Year 2020.

Response

Please refer to response CMV-5. Additionally, improvement plans which are adjacent to City boundaries will be forwarded to the City for review and comment.

CMV-8

Comments

6. Inventory of Assumed Circulation Improvements:
The project traffic study--Appendix F--identified a Year 2020 scenario in which levels of service at a City of Mission Viejo intersection is projected at Level of Service "F" Marguerite Parkway at El Toro Road. The city's performance standard is Level of Service "D".

The Draft EIR should be revised to include a mitigation measure that requires the applicant to assess, calculate and provide a fair-share contribution to transportation/circulation improvements at all impacted City of Mission Viejo intersections.

In addition, the County of Orange proposed, thorough this project (DEIR), the Year 2020 improvement program of northbound dual right turn lanes at the Marguerite Parkway (NS)/El Toro Road (EW) intersection This proposed improvement is not acceptable to the City of Mission viejo. The City of Mission Viejo does not have any intersection with dual right-turn lanes, and recommends that the Draft EIR analyze an alternative improvement program that will mitigate the Level of Service "F" condition.

Response

The proposed project will be conditioned to contribute to several roadway fee programs as outlined in Table 12 on Page 4-51 of the DEIR. Total road impact fees amount to $ 8,044 per dwelling unit and $8.34 per square foot of commercial land use.

Dual right turn lanes at the intersection of El Toro Road and Marguerite Parkway is an acceptable mitigation to mitigate unacceptable turning movement volumes and related intersection level of service values. Other mitigation measures, which would result in similar mitigation of adverse turning movement volumes and intersection level of service values include the addition of a free right turn lane and/or application of emerging intersection signalization control technologies.

CMV-9

Comment

This concludes the City of Mission Viejo comments on the Saddleback Meadows Project Draft Environmental Impact Report (DEIR 566). The City of Mission Viejo is also reviewing the June 1997 Draft EIR No. 565 for Live Oak Plaza Project. As a result of our technical review of the Draft EIR, the City may raise additional comments or request clarification on

certain issues such as transportation and other areas where there may be inconsistencies in findings or analyses. Thank you for the opportunity to comment on the document. The City would like Response to Comments on the DEIR as soon as they are available.

Response

The comment is noted. The City of Mission Viejo will be provided with a copy of the Response to Comments document in accordance with CEQA requirements.

COMMENTS AND RESPONSES - BOWIE, ARNESON, KADI, WILES & GIANNONE, August 11, 1997

BAKWG-1

The Trabuco Canyon Water District is in receipt of the above-referenced Draft Subsequent Environmental Impact Report (the "DEIR") prepared in regard to the Saddleback Meadows Recorded Tract Map No. 10692, Grading Application GA960048 (the "Project"). Our firm represents the District as general legal counsel. The District, having reviewed the DEIR, and having consulted with us, has requested our firm to provide your office with the comments set forth herein. It is the District's understanding that the Project will involve the phased development of 705 manufactured single family residential units and a 1.7 acre neighborhood commercial center on a 222.23 acre site This seems to correspond, generally, to the final tract map (Tract 10692) approved by the County of Orange (the "County") on 1988. However, the District has not been provided with updates of the plans for the Project and, as such, all of the comments submitted with this letter should be interpreted in that light.

The purpose of this letter is to provide to the County, on behalf of the District, various comments and matters relating to the Project, the potential impacts of the Project on the facilities of the District and the District's requested mitigation measure.

Response

The comment indicates that Bowie, Arneson, Kadi, Wiles & Giannone represents the Trabuco Canyon Water District relative to providing comments on DEIR 566. No response is necessary.

BAKWG-2

Comment

Request for Notices

Pursuant to the provisions of the California Environmental Quality Act ("CEQA") and Public Resources Code Section 21092.2, the District hereby requests that copies of all notices and other documents mailed in relation to the above-referenced Project (specifically including, but not limited to, environmental review notices) be furnished both to the District and the undersigned. If there are any fees and charges required for the provision of such notice(s), please provide our office with an invoice for such costs and we will reimburse the appropriate County department. This request for notice specifically includes, but is not necessarily limited to, notices of all hearings, proposed actions to be taken with regard to the development process and, in particular, any Notice of Determination prepared, furnished or filed with regard to this Project.

Response

The comment is noted. Bowie, Arneson, Fadi, Wiles & Giannone has been added to DEIR 566 mailing list.

BAKWG-3

Comment

Background Information

We have reviewed various referenced to the Trabuco Canyon Water District, and the District's water and wastewater (sewer) facilities contained within the DEIR. In regard to such matters, we would note the following additional facts which are important for a full and complete understanding of the District's background in providing the comments set forth below. The DEIR correctly notes that two improvement agreements were entered into between the prior owner of the property and District dated September 21, 1988 (see further discussion below). It is relevant to note that in connection with those improvement agreements two performance bonds were posted in order to secure the construction of the relevant water and sewer facilities a s required by the terms of those agreements.

The DEIR correctly notes that the District's Capital Improvement Charges ("CICs"), based on 705 residential units, were paid to the District. Those Capital Improvement Charges are levied as part of the District's master financial and facilities planning. Funds from the CICs were expended on various District-wide and master planned facilities is order to be able to furnish water service and water capacity to the property within Tract 10692 (the "Property").

Wastewater (sewer) treatment capacity was purchased in the Santa Margarita Water District ("SMWD") Chiquita Wastewater Treatment System by way of a pass-through payment made by the former property owner to the District and then paid to SMWD. It should be noted that the SMWD Chiquita Wastewater Treatment System is owned and operated by SMWD, and not TCWD. Specified wastewater treatment capacity (based on 705 residential units) was paid for in the Chiquita system and is now available to provide wastewater treatment service for the Property. The major wastewater trunk sewer and downstream lift station facilities were financed for the benefit Property by means of assessment district proceedings pursuant to the relevant provisions of the California Streets and Highways Code. Assessment district No. 5R of the Trabuco Canyon Water District is currently in place and levies assessments on the Property (as well as other properties within the boundaries of the Assessment District). The major trunk sewer and downstream lift station facilities financed through the Assessment District proceedings (and bonds issued by Assessment District No. 5R secured through the levy of assessments) have been constructed. These are available to provide service to the property based on 705 residential units. However, the related facilities for this Property, identified in the improvement agreements, were not finance and have not been constructed as of this date.

As noted above, the District entered into onsite and master plan improvement agreements

relative to the Property (collectively the "Improvement Agreements"). copies of the Improvement Agreements are attached to this letter as Attachments "A" and "B" and incorporated herein by this reference. The Improvement Agreements were entered into pursuant to TCWD's Rules and Regulations which require improvement agreements to be entered into before the District will authorize, or sign off on, any tract map. Correspondingly, TCWD's approval of Tract Map No. 10692 was expressly conditioned on the terms and conditions of the Improvement Agreements. The Improvement Agreements were subsequently assigned, with the District's consent, to a subsequent owner of the Property.

Subsequently, the prior owner of the Property (to whom the Improvement Agreements had been assigned) filed for bankruptcy with the Federal Bankruptcy Court. As a result of prolonged bankruptcy proceedings, the Improvement Agreements, and the corresponding performance bonds, were rejected by the debtor and this action was apparently sustained in the bankruptcy court. Corresponding, the Improvement Agreements are now ;of questionable enforceability and the performance bonds have lapsed. Any building or District service assumptions based on the terms of those Improvement Agreements, or dependent on them, are thus suspect until new agreements with the District are reached. In this regard we would specifically note that the District's Rules and Regulations (see Government Code Section 31024) require improvement agreements to be into in order for the District to approve tract maps and for the District to provide water and wastewater service to any property within its boundaries. The District previously requested of California Quartet (the then-property owner) to undertake negotiations relative to entering into new improvement agreements relative to the Property No response to those entreaties has been received by the District.

Response

The comment relating to the Chiquita Canyon Wastewater Treatment System being owned by the Santa Margarita Water District is acknowledged. It should be noted that the Chiquita Canyon Wastewater Treatment Plant has been constructed and has been operational for several years. Please refer to Corrections and Additions to the DEIR, contained in Section II of this document. The applicability and enforceability of existing improvement agreements between Trabuco Canyon Water District and the applicant are not applicable to a discussion of the environmental effects of the proposed project.

BAKWG-4

Comment

Water Distribution Facilities

As referenced above, the District has undertaken construction and completion of various master plan facilities in order to provide adequate water and water capacity to the Property. As noted, the District's Capital Improvement Charges were previously paid and satisfied in the identified amount. District master plan facilities have been sized based on the Property including 705 residential units. However, the District would note that it has not been provided with current improvement plant and therefore cannot state, at this time, that all

necessary water capacity for non-residential and irrigation needs is available. A re-evaluation of the Project, form an engineering perspective, by the District would be appropriate before definitive plans are finalized.

Also noted above, the Improvement Agreements relative to both master plan and in-tract water distribution facilities, including, but not limited, the water booster station identified in the DEIR, have lapsed and security for those agreements was rejected by action of the bankruptcy court. The specific facilities necessary in order to provide water transportation and distribution service within the boundaries of the Property were identified in those two (2) Improvement Agreements and are specifically enumerated in the improvement plans which were filed with the District and in the cost breakdowns which are included as part of the master plan agreement exhibits. Correspondingly, unless the Improvement Agreements are renegotiated and agreed to by the applicant, as required by the District's Rules and Regulations, and the water transportation and distribution facilities necessary in order to provide water service to the Property are designed, constructed, installed, funded and dedicated to the District as required under the District's Rules and Regulations and the previous improvement plans, the District will not be able to undertake to provide water service to the Property. The inability of the District to provide water transportation and distribution within the Property would constitute a potentially significant adverse environmental impact which would result from the Project unless adequately mitigated. Basic mitigation measures are stated within the DEIR, however, the District specifically requests that, in regard to water transportation and distribution facilities, the following mitigation measures be added to the DEIR:

1. Prior to undertaking construction of the Project the applicant shall enter into an improvement agreement(s) with the District to provide for the design, construction, installation, funding and dedication of all necessary master plan and in-tract water transportation and distribution facilities (Specifically including, but not limited to, a water booster station) as required under the District's Rules and Regulations and the tract map approval for Tract No. 10692; and

2. Pursuant to the aforementioned improvement agreement(s) and prior to receiving a certificate of occupancy for any structures located upon the Property, the applicant shall have completed, at its cost and expense, all design construction, installation, funding and dedication of master plan and in tract water transportation and distribution facilities as required under the District's Rules and Regulations and the tract map approval for Tract No. 10692.

Response

The referenced mitigation measures which are contractually required by the previous improvement agreements are reaffirmed as mitigation measures and hereby incorporated into DEIR 566. Please refer to Section II, Corrections and Additions to the DEIR.

BAKWG-5

Comment

The comments with regard to water distribution facilities, above, are generally applicable relative to water storage facilities in the context of the District Water storage facilities are important for the reasons of reserve water capacity, cost efficiency, fire fighting, emergency supply and system balancing.

Pursuant to determinations by the District's Board of Director, and the Rules and Regulations of the District, developers of property within the District's boundaries are required to either build and dedicate water storage facilities according the District's Rules and Regulations and standard specifications in order to provide stated levels of water storage capacity for the respective development or required to pay In-Lieu Water Storage Capacity Fees. Under the previous Improvement Agreements it was anticipated that the developer (the applicant) would in fact be building and dedicating water storage facilities to the District rather than pay the District's In-Lieu Water Storage Fee(s). It appears, based upon the description in the DEIR, that this is still intended.

On Page 3-9 of the DEIR it is indicated that the water storage tank will be constructed by the District. This is fact not the case. The prior Improvement Agreements and the District's Rules and Regulations, specify that master plan and in-tract facilities (including water storage facilities) which are to be constructed in order to service new development within the District are required to be constructed at the cost and expense of the applicant and in accordance with specified construction requirements, including, but not limited to, the District's standard specifications.

Also noted above, the Improvement Agreements relative to both master plan and in-tract water storage facilities, including, but not limited, the water reservoir identified in the DEIR, have lapsed and security for those agreement s was rejected by operation of the bankruptcy court. The specific facilities necessary in order to provide water service within the boundaries of the Property were identified in those two (2) Improvement Agreements and are specifically enumerated in the improvements plans which were filed with the District and in the cost breakdowns which are include as part of the master plan agreement exhibits. Correspondingly, unless the ;Improvement Agreement are renegotiated and agreed to by the applicant, as required by the District's Rules and Regulations, and the water storage facilities necessary in order to provide water service to the Property are designed constructed, installed, funded and dedicated to the District as required under the District's Rules and Regulations and the previous Improvement Plans, the District will not be able to undertake to provide water service to the Property. The inability of the District to provide adequate water storage with regard to the Property would constitute a potentially significant adverse environmental impact which would result from the Project unless adequately mitigated. Basic mitigation measures are stated within the DEIR, however, the District specifically requests that, in regard to water storage facilities, the following mitigation measures be added to the DEIR:

1. Prior to undertaking construction of the Project the applicant shall enter into an improvement agreements(s) with the District to provide for the design, construction, installation, funding and dedication of all necessary master plan and in-tract water storage facilities or, alternatively, pay the District's In-Lieu Water Storage Fees, as required under the District's Rules and Regulations and the tract map approval for Tract No. 10692; and

2. Pursuant to the aforementioned improvement agreement(s) and prior to receiving a certificate of occupancy for any structures located upon the Property, the applicant shall have completed, at its cost and expense, all design, construction, installation, funding and dedication of master plan and in-tract water storage facilities as required under the District's Rules and Regulations and the tract map approval for Tract No. 10692.

Response

Please refer to response to comment BAKWC-3. The referenced mitigation measures which are contractually required by the previous improvement agreements are reaffirmed as mitigation measures and hereby incorporated into DEIR 566. Please refer to Section II, Corrections and Additions to the DEIR.

BAKWG-6

Comment

Wastewater (Sewer) Facilities

The comments relative to alter distribution facilities, in the context of the Improvement Agreements, are generally applicable to wastewater (sewer) facilities relative to the District. The existence and operational readiness of wastewater collection, transportation and treatment facilities is necessary to satisfy health and safety requirements of occupancy of development in California.

As noted above, wastewater treatment capacity has been purchased in the SMWD Chiquita Waster Water Treatment Facilities. The major wastewater trunk sewer and downstream lift station facilities for the Property have been financed and constructed However, certain in-tract and master plan wastewater collection and transportation facilities, identified in the Improvement Agreements, and in the improvement plans filed with the District, have not yet been constructed. In this regard, the District would reference the previously approved improvement plans and the exhibits to the Improvement Agreements.

As also noted above, the Improvement Agreements relative to both master plan and in-tract wastewater facilities have lapsed and security for those agreements was rejected by operation of the bankruptcy court. Correspondingly, unless the Improvement Agreements are renegotiated and agreed to by the applicant, as required by the District's Rules and Regulations, and the wastewater facilities necessary in order to provide wastewater service

to the Property are designed, constructed, installed, funded and dedicated to the District as required under the District' Rules and Regulations and the previous Improvement Plans, the District will not be able to undertake to provide wastewater service to the Property. The inability of the District to provide adequate wastewater service with regard to the Property would constitute a potentially significant adverse environmental impact which would result from the Project unless adequately mitigated. Basic mitigation measures are stated within the DEIR, however, the District specifically requests that, in regard to wastewater facilities, the following mitigation measures be added to the DEIR:

1. Prior to undertaking construction of the Project the applicant shall enter into an improvement agreement(s) within the District to provide for the design, construction, installation, funding and dedication of all necessary master plan in-tract wastewater facilities as require under the District's Rules and Regulations and the tract map approval for Tract No. 10692, and

2. Pursuant to the aforementioned improvement agreements(s) and prior to receiving a certificate of occupancy for any structures located upon the Property, the applicant shall have completed at its cost and expense, all design, construction, installation, funding and dedication of master plan in-tract wastewater facilities as required under the District's Rules and Regulations and the tract map approval for Tract No. 10692.

Response

Please refer to response to comment BAKWG-3. The referenced mitigation measures which are contractually required by the previous improvement agreements are reaffirmed as mitigation measures and hereby incorporated into DEIR 566. Please refer to Section II, Corrections and Additions to the DEIR.

BAKWG-7

Comment

<u>Financing of Water and Wastewater Facilities</u>

Previously, the district undertook discussions with prior property owners relative to potentially providing financing for water and waste water facilities which needed to be constructed for the benefit of the Property,. These financing were separate and apart from the assessment district financing referenced above. In this regard it was previously proposed to use financing under the Mello-Roos Community Facilities Act of 1982, as amended (the "Act"). However, previous developers did not pursue this means of financing. The District Continues to be willing to discuss financing options relative to the water and wastewater facilities, but believes that the previous proceedings undertaken pursuant to the Act are most likely not viable for application to the current facilities at this time.

In regard to the Improvement Agreements the District notes that certain dollar figures of the construction of the facilities were provided in the exhibits and the referenced performance

bonds. the District would note that nearly a decade has passed since these agreements were signed and as such, the cost to design, construct, install and dedicate the water and wastewater facilities, each as referenced above, is probably significantly increased from the figures previously used. Adequate financing for water and wastewater facilities should be secured in order to ensure that they will be designed, constructed, installed and dedicated to the District in a timely manner relative to the developmental process.

Response

Please refer to response to comment BAKWG-3.

BAKWG-8

Comment

Master Plan Update

The District would note that it is currently in the process of reviewing its Master Plan water and wastewater facilities. This may also have consequences for the District's overall financing master plan. the engineering review and evaluation of the District's Master Plan may result in some reevaluation of engineering presumptions and system requirements. At this time the District is still in the early stages of planning its Master Plan review and as such cannot provide definitive information as to any changes or reevaluations that may occur as a result of this process. However, the District notes that this matter, inasmuch as, if the planning and development process for the Project is significantly delayed, additional information and figures may become available from the District.

Response

The comment is noted. Any additional information available from the Trabuco Canyon Water District will be incorporated into DEIR 566 to the extent feasible.

BAKWG-9

Comment

Conclusion

In light of the foregoing, the District notes that the Project has the potential to impact the infrastructure facilities and systems of the District. Such mitigation are principally related to the availability of facilities, their construction, installation, dedication and acceptance prior to occupancy of any development on the property and related matters. Such potential impacts can be mitigated by way of the above suggested mitigation measures. Provided that such mitigation measures are undertaken the District has no objection to the Project. However, the District specifically notes that a failure to provide the above-requested mitigation measures could result in an adverse environmental impact(s) as a result of the Project. In

such case, the District reserves its rights to protest the proceedings pursuant to Public Resources Code Section 21177 and to undertake all other legal remedies available to do it.

The District specifically requests that the County of Orange, including the County Environmentally and Project Management Services Department Carefully review the above-referenced comments and that those comments be considered as part of the environmental process for the Project.

If you have any questions regarding this matter, please do not hesitate to contact our offices. We would be pleased to provide you with any additional information you may require.

Response

The comment is noted. Please refer to response to comment BAKWG-1 through BAKWG-8.

COMMENTS AND RESPONSES - THE ORANGE COUNTY TRANSPORTATION AUTHORITY (OCTA)/Ben Jarvis, Associate Transportation Analyst, August 11, 1997

OCTA-1

Comment

The Orange County Transportation Authority (OCTA) has reviewed the Saddleback Meadows Recorded Tract Map 10692, Grading Application GA960048. OCTA has no comments at this time.

We appreciate the opportunity to provide input on this project. If you have further questions or need additional information, please call me at 714/560-5786.

Response

The comment is noted. No response is required.

COMMENTS AND RESPONSES - Kimberly A. Stocking, August 11, 1997

Comment

I am submitting this letter to comment on the proposed 705 unit mobile home park on the Saddleback Meadows stie. Not long ago approval was being sought for 318 houses on this site. Why it was not passed I don't understand. Now we are having to deal with the thought of an extremely large number of mobile homes in our very secluded and tranquil area. I was in favor of the 318 homes and even toured the site when they opened it to the public last year to show what they were proposing. Believe me my first choice would be to leave it untouched and unbuilt so we could continue to view the beautiful hillside of our rural area. But if something must be built lets have it be fewer homes with a much more aesthetic appearance that fits into the already existing areas surrounding it. Also, my concern is if 705 units are brought on-site where are all these children going to go to school? Portola Hills Elementary is already at full capacity and measures have had to be taken to accommodate its student load.

I will be following the developments and can only pray that the Planning and Development Service Department along with the County Supervisors will make fair and knowledgeable decisions regarding this 222-acre rural canyon site.

Response

Please refer to Section 3.0 (Project Description) in DSEIR 566 for a complete discussion of the project description. School impacts are evaluated in Section 4.12 of the DEIR. Please also refer to response to comment SVUSD-1.

COMMENTS AND RESPONSES - TPG MANAGEMENT, H. Pike Oliver, August 12, 1997

TPG-1

Comment

On behalf of the project applicant, California Quartet, Ltd., we submit the following comments on Draft Subsequent Environmental Impact Report No. 566, Saddleback Meadows Recorded Tract Map 10692, Grading Application GA 960048, prepared by Urban Vision for the Orange County Planning & Development Services Department.

Our review of Subsequent EIR 566 reveals that the project description should be supplemented to better satisfy provisions of the California Environmental Quality Act. We find it deficient in at least two respects: (1) it fails to discuss economic characteristics and supporting public service facilities relating to the project site; and, (2) it fails to reference the County Board of Supervisors recent (October 1996) failure and/or refusal to approve a reduced density project alternative in lieu of Recorded Tract Map 10692..

Please note that CEQA Guidelines Section 15124 provides that a project description "shall contain" [a] general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals if any and supporting public service facilities."

We consider Subsequent EIR 566 to be deficient because the project description on pages 3-1 through 3-2 fails to discuss certain significant economic characteristics of Tract Map 10692, and does not consider the supporting public service facilities for the project site paid for by California Quartet or its predecessors-in-interest. These economic characteristics and involved supporting public service facilities are discussed below.

When Tract Map 10692 was recorded in December of 1988, several contractual commitments were entered into by the predecessors-in-interest of California Quartet. These contractual commitments resulted in monies being expended for the construction of capital facilities, including a sewer treatment facility and related trunk lines that serve both Saddleback Meadows and its general vicinity.

One of the conditions of approval for Tentative Tract Map 10692 (Special Condition No. 22.), was that "[p]rior to recordation of each final map ... sewage treatment and disposal facilities will be available to serve all dwelling units. To facilitate this requirement, several subdivision improvement agreements were entered into prior to the recordation of the Final Map.

Response

The comment is noted. The DEIR does document both the supporting public facilities relating to the project site and the County Board of Supervisors recent denial of a 318-unit

residential alternative, as evaluated by DEIR 561. Section 3.2 of the DEIR, on Page 3-1, references the previously recorded tract map and lists all of the improvement plans that have been completed and undertaken associated with recordation of tract map no. 10692. In addition, detailed public facilities information ins contained within Section 4.13 of the DEIR, commencing on Page 4-233. Section 3.2 of the DEIR, beginning on page 3-2, states: *The project site can be presently services by sewer lines and treatment capacity predicated on the density authorized by Recorded Tract map 10692.*

Specific information pertaining to the recent County Board of Supervisors denial of the 318 unit proposal evaluated by DEIR 561 is contained in Section 3.2 of the DEIR, beginning on Page 3-2. The DEIR text states: *It is noted in DEIR 561 that though the 318 unit project was identified as "environmentally superior,* to the 705-unit project currently being proposed, the 318-unit proposal was denied. In addition, Table 3, on page 2-6 of the DEIR states: *October 22, 1996 - Board of Supervisors denied project and did not certify DEIR 561.*

TPG-2

Comment

The two subdivision improvement agreements relating to Master Plan Facilities and Onsite Water and Sewer Facilities for Tract Map 10692 were entered into between the Santa Ana Mountains County Water District, now known as the "Trabuco Canyon Water District" (the "District"), and Southmark Pacific Corporation ("Southmark"), a predecessor-in-interest to California Quartet. One of these agreements executed on September 21, 1988 between Southmark and the District is entitled "Agreement for Designing Construction of Master Plan Facilities, Tract No. 10692" ("MPFA"). The "RECITALS" portion of that agreement, regulations, required Master Plan Water and Sewer Improvements for the Property prior to providing water and sewer service The second subdivision agreement, entitled "Agreement for Construction of Onsite Water and Sewer Facilities, Tract No. 10692" ["Onsite Water and Sewer Facilities Agreement" ("OWSFA")], also executed on September 21, 1988 between Southmark and the District, required the construction and dedication of water and sewer facilities by the subdivider prior to the District's agreement to provide water and sewer service to the final tract Tract Map 10692 provided a zoning capacity density of 715 equivalent dwelling units ("EDUs").

Response

The comment is noted and is here incorporated into DEIR 566.

TPG-3

Comment

In February 1989, California Quartet's predecessor-in-interest paid $973,528.58 for the purchase of sewer treatment capacity rights for the project site in the District's Chiquita

Wastewater System Facilities (the "Chiquita Facilities"). These funds were used by the District to enlarge the Chiquita Facilities to accommodate the 715 EDUs zoned for the property. Thus, California Quartet, as a successor-in-interest, succeeded to all rights and liabilities flowing from the Tentative Tract conditions and subsequent above-described agreements for the purchase of sewer treatment capacity in the Chiquita Facilities for the benefit of the authorized development density of the property

Additionally, California Quartet's predecessor-in-interest was required to pay the District's Capital Improvement Charges ("CICs"). The District's CICs in effect then were $1,265.00 for each equivalent dwelling unit. The CICs for 715 dwelling units totaled $904,475.00. The District's CICs were, and are, imposed on all development within the District in accordance with the District's Master Plan, including the Water and Wastewater Master Plan, the Financial Plan and the District's Impact Fee Structure. The CICs that were paid were deposited in the District's fund and earmarked for capital improvement of water facilities, which have subsequently been constructed.

Response

The comment is noted. The issue of fee payments is beyond the scope of the DEIR.

TPG-4

Comment

It should also be noted that California Quartet is required to pay an annual sewer/water assessment on each of Saddleback Meadows 705 legal lots. This assessment appears on individual property tax bills and totals $60,000 to $75,000 per year for the entire property. California Quartet has been making these assessment payments and paying its tax liability since the 1994-1995 tax year and has not been delinquent on any of these payments. In addition, California Quartet has paid (May 1997) all back taxes, assessments and penalties owed by its predecessor-in interest (approximately ± $1,025,000). Further, California Quartet's predecessor-in-interest made good faith payments for premiums on security and improvement bonds (with a face amount over $9,147,700) for improvements on the Property, in reliance on, and as a condition of the Tract Map 10692.

In sum, the project description should be supplemented as it presently fails to disclose that California Quartet, as a consequence of Tract Map 10692 approval, made substantial expenditures for water and sewage capacity and construction of capital facilities, and entered into contractual obligations to develop the property consistent with the authorized density of Tract Map 10692.

Response

The comment is noted. The issue of fee payments is beyond the scope of the DEIR.

TPG-5

Comment

Further, the County Board of Supervisors at the public hearing on October 22, 1996 on Zone Change Case No. 95-5 and Area Plan Case No. 95-7 failed to approve any of the project alternatives discussed in proposed FEIR No. 561, including Alternative No. 4, the 100 unit alternative. The project description also is inadequate because it fails to disclose this action, which indicates that the Board did not approve any of the nine reduced density alternatives to Tract Map 10692 that were analyzed in FEIR 561.

Response

The project description for DEIR 566 is not required to specifically discuss alternatives evaluated by a previous EIR, and their disposition as the result of project related public hearings. However, it should be noted, as documented in response to comment TPG-1, that DEIR does document Board of Supervisors actions relating to the proposed project and alternatives evaluated in DEIR 561.

TPG-6

Comment

Based on the above, to remedy deficiencies in the project description, subsequent EIR 566 must be revised and supplemented with more detail concerning the economic characteristics of, and public service facilities for, Tract Map 10692 and the Board's decision to reject all reduced density alternatives in lieu of Recorded Tract Map 10692.

Response

Please refer to Response to Comments TPG-1 through TPG-5.

COMMENTS AND RESPONSES - Wayne L. Brown, August 12, 1997

WLB-1

Comment

This project was a bad idea when it was originally corruptly approved, it has only become more evident over time what a poorly conceived project it is. Please consider the animal corridor rather than the pocket book of the proposed builder. After all the builder knew the history of the property when they bought it at "fire sale" prices. They knew about the specific plan that now protects the area from ill conceived plans. If the proposed builder did not know these things, then all the more reason to deny approval to such poor business people who would not have the foresight to research the property.

Response

Please refer to Section 4.7 of the DEIR for a complete discussion of wildlife movement.

COMMENTS AND RESPONSES - Amber Graves, August 12, 1997

AMG-1

Comment

I know this project was approved long before the specific plan came into existence, but because of the way it was originally approved I think it should be looked at like it were being submitted for the first time. This project does not fit in with the area, it leaves no way for the animals to migrate and will be built on ground that will easily slide even after removing tons and tons of dirt. Please deny this builders request.

Response

Please refer to DEIR Section 4.1 (Land Use), 4.2 (Geotechnical Hazards) and 4.7 (Biological Resources).

COMMENTS AND RESPONSES - Debra Moddelmog, August 12, 1997

DBM-1

Comment

Please consider the past history of this property when making a determination. From the fraud that led it to be originally approved, to the sliding slopes and buildings at the Abbey and including the animal corridor THIS IS NOT A GOOD IDEA. Please uphold the principals of the specific plan.

Response

A complete discussion of project history is contained in Section 2.4 of the DEIR. Please refer to Section 4.2 of the DEIR for a complete discussion of Geotechnical hazards and Section 4.7 for a discussion of project impacts to wildlife movement.

COMMENTS AND RESPONSES - Justin Watson, August 12, 1997

JW-1

Comment

What effect is this project going to have on the Abbey and the Monistary, this is part of Orange Countys Culture. Where can these places be relocated without builders taking away their serenity??

Response

Project related impacts to the Ramakrishna Monastery and Saint Michael's Abbey are documented in Sections 4.1 (Land Use) and 4.9 (Cultural Resources) of DEIR 566.

COMMENTS AND RESPONSES - CITY OF LAKE FOREST
Kathy L. Graham, J.D., AICP, August 12, 1997

CLF-1

Comment

Thank you for the opportunity to review the Environmental Impact Report for the Saddleback Meadows Project. Last year, when the board of Supervisors considered this project in November, City staff provided verbal comments on the project at the public hearing The City continues to have concerns regarding the project. On April 23, 1997, the City submitted comments to the County on the Revised Notice of Preparation for DEIR #566. The City's NOP Comments were not cited or addressed in the DEIR Document. The comments identified below in this letter represent the City's previously stated concerns regarding the project. We are expecting that the county, as the lead agency, will address these comments in the "Response to Comments" Document for DEIR #566.

Response

The City of Lake Forest Notice of Preparation comment letter is hereby incorporated into DEIR 566. The comment letter does not raise any new issues not already evaluated by the DEIR. Please refer to Section II of this document, Corrections and Additions to the DEIR.

CLF-2

Comment

From the materials presented, it is clear that significant grading and remediation of the site will be necessary According to the EIR, this grading will involve 2.5 million cubic yards of conventional grading and just under 9 million cubic yards of remedial grading. The EIR did not address the amount of off-site trucking activity which will occur as a result of the earthwork. Earthwork of this magnitude could result in the functional equivalent of half a million double-trailer truck loads of material to be moved. It is our understanding that because of the constraints of this site, a significant portion of this earthen material will be required to be moved to off-site locations for stockpiling and drying prior to returning to the re-engineered and strengthened site.

Response

The comment restates project description and geotechnical information contained in the DEIR. The comment relating to offsite transport and stockpiling of earthen material during the remedial grading phase of the project is incorrect. No offsite transport of earthen material is proposed. All remedial grading will be conducted on the project site in phases.

CLF-3

Comment

The City of Lake Forest has significant concerns about the potentially tremendous increases in traffic, particularly truck traffic, that this project could have on the City. The reports indicate that the excavation and trucking may take as long as eighteen months to complete. The duration of construction is not addressed in the EIR. The City and its residents have been inundated over the last few years with significant public construction and private development outside the City, and the City and its residents have borne a disproportionate impact from this activity. A partial list of construction projects which have impacted the City are as follows: the foothill Transportation corridor, the El Toro Y Project (including streets and off-ramp closures), the Foothill circulation Phasing Plan improvements, and all of the construction and on-going industrial business operations in the City's Sphere of Influence and norther thereof.

Response

Truck traffic would not be a large component of overall project related traffic generation, as no offsite transport of material is proposed, as noted in response to comment CLF-2 Section 3.4 (project phasing) of the DEIR, on Page 3-16, contains a detailed discussion of the duration of construction.

CLF-4

Comment

Based on the impacts from these projects, our residents specifically requested that the City Council consider the adoption of truck routes within the City. The City Council has held a public hearing on this request and is actively studying the need for truck routes within the City. It is our view that approval of this project and the types of truck traffic it would generate would only further the need to establish truck routes within the City. At a minimum, the County needs to incorporate conditions of approval and environmental mitigation relative to truck traffic as it impacts the City, its residents, and its infrastructure. A financial mechanism should be established to reimburse the City for the repair and maintenance costs associated with such heavy truck traffic load on City streets.

Response

Please refer to response to comment CLF-2. No additional mitigation measures are required to mitigate additional truck traffic.

CLF-5

Comment

There are other concerns the City has regarding this project, including the appropriate mitigation of the coastal sage scrub plant community (68.7 acres) and other environmentally sensitive plant and animal species. It is not entirely clear from the documentation how these environmentally sensitive areas are to be addressed. Nor is it indicated or insured that adequate safety precautions will be taken during the grading process to insure that the environmentally sensitive areas (i.e. Aliso Creek) are protected from impacts such as grading, or a grading induced landslide.

Response

Section 4.7 of the DEIR outlines a comprehensive mitigation program designed to address project impacts to coastal sage scrub and the sycamore woodland associated with Aliso Creek. It should also be noted that appropriate permits and agreements must be executed with the U.S. Fish and Wildlife Service, California Department of Fish and Game and the U.S. Army Corps of Engineers (ACOE) prior to the issuance of any grading permit.

CLF-6

Comment

The EIR indicates that the project represents a potential conflict with the Aliso Creek Corridor Specific Plan (ACCSP). The potential conflict must be specified. The Aliso Creek Regional Riding & Hiking Trail is a valuable recreation resource currently used by residents of the City of Lake Forest and our Sphere of Influence. Significant impacts to Aliso Creek and the Trail, including construction impacts, should be avoided or completely mitigated.

Response

Section 4.1.3 of the DEIR, on Page 4-12, documents the inconsistencies of the proposed project with the Aliso Creek Corridor Specific Plan. These listed inconsistencies include lack of preservation of recreational open space and conservation of natural features, including Aliso Creek and adjacent habitat areas. Please note that the project only affects the portions of the ACCSP which are within the project site. The vast majority of the ACCSP area is unaffected.

CLF-7

Comment

Finally, the EIR indicates that children from the proposed project will be absorbed into the Saddleback Valley Unified School District. It is further indicated that all SVUSD schools in the project vicinity are near capacity. The Environmental Impact Report should address

whether the increase in school age children associated with the project will impact Saddleback Valley Unified School District Schools within the City of Lake Forest. Specifically, identify whether enrollment or teacher student ratio will be impacted at any Lake Forest public school site.

Response

Detailed Saddleback Valley Unified School District student and facility impact information is contained in Section 4-12 of the DEIR, beginning on Page 4-209. In addition, updated project related student generation data is included in Section II of the document, Corrections and Additions to the DEIR per comments from the Saddleback Valley Unified School District.

CLF-8

Comment

The concerns identified above must be addressed in the Draft Environmental Impact Report. Please provide the City with a copy of the DEIR "Response to Comments" Document as soon as it is available.

Response

The comment is noted. The City of Lake Forest will be provided with a copy of the Response to Comments document in accordance with State CEQA requirements and County of Orange procedures.

COMMENTS AND RESPONSES - SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS, J. David Stein, Manager, Performance Assessment and Implementation, August 12, 1997

SCAG-1

Comment

Thank you for submitting the County of Orange, Draft Subsequent Environmental Impact Report for Saddleback Meadows Project (Recorded Tract 10692) to SCAG for review and comment. As areawide clearinghouse for regionally significant projects, SCAG assists cities, counties and other agencies in reviewing projects and plans for consistency with regional plans.

The attached detailed comments are meant as administrative comments to provide guidance for considering the proposed project within the context of our regional goals and policies. SCAG's policy level review will be initiated with the presentation of the proposed Saddleback Meadows Project to SCAG's Standing committee on Implementation (SCI) on September 4, 1997 at 11:00 am at the SCAG office in Los Angeles. You or the project developer are cordially invited to attend this meeting and answer any questions. If you have any questions regarding the attached comments, please contact Bill Boyd at (213) 236-1960. He will be contacting you with further information concerning this SCI meeting.

Response

The comment is noted. The referenced meeting was not attended by either the applicant or the County of Orange.

SCAG-2

Comment

COMMENTS ON THE COUNTY OF ORANGE SADDLEBACK MEADOWS PROJECT (RECORDED TRACT 10692) DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT

PROJECT DESCRIPTION

The Saddleback meadows site encompasses approximately 222 acres and is located on the easterly side of El Toro Road, approximately ½-mile south of the intersection of Santiago Canyon Road/El Toro Road and Live Oak Canyon Road, in east-central unincorporated Orange County. The incorporated cities of Mission Viejo and Lake Forest lie approximately three miles to the south and southwest, with the Cleveland National Forest boundary located approximately ½-mile north of the project site. The project site is surrounded by residential development, with the Portola Hills and Foothill Ranch planned communities to the west, the Hidden Ridge/Hidden Hills community and a nursery to the south, and scattered low-density

residential uses to the north and east. O'Neill Regional Park is located adjacent to the southerly boundary of the site with St. Michael's Abbey immediately to the northwest and the Ramakrisha Monastery located immediately to the southeast.

The Project site is located within the Foothill-Trabuco Specific Plan and the DEIR states that the Project is inconsistent with many of the goals, objectives and policies of the plan which generally calls for preservation of the rural character and natural habitat of the area. The site is also located within the Aliso Creek Corridor Specific Plan area, and the DEIR notes that although it incorporates regional; riding and hiking trail connections into its design, it does conflict with several other aspects of the Plan. For example, it would not preserve recreational open space or conserve natural features of the Aliso Creek Corridor as it proposes to replace an existing natural creek with a trapezonal channel. The DEIR also states that the project is in direct conflict with the Natural communities Conservation Planning Program (NCCP) in that it would disturb sensitive wildlife habitat area. The project site is also situated just north of the Foothill Transportation Corridor.

The proposed Project would construct a previously approved and recorded Tract Map 10692 which was originally approved in 1979 and recorded in 1988. The Draft SEIR notes that the Project is consistent with the approved tract map, and proposes the phased planned development of 705 manufactured single family housing units and a 1.5 acre, neighborhood commercial center and associated infrastructure. The gross residential density is 3.17 du/ac, with minimum lot sizes of 2,630 square feet. The total development footprint would affect 86 percent or about 191 acres of the project site. Thirty-nine percent of the project site is proposed to remain in open space, including community slope area. The project proposes eight private park sites; regional equestrian hiking and bicycle trail connections; and the construction of a water tank site to be dedicated to the local water company.

Prior to the most recent submittal of a grading permit application for Tract Map 10692, the project was proposed for 318 single-family dwelling units. The Draft EIR for the Project noted that the 318-unit project was "environmentally superior" to the 705 unit project currently being proposed, the 318-unit proposal was denied. The earlier Draft EIR has identified the 705-unit project as one of the two environmentally inferior alternatives considered.

The Draft EIR identifies the following areas of controversy that have arisen in response to the Notice of Preparation and which are addressed in the DEIR:

- Land Use/Aesthetic Compatibility
- Foothill-Trabuco Specific Plan Conformance
- Emergency Access Requirements
- Wildlife Corridor Design Width
- Project Specific Affordable Housing Requirements
- EIR Preparation Process/Procedures
- Loss of Wild Habitat
- Geophysical Stability
- Traffic/Circulation

The following alternatives to the proposed development are evaluated in the DEIR:

Alt. 1 No Project/No Development.
Alt. 2 Foothill-Trabuco Specific Plan Alt. A - 150 Minimum 20,000 sq. Ft. lots.
Alt. 3 Foothill-Trabuco Specific Plan Alt. B - 100 SFD Units on 31.7 acres.
Alt. 4 OCP&DS Staff Alternative (EIR 561) - 299 SFD Units, Min 5,000 sq. Ft lots.
Alt. 5 Cluster/Reduced Development Footprint - 318 SFD/MFD.

Response

The comment restates information contained within the DEIR 566. No response is required.

SCAG-3

Comment

INTRODUCTION TO SCAG REVIEW PROCESS

The document that provides the primary reference for SCAG's project review activity is the Regional Comprehensive Plan and Guide (RCPG). The RCPG chapters fall into three categories: core, ancillary, and bridge. The Growth Management (adopted June 1994), Regional Mobility (adopted June 1994), and Water Quality (adopted January 1995) chapters constitute the core chapters. These core chapters respond directly to federal and state planning requirements. The core chapters constitute the base on which local governments ensure consistency of their plans with applicable regional plans under CEQA. The Air Quality and Growth Management chapters contain both core and ancillary policies, which are differentiated in the comment portion of this letter. The Regional Mobility Element (RME) constitutes the region's Transportation Plan. The RME policies are incorporated into the RCPG.

Ancillary chapters are those on the Economy, Housing, Human Resources and Services, Finance, Open Space and Conservation, Water Resources, Energy, and Integrated Solid Waste Management These chapters address important issues facing the region and may reflect other regional plans. Ancillary chapters, however, do not contain actions or policies required of local government. Hence, they are entirely advisory and establish no new mandates or policies for the region.

Bridge chapters include the Strategy and Implementation chapters, functioning as links between the Core and Ancillary chapters of the RCPG.

Each of the applicable policies related to the proposed project are identified by number and reproduced below in italics followed by SCAG staff comments regarding the consistency of the project with those policies.

Response

The comment outlines the components of the Regional Comprehensive Plan and Guide. No response is required.

SCAG-4

Comment

Consistency With Regional Comprehensive Plan and Guide Policies

1. The Growth Management Chapter (GMC) of the Regional Comprehensive Plan contains a number of policies that are particularly applicable to this Project.

a. *Core Growth Management Policies*

3.01 The population, housing, and jobs forecasts, which are adopted by SCAG's Regional Council and that reflect local plans and policies, shall be used by SCAG in all phases of implementation and review.

SCAG staff comments. As SCAG has designated subregions, the project is situated in the Orange County subregion. Implementation of the project would result in the creation of 705 housing units. The DEIR acknowledges on page 4-3 that the project site is situated within a Regional Statistical Area that is forecasted to grow at the rate of 2.3 percent between 1995 and 2000 Although the DEIR does not identify the projected population that would be accommodated by the 720 units, it is evident that this growth can be accommodated in that forecasted by SCAG for the subregion. The project is consistent with this RCPG policy.

Response

The comment documents consistency with the Growth Management Chapter of the Regional Comprehensive Plan. No response is required.

SCAG-5

Comment

3.03 The timing, financing, and location of public facilities, utility systems, and transportation systems shall be used by SCAG to implement the region's growth policies.

SCAG staff comments: The DEIR contains an analysis of the relationship of the Project to this policy (18 months to complete project grading, phasing of residential units within 5 years following completion of grading, installation of all infrastructure during initial phase) on page 3-16. The Project is consistent with this RCPG policy.

Response

Please refer to response to comment SCAG-4.

SCAG-6

Comment

b. *Ancillary Growth Management Policies*

3.04 Encourage local jurisdictions' efforts to achieve a balance between the types of jobs they seek to attract and housing prices.

SCAG staff comments. The DEIR references consistency of the Project's objectives of providing affordable housing in a jobs-rich, housing-poor area on page 4-11. It notes that the project was conditionally approved in 1979 with a 66 2/3 percent affordable housing requirement in accordance with the County's Inclusionary Housing Policy. The county policy has since been rescinded, but the project is bound by the original tract map to provide a total of 470 lots to be sold in the affordable range. These lots are further broken down to include: 188 low/moderate and 282 Medium I level housing units. The Project is supportive of this RCPG policy

Response

Please refer to response to comment SCAG-4.

SCAG- 7

Comment

3.05 Encourage patterns of urban development and land use which reduce costs on infrastructure construction and make better use of existing facilities

SCAG staff comments. This Project would utilize existing water and sewer infrastructure that is available at the site boundary. The type of development proposed in the Project makes good use of this infrastructure as stated on pages 4-230 and 231 of the DEIR. The Project is supportive of this RCPG policy.

Response

Please refer to response to comment SCAG-4

SCAG-8

Comment

3.11 Support provisions and incentives created by local jurisdictions to attract housing

growth in job rich subregions and job growth in housing subregions.

SCAG staff comments. See comments on policy 3.04. The Project is supportive of this RCPG policy.

Response

Please refer to response to comment SCAG-4.

SCAG-9

Comment

3.12 Encourage existing or proposed local jurisdictions' programs aimed at designing land uses which encourage the use of transit and thus reduce the need for roadway expansion, reduce the number of auto trips and vehicle miles traveled, and create opportunities for residents to walk and bike.

SCAG staff comments. The Draft EIR on page 4-52 states that the proposed Project will generate 6,220 trip-ends per day with 345 vehicles per hour during the AM peak hour and 635 vehicles per hour during the PM peak hour. The project site is not served by an existing bus route adjacent to the site on El Toro Road The nearest OCTA bus service (2 routes) are located 2.25 and 2.5 miles southwest of the project site, and the nearest park-and-ride facility is located 2.0 miles southwest of the site. No provisions are made to provide for transit access to the site and to reduce the reliance on the automobile. The Project will result is increased need for roadway improvements to meet projected vehicle trips and miles traveled. The Project is not supportive of this RCPG policy.

Response

OCTA provides bus service to Orange County and expands service to meet demand.

SCAG-10

Comment

3.17 Support and encourage settlements patterns which contain a range of urban densities.

SCAG staff comments. The Project proposes that the entire site be developed for single residential use at a gross residential density of 3.17 du/acre. Alternative No. 5 (Cluster/Single Family/Multifamily) would have significantly less total acres of the site disturbed (113.0 ac versus 191.4 ac). This alternative could better achieve intent of this SCAG policy, while minimizing site disruption and preserving more open space The Project is not supportive of this RCPG policy.

Response

The comment documents the inconsistency between the proposed project and the RCPG.

SCAG-11

Comment

3.18 Encourage planned development in locations least likely to cause adverse environmental impact.

SCAG staff comments. The DEIR states that the proposed Project will result in the following unavoidable adverse impacts that cannot be mitigated to a level less than significant.

- Land use incompatibility impacts to O'Neill Regional Park (wildlife habitat), the Ramakrishna Monastery and St Michael's Abbey.
- Vehicular emissions from project related traffic will have a cumulative significant air quality impact
- Project specific and cumulative impacts to 50.3 acres of Venturan-Diegan transitional coastal sage scrub until such time as a section 4 (d) interim take is authorized.
- Development of the first large tract within the Foothill/Trabuco Specific Plan area will result in cumulative impacts to existing rural and natural open space and to a continued urbanization of foothill areas in south Orange County.
- Permanent viewshed alteration will occur with regard to the regional park, monastery and abbey and additional night lighting glare change night views from an unlit dark open space to an urban night environment.

Furthermore, the project would result in significant impacts related to slope stability, landslides, mud slides, subsidence and erosion. Mitigation measures are proposed to address these impacts, but the fact remains that the project will result in a total of 2.6 million cubic yards of conventional grading and 8.9 million cubic yards of remedial grading. Taken as a whole, the Project is not supportive of this RCPG policy.

Response

Please refer to response to comment SCAG-10.

SCAG-12

Comment

3.19 National Forests shall remain permanently preserved and used as open space. SCAG shall support policies and actions that preserve open space areas identified in local, state, and federal plans.

SCAG staff comments. The DEIR states that the proposed Project will result in the following conflicts with local or state open space plans and policies:

- The project conflicts with the Foothill-Trabuco Specific Plan, specifically with regard to the preservation of a regionally contiguous wildlife corridor and the types of homes being proposed would be incompatible with site topography and biological resources.
- The project conflicts with the Aliso Creek Corridor Specific Plan in that it would not preserve recreational open space or conserve the natural features of the Aliso Creek Corridor as it proposes to replace an existing natural creek with a trapezonal channel.
- The project conflicts with the Natural Communities Conservation Planning Program in that it would further disturb a sensitive wildlife habitat area.

The Project is not supportive of this RCPG policy.

Response

Please refer to response to comment SCAG-10.

SCAG-13

Comment

3.20 Support the protection of vital resources such as wetlands, groundwater recharge areas, woodlands, production lands, and land containing unique and endangered plants and animals.

SCAG staff comments. The Draft EIR identifies a number of instances where this policy is not supported:

- The loss of 50.3 acres of Venturan-Diegan Transitional Coastal Sage Scrub that, although it will not be considered a "take" under federal requirements, will when added to other losses in the area, total about 2.4% of the coastal sage scrub in the Southern Subregional NCCP program area.
- The loss of 3.8 acres of Muelfat Scrub (associated with three ephemeral ponds) and 3.3 acres of Southern Sycamore Riparian Woodland which are significant because of their values as wildlife habitats and their function as wetlands.
- The loss of 14.6 acres of Coast Live Oak Woodland (312 individual trees) which are significant because of their wildlife values, their function in watershed protection and their function as part of the planned NCCP regional wildlife corridor.
- The loss of 0.6 acres of existing Ephemeral Ponds which is significant due to the presence of the Riverside fairy shrimp which is a federally endangered species.

- Direct impacts to 1.65 acres of wetlands and 1.78 acres of "Waters of the United States" (intermittent streams and man-made stock ponds).
- Adverse, but not significant, loss of populations of two sensitive plant species, the Catalina mariposa lily and intermediate mariposa lily.
- The loss of approximately 50.3 acres of potential nesting and foraging habitat (coastal sage scrub) on and off site, including portions of areas occupied by at least 12 pairs of southern California rufous-crowned sparrows and at least six pair of coastal cactus wrens, both of which are regionally sensitive species
- General loss of habitat for at least 63 animal species which were observed during various on-site surveys.
- Acknowledgment that "the project, as currently proposed, may hinder or preclude the preparation of the Southern Subregional NCCP Preserve, due to restricted wildlife movement corridors".

The Project is not supportive of this RCPG policy.

Response

Please refer to response to comment SCAG-10.

SCAG-14

Comment

3.21 Encourage the implementation of measures aimed at the preservation and protection of recorded and unrecorded cultural resources and archaeological sites.

SCAG staff comments. The Draft EIR acknowledges that the Project is known to contain significant deposits of artifacts (four significant sites) and fossils, as well as a ranch house ruin. The project is not supportive of this RCPG policy.

Response

Please refer to response to comment SCAG-10.

SCAG-15

Comment

3.22 Discourage development, or encourage the use of special design requirements, in areas with steep slopes, high fire, flood, and seismic hazards.

SCAG staff comments. The Draft EIR acknowledges that the Project site is characterized as containing ridges, ravines, and gullies with natural slope gradients ranging from nearly level along some ridge crests and valley bottoms to 1:1 (horizontal:vertical) within deep incised gullies. The slope characteristics of the site

are as follows: 95.5 acres (43% of site) is in the 0-25 percent slope category; 94.9 acres (43%) is in the 26-50 percent slope category; and, 31.8 acres (14%) of the project site has slopes in excess of 50 percent. As noted in the project description, significant grading is required to develop the site as proposed.

The Draft EIR also acknowledges that the Project is located in an area designated as a high "Special Fire Protection" area due to its combination of natural combustible vegetation, topography and weather conditions (frequent dry Santa Ana winds). Furthermore, Draft EIR notes a potential conflict between the human environment and the two main top predators of the region, coyotes and mountain lions.

The Project is not supportive of this RCPG policy.

Response

Please refer to response to comment SCAG-10.

SCAG-16

Comment

3.23 *Encourage mitigation measures that reduce noise in certain locations, measures aimed at preservation of biological and ecological resources, measures that would reduce exposure to seismic hazards, minimize earthquake damage, and to develop emergency response and recovery plans.*

SCAG staff comments Discussion of mitigation measures to address emergency response concerns due to seismic hazards, biological and ecological resources and other natural or manmade hazards are included in the Executive Summary of the Draft EIR. The Project is supportive of this RCPG policy.

Response

Please refer to response to comment SCAG-4.

SCAG-17

Comment

3.24 *Encourage efforts of local jurisdictions in the implementation of programs that increase the supply and quality of housing and provide affordable housing as evaluated in the Regional Housing Needs Assessment.*

SCAG staff comments. See staff comments on policy 3.04. The Project will increase the supply and quality of affordable housing in southeastern Orange County. The Project is supportive of this RCPG policy.

Response

Please refer to response to comment SCAG-4.

SCAG-18

Comment

2. The Regional Mobility Chapter (RMC) also has policies, all of which are core, that pertain to the proposed project. This chapter links the goal of sustaining mobility with the goals of fostering economic development, enhancing the environment, reducing energy consumption, promoting transportation-friendly development patterns, and encouraging fair and equitable access to residents affected by socio-economic, geographic and commercial limitation. Among the relevant policies in this chapter are the following:

Transportation Demand Management and Regional Transit Program Policies

4.01 Support Promote TDM programs along with transit and ridesharing facilities as a viable and desirable part of the overall mobility program while recognizing the particular needs of individual subregions.

4.03 Support the extension of TDM program implementation to non-commute trips for public and private sector activities.

4.04 Support the coordination of land use and transportation decisions with land use and transportation capacity, taking into account the potential for demand management strategies to mitigate travel demand if provided for as a part of the entire package.

SCAG staff comments. See staff comments on policy 3.12. SCAG's December 31, 1996 letter on the Notice of Preparation for the Saddleback Meadows project recommended consideration of these three policies in the preparation of the Draft EIR. No apparent consideration was given to the provision of TDM or transit services to meet the needs of the proposed 6,220 trip ends per day in year 2020. Mitigation measure AM 5-3 is not an air quality mitigation measure, but rather a commentary on not taking credit for mobile source emission reductions, including trip reduction programs. The Project is inconsistent with the three TDM/transit RCPG policies.

Response

Please refer to response to comment SCAG-9.

SCAG-19

Comment

Regional Street and Highways Program Policies

4.20 Expanded transportation system management by local jurisdictions will be encouraged.

4.23 TSM activities throughout the region shall be coordinated among jurisdictions.

SCAG staff comments. The Draft EIR notes that the Project developer will pay for signal modifications and turn lanes at the intersections of El Toro Road with Valley Vista Way and the new northern collector street serving the site. Furthermore, a mitigation measure (AM 4-16) assures that the developer will participate in existing road fee programs, including the Foothill/Eastern Transportation Corridor Fee Programs, Foothill Circulation Phasing Program, El Toro Road Fee Program and the Santiago Road Fee Program. The Project is consistent with these two RCPG policies.

Response

Please refer to response to comment SCAG-4.

SCAG-20

Comment

Regional Non-Motorized Transportation Program Policies

4.25 The development of the regional transportation system should include a non-motorized transportation system that provides an effective alternative to auto travel for appropriate trips. The planning and development of transportation projects and systems should incorporate the following, as appropriate:

a • Provision of safe, convenient, and continuous bicycle and pedestrian infrastructure to and throughout areas with existing and potential demand such as activity areas, schools, recreational areas (including those areas served by trails), which will ultimately offer the same or better accessibility provided to the motorized vehicle.

b • Accessibility to and on transit (but terminals, rail stations, Park-And-Ride lots), where there is demand and where transit boarding time will not be significantly delayed.

c • Maintenance of safe, convenient, and continuous non-motorized travel during and after the construction of transportation and general

development projects. Existing bikeways and pedestrian walkways should not be removed without mitigation that is as effective as the original facility.

SCAG staff comments. The Draft EIR acknowledges that the Project abuts the Aliso Creek Bikeway. Mitigation measures (PDF 10-1 and 10-2) assure the construction of the Live Oak Canyon and Aliso Creek riding and hiking trails within the Project boundaries. No local bikeway or pedestrian circulation improvements are provided for in the Project design The Project is consistent with this RCPG policy as it relates to regional bikeway and trail access but inconsistent with the policy as it pertains to local bikeways and pedestrian walkways within the Project site.

Response

The comment documents both the project's consistency and inconsistency with the non-motorized transportation policies.

SCAG-21

Comment

4.27 Urban form, land use and site-design policies should include requirements for safe and convenient non-motorized transportation, including the development of bicycle and pedestrian-friendly environments near transit.

SCAG staff comments See previous comments on policies 3.12, 4.01, 4.03, 4.04 and 4.25 The Project is inconsistent with this RCPG policy

Response

Please refer to response to comment SCAG-10.

SCAG-22

Comments

3. The Water Quality Chapter (WQC) core recommendations and policy options relate to the two water quality goals; to restore and maintain the chemical, physical and biological integrity of the nation's water; and, to achieve and maintain water quality objectives that are necessary to protect all beneficial uses of all waters. The core recommendations and policy options that are particularly applicable to the Project include the following:

11.02 Encourage "watershed management" programs and strategies, recognizing the primary role of local governments in such efforts.

SCAG staff comments: The Draft EIR acknowledges that the project site is located

within the boundaries of two primary watershed areas: 1) Aliso Creek (75% of site) and 2) Oso Creek (24% of the site). The Draft EIR on page 4-38 acknowledges that "Implementation of the proposed project will result in the introduction of impervious surfaces (streets, driveways, residential units) and will result in **a decrease in the area available for stormwater percolation and a substantial increase in stormwater runoff**. Implementation of the proposed project will result in **substantial landform modification**, redirecting site drainage throughout the site." [emphasis added] The Project proposes drainage improvements that mitigate drainage impacts to a level less than significant However, the project as noted previously herein, conflicts with the Aliso Creek Corridor Specific Plan in that it "would not preserve recreational open space or conserve the natural features of the Aliso Creek Corridor as it proposes to replace an existing natural creek with a trapezonal channel". The Project does not recognize watershed management policy in the local government approved Aliso Creek Corridor Specific Plan. The Project is inconsistent with this RCPG policy.

Response

Please refer to response to comment SCAG-10.

SCAG-23

Comment

Conclusions and Recommendations:

(1) As noted in the staff comments, the proposed Sadddleback Meadows Project is consistent with or supports many of the policies in the Regional Comprehensive Plan and Guide, but is inconsistent with core policies 4.01, 4.03, 4.04, 4.27 and 11.02 and is not supportive of ancillary policies 3.12, 3.17, 3.18, 3.19, 3.20, 3.21 and 3.22. Furthermore, the Project is consistent with some aspects of core policy 4.25 and inconsistent with others, as noted in the staff comments.

(2) All mitigation measures associated with the project should be monitored in accordance with AB 3180 requirements and reported to SCAG through the Annual Reasonable Further Progress Reports.

Response

The comment summarizes the comments contained in the comment letter and requests that all mitigation measures be monitored and reported to SCAG on an annual basis. All mitigation measures contained within the Final EIR will be monitored in accordance with the requirements promulgated by CEQA. Copies of the monitoring reports will be made available for SCAG review.

COMMENTS and RESPONSES - SADDLEBACK VALLEY UNIFIED SCHOOL DISTRICT, Peter A. Hartman, District Superintendent, August 13, 1997

SVUSD-1

Comment

In response to the above Draft EIR #566 indicating that approval of this project would have significant impacts on the district's provision of adequate school facilities unless mitigation is provided, we would like to provide some information for your consideration:

K-6	= 2264	=	160
7-8	= .0566	=	40
9-12	= .0755	=	54
K-12	= .3585	=	254 students

As we have no district standard for manufactured housing, the above is our prediction for the impact of this project on our district.

Response

The proposed project is not designated as an *adults only* community, and student generation rates would be expected to be similar to standard single family detached dwelling units. The identified student generation rates, based on an existing non-adults only manufactured housing development located within the district, are hereby incorporated into the Final EIR. Please refer to Section II of this document, Corrections and Additions to the DEIR.

SVUSD-2

Comment

Currently, students in this general area are assigned to Portola Hills Elementary, Rancho Santa Margarita Intermediate and either El Toro High School or Trabuco Hills High School. ALL of these schools are filled to capacity and either do have now or will have by fall, 1997 added a number of relocatable buildings to house enrollment exceeding the capacity of their original construction.

Per the current practice of the County of Orange regarding other projects, the district requests that this project be conditioned to require that the proponent, California Quartet, Inc , meet with district staff to review the impact and necessary mitigation measures needed as a result of this project.

Response

The comment relating to high schools which would serve the proposed project and the

overcrowded conditions of all schools that would serve the proposed project is hereby incorporated into DEIR 566. Please refer to Section II of this document, Corrections and Additions to the DEIR.

COMMENTS AND RESPONSES - STATE OF CALIFORNIA - RESOURCES AGENCY, DEPARTMENT OF PARKS AND RECREATION, Bill Berry, District Superintendent, August 15, 1997

DPR-1

Comment

The California Department of Parks and Recreation (CDPR), Los Lagos District office has reviewed the above referenced document thank you for the opportunity to provide comments.

The CDPR is s trustee agency as defined by CEQA. In addition, a defining tenant of our mission is to help to preserve the state's extraordinary biodiversity. As the office responsible for the stewardship of the natural cultural resources of Chino Hills State Park, we have an interest and concern about land use decisions in the geographic area as they relate to our mission and responsibilities under CEQA.

Response

The comment states the trustee responsibility that the State of California, Department of Parks and Recreation has in relationship to DEIR 566.

DPR-2

Comment

We view the maintenance of a functional system of interconnected wildland areas throughout the region as vitally important to the preservation of biodiversity. The Santa Ana mountains and the Puente-Chino Hills are an interdependent ecological system. The health of each area is integral to the other CHSP is located in the Puente-Chino Hills adjacent to the northern end of the Santa Ana Mountains. The Santa Ana Mountains provide a valuable source of genetic material that helps to maintain the health and diversity of CHSP's plant and animal populations.

The importance of the two areas to each other continues to increase as they each become smaller, more isolated, and more fragmented by surrounding development. Fragmentation and isolation portends massive ecosystem collapse that could render all of our other regional conservation efforts nearly pointless.

Given the importance of the Santa Ana Mountains to the maintenance of the diversity of life in CHSP and the Puente-Chino Hills, we are concerned about the potential isolating and fragmenting effects of projects in the vicinity of the mountain range, and conserved lands within it such as the Cleveland National Forest and O'Neill Regional Park We believe that development adjacent to these protected wildland areas would be designed in a manner that will preserve functional biological corridors and buffer protected lands from more intensive land uses

Response

It should be noted that Chino Hills State Park is over twenty air miles northwest of the project site, separated from the project site by the SR 91 freeway. Section 4.7 of the DEIR, beginning on page 4-118 of the DEIR, documents the project related effects to wildlife movement in the vicinity of the project site and in relationship to the ongoing planning efforts associated with the NCCP southern sub-regional preserve. Implementation of the proposed project would have an incremental effect on wildlife movement between O'Neill Regional Park and the Cleveland National Forest, although would not represent a significant impediment to wildlife movement between the Santa Ana Mountains and the Puente-Chino Hills.

DPR-3

Comment

After reviewing the alternative for the project, it appears that Alternative 3 is the most responsible one. It limits development to the western side of the project, thereby protecting connectivity between O'Neill Regional Park and the Cleveland National Forest. It also places new development next to existing residential and commercial areas while providing a significant buffer to the park and forest. It appears that all of the other alternatives in some way fragment the National Forest from the Regional Park, and reduce the buffer to existing wildland.

Response

The comment restates information contained in the Alternatives section of the DEIR.

DPR-4

Comment

In the final development decision, we believe it is incumbent on the lead agency to approve an alternative that is responsible to the invaluable natural resources found in the Cleveland National Forest, the County Regional Parks, and throughout the surrounding Region. We appreciate the consideration given to buffers and corridors in the environmental review, and we encourage their full protection. Thank you for the opportunity to comment. If you have any questions, please contact Geary Hund, Doreen Ferguson or myself at (909) 657-0676

Response

Please refer to response to comment No. DPR-3.

COMMENTS AND RESPONSES - RURAL CANYONS CONSERVATION FUND, Ray Chandos, August 18, 1997

RCCF-1

Comment

We have reviewed Draft EIR 566 (the DEIR) and comment as follows:

1. DEIR MUST IDENTIFY FEASIBLE MITIGATION MEASURES AND PROJECT ALTERNATIVES

A bizarre disclaimer precedes the body of this DEIR at page 3-8.

It is therefore understood that the environmental analyses and evaluations contained in this document are largely informational, and not prescriptive in nature in that mitigation measures which would alter features of the final recorded tract map can not be implemented to reduce all project impacts to a level of insignificance. This is attributable primarily to the physical limitations of the site and the inability to deviate from the final recorded tract map. Accordingly any findings of significant impacts must be offset through the issuance of a statement of Overriding Considerations.

Does this mean that some or all of the mitigation measures listed in the DEIR are "largely informational" and "can not be implemented"? If so, those mitigation measures should be identified, because CEQA required the EIR to set forth feasible mitigation measures and alternatives to reduce or eliminate the project's identified significant environmental impacts to the extent feasible. Please identify for the decision makers which mitigation measures "can not be implemented," and which can be implemented.

Response

The referenced statement was included in DEIR 566 to describe the unique parameters associated with the evaluation of an existing recorded tract map in a DEIR. Mitigation measures which would require the applicant to substantially deviate from the physical design of the recorded tract map are not possible under the Subdivision Map Act, and as such would not be enforceable or considered feasible. As such, mitigation measure development must focus on reducing or eliminating adverse project related impacts through means which would not alter the physical parameters of the recorded tract map. Consequently, as stated in the referenced portion of the document, any unavoidable adverse impacts which cannot be reduced to a level of less than significant, would require a Statement of Overriding Considerations as part of the Final EIR certification process.

RCCF-2

Comment

Further, in stating that "any findings of significant impacts must be offset through the issuance of a statement of Overriding Considerations," the disclaimer implies that the County lacks any discretion to deny the grading permit. As explained below, however, the County may deny the grading permit, or approve an alternative to it.

Response

Please refer to response to comment RCRF-1.

RCCF-3

Comment

2. THE COUNTY HAS DISCRETION TO DENY THE PROJECT OR APPROVE AN ALTERNATIVE PROJECT.

As acknowledged in the DEIR, the Foothill/Trabuco Specific Plan explicitly mandated environmental review of the project under CEQA, requiring an Initial Study and "additional environmental documentation" "[p]rior to the issuance of any grading permit for the subject property." (FTSP Section III.3.2(c).) This provision implies discretion--preparing environmental documentation would simply waste time and paper if it could not be acted upon. CEQA Guidelines classify the issuance of a building permit as discretionary if local ordinance--in this case the FTSP (enacted in 1991 by ordinance)--contains "any discretionary provision." (CEQA Guidelines Section 15268(b).) Section III.3.2© recited above appears to constitute such a "discretionary provision" in this case.

As this court noted in Friends of Westwood v. Los Angeles (1987) 191 Cal.App.3d 259, 266-268, preparing environmental documentation for a purely ministerial project would be futile since the approving agency has no discretion to modify such a project to eliminate or reduce environmental impacts.

Nor does any statute or regulation say that the granting of a grading permit is necessarily ministerial. That depends on the particular circumstances. (CEQA Guidelines Section 15268(a).) The Westwood court held that "doubt whether a project is ministerial or discretionary should be resolved in favor of the latter characterization." (Id. at 191.)

Also, the court in Day v. Glendale (1975) 51 Cal.App.3d 817, 824, held that CEQA may apply even to a governmental approval involving virtually no discretion if that approval "is the only point at which the environmental impact of the project may be publicly considered ..."--certainly the case here

The County's Grading Code also appears to contain several "discretionary provisions" under

Section 7-1-821, "Denial of permit." It says, in part especially pertinent to this project: "If, in the opinion of the Building Official, the land area for which grading is proposed is subject to geological or flood hazard to the extent that no reasonable amount of corrective work can eliminate or sufficiently reduce the hazard to human life or property, the Grading Permit and the Building Permits for habitable structures shall be denied." (O.C. Grading Code, Section 7-1-821(d).) Still another says the "Building Official may require plans and specifications to be modified in order to mitigate anticipated adverse environmental effects of proposed grading projects." (Section 7-1-821(c).) These ordinances, then, provide considerable discretion for the County in granting or denying the proposed grading permit.

Finally, and contrary to the disclaimer, CEQA provides for reducing or avoiding a project's significant environmental impacts through adoption of an alternative project. The DEIR in fact sets forth two alternative projects, numbers 3 and 4, which mitigate every one of the project's identified significant environmental impacts while still attaining its objectives. (DEIR page 6-22.) The DEIR contains no evidence that either of these two alternatives is not feasible.

Response

The comment regarding the discretionary aspects of the grading permit approval process is acknowledged. The grading permit must be approved by the Manager, Subdivision and Grading Services prior to issuance of any grading permits for the proposed project. The comment relating to alternatives is correct.

RCCF-4

Comment

3. DEVELOPMENT COSTS MAY RENDER THE PROJECT ITSELF INFEASIBLE.

In making required CEQA determinations, the decision makers will have to compare the project's feasibility with that of the available alternatives. Unfortunately, the DEIR supplies little or no evidence on which to base such findings.

the feasibility of the preferred project, however, seems obvious at best. On the one hand, several factors limit the selling price of the 708 housing units, including the County's affordable housing requirements (Condition 19 or recorded tract map), small lot size, crowded design, and the low market value of manufactured unit. The $155,000 average per unit selling price used in the DEIR's fiscal impact report seems unduly optimistic, especially since much larger, conventional houses across El Toro Road have assessed valuations averaging only $200,000 to $250.000.

On the other hand, development costs seem unusually high, due primarily to the extensive amount of required grading (11.5 million cubic yards, DEIR page 4-22). Even for a project having much less grading than proposed here, Larry L. Simon estimated $44 million in site

preparation costs in a August 1990 report prepared for Imperial Federal Savings Association (No. RTC-90-000042), or $62,000 per units in site preparation costs alone. Land and construction costs, plus per-unit fees for roads, tollways, bridges, schools, etc. would of course add to the project's costs.

The DEIR should contain the best available information on the feasibility of this project and its alternatives so that the decision makers can make a reasoned choice.

Response

The comment is noted. Financial feasibility information for each alternative has not been provided by the applicant, and as such, is not included in the DEIR.

RCCF-5

Comment

4. THE GRADING PLAN MUST BE PROVIDED FOR REVIEW.

The DEIR seems to contain only a "conceptual" and mostly illegible grading plan" (DEIR page 4-23). Since the project is a grading permit, involving a phenomenal amount of grading, the grading plan itself must be included in the DEIR to allow the public and responsible agencies to review it.

The grading plan must indicate the location of the 19.77 acres of "offside grading" (DEIR page 3-8).

We consider this omission sufficiently serious to require supplementation of the DEIR and an extension of the comment period.

Response

Please refer to response to comment SFC-1 Areas of offsite grading are clearly shown in Exhibit 7, Site Plan.

RCCF-6

Comment

5. A FULL FAITHFUL PERFORMANCE BOND SHOULD BE REQUIRED.

Given the project's questionable feasibility and extensive geological instability, it remains a prime candidate for failure during the 18-month grading process. We note that two previous owners and would-be developers of this site went bankrupt. The EIR must assess the potential safety problems resulting from a half excavated site: drainage and erosion, collapse of adjacent properties, collapse of El Toro Road, etc., as well as the possible financial liability

to the County in the event of abandonment. As a mitigation measure, the County must impose as a condition of approval of any grading a full faithful performance bond sufficient to restore the site to a safe condition.

Response

Please refer to Section 4.2, Soils and Geology for a complete discussion of project related geotechnical hazards and mitigation measures. The financial conditions of the two previous owners of the site is not related to geotechnical conditions. Therefore, the comment regarding bankruptcy is speculative and does not require a response per CEQA.

RCCF-7

Comment

6. DEIR MUST ANALYZE REAL EFFECTS ON CIRCULATION--NOT INTERSECTION LEVELS OF SERVICE.

The DEIR analyzes the project's impacts on traffic and circulation by listing the level of service expected at various intersections around the project. These levels of service, based on the number of lanes, roadway geometry, and traffic volumes, generally indicate how many signal changes it will take to get through an intersection.

The County must stop using this methodology, because it does not measure the true impact on transportation--i.e., on people trying to get from one place to another. Not surprisingly, typical developer-prepared EIR's invariably conclude, as does this one, no significant impact on the region's traffic and circulation. Only minor road widenings, restriping traffic lanes, and installation of more traffic signals are normally deemed necessary to avoid such significant impacts.

And yet, the average travel times have dramatically increased in the region, due mainly to the proliferation of traffic signals. For example, in 1983, there were no traffic signals on El Toro Road from Cook's Corner to Trabuco Road By 1997, there were seven While each one may operate at level of service "D" or better, they collectively can (and often do) add several minutes to a trip which used to take only five minutes.

The average trip time more effectively measures and summarized the project's true impact on "traffic and circulation" than does simply tabulating the expected levels of service at a growing number of signalized intersections, and will more realistically reflect the inevitable and increasing conflicting movements of vehicles generated by the sprawling suburban development in this region.

Under CEQA, EIRs must be written in plain language so that the public can understand the potential effects of a project. This DEIR's traffic analysis fails this requirement, as explained above. Typical travel times, with and without the project, would be included in the DEIR.

Response

The methodology employed in the DEIR to analyze project related traffic impacts is a standard protocol adopted by the County of Orange, and is used in all EIR documentation. Travel time and delay analysis is not appropriate for long range planning purposes. With regard to the plain language comment, the County requires all technical reports, including traffic reports, to be summarized in language understandable by an informed public.

RCCF-8

Comment

7. DEIR MUST ASSESS THE ACTUAL IMPACT ON SCHOOL.

The DEIR gives short shrift to the project's impacts on schools--a single sentence affirming the obvious, that the project would send "400 additional students into the currently overcrowded Saddleback Valley Unified School District." (DEIR page 4-220.) As mitigation, it proposes only the payment of required school fees of $1.72 per square foot of residential (page 4-224), and then somehow concludes that "[n]o unavoidable adverse impacts would occur to education services" (page 4-226).

This conclusion cannot be supported by the available evidence. As the school district has repeatedly verified, the state-required fees do not suffice to provide required school facilities in the region. The DEIR must list the school facilities to be impacted by the project, describe the existing conditions at these facilities, and then assess the expected impact of the project on each

Response

The proposed project must comply with the requirements of the State School Impact Fee Program to alleviate any incremental burden, in accordance with the School Facilities Act, (Government Code Section 65995).

It should be noted that there are other mechanisms available to school districts to fund new school construction. These include community assessment districts and general obligation bonds. However, implementation of these programs will require two-thirds vote of the residents and therefore, are not presently enacted. At this time, the only mechanism enacted by the Saddleback Valley Unified School District is the use of developer fees in accordance with state mandated limitations.

COMMENTS AND RESPONSES - RUTAN & TUCKER, LLP.
David B. Cosgrove, August 21, 1997

RAT-1

Comment

This office, and the undersigned in particular, represent St. Michael's Abbey ("Abbey"). As you may be aware, the Abbey is a landowner adjacent to the proposed Saddleback Meadows Project ("Project") for which the above-referenced Draft Subsequent Environmental Impact Report ("DSEIR") has been prepared. The Abbey will be directly affected by this Project.

The Abbey opposes the Project as currently proposed, for many of the same reasons already expressed in connection with the processing of Environmental Impact Report No. 561. That EIR was the subject of numerous letters from our office, raising various objections to CEQA, land use inconsistencies, and other problems with the Project. The provisions of those letters are incorporated herein by reference, and we would request that copies of them be made a part of the administrative record in the processing of this DSEIR.

The Abbey believes there are a number of legal, environmental, planning, and other defects in the currently proposed Project. This letter, and the items incorporated herein by reference, constitute the Abbey's comments under CEQA public comment procedures for DSEIR No. 566.

Response

The comment is noted. Please note that DEIR 561, including the response to comments document, has been incorporated by reference into DEIR 566.

For ease of reference, the comments are grouped under separate subject headings below.

RAT-2

Comment

1. <u>The Project description and public review of the Project are flawed.</u>

At the outset, the Abbey must note that there is significant confusion regarding exactly what is the Project being reviewed. The Project chronology at DSEIR 2-8 and 2-9 indicate the catalyst for the preparation of this DSEIR was an application for a Phase I grading plan. The Project description at DSEIR 3-1, et seq., seems to indicate the Project is the actual construction of a 705-unit affordable housing project. This project includes a 1.5 acre neighborhood commercial center, which is referenced at DSEIR 3-1, but not analyzed further in other sections of the DSEIR. Moreover, DSEIR 3-15 lists approval of a grading plan and issuance of a grading permit as included within the discretionary actions covered by the environmental review.

Response

Please refer to Section 3.0 of the DEIR for a complete discussion of the project description, and Response to Comment SFC-1. The 1.5 acre neighborhood commercial center is a component of the proposed project that is evaluated throughout the entirety of the DEIR.

RAT-3

Comment

Given this, an obvious question arises. Where is the grading information? Neither the DSEIR nor the grading study attached as Appendix D includes any specific grading plan. In fact, page 4 of the grading study indicates that the report was conducted at what it terms a "EIR level," and that more detailed evaluation would occur during 40-scale grading plan review. Given the imminence of the grading activities, and their role as the entire cause for the environmental processing, this in inadequate. Title 14, California Code of Regulations § 15147[1] requires an EIR to include technical information "sufficient to permit full assessment of significant environmental effects by reviewing agencies and members of the public." This Project appears to be at a "construction project" level, as that term is used in CEQA Regs. § 15146(a), and consequently deferred analysis of the full range of all effects from the massive grading proposed is inappropriate.

Further, I am advised that the 40-scale grading plan, and other information required to determine and assess the specific impacts of the proposed grading, has not been publicly available, even up until a few days prior to the announced deadline for submission of DSEIR comments. This is a "construction phase" project proposal; it is not a general plan or program EIR. Consequently, all of the specifics of the grading proposal should have been formulated, and available for public review and comment, prior to Project approval. The DSEIR has failed to follow this process. Attached as Appendix "A" is a listing of all "mitigation measures" which defer analysis on various topics until the time of grading permits. Obviously, no grading permit can issue without a specific grading plan, yet that plan was not proffered for public review and comment. Given the large number of other analyses which hinge on the grading information, such information certainly constitutes "significant new information" as that term is used in CEQA Reg. § 15088.5, without which full, adequate public review is impossible. The DSEIR therefore must be re-noticed and recirculated after all the appropriate grading and other information has been available for the full comment period.

Response

Please refer to response to comment SFC-1.

[1] Cited herein as "CEQA Regs."

RAT-4

Comment

2. Analysis and incorporation of mitigation measures is improperly deferred.

No doubt in large part due to the failure to have specific grading information available, an entire host of items which require environmental analysis has been improperly deferred. Appendix "A" hereto is a chart of deferred analysis listing the various mitigation measures purportedly imposed upon the Project, but which actually reveal that fundamental aspects of the mitigation of impacts on endangered species such as the Riverside Fairy Shrimp, impacts on the California Gnatcatcher, acoustical analyses, street configurations and lines of sight, drainage studies, and design of storm drain improvements, to name a few.

The environmental impacts of these components of the Project are neither described or assessed, and no readily identifiable mitigation standard for these impacts is adopted. Given this, the conclusions regarding mitigation of the related impacts to a level of nonsignificance is unsupported by any evidence in the record, and therefore fails to meet the standards imposed upon the lead agency under CEQA Regs. § 15091(b).

Response

The comment is noted. DEIR 566 incorporated by reference the entirety of DEIR 561, including all of the technical studies completed for the previous proposal. Any updates required to existing studies will be completed prior to the issuance of the grading permit for the proposed project.

RAT-5

Comment

3. The available grading information demonstrates the Project should not proceed.

Although incomplete, what grading information is included in the DSEIR clearly indicates the Project should not proceed. The entire Project area is underlain by landslides, and excavations reveal heavy seepage (DSEIR 4-31; appendix D, p. 7). In addition, the oldest and deepest landslides on the property are merely projected from "necessarily limited exploratory borings." (Appendix D, p 8, 16.) This is hardly the type of area which is suitable for the projected 11.5 million cubic yards of direct and remedial grading.

Response

The comment restates information in DEIR 566 and expresses an opinion relative to grading the project site.

RAT-6

Comment

Incredibly, the DSEIR identifies 4" to 6" of settlement likely over the graded area. It finds such impacts insignificant, based upon a wildly optimistic presumption that settlement will occur at uniform rate, and occur evenly over a well-distributed area. (DSEIR 4-33.) With all due respect, the courts are filled with multi-party landslide cases, involving millions of dollars of damage, on ground settlement which is considerably less extensive. This effect must be regarded as significant, and must be mitigated.

Response

The comment correctly restates information contained in DEIR 566, and expresses an opinion relative to landslide related lawsuits. Because County of Orange Standard Conditions of Approval require stability following grading, geotechnical impacts will be reduced to less than significant levels, following implementation of all mitigation measures.

RAT-7

Indeed, the grading information in the DSEIR is contradictory. At page 4-24, it is indicated that no blasting is anticipated. Mitigation measure AM 2-33 contemplates blasting of hard cemented sandstone beds, however. If the Project proponent and its consultants cannot at this phase even uniformly identify the grading measures needed, how is the County or the reviewing public to accurately determine the grading impacts from this proposal?

Response

The referenced statement on Page 4-24 of the DEIR is a statement of general conditions encountered during the exploratory drilling phase of the geotechnical analysis. AM 2-33, on Page 4-31 of the DEIR, discusses excavation options should certain earthen materials be encountered during the grading phase of the project.

RAT-8

Comment

Last December, the Board determined this site was not appropriate for a 318-unit development. The comments already submitted by St. Michael's Abbey on grading and soils matters in connection with EIR No. 561 remain fully applicable here, are incorporated herein by reference, and show grading impacts will be significant. These effects remain unmitigated. Obviously, the site remains unsuitable for the far more intense 705-unit proposal now proposed.

Response

Please refer to the Responses to Comments received on DEIR 561. Both DEIR 561 and DEIR 566 contain detailed information on existing site geotechnical conditions, project impacts, and required mitigation measures.

RAT-9

Comment

4. Seismic impacts are improperly assessed.

Appendix D, page 11, seems to dismiss seismic risks to the site, with a generalized discussion of risks inherent throughout Southern California. Given the grading constraints on the property, a more particularized discussion of potential faulting and its potential impacts on the proposed Project are required. Specifically, DSEIR 4-20 lacks any discussion of the El Modena or Norwalk faults, both of which appear sufficiently proximate to the Project site to create seismic disturbances.

Response

No active or potentially active faults have been identified onsite. Primary regional faults which could seismically affect the project site have been identified in Table 7 on Page 4-20 of the DEIR. Mitigation measure SC2-7 reduces potential seismic impacts to less than significant levels.

RAT-10

5. The DSEIR contains a number of improper or vague mitigation measures.

In order to meet legal requirements, a mitigation measure must have a readily identifiable, performance-based standard which must be met. A number of the mitigation measures in the DSEIR fall short of this requirement.

For example, AM 2-22 merely contains advisory language that certain types of rock are "best not incorporated" in fills. AM 2-27 contains only recommendations, and no requirements. AM 2-45 calls for "precautions in respective expanse of soils, "which is vague, and should be further specified.

Mitigation measure SC 2-4 simply cannot be met. The DSEIR recognizes the incompatibility of the Project with O'Neill regional Park. (See DSEIR 4-12.) The degree of required grading eliminates any compatibility with natural land characteristics of adjacent open space areas, making compliance with this mitigation measure impossible.

Response

Mitigation Measures AM 2-22, AM 2-27 and AM 2-45 are standard Soils Engineer recommendations which supplement the County's standard conditions of approval to identify potential geotechnical constraints Mitigation Measure SC 2-4 will ensure that the transition between the project site grading and adjacent sensitive land uses is as compatible as possible. Other PDF, SC and AM mitigation measures will ensure an adequate transition between proposed grading and adjacent land uses.

RAT-11

Comment

6. A number of significant environmental impacts are improperly addressed.

The DSEIR is also rife with inaccurate or contradictory information in assessing environmental impacts, and concludes they are insignificant. For example, the hydrology study listed in Appendix L appears to have been done for a 318-unit proposal, not the 705-unit proposal listed in the project description. (See hydrology map and "Discussion" text in Appendix L.) DSEIR 4-39 contains an admission that the drainage analysis is inadequate, in stating that it may need to be updated after review of the 40-scale rough grading plans. The preliminary master plan of storm drain improvements listed in PDF 3-1 (DSEIR 4-41) references a tentative map 15230, not the Project, and is essentially unreadable. This map gives no legible reflection of what drainage facilities will be built, where, and no narrative or other graphic summary providing any further explanation appears in the DSEIR. All these studies need to be redone to analyze the Project now proposed.

Response

PDF 3-1 does not reference any Tentative Tract number. Hydrology analysis and data contained within the DEIR evaluates the effects of implementation of the proposed project on onsite hydrology. Baseline hydrology information contained in DEIR 561 remains applicable to DEIR 566.

RAT-12

Comments

Regarding noise, DSEIR 4-110 assesses noise from a projected 3,780 daily Project trips. DSEIR 4-52 indicates the daily trip projection is 6,220. The conclusions regarding vehicular noise are therefore suspect, and should be redone. In addition, DSEIR 4-113 indicates that air conditioning units are standard for housing projects, but fails to require such units as a mitigation measure for exterior noise. This should be included as a mitigation measure. IN addition, the entire acoustical analysis appears to be deferred (see DSEIR 4-115). IT should be conducted now.

Response

Please refer to the Introduction on page I-1 of this report for an explanation of timing for mitigation implementations. The reference to 3,780 daily trips is a typographical error. The acoustical analysis was not deferred and is based on the current traffic study completed for the 705 unit manufactured housing project. Although the County of Orange may require the installation of mechanical ventilation units as part of the building permit process, air conditioning units are normally a market driven feature.

RAT-13

Comment

Most strikingly, the DSEIR completely "ducks" impacts to the Riverside Fairy Shrimp, Coastal Sage Scrub habitat, and the California Gnatcatcher. DSEIR 4-152 indicates 105 acres of off-site mitigation will be reacquired, but the availability or location of this mitigation property receives no discussion DSEIR 4-157 delays the Gnatcatcher survey until some future time, and fails to provide the County or the reviewing public sufficient information to determine Gnatcatcher impacts from the Project whose approval is sought.

Response

Please refer to Response to Comment USFWS-3 and USFWS-16. Section 4.7.6 of the DEIR, beginning on Page 4-151, outlines a comprehensive mitigation program required to mitigate the impacts to onsite biological resource as a result of project implementation.

RAT-14

DSEIR 4-199 indicates a population generation estimate of 2.57 persons per household. The fiscal study, in Appendix G, page 22, uses 2.4. This inconsistency should be reconciled.

Response

The official County of Orange average household population is 2.57 persons/dwelling unit. The population generation factor (2.4 persons per dwelling unit) used in the fiscal impact report, contained in Appendix G of the DEIR was obtained from the California Department of Finance, based on January 1996 data. As of January, 1996 there were 179,571 residential units within the unincorporated portions of the County, containing 74,842 residents, with an average of 2.4 persons/dwelling unit.

RAT-15

Comment

Regarding transportation, the DSEIR notes the nearest bus stop is between 2.25 and 2.5 miles from the Project site (DSEIR 4-52.) This is completely inconsistent, with the proposed

affordable nature of the housing development, whose residents are likely to be more heavily reliant on public transportation. Extension of service or alternative project locations should therefore be analyzed. There is no separate analysis of the traffic, noise, or air quality impacts of the buss which will be required to transport the estimated 399 additional students which will come from the Project, to already overcrowded schools. (DSEIR 4-218.) More fundamentally, students, all the while acknowledging current classrooms are overcrowded. DSEIR 4-216 contains a number of ambiguous conclusions regarding impacts on sheriff, fire, education, and library services. The double negative wording of these sentences seems to indicate each may have a significant impact, none of which is mitigated.

Response

The Orange County Transportation Authority (OCTA) routinely adds public transit lines and stops to their system to accommodate demand. Project related effects on Public services and utility systems are evaluated in Sections 4.12 and 4.13 of the DEIR, beginning on Page 4-209. The OCTA which has reviewed the subject EIR, has not requested or recommended bus facilities in conjunction with the proposed project

RAT-16

Comments

7. The alternatives analysis is insufficient.

CEQA Regs. § 15126(d)(5)(B) calls for review of alternative locations, or finding regarding the infeasibility of alternative locations. The DSEIR fails to address alternative locations.

Response

As outlined in *Goleta II,-Citizens of Goleta Valley v. Board of Supervisors, (1990) 52 Cal. App.3d 553*, alternative site analysis is not warranted for certain types of projects, including those where the applicant has vested development rights based on an approved specific plan and a recorded tract map. Alternative site analysis is appropriate for projects with other viable site options. Several alternatives to the proposed project were evaluated in both DEIR 561 and DEIR 566.

RAT-17

Comment

The alternatives discussion contains inappropriate language suggesting some sort of legal obligation for the county to refund various payments, many of which we understand were made by the Project applicant's predecessor in interest, and not the applicant itself. While we have not conducted a legal analysis of these somewhat unusual claims, we have been informed that many of the water and other development impact credits resulting from these previous payments are fully transferrable, and could be marketed by the owner of the Project at any

time. Consequently, he statement regarding any obligation for refunds in the even to consideration of a "No Project" alternative appears incorrect factually, let alone irrelevant to the environmental analysis the DSEIR purports to be undertaking.

Response

Under the Alternative 1 discussion on Page 6-4 of the DEIR, previously paid development fees, utilized to construct capital facilities, are listed, documenting the total expended by the applicant to date. Implementation of the No Project Alternative would not require any infrastructure, and as such, would require a refund of fees previously paid for site infrastructure.

RAT-18

Comment

The DSEIR makes clear that the "No Project" alternative is the environmentally superior choice. Consistent with prior representations it has made, however, the Abbey has no objection to the 100-unit proposal, currently listed as Alternative 3. The Abbey believes this represents a sound balance between the environmental constraints on the site, and the Project proponent's desire for some degree of development on the property.

Response

The comment states the commentator's preference for Alternative 3, the 100 unit alternative.

RAT-19

Comment

8. The DSEIR's land use planning presumptions are inaccurate.

Although not precisely related to environmental impacts, the DSEIR contains a number of statements regarding land use entitlements the Abbey believes are inaccurate. The proposed Project is not, as the DSEIR asserts, essentially exempt from the Foothill Trabuco Specific Plan ("FTSP"). (DSEIR 4-4, 4-11). The Growth Management element of the county's General Plan was last revised on October 19, 1993, after the adoption of the Foothill Trabuco Specific Plan in 1991. This element is the self-described "key resource document for growth management concerns." Subsection (E) (6) requires that all new development within the Foothill Trabuco Specific Plan planning area "shall be rural in character, and shall comply with the policies of the [Foothill Trabuco Specific Plan] ... in order to maintain a buffer between urban development and the Cleveland National Forest," The Project is clearly contrary to these goals, does not comply with FTSP standards, and is therefore inconsistent with the General Plan.

Moreover, the Project is not "exempt" from FTSP requirements even under the terms of the

Specific Plan. Section 3.2(c) of the Bridlewood Residential District Requirements specifically indicates CEQA review is required prior to the issuance of grading permits for the previously-approved map. Consequently, additional discretionary review and approval was specifically contemplated prior to the time the Project was to be implemented. Any contention of "vested rights" from the filing of he the map is therefore inappropriate.

Response

Please refer to Sections 3.0 and 4.1 of DEIR 566 for a complete discussion of the consistency of the proposed project with land use policy documents. As documented, the proposed 705 unit manufactured housing project is consistent with the Foothill Trabuco Specific Plan and the countywide General Plan. The Growth Management Element of the OC General Plan assumes the development of the 705 unit project.

RAT-20

Comment

In addition, there is some question regarding the validity of the map in the first instance, given the chronology which the DSEIR lists. The map was apparently approved in December of 1979, and recorded some nine years later, in December 1988. The chronology points out that the last stay was granted only until July 24, 1986. There is no indication, at least in the chronology, that the County approved any further extension. What was recorded therefore very may well have been an expired map, which would vest no development rights whatsoever, regardless of any claimed FTSP "exemptions."

Response

Tentative Tract Map 10692 was recorded December 16, 1988, in accordance with the requirements of the County of Orange in effect at that time. The FTSP recognizes the legal status of the recorded Tract Map.

RAT-21

Comment

9. Conclusion.

Even without all the defects listed above, the DSEIR concludes a number of significant impacts are unmitigated, including land use impacts and grading impacts. Given this, the Project approval will require a Statement of Overriding Considerations, which the Abbey believes is wholly insupportable in this context.

Put simply, the Project is inconsistent with the Abbey and the neighboring Ramakrishna Monastery. With all due respect to housing needs, the Abbey submits that the roles the Abbey and Monastery plan, and the services they provide, are unique assets in Orange county. The Abbey would hope that the County would value these assets more than another in what

many consider to be all-to-common residential developments, and not issue a Statement of Overriding Considerations condoning the Project's inconsistency with surrounding land uses.

Whether seriously proposed in its own right, however, or merely as a backdrop to make a previously-rejected project appear more palatable, the DSEIR is insufficient to support the Project approval sought. For this reason, the Abbey respectfully requests the County to fail to certify the DSEIR, and to reject any grading applications, or other development permits, which may be sought pursuant to it.

St. Michael's Abbey thanks the County for the opportunity to respond to this DSEIR, and looks forward to working with the county and the applicant on a more environmentally sound Project proposal.

Response

Please refer to response to comments RAT-1 through RAT-20.

COMMENTS AND RESPONSES - SFC CONSULTANTS/Saundra F. Jacobs, REA, Principal, August 22, 1997

SFC.2-1

Comment

SFC Consultants (SFC) has reviewed the Saddleback Meadows Draft Subsequent EIR 566 ("DSEIR 566" or "EIR") for CEQA compliance and consistency. SFC understands that the County of Orange required DSEIR 566 to be prepared as a result of a grading permit application having been submitted by the developer of the Saddleback Meadows project for the construction of grading improvements for 705 manufactured single family dwelling units with concomitant infrastructure and utilities on approximately 222 acres.

Before getting into the details of the EIR adequacy, some very basic concerns about this DSEIR 566 should be enumerated. First, although the filing of the grading permit application appears to have been the event which triggered the preparation of DSEIR 566, the 40-scale grading plans upon which the permit application is based have not been made available for public review, nor has the geotechnical review of those plans been made available. In addition, these materials have not been addressed in or made a part of DSEIR 566. As a result, a full assessment of the construction level impacts of the project has not been done as required by CEQA.

Response

Please refer to response to comment SFC-1.

SFC.2-2

Comment

Second, whether or not the project analyzed in this DSEIR 566 is a grading plan application or the basic development plan, it is extremely important for this EIR to provide as much detail as possible in discussing environmental impacts and providing relevant mitigation measures. Gathering further information and complying with resource agencies in the future is not proper mitigation. However, this type of mitigation is listed throughout the EIR> exactly 51 of the 200 EIR mitigation measures are based on "Prior to Grading Permit" timing. It is important for the Planning Commission to realize that at this late stage in the development, many of the required mitigation measures should be formulated and be subject to public scrutiny now, not at a later date after the EIR has already been certified.

Response

Please refer to the Introduction section of this document and response to comment SFC-1 for a discussion of the planning process associated with the grading application and the related timing of mitigation measures.

SFC.2-3

Comment

Third, the geotechnical section of the EIR is also riddled with references to "gathering future information as mitigation measures". This may be acceptable if the environmental issue remains significant after mitigation; however, the EIR states that the geotechnical mitigation will mitigate any future and unknown impacts to less than significant levels. This is not a realistic conclusion considering future unknown impacts. A geotechnical review of the grading plans is the mechanism with which we can be assured that the mitigation measures recommended will actually work.

Response

Please refer to response to comment SFJ-1.

SFC.2-4

Comment

Fourth, the traffic section of the DSEIR arbitrarily limits its review and impact analysis of intersections to the El Toro Road/Santa Margarita Parkway intersection and intersection to the north thereof. No analysis has been presented for critical intersections to the south. Also, there is no indication in the traffic study if the traffic calculations have been adjusted to account for the difference in projected use versus actual use of the Foothill Corridor. Published reports indicated that the San Joaquin Corridor's projected usage was overestimated by nearly 50%. The DSEIR should include all intersections that will be impacted by 705 units, including El Toro Road and the San Diego Freeway (I-5), and especially if the Foothill Corridor estimates are similarly overstated. In addition, not withstanding the requirements of CEQA Guidelines Section 15130(b)(1)(B), the DSEIR fails to provide a cumulative analysis of the traffic impacts from the reuse of the El Toro MCAS as a commercial airport. It is also not clear from the DSEIR if the regional traffic model utilized for the project impacts, and cumulative project impacts, actually incorporate the regional changes to the traffic resulting from a commercial airport at El Toro.

Response

Please refer to responses to comments CMV-01 through CMV-09.

SFC.2-5

Comment

Fifth, the DSEIR provides a baseline discussion of the impacts from the El Toro MCAS fly-overs. However, the impact section of the EIR fails to identify a noise analysis or potential CNEL contours as a result of the base reuse plan as an active commercial airport No

mitigation measures are included for a multiple fly-over commercial airport. Notwithstanding the requirements of CEQA Guidelines Section 15130(b)(1)(B), the DSEIR fails to provide a cumulative analysis of the noise impacts from the reuse of the El Toro MCAS as a commercial airport or the regional traffic noise associated with the commercial airport. The DSEIR states "Depending upon future site re-use, aircraft noise may or may not be an important issue." The aircraft noise from a commercial airport at El Toro will be an important issue and must be addressed in the DSEIR.

Response

MCAS El Toro reuse plans have not been finalized, and as such, noise analysis associated with the reuse would be speculative. However, it is acknowledged that subsequent to the closing of MCAS, the potential exists for the development of a civilian airport on the MCAS site. Draft EIR 563 "MCAS El Toro Re-Use," which was certified on December 11, 1996, analyzed the impacts associated with such a use. Depending on the configuration of a future civilian airport, the potential exists for on-going impacts. Draft EIR 566 contains sufficient mitigation measures to effectively mitigate all potential current and future noise impacts.

SFC.2-6

Comment

Sixth, it is also important to note that the biological mitigation for ACOE and CDFG coordination may change the site plan, which would then require a revised EIR. If site plan redesign is not feasible, then the EIR should point out where the off site mitigation locations will be. In addition, the EIR indicates in several places that mitigation measures cannot be implemented by changes to the grading plan because this proposed project is a legally recorded tract map. However, under the Federal Endangered Species Act, all "take" must be accommodated, regardless of tract recordation or not.

Response

Please refer to Section 4.7 of the DEIR for a discussion of project related impacts to biological resources. Also refer to the introduction section of this document for a complete discussion of the planning process associated with the grading application, and the related timing of mitigation measures.

SFC.2-7

Comment

Seventh, the alternatives in the EIR should reflect alternative grading scenarios together with the comparable grading impacts associated with them. DSEIR 566 alternatives currently compare alternative land uses or densities, although these tend to be limited to different grading scenarios. Also, CEQA requires an alternative location to be discussed. This issue is missing in the EIR and should be included.

Response

Each of the alternatives evaluated in the DEIR contain a grading scenario different from that of the proposed project. Please refer to response to comment RAT -16 regarding alternative location.

SFC.2-8

Comment

Eighth, the EIR mitigation measures are also plagued with the word "should" instead of "shall". "Should" mitigation measures will become "shall" upon certification of the EIR. If the lead agent is not sure of a mitigation measure's applicability at this stage of approval, then perhaps the lead agent does not really want to implement important mitigation measures, but simply provide the necessary environmental paper work for a recorded tract map.

Response

All *should* wording contained within mitigation measures is hereby changed to *Shall.* Please refer to Section II of this document, Corrections and Additions to the DEIR.

SFC.2-9

Comment

Finally, the Planning Commission should keep in mind, that this recorded map for 705 units does not tie the County to instant EIR certification, in which CEQA simply becomes a necessary evil. CEQA allows for a public agency to not approve a project as proposed, if there are feasible alternatives or mitigation measures available that would substantially lessen any significant effects that the project would have on the environment (CEQA Guideline Section 15021). The Planning Commission can only override unavoidable adverse impacts if it finds that there are legitimate social, economic, or other considerations which truly outweigh such impacts. Simply implying that affordable housing is an overriding consideration is insufficient to justify the significant environmental effects of the project.

Response

The comment restates provisions of CEQA related to alternatives, mitigation and overriding considerations.

SFC.2-10

Comment

CEQA Guidelines Section 15161 indicates that "The EIR shall examine all phases of the project including planning, construction, and operation". A phased project must be evaluated

in light of each phase. The first sentence of Section 1.0 Executive Summary, Subsection 1.1, page 1-1, describes the project as "the phased development of 705 manufactured single family housing units..." yet the EIR states on page 3-16, Section 3.4 Project Phasing that grading will occur in one phase. This statement, in turn, appears to be at odds with the reference (in Table 3 on page 2-8 of the EIR) to the developer's submittal of an application for "Phase I Grading Plan" on December 3, 1996. Therefore is the grading being phased, or is the construction being phased? If the grading is phased, a phasing plan should be submitted with the EIR distribution and review. DSEIR 566 should describe what the grading phases are, including how much grading in Phase I, II, III etc. A Phasing Plan should be included as part of this DSEIR, and not just be made another condition of approval. Moreover, if residential construction is also being phased in addition to the grading, this needs to be spelled out and addressed in the DSEIR. The Planning Commission cannot certify a DSEIR having such piece-meal information on grading and phasing.

Response

As stated in the DEIR, all grading will be completed in one continuous phase. Only the first portion of the grading plans, referred to in the DEIR as *Phase I* grading plans, have been submitted in conjunction with the grading application.

SFC.2-11

Comment

Section 2.0 Introduction

Technical error: Page 2-7, Table 3 chronology of June 13, 1984: Ordinance 3486 should read - Ordinance 3468.

Response

Error noted and correction incorporated into Final EIR. Please refer to Section II of this document, Corrections and Additions to the DEIR.

SFC.2-12

Comment

Page 3-8, first paragraph. The project description indicates that the removal of the mandated Inclusionary Housing Program requirements could undermine the County-wide calculation used to eliminate the affordable housing mandate. This statement on the surface may seem valid enough, but there is no factual evidence in the EIR to support such speculation. Instead of mere speculation, the DSEIR should include a thorough discussion of housing issues, including the possibility of eliminating the need for affordable units and allowing for a more environmentally sensitive project to be considered.

Response

A thorough analysis of housing issues associated with the affordable housing provisions associated with recorded tract 10692 is beyond the scope of analysis of DEIR 566, and is not warranted.

SFC.2-13

Comment

Page 3-8, Project Features, indicates that a 1.4 million-gallon water tank would be required for this project of 705 units. EIR 561, which analyzed 318 units, also required a 1.4 million-gallon water storage tank. The quantity of fire flow, and stored water necessary for the 705 units therefore appears inconsistent. If two 1.4 million-gallon tanks, or one 2.8 million gallon tank are required, this would significantly increase either the size of the tank location for two tanks, or the amount of grading and screening that would be needed for an increased tank size. The water tank site is owned by the Trabuco Canyon Water District, however, Mr. Bruce Bonner, General Manager of the District was not aware of the discrepancy, and was planning to comment on the EIR for the proper information. Without the proper water storage available for 705 units, the project could not be developed and the DSEIR could not be certified. The extent of grading for the increased tank size and its location must be addressed in the DSEIR. Changing the size of the tank size will also require an amendment to the original Recorded Tract Map. Once the County receives this information, a revised section for review and comment by the public should be prepared.

Response

The water tank site was part of the project site and was dedicated to the Water District, in conjunction with recordation of TT 10692. The 1.4 million gallon water tank has been sized to serve a larger area than the proposed project, and remains adequate to serve project related fire flow and domestic service demand requirements.

SFC.2-14

Comment

Page 3-16, Project Phasing. Project grading is noted as being implemented in one phase, but this does not square with the fact that the developer has only submitted 40-scale grading plans for "Phase I" of the project which, apparently, only involves a portion of the proposed 705 units. This inconsistency should be resolved because, obviously, if the grading is to occur in several stages, instead of in "one phase," then the grading impacts would occur over a much longer period of time than the 18-month estimate set forth in the DSEIR

Moreover, if the EIR shows and states the grading in one phase, then the entire grading plan at 40 scale should be made part of the Appendices to the EIR or, at the very least, the grading plans (and the geotechnical reports needed to fully understand them) should be incorporated

by reference so that members of the public could review them. Either solution will require DSEIR 566 to be revised and recirculated in accordance with CEQA Guidelines Section 15088.5.

The Project Description has inaccurately depicted the project phasing. CEQA Section 15126 requires a complete project description, including all phases, and should be included for review with this DSEIR. Since it appears that the grading will be in phases, this project description is not consistent with CEQA Guidelines Section 15126 and cannot be certified as adequate.

Response

Please refer to response to comment SFC-1.

SFC.2-15

Comment

Section 4.0 Existing Conditions, Project and Cumulative Impacts, Mitigation Measures and Level of Significance After Mitigation:

Section 4.1 Land Use/Housing

Notwithstanding the requirements of CEQA Guidelines Section 15126(c), the EIR makes no attempt to explore feasible measures to mitigate land use impacts to surrounding areas. Suggested land use mitigation should include: Setback criteria, buffer zones of vegetation, pet restrictions, ridgeline protection, project phasing coupled with an Annual Monitoring Report under Zoning Code Section 7-9-103.2(a)(12) to identify imbalances between development and infrastructure, etc. These new mitigations should be included in a revised draft EIR and recirculated for public review and input.

Response

Please refer to response to comment SFC-1 and sections 2.0, 3.0 and 4.1 of the DEIR for a discussion of the recorded tract map.

SFC.2-16

Comment

CEQA Guidelines Section 15131 (b) expressly recognizes that construction can adversely impact religious practices: "if the construction of a road and the resulting increase in noise in an area disturbed existing religious practices in the area, the disturbance of the religious practices could be used to determine that the construction and use of the road and the resulting noise would be significant effects on the environment". While the Land Use/Housing section of the EIR indicates that the impacts would remain significant,

unavoidable and adverse, there is no attempt to mitigate impacts on surrounding religious uses to any level at all.

Response

Mitigation measures are proposed throughout the DEIR to reduce/eliminate adverse impacts to surrounding land uses. These mitigation measures are summarized in Section 7.0 of the document.

SFC.2-17

Comment

Section 4.2 Soils and Geology

Although SFC was not able to gain access to any of the current grading plans at the County, SFC has learned that, for a price, the developer made copies of such plans available to certain interested parties and that the plans showed only half of the grading that is proposed for the 705-unit project. As stated above, if the rough grading (including all remedial grading) is to be accomplished in one phase, then the plans showing all the grading work to be performed should be made available for public review and DSEIR 566 should be revised and recirculated to incorporate such plans and all related geotechnical reports. This is particularly important with respect to the remedial grading improvements, (which account for the vast majority of the rough grading operations) because mitigation measures, such as shear keys, cannot be property evaluated without the grading plans and soils reports, and cannot be constructed in a piecemeal fashion without the risk of slope instability.

Response

Please refer to response to comment SFC-1.

SFC.2-18

Comment

Page 4-16, Ground Water: It appears from the State Water Resources Board map of wells in the area that there are at least five wells located northerly, westerly and southerly of the site and landslide areas. These wells depend on the groundwater supplies to remain in operation. During remedial grading, perched groundwater and saturated zones will be encountered (according to the geotechnical study). This excess groundwater will require pumping to a point to where the bottom layer of the 120-foot key cut will need to be cleaned out. The EIR does not discuss the high probability that this excessive pumping may impact groundwater and groundwater recharge to these surrounding wells. Impacts to groundwater and surrounding wells is considered a significant impact in CEQA Guidelines Appendix G(h) and (I). The EIR provides neither discussion of this important issue, nor any mitigation for potential impacts

to these wells. While the EIR preparer, or the geotechnical engineer for the project, may speculate that the surrounding wells are being fed by Aliso Creek or "other groundwater", **there is no factual basis to support the conclusion that there will be "no significant groundwater impact" caused by project grading and development.** The Planning Commission must be provided with complete information on this issue before passing on the adequacy of DSEIR 566, and gathering groundwater information during remedial grading for future decisions, and complying with the water resource agencies, is not the proper way to proceed.

Response

The comment is speculative. All grading and any required groundwater pumping will be conducted in compliance with Orange County Grading and Excavation Code requirements.

SFC.2-19

Comment

Page 4-24, last two paragraphs. These paragraphs state that "unfavorable conditions (i.e. "Some ground water") can be mitigated by implementing corrective grading concepts". Yet the DSEIR only speculates on the mitigation necessary to truly lessen future impacts to the development from groundwater and postpones for future analysis whatever specific mitigation measures might eventually be proposed by the soils engineer for the project (see page 4-25). This is not in keeping with CEQA.

Once the shear keys are cut on the project site, the DSEIR indicates that subdrains will be required. Subdrains and dewatering facilities are permanent features, and are notoriously unreliable. This was the case in the Hidden Hills development located immediately adjacent to the south of this site, and is the proposed location of the emergency access to Saddleback Meadows. In this study, the buttress subdrains failed, or in most cases the subdrains were missing and groundwater backed up behind the buttress fill, severely impacting the residences and infrastructure. To truly mitigate geotechnical impacts to less than significant levels, and to a degree that will ensure the Planning Commission that CEQA has been satisfied, additional detailed recommendations should be included in this DSEIR prior to certification. In addition, if in fact the subdrains are only to work temporarily, the DSEIR does not explain to where these subdrains will drain. It is presumed that these features will drain to Los Alisos Creek, which is shown as a blue line on the USGS Quad Map. The EIR should discuss the impact of a permanent alteration to the flow of Los Alisos Creek. A higher degree of specificity on this important issue is required prior to EIR certification.

Response

DEIR 561 and DEIR 566 contain a comprehensive discussion of geotechnical and hydrology impacts associated with the proposed project. Please refer to Sections 4.2 and 4.3 of these documents.

SFC.2-20

Comment

Page 4-25, Mitigation Measure 2-1, state that "A comprehensive remedial grading mitigation plan has been designed to stabilize the project site..." yet on page 4 of the G.A. Nicoll and Associates report in Technical Appendix D, Mr. Nicoll's firm indicates that "a more detailed evaluation" of slope stability issues has yet to be completed and will be conducted as part of the geotechnical review of the 40-scale grading plans. This underscores the fact that only vague and general "concepts" about grading mitigation measures are referenced in DSEIR 566 even though CEQA Guidelines Section 15146 would require a much more detailed and specific discussion of grading impacts and mitigation at this construction-level stage of the project. The mitigation measures listed in this section of the DSEIR are general, boilerplate statements about what information is yet to be gathered and they **do not** represent "a comprehensive remedial grading mitigation plan". The seminal question which remains unanswered is whether DSEIR 566 is intended to be used as the environmental documentation to support the issuance of one or more grading permits for the project or does the County intend to require yet another Supplemental EIR to be prepared to address the grading mitigation measures which are still being analyzed by the project soils engineer? If DSEIR 566 is intended to support the issuance of grading permits, then the construction-level plans and reports necessary for the permits to be issued must be in the EIR itself, instead of being the subject of speculation as to what will be determined at some future date.

Response

Please refer to response to comment SFC-1.

SFC.2-21

Comment

Page 4-27, Mitigation Measure 2-3. This mitigation is unnecessarily vague as to who the "decision-maker" is (the Board of Supervisors? The Planning Commission?), and it is also misleading for the public. CEQA Guidelines Section 15162 states that a subsequent EIR is necessary if "Substantial changes are proposed in the project..." (In this case any substantial change to the grading plan). If the applicant "deviates" from the recorded tract map grading to such an extent that the project has changed and a new application must be submitted per the zoning code, then a subsequent EIR will be required for public review of the changed project. In addition, as the current geotechnical mitigation measures are worded, a subsequent EIR would be required if conditions are exposed during grading which are significantly different from those described in the project description or geotechnical report. As indicated on page 16 of the Nicoll report: "In the event that during construction, conditions are exposed which are significantly different from those described in this report, they should be brought to the attention of the Soil Engineer." Preparing a Subsequent EIR for changed conditions during remedial grading would not be feasible, therefore sufficient

detail must be included with the DEIR and recirculated for public review. The mitigation measure should be revised to reflect this change.

Response

The decision maker, in this case, is the Orange County Grading Official. Please refer to Section II of this Document, Corrections and Additions to the DEIR. Also refer to response to SFC-1. Grading permit authorization is an administrative determination.

SFC.2-22

Comment

Page 4-27, Mitigation Measure 2-4, is not enforceable unless the Planning Commission requires that the EIR show how the graded areas will be compatible with natural land characteristics of the adjacent open space. Future gathering of information is not proper mitigation for a significant impact.

Response

Mitigation measure SC 2-4 is a standard county condition, applied to numerous projects, and is enforceable, under CEQA and California planning and zoning law..

SFC.2-23

Comment

Page 4-29, Mitigation Measure 2-16, the back cut failure guidelines should be provided now for a construction-level grading permit application EIR. This project is already approved with a recorded map. Therefore, a higher level of detail is essential to demonstrate the overall feasibility of the recommended grading techniques. The criterion the project applicant has to follow is to mitigate impacts to less than significant levels and demonstrate that the mitigation measures are adequate under CEQA. The DSEIR has not accomplished this yet.

Response

Please refer to response to comment SFC-1

SFC.2-24

Comment

Page 4-29, Mitigation Measure 2-20 Ponding will be necessary as part of the dewatering process and within Best Management Practices for Regional Water Quality Control Board requirements. This mitigation measure should be amended to reflect actual ponding that will be necessary and the possibility of Vector Control Permits.

Response

The comment is speculative. Ponding may or may not be required depending on subsurface conditions encountered.

SFC.2-25

Comment

Page 4-31, Mitigation Measure 2-34. Ironically, this so-called "mitigation measure" provides more detailed information regarding groundwater problems and dewatering than any discussion set forth in the text of DSEIR 566. Although page 4-24 of the text merely alludes to "some" ground water that might be encountered during grading, this mitigation measure paints a far more graphic and alarming picture. **"Heavy seepage was encountered, as indicated on the Boring Logs, at multiple elevations. Consequently, considerable water can be expected within planned excavations, typically reaching maximum discharge within 2 to 5 days after exposure. Additional nuisance water is foreseen in nearly all major cuts decreasing in volume with time, and being less at higher elevations as well as in cuts made late in the year."** As indicated above, groundwater wells are located adjacent to the site and landslide areas. Impacts to surrounding groundwater and groundwater wells from required pumping and dewatering are not even discussed in the text of the DSEIR, yet this mitigation measure appears to expect it. Again, the DSEIR does not, but certainly should, discuss the extreme likelihood that this excessive pumping may impact groundwater wells and groundwater recharge to these surrounding wells. Impacts to groundwater and surrounding wells are considered a significant impact under CEQA. The Planning Commission must be provided with enough factual information before it is asked to certify this EIR. Gathering groundwater information during remedial grading is not proper mitigation.

Response

Please refer to response to comment SFC-1

SFC.2-26

Comment

To truly mitigate geotechnical and groundwater impacts to less than significant levels, and to a degree that will ensure the Planning Commission that CEQA has been satisfied, additional detailed recommendation on grading, dewatering and impacts to groundwater and groundwater wells should be included in this DSEIR prior to EIR certification. This DSEIR requires a higher degree of specificity on this important issue prior to EIR certification

Response

Please refer to response to comment SFC-1.

SFC.2-27

Comment

Page 4-33, Section 4.2.7 of **the DEIR should be changed to read "Implementation of this proposed project, with the mitigation measures outlined above will result in unavoidable adverse geotechnical impacts."** At a minimum, there are significant groundwater impacts and slope stability issues that have not been adequately discussed or mitigated in DSEIR 566 and revision and recirculation of the DSEIR is in order to allow public comment on these matters when they are completed.

Within the Technical Appendix D, page 4, Mr. Nicoll's firm indicates that this geotechnical review is for an EIR level of analysis, and that subsequent analysis will be necessary. However, the "EIR level" soils report in Appendix D does not provide the required specificity for the considerations outlined in the DSEIR, including impacts of dewatering during and following construction, slot cutting or staged excavation to assure on-going support of landslide masses to be stabilized, backcut forecut slope inclinations, and dewatering criteria. A grading plan review report should include all recommendations and geotechnical criteria necessary to undertake and complete all remedial grading improvements and measures, and it should be included as part of DSEIR 566 and circulated to the public. The Planning Commission cannot, without uncertainty, approve this project under the premise that the impacts are mitigated to less than significant levels. If planning staff chooses to amend the DSEIR to show that significant grading impacts will remain after mitigation, then the introduction of new information will trigger recirculation of the EIR per CEQA Guideline Section 15088.5(a).

Response

Please refer to response to comment SFC-1.

SFC.2-28

Comment

Section 4.3 Water/Hydrology

EIR 566 appears to utilize the hydrology map from EIR 561 without changing the underlying site plan. While the existing drainage will not change regardless of the site plan, the post development drainage will change from EIR 561 to EIR 566. DSEIR 566 does not include post development drainage circulations. The DSEIR needs to correlate existing versus post-development change in cfs and % in order for the Planning Commission to base its decision on the storm drain improvement plans that were approved in 1988. This subsequent EIR should incorporate all pertinent information and re-verify the prior calculations and not rely solely on County approvals from 1988.

Response

The comment is incorrect. Exhibit 22, Conceptual Drainage Plan, uses the proposed 705 lot manufactured housing project as the base map.

SFC.2-29

Comment

Page 4-39, Table 10 does not correspond with Exhibit 22 as far as proper labeling of the storm drains. If there are not accurate, the Planning Commission should require updated concepts to verity mitigation measures.

Response

Storm drain reference numbers are hereby added to Exhibit 22, *Conceptual Drainage Plan*, that correspond to Table 10. Please refer to Section II of this document, Corrections and Additions to the DEIR.

SFC.2-30

Comment

Page 4-38 The EIR states that alterations of the rate of flow of groundwater or impacts to groundwater quality are considered to be insignificant. The geotechnical report indicates that groundwater and saturated zones will require dewatering during grading and excavation of the sheer key. Groundwater from these slide planes will require pumping for an undetermined period of times (as demonstrated in Mitigation Measure 2-34). At least five (5) groundwater wells are located near this project site, directly in the path of the groundwater flow. The geotechnical report has completely disregarded the impacts that may be incurred downstream during construction dewatering. **This EIR section should consider impacts to groundwater as significant,** otherwise the Planning Commission should not certify this EIR with an incorrect impact finding.

Response

Impacts to groundwater quantity/quality, as a result of grading operations, will be mitigated by standard County condition of approval SC 2-6 and mitigation measure AM 2-34..

SFC 2-31

Comment

Page 4-41, Mitigation Measure 3-1 indicates that the master drainage concept is included as Appendix L. However, upon closer evaluation of the site plan in Appendix L, it appears that the post development calculations are for the smaller 318 units (EIR 561) project. This EIR

cannot be certified as adequate with erroneous information pertaining to a much smaller project.

Response

Information contained within Section 4.3 of the DEIR, beginning on Page 4-33 contains a comprehensive evaluation of impacts to Water/Hydrology, including the master drainage concept for the proposed project. It should be noted that all information, including the appendices, from DEIR 561 have been incorporated into DEIR 566 by reference.

SFC.2-32

Comment

Page 4-42, Mitigation Measure 3-5. How and why is this mitigation important to reducing hydrologic impacts to less than significant levels? What if the upstream and down stream property owners do not sign or agree to a letter of consent? Does the Manager, PDS/Subdivision and Grading Services Division override the property owner and allow consent? The mitigation measure is not enforceable and does not reduce impacts in any way. It should be deleted.

Response

Mitigation measure SC 3-6 is an adopted County Standard Condition of Approval, and is applicable to the proposed project, subject to the approval of the Manager, PDS/Subdivision and Grading Services Division

SFC.2-33

Comment

Page 4-42, Mitigation Measure 3-6 indicates participation in a Master Plan of Drainage prior to issuance of any building permits. Preparing a master plan of drainage after the grading has been completed does not allow the County or the public to comment on proper hydrologic calculations. As indicated in the above comment to mitigation measure 3-1, the master drainage concept included in Appendix L was prepared for the smaller 318 units (EIR 561). The master plan of drainage should be submitted with and incorporated into the DSEIR for recirculation and public review.

Response

The Master Plan of Drainage referred to in SC 3-6 is an existing county master plan and not subject to negotiation by the applicant. SC 3-1 through SC 3-7 outline the hydrology/drainage requirements that must be satisfied prior to the issuance of grading permits.

SFC.2-34

Comment

Page 4-42, Mitigation Measure 3-7 indicates that impacts to the site's hydrology shall be reduced to a level of insignificance through engineering design and construction techniques. However, the mitigation measures and analysis leading to the measures must be commensurate with the specificity required for a construction-level grading permit application EIR. There is no guarantee that implementation of this mitigation measure will result in insignificant impacts to this environmental issue. Therefore **this impact should be changed to potentially significant after mitigation** because the mitigation measure is not specific enough to conclude otherwise. The mitigation measure is too speculative for future hydrology of a site, particularly with the wrong hydrology report in the DEIR. In addition, there is no timing associated with implementation of this mitigation measure.

Response

Please see response to SFC-1. Timing associated with mitigation measure SC 3-7 is prior to the issuance of any grading permit, similar to other hydrology related SC mitigation measures.

SFC.2-35

Comment

Page 4-43, Section 4.3.7. indicates that implementation of the proposed mitigation measures would result in no unavoidable adverse impacts to groundwater hydrology, yet there is no information on impacts to downstream wells from excessive dewatering to support the less than significant impact. This conclusion should be changed to **potentially significant impacts will result after implementation of the mitigation measures.** In addition, the new information associated with the new finding will require recirculation of DSEIR 566.

Response

The referenced statement regarding no unavoidable adverse impacts to groundwater hydrology is valid, and is supported by information contained in Sections 4.2 and 4.3 of the DEIR and DEIR 561 which has been incorporated be reference, in conjunction with standard county conditions of approval

SFC.2-36

Comment

Section 4.4 Transportation/Circulation

The traffic section of the DSEIR unfairly limits its review of intersection impacts to El Toro Road/Santa Margarita Parkway and north. No explanation is given in the DSEIR for this

limiting factor, and no analysis is included for the intersections along El Toro south to the San Diego Freeway (I-5). The DSEIR should include all intersections that will be impacted by 705-unit project. This lack of analysis raises another unanswered question: Have the traffic calculations been adjusted to account for the difference in projected use versus actual use of the Foothill Corridor? (The San Joaquin Corridor's projected usage was substantially overestimated by nearly 50%). This difference in projected use versus actual use should be incorporated into the project and regional buildout traffic calculations of the area. With an over estimation of the Foothill Corridor usage, there will need to be an analysis and discussion of traffic along El Toro Road from the Foothill Corridor south to the San Diego Freeway. The intersection of El Toro at the 5-Freeway north and south is virtually impassable during peak hours and the addition of Saddleback Meadows will only exacerbate this growing problem.

Response

The scope of the traffic and circulation impact analysis contained in DEIR 566 was based upon several meetings with County of Orange, PF&R Department, Programs Division, Traffic Engineering Section staff, in conjunction with standard accepted traffic engineering analysis practices and County of Orange adopted policies. Fifteen percent of the project related average daily traffic generation is distributed southbound on El Toro Road, south of Santa Margarita Parkway, with 20 % of the project related average daily traffic generation distributed onto the northbound Foothill Transportation Corridor. The above outlined trip distribution remains valid. Intersections which would experience less than a 1% impact are not considered to have "measurable impacts."

The Foothill Transportation Corridor is currently operating at projected traffic volumes and levels of service (LOS), in contrast to the underutilized San Joaquin Transportation Corridor.

SFC.2-37

Comment

Notwithstanding the requirements of CEQA Guidelines Section 15130(b)(1)(B), the DSEIR fails to provide a cumulative analysis of the traffic impacts from the ruse of the El Toro Marine Corp Air Station as a commercial airport. In addition, it is not clear from the DSEIR if the regional traffic model utilized for the project impacts, and cumulative project impacts, actually incorporates the regional changes to the traffic resulting from a commercial airport at El Toro. CEQA Guidelines Section 15130(b)(1)(B) provides the cumulative impact elements necessary for an adequate discussion include: "A summary of projections contained in an adopted general plan or related planning document (in this case the Draft Reuse Plan EIR) which is designed to evaluate regional or areawide conditions. Any such planning document shall be referenced and made available to the public at a location specified by the lead agency." The El Toro Reuse Plan and EIR should be included in the regional analysis and cumulative impacts, incorporated by reference, and made available for public review during the recirculation process. Without such an analysis, **the DSEIR cannot conclude that this traffic issue will have less than significant impacts.**

Response

The cumulative traffic impact analysis is based on the most current modeling source available from the County of Orange: the OCTAM, Version 2.5, South County Subarea traffic model. No specific MCAS El Toro reuse cumulative traffic data is available, as a preferred alternative and the related EIR/EIS has not been prepared.

SFC.2-38

Comment

It appears as though the traffic study has distributed residential trips to the commercial area from the project internally via Valley Vista Way. The traffic analysis does not take into account that Valley Vista is closed to through traffic and is to be used as an emergency access only. According to the grading plan, the only way to the commercial area will be from either El Toro Road or Valley Vista. If Valley Vista is to be blocked off, all trips in the traffic study that were to use Valley Vista will now use El Toro Road. This inconsistency should be resolved.

Response

Twenty percent of the commercial site trip generation was distributed internally to the project site via Valley Vista Way. Redistribution of these trip to El Toro Road will not alter the post development level of service analysis contained in the DEIR.

SFC.2-39

Comment

Review of the traffic count data shows that the information was gathered after schools in the District had been let out for summer Updated counts should be included after school has started, but before the Christmas holiday season.

Response

The timing of the baseline traffic data collection, in reference to school schedules, does not have a significant effect on the traffic impact analysis

SFC.2-40

Comment

Page 4-52, Traffic Impact Modeling section of DSEIR 566 indicates that the proposed project of 705 units will generate 6,220 trip-ends per day with 345 vehicles per hour during the AM peak hour and 635 vehicles per hour during the PM peak hour. However, the Traffic Report in Technical Appendix E states on page 27 that "The Saddleback Meadows (TT-10692)

development is projected to generate a total of approximately 8,340 trip-ends per day with 540 vehicles per hour during the AM peak hour and 825 vehicles per hour during the PM peak hour". **Why is there nearly a 25% discrepancy with respect to trip-end figures?** Even with the inclusion of passby/diverted trip reductions (as calculated on Table 4, page 29 of the Traffic Report in Appendix E), the total project trip-ends is 7,530, nearly 20% greater than what is stated in the DSEIR. The traffic section of the DSEIR should be reanalyzed and recirculated for public review.

Response

Please see response to comment CMV-3

SFC.2-41

Comment

Page 4-52, Section 4.4.2. Effects Found To Be Insignificant. This section concludes that the proposed project would not result in insufficient parking capacity onsite or offsite. This is not consistent with the traffic report in Appendix E which indicates on page 10 that "Verification of adequate parking should be analyzed for the project in conjunction with approval of the site plan." The site plan for Saddleback Meadows is already approved. Lack of available parking for high density housing such as this is the number one Home Owner Association complaint and the subject of many homeowner lawsuits against the developer. The DSEIR should discuss what constitutes a significant parking impact, however, in order to do that, parking verification must be performed first. In order for the traffic engineer's recommendation to be consistent with the DSEIR's finding of insignificance for this parking issue, a parking analysis for the site should be performed prior to certification.

Response

Residential and commercial parking requirements have been incorporated into the recorded tract map, and will be reviewed and verified at the site plan review stage for the commercial land use

SFC.2-42

Comment

Page 4-82, Mitigation measure 4-12 and 4-13 seem to contradict each other. MM 4-12 requires the applicant to design and construct roadway improvements for El Toro Road, including deceleration lanes an entrance pockets, whereas MM 4-13 requires the applicant to provide only a cash deposit for the difference in cost of designing and constructing the roadway improvements of the project compared to the costs associated with the ultimate configuration of El Toro Road The question that remains, therefore, is whether the project has to pay for or build its fair share of the traffic improvements to El Toro Road?

Response

The comment restates mitigation measures contained in the DEIR. Mitigation Measure SC 4-12 requires the construction of specific, project related, improvements to El Toro Road, with Mitigation Measure SC 4-13 requiring a deposit for the construction of ultimate right of way facilities. This mitigation measure is adequate to ensure that the project meets its obligation towards El Toro Road improvements.

SFC.2-43

Page 4-83, Mitigation measure 4-15 states that "Verification of adequate parking shall be analyzed for the site in conjunction with approval of the site plan". This mitigation measure should be revised based on the comments from page 4-52, Section 4.4.2.

None of the mitigation measures listed in the traffic section of the DSEIR provides for reasonable contributions to the regional impacts on traffic from the proposed El Toro commercial airport.

Response

The comment refers to mitigation measure AM-16, not AM-15. Please refer to response to comment SFC.2-41.

SFC.2-44

Comment

Section 4.5 Air Quality

Page 4-94, Mobile Source Impacts. The Air Quality section for Mobile Source Impacts has based its calculation on 5,410 daily vehicle trips, the DSEIR traffic section states a calculation of 6,222 daily trips, while the Traffic Report in Appendix E of the DSEIR states a daily trip calculation of 8,340, a total difference of 35%. Therefore it would appear that the air quality calculations are underestimated. Any CEQA calculations that differ by a factor of 10%, let alone 35% or more, cannot be considered similar and therefore, the Air Quality analysis should be updated with the proper information before certification by the Planning Commission.

Response

The comment is correct in noting that the air quality analysis is based on 7,530 trips per day, rather than 8,340, a difference of 810 trips per day, or 11%. An increase in project related operational emissions would not change any conclusions relating to the potential significance of AQMD threshold exceedances, as outlined in Table 19 of the DEIR, on Page 4-94. Please refer to section II of this document, Corrections and Additions to the DEIR .

SFC.2-45

Comment

Page 4-110; It appears that the applicant has chosen to utilize the project related vehicle trips from the previous noise study prepared for 318 units (EIR 561), rather than updating EIR 566 to reflect more than double the number of units associated with the manufactured housing project. This study should be updated with the proper information prior to certification of the EIR.

Response

The comment is incorrect The acoustical analysis was updated to reflect the 705 unit proposal evaluated in DEIR 566. The reference to the number of daily trips in the text on Page 4-110 of the DEIR is a typographical error. The updated acoustical analysis is contained in it's entirety in Appendix G of the DEIR.

SFC.2-46

Comment

Page 4-118, Section 4.6.7 indicates that the project in conjunction with proposed mitigation measures would not result in any unavoidable adverse operational impacts. However, the EIR fails to analyze the noise impacts the project would have, at buildout, on the surrounding religious organizations to the north and south of the site.

Response

Please refer to Page 4-113, Paragraph 5 in the DEIR for a discussion of noise impacts to adjacent land uses.

SFC.2-47

Comment

Section 4.6 Noise

Notwithstanding the requirements of CEQA Guidelines Section 15130(b)(1)(B), the DSEIR fails to provide a cumulative analysis of the noise impacts from the reuse of the El Toro Marine Corp Air Station as a commercial airport or the noise from traffic associated with the commercial airport. Once this information has been included in this DSEIR, this document should be recirculated for public review.

Page 4-102, Baseline Noise Levels. The Noise section of the DSEIR provides a baseline discussion of the current impacts from the El Tor MCAS fly-overs which exist at present, but

the impact section of the EIR fails to identify potential CNEL contours as a result of the base reuse plan as an active commercial airport.

Response

Please refer to response to comment SFC.2-37.

SFC.2-48

Comment

Page 4-103, the first paragraph discusses an area of proposed open space as the project location where the 62 dB CNEL contour falls. This may have been true for the previous EIR 561, however, page 7 of the noise study provided in Appendix G states that the 62dB CNEL location is in an area of proposed commercial development. The proper location of the 62 dB CNEL should be verified prior to EIR certification.

Technical Error: page 4-103, first paragraph, last sentence· The DSEIR incorrectly uses the 62 dB CNEL as "over productive". Correct terminology from the Noise Study, page 7, first paragraph. the use of 62 dB CNEL is "overpredictive".

Response

Exhibit 48 shows the location of the existing 60 dB CNEL noise contour for MCAS El Toro. The 60 dB CNEL contour effects the southwest portion of the project site which is proposed as commercial as well as natural open space land uses.

SFC.2-49

Comment

Page 4-103, third paragraph, states "Depending upon future site re-use, aircraft noise may or may not be an important issue." **The aircraft noise from a commercial airport at El Toro will be an important issue.** Nowhere else in the DSEIR is the El Toro MCAS reuse discussed or incorporated by reference. No commercial aircraft noise impact analysis is provided. The DSEIR should include project related noise impacts as a result of the El Toro reuse plan as a commercial airport and traffic related impacts Once this information has been included in this DSEIR, the document should be recirculated for public review.

Response

Please refer to response to comment SFC.2-37.

SFC.2-50

Comment

Page 4-103, fourth paragraph indicates that individual fly-over events may be noise intrusive and mitigation has been provided. However, neither the baseline discussion, impact analysis nor the mitigation measures in the DSEIR include mitigation for a multiple fly-over commercial airport.

Response

Please refer to response to comment SFC.2-37.

SFC.2-51

Comment

Section 4.7 Biological Resources

The Planning Commission should be aware of a note that was included on the preliminary grading plans, that indicates: "Upon issuance of the grading permit by the County, the County will inform the USFWS of the issuance of this permit and any related activity that may potentially involve a CSS "take" resulting from the associate grading activities". This note on the grading plan takes the mitigation monitoring responsibility out of the hands of the County and impermissibly transfers it to the developer and its grading contractor. The note, a copy of which is attached, is an attempt to sidestep the need for coordinating the CDFG and USFWS permits prior to issuance of the grading permit.

Responses

The comment restates information contained on the preliminary grading plans. Mitigation measures SC 7-4 through SC 7-6 require the notification of the appropriate resource agencies of any potential impacts to coastal sage scrub, prior to the issuance of any grading permits.

SFC.2-52

Comment

No grading permit should even be considered for issuance unit after the gnatcatcher study has been completed per USFWS protocol. Under the Federal Endangered Species Act, all "take" must be accommodated regardless if a recorded tract map is involved. This is a grading permit level of detail EIR, and thus, the studies included should reflect CEQA Guidelines Section: 15146: "the degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR." (i.e. grading plan permit). Section 15146 (a) states: "An EIR on a construction project will necessarily be more detailed in the specific effects of the project than will be an EIR on the adoption of a

local general plan or comprehensive zoning ordinance because the effects of the construction can be predicted with greater accuracy". If USFWS decides that project modifications or on-site mitigation is required, then the final tract map will have to be changed any way.

Response

Please refer to response to comment SFC-1.

SFC.2-53

Comment

Between the time when EIR 561 and EIR 566 were both prepared, there seems to have been a change in the vegetation communities on the site, or the biology reports are inconsistent between last year's EIR and this year's EIR. Both EIR 561 and 566 are based on the same site and the same biological study, yet the numbers of plant species have changed without new field work. The only updated biological fieldwork was done April 1996 for the western spadefoot toad The following discrepancies between the two biological reports prepared for this EIR need to be rectified: EIR 561 indicated 119 plant species where EIR 566 indicated 110; what were the previous other 9 plant species and where are they now?; were any of these 9 disappearing plant species sensitive? EIR 561 indicates 70 native plant species on site, yet EIR 566 indicates 73 native plant species. Were three more native plant species planted in a year or is EIR 566 incorrect? EIR 561 originally indicated 49 non-native species and now EIR 566 indicates only 39 non-native species. Without new fieldwork having been conducted by the consultant, which biology report is correct? Both Figure 5 in EIR 566 technical appendix and Figure 3 in EIR 561 technical appendix show the same vegetation, yet the vegetation quantities have changed.

Response

New biological resource field work was completed for DEIR 566 for the offsite areas impacted by project implementation, that were not previously impacted by the project evaluated in DEIR 561 DEIR 566 includes an analysis of 19.77 acres of offsite impact area as compared to 7.86 acres of offsite impact area evaluated in DEIR 561. These differing sizes and locations of offsite impact areas have resulted in the changes that have been noted in plant community acreage and numbers of individual species.

SFC.2-54

Comment

Page 4-126, Amphibians This section states that "No amphibians ere observed during surveys of the site", yet Exhibit No. 50 on page 4-122 lists the Western Spadefoot Toad as present. This discrepancy should be corrected.

Response

Comment noted. Please refer to Section II, Corrections and Additions to DEIR.

SFC.2-55

Comment

Page 4-125, Ephemeral Ponds The section states that "All of the ephemeral ponds were artificially created a number of years ago..." Given the geological conditions of frequent landslides in the area, these wetlands could have been "slump" or "slope" ponds that underwent human modification at a later time. Further information is needed in the DSEIR regarding the origin of these wetlands.

Response

Please refer to response to comment USFWS-11.

SFC.2-56

Comment

Page 4-148 of EIR 566, Coastal California Gnatcatcher, indicates that no gnatcatcher survey has been performed with USFWS protocol. Specific surveys for presence or absence must be performed at this level of detail for this construction stage in the project. Combined with the disturbing note on the grading plans, the County will lose the ability to monitor any mitigation for the CCG. In order for this EIR to be deemed adequate under CEQA Guidelines Section 15126 (c), the focused CCG survey must be performed prior to certification of this EIR.

Response

Please refer to response to comment USFWS-16 and Section II of this Document, Corrections and Additions.

SFC.2-57

Comment

Page 4-148, Raptor Foraging Habitat. Whatever consultant recommended to the developer that project slopes would constitute sufficient raptor foraging habitat did not determine this through any consultation with either CDFG or the USFWS. Consultation on appropriate impact significance should be reflected in this DSEIR prior to certification

Response

The USFWS and CDFG were consulted with during the NOP comment period and have provided comments on the DEIR. The referenced statement on Page 4-148 of the DEIR does not indicate that "project slopes would constitute sufficient raptor foraging habitat." Rather, the statement indicates that onsite and surrounding open space would continue to function as raptor foraging habitats.

SFC.2-58

Comment

Page 4-151, Section 4.7.6, commences its discussion on mitigation measures by stating as a "given" that there is supposedly no ability on the part of the County to "deviate from the final recorded tract map." However, no legal or factual support is given for this statement, and it appears to be directly at odds with CEQA Guidelines Section 15041 which provides that the "lead agency for a project has the authority to require changes in any or all activities involved in the project in order to lessen or avoid significant effects on the environment." If this statement, which appears to be an excuse for not doing a complete mitigation analysis, is based on some unstated legal assumptions about the rights of the developer, then this analysis should be explained in detail in DSEIR 566 to let the public know why CEQA is not being complied with fully

Response

Please refer to Section 2.8 on Page 2-10 of DEIR 566.

SFC.2-59

Comment

Page 4-153, Mitigation Measures SC 7-1 though 7-7 and measures 7-11 though 7-14 would appear to be of no value in light of the note placed on the preliminary grading plans. In addition, although EIR 561 provided the mitigation plans as a component of the EIR, DSEIR 566 only provides mitigation in the form of conditions to prepare mitigation plans in the future. The level of detail of the mitigation measures should be commensurate with the level of detail in a recorded tract map. Therefore this Eir does not adequately satisfy CEQA Guidelines Section 15126 (c) requirements at this time. Gathering further information and complying with resources agencies in the future is not proper mitigation. Biological mitigation of ACOE and CDFG coordination may change the development plan, which would then require a revised EIR.

Response

Please refer to response to comment SFC-1.

SFC.2-60

Comment

Page 4-153, Mitigation Measure 7-2 states that a 1603 application has been submitted to CDFG. What is the status of the application? Has CDFG acknowledged receipt of the application? Was the application deemed complete by CDFG? What additional information did CDFG ask for? This future mitigation would hold more credence as a CEQA mitigation measure if more detail were known about the 1603 permit for this project. CDFG has a very limited staff and processing of the permit may take upwards of nine months to a year or more to complete. Is the County going to wait a year for the 1603 permit prior to issuing the grading permit, as indicated in the mitigation? Or will they issue the preliminary grading permits to allow the site to be radically altered prior to the issuance of the 1603 permit?

Response

A 1603 Streambed Alteration Agreement application has been submitted to the California Department of Fish and Game, and is being held in abeyance until final action is taken on the proposed project and a CEQA document is certified. Mitigation measure SC 7-2 requires the applicant to obtain a 1603 Streambed Alteration Agreement prior to the issuance of any grading permit.

SFC.2-61

Comment

Page 4-153, Mitigation Measure 7-3 states that the applicant will obtain the necessary individual or nationwide permit... According to Page 4-146, second paragraph, the biological consultant states that an individual permit will be necessary. The mitigation measure should accurately state the proper permit necessary. As with the 1603 permit, has the applicant submitted an application for a 404 permit? Has the ACOE acknowledged receipt of the application? Was the application deemed complete by the ACOE? What additional information did the ACOE ask for? The ACOE has even fewer staff than the CDFG, and processing of the permit may take more than a year to complete. Is the County going to wait a year for the 404 permit prior to issuing the grading permit, as indicated in the mitigation? Or will they issue the preliminary grading permits to allow the site to be permanently stripped of sensitive biological resources prior to the 404 permit being issued?

Response

The applicant has not submitted an application for a Section 404 permit.. The Army Corps of Engineers determines the appropriate type of 404 permit required based on the types and intensity of impacts to waters of the United States and adjacent wetlands. Mitigation measure SC 7-3 requires the applicant to obtain the appropriate type of 404 permit prior to the issuance of any grading permits

SFC.2-62

Comments

Page 4-153, Mitigation Measure 7-4 states that the applicant is to provide a summary in acres of coastal sage scrub to be impacted, but this has already been stated in Table 30 of the DSEIR. The mitigation measure only serves to lead the reader back to the beginning of the impacts section of the DSEIR. The mitigation measure should be specific and consistent with the biological consultants recommendation of "The dedication and long-term preservation of 22.9 acres of habitat of Saddleback Meadows, revegetation of 46.5 acres of Veturan-Diegan transitional coastal sage scrub on site and contribution of the Orange County NCCP".

Response

Mitigation measure SC 7-4 is a standard County condition requiring the applicant to provide an accounting of impacts to coastal sage scrub to the County.

SFC.2-63

Comment

Page 4-153, Mitigation Measure 7-5 states that the applicant shall provide proof that the appropriate Federal approvals required for impacts to Coastal Sage Scrub have been obtained from the USFWS This mitigation measure is misleading because it fails to state what permit is needed. USFWS may impose additional mitigation measures as part of its review process. In order to assure that USFWS mitigations do not conflict with any other measures in the DSEIR, the consultation with USFWS should be conducted prior to certification of the DSEIR. As with the 1603 and 404 permit, has the applicant submitted a request for USFWS consultation or filed an application? Has the USFWS acknowledged receipt of the application? Was the application deemed complete by the USFWS? What additional information did USFWS ask for? The USFWS has the fewest staff of all three agencies, and processing of the permit and consultation may take more than a year to complete. Is the County going to wait a year for the Section 10 a permit prior to issuing the grading permit, as indicated in the mitigation? Or will they issue the preliminary grading permits to allow clearing and grubbing of the site prior to the 10 a permit?

Response

Mitigation measure SC 7-5 is a standard County condition, and requires the applicant to obtain approval for impacts to coastal sage scrub, prior to the issuance of any grading permits The applicant has not filed a request with the USFWS to initiate the process.

SFC.2-64

Comment

Page 4-154, Mitigation Measure 7-6 could in effect override mitigation measure 7-5, if the Administrator, Planning and Zoning so desired. This mitigation measure should be deleted.

Response

Mitigation measure SC 7-6 adds an additional level of protection for the County of Orange to regulate project impacts to coastal sage scrub in relationship to the counties NCCP responsibilities.

SFC.2-65

Comment

Page 4-154, Mitigation Measure 7-7. If there are additional permits required by the USFWS, the DSEIR should list those specific permits. Consultation with the USFWS, as indicated on page 4-151 last paragraph of the DSEIR, states that input has been received from the USFWS. Why didn't the EIR preparer ask what additional permits may be necessary for native vegetation?

Response

Mitigation measure SC 7-7 is a standard County condition, and is designed to ensure that proposed grading activities will be in compliance with the provisions of the Endangered Species Act, and in this case, the NCCP program .

SFC.2-66

Comment

Page 4-155, Mitigation Measure 7-8, F, states that an experienced nursery or other landscape contractor shall care for the transplanted trees for only six (6) months. The biological report states on page 49, second paragraph, "In order to ensure the success of mitigation, the Project proponent should enter into a five year secured agreement with the County of Orange to cover the Projected cost to install, monitor, and report on the mitigation Project. This agreement will be in the form of a 100 percent bond." This extremely important mitigation measure is found nowhere in the DSEIR. IF the DSEIR does not reflect the recommendations of the expert biologist, then mitigation measure 7-8F is ineffective and invalid. The DSEIR cannot be certified without amending this measure to reflect the biologist's's recommendation.

Response

The provision for five years of biological resource mitigation monitoring is hereby incorporated into the DEIR. Please refer to Corrections and Additions to the DEIR.

SFC.2-67

Comment

Page 4-157, Mitigation Measure 7-11 states that the applicant shall provide additional evidence that onsite CSS habitat is not occupied by California Gnatcatchers. The survey for the CCG should be performed now to rule out any occupied habitat. What the mitigation measure is trying to say is that if CCG is found on site, the applicant will be required to file an application for a Federal Section 10(a)(1)(b) permit. If CCG is found, the USFWS will commences their consultation and additional mitigation measure may be imposed by the USFWS In order to assure that USFWS mitigations do not conflict with any other measures in the DSEIR, the CCG survey should be performed prior to certification of the DSEIR. The mitigation measure should accurately state the proper permit necessary. As with the 1603 and 404 permit, has the applicant submitted a request for USFWS consultation or filed an application for a Section 10 a permit? Has the USFWS acknowledged receipt of the application? Was the application deemed complete by the USFWS? What additional information did USFWS ask for? The processing of the permit and consultation may take more than a year to complete. Is the County going to wait a year for the Section 10 a permit prior to issuing the grading permit, as indicated in the mitigation? Or will they issue the preliminary grading permits to allow clearing and grubbing of the site prior to the 10 a permit?

Response

Please refer to response to comment USFWS-26.

SFC.2-68

Comment

Page 4-158, Mitigation Measure 7-12, is not enforceable as a mitigation measure. The mitigation for the wildlife movement corridor should be included as part of the DSEIR for public review. The mitigation measure should list the onsite or off site options for the movement corridor. This measure should be deleted, and an alternative mitigation measure should be provided.

Response

Mitigation Measure SC 7-12 requires the mitigation of project effects on local and regional wildlife movement, prior to the issuance of any grading permit.

SFC.2-69

Comment

Page 4-158, Mitigation Measure 7-14. This measure in not enforceable as a mitigation measure. The relocation and establishment of a mitigation plan should be included as part of this DSEIR as it was with EIR 561.

Response

The comment restates information contained in DEIR 566.

SFC.2-70

Comment

Page 4-158, Mitigation Measure 7-15. This measure is not enforceable not does it further minimize impacts with wording such as "**Where possible**..." "Lighting within development projects adjacent to conserved habitat "**should**" be selectively placed...",..."lighting from homes abutting conserved habitat "**should**" be screened...",and, "These lighting restrictions "**should**" be incorporated into the project's CC&Rs." All of these "should" mitigation will become "shall" upon certification. If the Planning Commission is not sure that it wants to implement these measures, they should either delete them or change all "shoulds" to "**shalls**".

Response

The reference to *should* in mitigation measure SC 7-15 is hereby changed to *shall.* Please refer to Section II of this document, Corrections and Additions to the DEIR.

SFC.2-71

Comment

Page 4-159, Section 4.7.7 Unavoidable adverse impacts. Under CEQA Guidelines Section 15126(c) all mitigation must be enforced that will "minimize the significant effects" prior to EIR certification. The comment that the County will issue a letter of insignificance once the Interim Loss Habitat Mitigation Plan is approved has no meaning in terms of CEQA. The public has a right to review the ILHMP prior to EIR certification. Also, the second bullet item under this same section discusses future mitigation. A future survey is not mitigation according to the Federal EPA. This is a recorded tract map and a construction level grading permit application EIR. The biological report in the EIR should be the basis of any biological opinion.

Response

Section 15126(c) of the CEQA guidelines does not contain any provisions for *enforcement*

prior to EIR certification. The *Interim Habitat Loss Habitat Mitigation Plan*, is required as a condition of participation in the NCCP program. The NCCP contains provisions for interim loss of coastal sage scrub habitat while the NCCP is being prepared, prior to adoption.

SFC.2-72

Comment

Section 4.8 Aesthetics

Page 4-174. Although aesthetic impacts will remain significant, even after mitigation, the Project Design Feature mitigation measures 8-1 through 8-4 are only standard conditions of approval for any development project. Mitigation measure 8-1 requires public utilities to be undergrounded, but the County would require this "Design Feature" anyway. Mitigation measures 8-2 and 8-3 would only truly be design features if the applicant were required to underground all drainage swales. This is more costly, but in order for these aesthetic mitigation measures to be compatible with the biological mitigation of the manufactured slopes providing rapture foraging habitat, the cost would be justified by both mitigations that would be accomplished.

Response

The comment restates information contained in the DEIR No response required.

SFC.2-73

Comment

Page 4-174, Mitigation Measure 8-4 in not enforceable as a Project Design Feature. If the Trabuco Canyon Water District owns the tank site, the District will be responsible for the landscape screening, not the developer or the County. This mitigation measure should include additional monetary compensation to the Water District for additional landscape screening.

Response

The comment is correct. Please refer to Corrections and Additions to the DEIR.

SFC.2-74

Comment

Section 4.9 Cultural/Scientific Resources

Page 4-178 The DSEIR makes no attempt to analyze either the direct or indirect environmental impacts of the project on the religious or sacred uses withing the potential

impact area. In this case, the potential impact area extends outside of the property boundary. This important issue should be discussed int he DSEIR prior to certification.

Response

The comment is incorrect. Please refer to Sections 4.1, 4.2, 4.3, 4.6 and 4.8 of the DEIR for a discussion of project related impacts to adjacent land uses.

SFC.2-75

Comment

Page 4-216, Section 4.122, Effects Found to be Insignificant. The EIR preparer should look at this section again. The EIR incorrectly reads, "The Initial Study prepared for the proposed project did not identify any (sheriff, fire, education, and library) related effects as insignificant". Therefore, all the effects were significant.

Response

The comment is incorrect. The DEIR text is correct in noting that the Initial Study did not identify any effects as insignificant, and as such, are evaluated in the DEIR.

SFC.2-76

Comment

Page 4-217, Section 4.123, Fire. The 1.4 million-gallon tank was the same quantity tank utilized in EIR 561 for 318 homes. The EIR should reflect the proper fire flow amount for 705 units and the proper tank size or number. New impacts to the tank site will require recirculation of the EIR prior to certification.

SFC.2-79

Comment

The EIR has failed to identify an alternative location for this project, and is therefore inconsistent with CEQA. DSEIR 566, without a discussion of an alternative location cannot be certified as adequate. Should the Final EIR for 566 choose to include an alternative location analysis, the EIR should be recirculated with the new information for public review. Section 15126 (B) 2 states that "If the lead agency concludes that no feasible alternative locations exist, it must disclose the reasons for this conclusion, and should include the reasons in the EIR" However disclosure, at this time, of a new location would constitute new information and require recirculation of the DEIR.

COMMENTS AND RESPONSES - CONNOR, CULVER, BLAKE & GRIFFIN, LLP., Edmond M. Connor, August 22, 1997

CCBG.3-1

Comment

As you know, our firm represents the Vedanta Society of Southern California (the "Society") which, for over five decades, has owned and maintained the Ramakrishna Monastery (the "Monastery") in an area of Trabuco Canyon which is immediately adjacent to the southeastern portion of the Saddleback Meadows property (the "Property") On behalf of the Society, and pursuant to the 10-day extension of time granted in the August 12 letter which I received from Tom Mathews, Director of the Orange County Planning & Development Services department (the "Department"), we are submitting written comments on Draft Subsequent Environmental Impact Report No 56 (DSEIR 566" or the DSEIR").

A. **Regrettably, The Society Is compelled To Submit Its Comments Under Protest.**

The Society must note for the record that it is submitting its comments under protest because of the Department's refusal to accommodate the Society's request, as set forth in my letters of August 6 and 8, 1997, that the Society, and all members of the public be provided with adequate time to comment on DSEIR 566 *after* the grading plans and the grading plan review which are the subject of Grading Application GA960048 (the "Grading Application") have been made a part of DSEIR 566 and the DSEIR has been recirculated for public comment. Because of the Department's decision to deprive the public of access to the very documents upon which the Grading Application is based, i.e., the 40-scale grading plans and the detailed review of those plans by the soils engineer of record, the geotechnical consultants engaged by the Society to comment on DSEIR 566 have been thwarted in their efforts to fully and properly assess the adverse environmental impacts and feasible mitigation measures associated with the rough grading operations for the construction of the 705 units of manufactured housing which were supposedly authorized by Final Tract map 10692 (the "Tract Map").

Without being allowed access to the basic documents that will, in fact, "accompany" the Grading Application, it is hardly fair that the Society, or any other members of the public, be required to submit comments on the adequacy of the environmental documentation prepared to evaluate the effects of the Grading Application. However, the Society will endeavor to do so without waiving its objections to the inherent unfairness of the CEQA review process that is currently being conducted by the Department. The Society urges the Department to reconsider its decision to push ahead with the review of DSEIR 566 without allowing the public to see documents which are crucial to the approval of the Grading Application. Indeed, the Society believes that the fairness and disclosure problems which presently exist can easily be corrected by simply recirculating DSEIR 566 after all of the grading plans and the grading plan review have been made a part of the DSEIR or, at the very least, have been incorporated by reference in the DSEIR and have been made available for public to see documents which are crucial to the approval of the Grading Application. Indeed, the Society

believes that the fairness and disclosure problems which presently exist can easily be corrected by simply recirculating DSEIR 566 after al of the grading plans and the grading plan review have been made a part of the DSEIR or, at the very least, have been incorporated by reference in the DSEIR and have been made available for public review.

Of course, the Society also believes that, if the Department persists in its refusal to make important project documents available to the public, a court of law would certainly find that the Department's actions in this regard were exceedingly unfair and not at all in keeping with either the letter or the spirit of CEQA.

B. <u>DSEIR 566 Fails To Comply With The Specificity Requirements Of CEQA Guidelines Section 15146.</u>

The Society will give credit where credit is due and will commend the Department for determining that a Subsequent EIR under CEQA Guidelines section 15162 would have to be prepared and certified before the Grading Application submitted by the Applicant in December 1996 could be approved.

In requiring the preparation of a Subsequent EIR, the Department was not only complying with the dictates of the Foothill/Trabuco Specific Plan (*see*, FTSP, p. III-20, § III.D.3.2c), but it was also adhering to the legal analysis set forth in the landmark case of *Day v. City of Glendale* (1995) 51 Cal.App.3d 817. In *Day*, the Court of Appeal held that a grading permit application is a "project of mixed ministerial-discretionary character [which] should be treated as a discretionary project" for purposed of CEQA review, especially in cases in ;which the applicable grading code affords staff a great deal of discretion in issuing, or conditioning the issuance of, a grading permit (51 Cal.App.3d at pp. 823-824).

However, having correctly determined that a Subsequent EIR should be prepared, the Department must now ensure that the environmental documentation prepared by the Applicant's consultant fully complies with the requirements of CEQA and the State CEQA Guidelines which govern the preparation and review of a construction level EIR. Unfortunately, in its present form, DSEIR 566 does not comply with these requirements because it postpones for *future* analysis the specific details of the very activity which it was supposedly prepared to address, i e., the rough grading of the Project.

There can be no doubt that DSEIR 566 was supposed to analyze the impacts and mitigation measures relating to the Grading Application As stated on page 2-8 of DSEIR 566, the Department determined, on December 16, 1996, that "a Subsequent EIR is required to

evaluate the effects of the *grading application.*" (Emphasis added.) In addition to what is stated in the DSEIR, Mr. Mathews also confirmed in his August 12 letter to me that the Applicant's grading permit application was "the *initiating activity* which resulted in the determination that Draft EIR 566 be prepared " (Emphasis added.)

Since it is clear, therefore, that the Grading Application was the project approval which *initiated* and *necessitated* the preparation of DSEIR 566 it is only logical that the DSEIR analyze the impacts of the rough grading operations not in mere general and conceptual terms but in the *specific* and *detailed* terms that CEQA requires. CEQA Guidelines section 15146 is very explicit on this point and requires far more specificity than is evidenced in DSEIR 566. As stated in section 15146, [a]n EIR on a construction project will necessarily be *more detailed* in the *specific effects* of the project than will be an EIR on the adoption of a local general plan or comprehensive zoning ordinance because the *effects of construction* can be predicted with greater accuracy." (Emphasis added.)

Response

Please refer to response to comment SFC-1.

CCBG.3-3

Comment

CEQA Guidelines section 15146 further provides that the degree of specificity required in an EIR must correspond to "the degree of specificity involved in the underlying activity which is described in the EIR." What this means with reference to DSEIR 566 is that, since the DSEIR was expressly prepared to evaluate the effects of the Grading Application, the *specific details* of the rough grading activities for the construction of the 705-unit Project must be analyzed in DSEIR 566. In order to do that, of course, the documents which County staff will necessarily review and comment on *before* approving the Grading Application -- which will include, at a minimum, the grading plans and the geotechnical review of those grading plans-- must be made a part of or at least incorporated by reference into, the DSEIR so that all the detailed information that is available to the County is likewise made available to the public though the CEQA review process.

Response

Please refer to response to comment SFC-1.

C. <u>DSEIR 566 Fails To comply With The Technical Detail Requirements of CEQA Guidelines Section 15147.</u>

In the letter which I sent to you on August 8, 1997, a copy of which is attached as Exhibit "A" hereto and is incorporated herein, the point was made that both California case law and the provisions of CEQA Guidelines section 15147 make it abundantly clear that all technical data, maps, plans, diagrams, etc., which are necessary to make a "full assessment" of the environmental impacts of the project being evaluated must be contained in the EIR or in the Appendices thereto. In this case, therefore, since DSEIR 566 was expressly prepared to evaluate the environmental effects o the Grading Application , the 40-scale grading plans and the geotechnical review of those plans should have been made part of the DSEIR *before* it was circulated for public comment.

In his August 12 letter to me, Mr. Mathews disagreed with the above-stated position and stated that "[sufficient detailed grading and geotechnical information is available in the Draft EIR." This is simply not the case. Indeed, without the grading plans and the geotechnical grading plan review which G.A. Nicoll indicates will "accompany the Grading Application *L.A. Times* article could occur as a result of the grading activities to be undertaken in construction the Project. This requires a careful study -- not simply a response to comments -- and the Society requests that it be undertaken *before* any further action is taken to process the Grading Application

The *only* soils report referenced in DSEIR 566 which addressed the 705-unit Project is the one found in Appendix D to the DSEIR. However, that report makes no bones about the fact that it was only "prepared at an EIR level" (whatever that means). In fact, the Geotechnical Environmental Impact Report prepared by G.A. Nicoll & Associates, dated March 14, 1997, expressly states that a "*more detailed evaluation* of the slope stability, including analysis of buttress backcuts and forecuts, individual cut slope buttreses, etc., will be conducted during the 40-scale grading plan review to accompany the grading permit application." (Appendix D, p.4, ¶ 4, emphasis added.)

The March 1997 report prepared by Nicoll & Associates also states at page 16 that "*[c]omplete details* of the corrective grading will be illustrated in the final geotechnical report of the site, which will be submitted *for grading plan permitting* purposes." This is obviously a concession by the soils engineer of record for the Project that more detailed geotechnical analysis must be performed before the county will be in a position to approve the Grading Application and issue a grading permit to the Applicant The question which naturally arises, therefore, is *why* is DSEIR 566 being processed for certification *before* this more detailed information has been made available to the County?

The above question must be answered by the Department and cannot be dismissed as a mere hypertechnical inquiry relevant only to lawyers and judges. Indeed, the question goes to the very heart of the problem facing anyone who tries to determine -- *without* the benefit of the 40-scale grading plans for the entire Project and the geotechnical review of those plans -- how extensive, how costly, and how time-consuming the grading operations for the Project will be.

Response

Comment

D. Important Details Regarding The Nature And Extent Of The Proposed Grading Must Be Provided In Order To Determine The Cost And Duration Of The Grading And To Ascertain whether The Affordable Housing Condition Imposed On The Project Is Still Achievable.

Without knowing certain basic details regarding the nature and extent of the millions and millions of cubic yards of corrective or "remedial" grading that will need to be undertaken in construction the Project -- such as, for example, the estimated depth of the removals (possibly up to 120' deep in places!), the limits of the backcut that may be left open at any one time without increasing the risk of slope failure beyond the 10% estimated failure rate, the recommended procedures for controlling groundwater encountered during excavation, etc. -- it is *not* possible to develop a reliable estimate of the cost or duration of the grading activities to be performed at the Project site.

According to section 4.2 of DSEIR 566, all of the rough grading at the Project is to be "completed in one *continuous* phase." (DSEIR, at p. 4-22, emphasis added.) Assuming this is true, [2] then all of the persons living in close proximity to the Property, including the monks at the Monastery, the priests and students at St. Michael's Abbey, and the residents of the Hidden Ridge and Portola Hills developments, would be keenly interested in knowing how many months or Iyearsl they could expect to be subjected to the noise, dust, diesel smells, and bare-dirt conditions which would be caused by the veritable army of large earth-moving equipment (e.g., scrapers, dozers, blades, compactors, trucks, etc.) that would have to be deployed at the Project site.

However, without being allowed access to the 40-scale grading plans for the entire Project and the grading plan review containing all of the soils engineer's specifications and recommendations for undertaking the proposed 8.9 million cubic yards of remedial grading work, including the construction of buttresses, shear keys, stabilization fills, and subdrain systems, no grading contractor in Orange county could even begin to estimate the amount of labor, material, and equipment that would be required to rough grade the Project in one continuous phase. IN fact, to even project an average daily production rate for the remedial

[2] After being compelled to make separate arrangements with the applicant to pay for copies of the 40-scale grading plans relating to the Grading Application, the society was surprised to learn that the plans made available by the Applicant cover only a portion of the Project referred to as "Phase I." This would clearly seem to suggest that the statements in DSEIR 566 that all grading will be completed in one continuous phase is not true

grading operating without knowing the soils engineer's recommendations contained in the grading pan review would be nothing short of wild speculation.

Response

The DEIR contains a discussion of project related grading activities, including the phasing and duration of grading, in Section 3.4 on Page 3-16.

CCBG.3-6

Interestingly, without providing any explanation or breakdown of any kind, the applicant's consultant has projected an average daily production rate of 30,000 cubic yards per day for the "total project-related grading," amounting to 11.5 million cubic yards. (DSEIR, at p. 4-23.) Based on this projected rate, it has been estimated in DSEIR 566 that all of the rough grading at the Project "would require approximately 18 months to complete." (Id.) To say the least, this estimate strains credulity, and raises serious questions about whether the duration of the Project grading has been purposely understated in the DSEIR.

Since almost 80% of the grading (8.9) out of a total of 11.5 million cubic yards) will consist of slow, costly, and very difficult remedial work to stabilize the proposed slopes by means of landslide shear keys, buttresses, and stabilization fills, it is nothing short if incredible that anyone could even suggest that this work – which will involve deep slop-cutting that will have to be performed by using special excavating equipment and extremely conservative backcutting procedures – could be accomplished at anything close to 30,000 cubic yards per day on *average*.

In fact, the Society has engaged the chief estimator of a local grading contracting firm as a consultant, but, without having access to all the grading plans and to the grading plan review to know what the soils engineer will be recommending regarding how the remedial grading work will have to be performed at the Project, he has been unable to formulate any reasonable estimates of the time or cost that will be involved in the grading – except to note that the 18-month projection set forth in DSEIR 566 appears to be grossly *underestimated*, possibly by a factor or 100% or more.

The reason that it is important to know the approximate *cost* of the rough grading is that, unless one knows what kind of dollars are involved, one cannot determine whether the measures proposed in DSEIR 566 to mitigate the geotechnical hazards at the site (e.g., landslide shear keys, buttresses, stabilization fills, etc.) Are truly *feasible*, within the meaning of CEQA section 21061.1, and can be "accomplished in a successful manner within a reasonable period of time, taking into account economic...factors." In other words, the costs of the remedial grading work could turn out to be so prohibitively expensive in light of the economics of the Project that the mitigation measures proposed in the DSEIR might not be feasible and thus could not be used to "substantially lessen" the significant impacts of the grading, withing the meaning of CEQA Guidelines section 15091.

Moreover, without knowing the cost of the proposed mitigation measures for the grading

(i.e., the 8.9 million cubic yards of remedial work), one cannot determine whether the economics of the Project would make it even remotely possible for the Applicant to meet the 66.6% affordable housing requirement which was imposed as a condition of approval on the Tract Map when it was originally approved in 1979. Although there is a passing reference to this requirement on page 4-11 of DSEIR 566, there is no discussion of whether the requirement of selling 470 of the 705 units of manufactured housing "in the affordable range" would be achievable, even in part, considering the cost of developing the Project at today's prices for labor, equipment, and material.

For CEQA compliance purposes, it is imperative that a comprehensive discussion regarding the feasibility of achieving the affordable housing requirement be included in DSEIR 566 and that the document then be recirculated so that the public can see and comment on what evidence there might be, if any, to support any proposed findings or statement of overriding considerations prepared by the Department which attempted to cite the affordable housing component of the Project as a "benefit" which might outweigh the unavoidable adverse impacts of the Project, within the meaning of CEQA Guidelines section 15093.

If the Department were to supply the Society with the information it has requested - specifically, the 40-scale grading plan for the entire Project and the geotechnical review of all the grading plans - the Society would be willing to perform the economic analysis necessary to determine whether it would be economically feasible, in light of land acquisition and debt service costs, taxes, planning costs, grading costs, and construction costs, for the Applicant to develop 705 units of manufactured housing and to sell two-thirds of these units as affordable housing. This analysis could then be made a part of DSEIR 566 and the document could be recirculated for public review and comment

Response

The estimate of 30,000 cubic yards of grading per day is appropriate, and can be compared with several other grading projects that have been completed in the vicinity of the project site. The Portola Hills project graded a maximum of 100,000 cubic yards per day. Costs associated with remedial grading activities have not been provided by the applicant. The DEIR, in Section 4.1, beginning on Page 4-1 contains a discussion of the proposed project's affordable housing requirements.

CCBG.3-7

Comment

E. <u>The Discussion Of Soils Impacts And Grading Mitigation Measures In DSEIR 566 Is Seriously Deficient And Fails To Address Significant Adverse Impacts Which Will Be Caused By The Ought Grading.</u>

To assist it in analyzing and commenting on the "Soils and Geology" section of DSEIR 566, the Society has engaged the services of Kenneth R. King, a registered civil engineer, and John R. Byerly, a registered geotechnical engineer. Unfortunately, the assistance provided by these

two consultants has been severely limited due to their inability to obtain access to the 40-scale grading plans and the accompanying grading plan review.

Despite not being able to review the essential documents relating to the Grading Application, Mess King and Byerly have nonetheless found serious deficiencies in how important geotechnical issues have been analyzed, or overlooked, in DSEIR 566. In the hope that DSEIR 566 will be revised and recirculated with the appropriate documentation and a more complete analysis of the true impacts and feasible mitigation measures associated with the rough grading of the Project, the Society is providing the comments received to date from Mess King and Byerly.

Response

Please refer to response to comment SFC-1.

CCBG.3-8

1. Comments From Ken King.

Attached as Exhibit "B" hereto and incorporated herein by reference is a copy of Mr. King's preliminary review of section 4.2 "Soils and Geology" of DSEIR 566. The Society requests that each of the points raised in Mr. King's report be carefully considered and responded to by the Department. In addition, the Society asks that DSEIR 566 be revised and recirculated with the information necessary to address the deficiencies cited in Mr. King's report, particularly with respect to the failure of the DSEIR to analyze the devastating and potentially irremedial impacts which the excavation and dewatering activities will have on the water wells surrounding the Project site.

A recent article appearing in the Los Angeles Times, a copy of which is attached as Exhibit "C" hereto and is incorporated herein by reference, supports the concerns raised by Mr. King, for it reports on how the tunneling and dewatering activities for the construction of the Los Angeles subway system have dried up local streambeds and so drastically depleted groundwater resources that once lush plants and vegetation have died off. DSEIR 566 should address whether the environmental parade of horribles discussed in the L.A. Times article could occur as a result of the grading activities to be undertaken in constructing the Project. This requires a careful study -not simply a response to comments - and the Society requests that it be undertaken before any further action is taken to process the Grading Application.

Response

The comment references an article that was published in the Los Angeles Times relating to Metro Rail construction impacts on local ground and surface water. No additional response is required.

CCBG.3-9

Comment

2. **Comments From John Byerly.**

The comments received from Mr. Byerly regarding section 4.2 of DSEIR 566 may be summarized as follows:

(a) Perched groundwater was encountered in the geotechnical investigations on this site at various elevations in many of the test borings by G.A. Nicoll & Associates and others. DSEIR 566 alludes to "potential dewatering activities." Remedial grading will require the construction of buttresses and extensive shear keys, involving an estimated 8.9 million cubic yards of earth. The excavations fro the shear keys will surely intercept water bearing soil and bedrock layers. The potential effect of the disruption of these water bearing layers on water wells located downstream of this project site has not been evaluated in the DSEIR.

Response

Please refer to response to comment SFC-1.

CCBG.3-10

Comment

(b) During construction, dewatering will remove significant quantities of groundwater and discharge the collected water into existing surface drainage systems. The potential impact of the discharge of the removed groundwater, including turbidity, chemical water quality, and potential for erosion and pollution of streams and other riparian areas subject to regulation by state and federal; authorities has not been addressed in the DSEIR.

Response

Please refer to response to comment SFC-1.

CCBG.3-11

Comment

(c) When the shear keys are completed, they will provide a permanent barrier to the lateral transmission of the presently existing groundwater flow. The groundwater will tend to accumulate behind the shear keys, and could surface unless permanent dewatering systems are provided. The analysis of the practicality of permanent dewatering systems, whether

passive or requiring well points and pumps, and the long term effect of dewatering system discharge has not been evaluated in the DSEIR.

Response

Please refer to response to comment SFC-1.

CCBG.3-12

Comment

(d) Approximately 2.6 million cubic yards of excavation is estimated to "achieve planned elevations and profiles." An additional 8.9 million cubic yards of remedial grading is also described, including 7.5 million cubic yards for shear key and buttress construction. The DSEIR concludes that this grading "would not result in any impact on the stability of adjacent properties." While engineering analysis may show that the *complete* grading improvements would not have an adverse impact on the stability of adjacent property the actual *construction* of these grading improvements may have immense impacts on neighboring properties such as the Monastery and the Abbey. For example, the excavation for shear keys will remove support for existing landslide masses, and will expose landslide shear planes. No discussion of the details of assuring adequate support for the landslides extending onto adjacent properties during the excavation and backfilling of shear keys has been provided in the DSEIR.

Response

Please refer to response to comment SFC-1.

CCBG.3-13

Comment

(e) Currently, both the Monastery and the Abbey are experiencing ongoing distress due to land slippage. As such, the risk of activating existing landslides and triggering catastrophic land movement on these adjacent properties, particularly during the shear key excavation and backfill process, should be addressed in great detail in the DSEIR.

Response

Please refer to response to comment SFC-1.

CCBG.3-14

Comment

An average daily grading rate of 30,000 cubic yards per day is projected in the DSEIR. However, it is inconceivable that the excavation and filing for the shear keys and buttresses, which constitute at least two-thirds of the total grading anticipated for the Project site, can be accomplished at a grading rate of anything more than 10,000 cubic yards per day at best.

Even at the rate of 10,000 cubic yards per day (which is *optimistic* because, if wet material is required to be top-loaded, then only a rate of 5,000 cubic yards per day could be achieved), the grading for the shear key and buttress construction alone will require 35 months to complete -- which is nearly *twice* the duration estimated in the DSEIR. This extended period of grading will also expose the inherently unstable conditions at this site during grading to at least three, if not four, rainy seasons and this has not been accounted for the DSEIR.

Response

Please refer to response to comment CCBG.3-6.

CCBG.3-15

(g) Appendix D of DSEIR 566 ("Geotechnical Environmental Impact Report") presents a brief commentary regarding the geotechnical conditions at this site, and a brief review of recommendations for mitigating and remediating adverse conditions. The county of Orange Grading Manual (Board of Supervisors Resolution No. 81-1358) and current geotechnical practice require a geotechnical review of 40-scale grading plans to be prepared by the developer's geotechnical investigation was performed in 1994, but was done in connection with a different project that involved less extensive grading. Subsequent investigations have focused on EIR issues, and have not provided the required specificity to analyze the significant effects of the grading, including impact of dewatering during and fol+lowing construction, slot cutting or staged excavation to assure ongoing support of landslide masses to be stabilized, backcut and forecut slope inclination, and groundwater water control criteria. The grading plan review report should include all recommendations and geotechnical criteria necessary for a grading contractor to prepare a bid go accomplish the rough grading, and this report should be made part of the DSEIR.

Response

Please refer to response to comment SFC-1.

CCBG.3-16

Comment

(h) Proposed mitigation measure AM-47 on page 4-33 of the DSEIR references total settlements of 4 to 6 inches or more in some areas, and suggest "the degrees and rates of settlement shall be analyzed during the final design phase." The grading plan review report

is an appropriate document for this analysis. However, the report should be prepared now, instead of later, and should be made part of the DSEIR.

Response

Please refer to response to comment SFC-1.

CCBG.3-17

Comment

(I) A cursory review of the "Phase I" grading plans for a portion of the Project underscores the need for access to the grading plan review. For example, with respect to the proposed buttress excavation near the intersection of El Toro Road and the proposed main entrance road to the Project (Saddleback meadows Drive), the main question to be answered by the grading plan review is how much back slope can be open at any one time to ensure only the 10% slope failure rate predicted in the DSEIR?

Response

Please refer to response to comment SFC-1.

CCBG.3-18

Comment

(j) Since the remedial grading quantities are 3.5 times greater than the onsite cut/fill quantities, a large, accessible area will be needed for stockpiling and drying operations, but the grading plans are silent on this point. Will off-site areas be needed for stockpiling and for processing wet material? Another question to be answered is how will the slope rights beyond the limits of grading shown on sheet 4 of 13 of the grading plans be obtained in order to construct the buttress? The questions must be answered before the Grading Application can be approved, and thus they should be addressed in the DSEIR.

Response

All grading is proposed to be completed onsite, as documented in Section 4.2.2 of the DEIR.

CCBG.3-19

Comment

In conclusion, the Society sincerely hopes that, in light of ;the important questions and issues raised above regarding the geotechnical impacts of the Project, the Department will request the Applicant to substantially revise and supplement the "Soils and Geology" section of DSEIR 566 so that the DSEIR can be recirculated for public review and comment once all of the grading plans and the grading plan review have been made part of the DSEIR. AT that point, the Society and its consultants will be in a much better position to understand and comment on the true environmental effects of the proposed grading and the feasibility of the mitigation measures designed to lessen such impacts. Thank you in advance for the Department's anticipated cooperation in this regard.

Response

Please refer to response to comments CCBG.3-1 through CCBG.3-18

Comments on DSEIR No. 566; Saddleback Meadows

Dear Mr. Britton:

On behalf of the Orange County chapter of the California Native Plant Society (CNPS), and on my own behalf as a wildlife biologist, I offer the following comments on Draft Subsequent EIR No. 566. My knowledge of the CEQA review process, as it applies to biological resources in Orange County and the region, derives from over eight years' experience as a full-time biological consultant based in Orange County. During this time, I have prepared numerous biological technical reports for CEQA documentation covering large and small projects throughout Orange County and elsewhere in the region. I've certainly never encountered a situation where a project, once denied because of its incompatibility with applicable planning and zoning laws, was resubmitted in a form that actually flaunts the law more flagrantly than it did the first time around. I know better than to inquire about the circumstances under which such a ridiculous situation has come to be, or to spend much time actually considering the new development scheme.

On 29 February 1996, I submitted a letter to the County of Orange (County) commenting on DEIR No. 561, which covered the applicant's previously proposed project on this same site. This letter contained 26 comments (many more, actually, but that's the number that were responded to in any form). Most of my comments addressed the DEIR's factual errors and internal inconsistencies. I also suggested a number of realistic solutions to problems that I identified.

I have just completed a review of the responses prepared by the applicant/County in response to my previous letter, and now remember afresh that most of my direct questions and comments were sidestepped, ignored, vaguely acknowledged, or responded to in a manner that obfuscated the comment's intent. This, combined with the fact that the new project makes no pretense of complying with planning and zoning laws, or the concerns of this community, indicates to me that the applicant/County has no meaningful interest in my thoughts or opinions.

I'm sure this is a common reaction of citizens who commented on the previous DEIR, but I find the situation particularly confounding, as the County recently selected me to serve on the 37,000-acre Nature Reserve of Orange County's Technical Advisory Committee. According to the 23 May 1997 appointment letter that I received from Executive Director Tim Neely, this committee will "serve as advisors to the Board of Directors on issues relating to monitoring, management and science." These are precisely the types of issues that I have commented on with regard to this project. I can't be an ignorant gadfly and a trusted scientific advisor simultaneously, so I ask the County to make up its mind.

20571 Sycamore Drive ~ P.O. Box 961 ~ Trabuco Cyn, CA 92678 ~ (714) 459-1876 (Phone/Fax)

Finally, I ask at least one County planner to review the responses that the applicant's consultants gave to my previous comments on this project; these were given with your approval and under your agency's name. If the goal of the Environmental & Project Planning Services Division is to completely frustrate the few citizens who take the time to read and comment on your EIRs, and to thus subvert the California Environmental Quality Act, you have succeeded.

If the County is interested in taking a step in a more productive direction, I suggest that you spend a few dollars having an outside biological consultant review biological assessments *and* responses to comments prepared for major EIRs. For documents prepared by biologists based outside of Orange County, the reviewing firm should be based within Orange County, as consultants based elsewhere often display limited knowledge of the status and distribution of plant and animal species in Orange County. This simple and relatively cheap process would greatly improve the quality and credibility of the County's environmental documents; it is a fairly common practice for CEQA lead agencies statewide.

Please provide any written responses to this letter to the following address:

Subject: Saddleback Meadows Draft Subsequent Environmental Impact Report

Dear Mr. Brantley:

Thank you for the opportunity to review and comment on the Draft Environmental Impact Report for Saddleback Meadows. The proposed project is for the phased development of 705 manufactured single family housing units and a 1.5 acre, neighborhood commercial center and associated infrastructure. The project site is located within the Foothill/Trabuco Specific Plan and the Aliso Creek Corridor approximately 1/2 mile south of the El Toro Road/Live Oak Canyon Road intersection. Caltrans District 12 is a reviewing agency and has no comment at this time.

Please continue to keep us informed of future developments which could potentially impact our State Transportation Facilities. If you have any questions, or need to contact us, please call Aileen Kennedy on (714) 724-2239.

Sincerely,

Robert F. Joseph, Chief

Subject: Saddleback Meadows - Request For Time Extension on Comments to Draft EIR 566

Dear Mr. Brantley:

I want to thank you and Bill Grieman again for providing for me, not only the previous EIR's for Saddleback Meadows, but for providing a desk and room for me to review these documents in your office.

While I intend to provide the County with my comments to Draft EIR 566, I would like a reasonable period of time to review the current Phase I grading plans which are referenced in the Draft EIR. My objective would be to determine whether the Draft EIR adequately addresses the impacts associated with the proposed grading shown on the grading plans. Unfortunately, I have been informed that the grading plans, which are the subject of the grading permit application, are not currently on file at the County for me to review at this time. I was able to review an older version of the grading plans that Bill Grieman had available. However, I have been told that I can make separate arrangements with the applicant to obtain a copy of the current grading plans, but that would take additional time and money that I had not planned on spending. Under the circumstances, I would ask that I be provided with an extension of time to submit comments on the Draft EIR, after I have had a chance to review the grading plans, which I hope will be made available at the County shortly.

I am requesting a three-week extension to the September 12, 1997 deadline, to review not only the grading plans, but also to review the files to the Zone Changes previously approved by the County. I have asked the Clerk of the Board to pull files for the following Zone Change Applications: ZC 79-24, ZC 82-63 and ZC 84-3, and I have received a call back from Beverly at the Clerk of the Board, indicating that these files should be available for my review sometime this week.

Please let me know whether your office will be able to accommodate my request for the three-week time extension to submit comments on the Draft EIR. The August 12 deadline is coming on too fast for me to be able to complete my review of all the necessary documents, particularly the grading plans, so I hope that you will be able to grant me the extra time I have requested. Please call me with your response.

Thank you again for your consideration.

Very truly yours,

Re: Saddleback Meadows Draft EIR 566
Request for Extension of Time to Submit Comments

Dear Messrs. Brantley and Grieman:

As you know, August 12, 1997 is the current deadline for submitting comments on Draft EIR 566, the subsequent environmental impact report which has been prepared in connection with the grading permit application submitted by the developer of the Saddleback Meadows project. Our firm has been asked to submit comments on the Draft EIR on behalf of the Vedanta Society of Southern California (the "Society") which owns and maintains the Ramakrishna Monastery adjacent to the project site. However, due to an unusual set of circumstances, we find ourselves unable to submit comments prior to the August 12 deadline because critically important documents that we and our consultants need to analyze in assessing the adequacy of Draft EIR 566 have not been made available for public review

The problem that we have encountered is that we have not been able to gain access to the developer's grading plans which are the *sine qua non* of the grading permit application process. Without such plans, no permit can be issued. Moreover, without access to the grading plans themselves, it is *impossible* to comment on the adequacy of Draft EIR 566 which, as stated in the Initial Study, was prepared for the express purpose of evaluating the environmental effects associated with the grading permit application.

Indeed, without being able to review the grading plans, neither our firm, nor the geotechnical consultants which have been engaged on behalf of the Society, can

determine whether Draft EIR 566 properly evaluates the impacts, and adequately addresses the mitigation measures, associated with the proposed grading of the Saddleback Meadows property. Thus, the Society is effectively stymied in its ability to submit adequate comments on the Draft EIR by the August 12 deadline

Last Friday, during a meeting with Messrs. McGill and de Mayo at the County offices, I asked if I could obtain copies of the grading plans, but I was informed that the County had returned the plans to the developer and no longer had a set available for public review. I was also told that, if I wanted to obtain a copy of the grading plans, I would have to contact the developer directly and make arrangements to pay for copies of the plans to be made Although my office promptly contacted the developer's agent, TPG Management, immediately following my meeting at the County, and then, first thing Monday morning, messengered a check to TPG to comply with its demand that we pay *in advance* for the cost of copying the plans, several days have gone by and we still have not received any plans as of this writing. I am surprised that it would take more than three days to run blue lines of the grading plans, but, be that as it may, we still do not have them and the August 12 deadline for submitting comments is coming on fast. Under these circumstances, therefore, I would respectfully request that the Society be granted a minimum of a 30-day extension of time to submit its comments on Draft EIR 566.

Actually, I think the proper thing to do in light of the fact that the grading plans have not been available for public review at *any* time during the 45-day comment period for Draft EIR 566 is to circulate a *new* public notice setting a *new* deadline for submitting comments on the Draft EIR. The new time period for submitting comments should not start running until the grading plans are made available for public review at the County

What should *also* be made available for review and copying at the County is the soils engineer's geotechnical review of the 40-scale grading plans which the Orange County Grading Code requires be submitted *before* any grading permit can be issued. Indeed, without the soils "specs" providing details regarding proposed buttresses, shear keys, back cuts, etc., it is difficult to understand the grading plans. Moreover, it is virtually *impossible* to assess feasible mitigation measures for known geotechnical hazards without having access to the grading plan review prepared by the soils engineer of record.

Please let me know whether the grading plan review by G.A. Nicoll & Associates is available for public review and copying As you may be aware, Draft EIR 566 specifically states that a grading plan review will be prepared "to accompany the grading permit application " (See Appendix D, p. 4, ¶ 4) If, as I suspect, Nicoll's grading plan review is *not* available for review and copying, then this would be yet another reason for re-noticing the public comment period on Draft EIR 566. In fact, if the grading

plan review has not been prepared or is unavailable for public review, this would raise serious questions as to the legal adequacy of Draft EIR 566.

I do not wish to criticize the County for what appears to have been a problem created by the developer in not making critical documents available for review, but the fact remains that neither the Society, nor any other "interested party" or member of the public, has been dealt a "fair hand" in being required to submit comments on Draft EIR 566 without being allowed reasonable and timely access to the documents which are the "very heart and soul" of the grading permit application, i.e., the grading plans and the grading plan review. I would greatly appreciate it if your office would rectify this problem by (1) making copies of the grading plans and the grading plan review available for public review at the County as soon as possible and (2) providing public notice to all interested persons that a new 45-day time period to submit comments on Draft EIR 566 has been established. If your office is not inclined to provide all members of the public with such an extension of time, then, at the minimum, I would ask that the Society be provided with the 30-day extension which I have requested.

As a final note, I would ask that my name and address be placed on whatever public notice lists are being maintained by the County in connection with the Saddleback Meadows project and any planning approvals and matters relating thereto. Please add me as an "interested party" on all mailing lists so that I can receive public notice, information, and reports regarding any and all aspects of the Saddleback Meadows property or project. Thank you for your courtesy and cooperation in this regard.

Very truly yours,

Edmond M. Connor

Subject: Draft EIR 566 for the Saddleback Meadows Project Grading for Recorded Tract No. 10692.

This letter is not to be interpreted as a contractual commitment to serve the proposed project, but only as an information service. Its intent is to notify you that the Southern California Gas Company has facilities in the area where the above named project is proposed. Gas service to the project could be served from an existing main as shown on the attached atlas sheet without any significant impact on the environment. The service will be in accordance with the company's policies and extension rules on file with the California Public Utilities Commission at the time contractual arrangements are made.

The availability of natural gas service, as set forth in this letter, is based upon present conditions of gas supply and regulatory policies As a public utility, the Southern California Gas Company is under the jurisdiction of the federal regulatory agencies. Should these agencies take any action which affects gas supply or the condition under which service is available, gas service will be provided in accordance with revised conditions.

Residential (System Area Average)	Yearly
Single-family	750 therms/year/dwelling unit
Multi-family units	475 therms/year/dwelling unit

These averages are based on total gas consumption in residential units served by Southern California Gas Company and it should not be implied that any particular home, apartment or tract or homes will use these amounts of energy.

We have developed several programs which are available, upon request, to provide assistance in selecting the most energy efficient appliances or systems for a particular project. If you desire further information on any of our energy programs, please contact this office at 1(800)427-2000. for assistance.

Sincerely,

Robert S. Warth/Myron Spencer

Re: Saddleback Meadows/Draft EIR 566
Request for Re-Noticing of Public Comment Period

Dear Nick:

This will confirm this afternoon's telephone conversation during which you kindly agreed to provide my client, the Vedanta Society of Southern California (the "Society") with an extension of time, to and including next Friday, August 15, 1997, within which to submit comments on Draft EIR 566. You explained that you had consulted with John Buzas and had concluded that, since various County personnel were unavailable to make a final decision on the requests set forth in my August 6 letter to Messrs. Brantley and Greiman, a three-day extension of time seemed to be an appropriate "stop-gap" remedy under the circumstances.

I understand that, when the appropriate personnel are available at the County next week, I will receive a definitive answer to the requests set forth in my August 6 letter. I certainly appreciate receiving the three-day extension, but my firm and the Society's geotechnical consultants still need more time to review the grading plans and the grading plan review before any of us will be in a position to submit comments on Draft EIR 566. Although the public review provisions of CEQA and the State CEQA Guidelines would suggest that we should not have been required to do so, we have already been compelled to make separate arrangements with, and to pay money to, the

developer's agent to obtain the right to review the grading plans for which a grading permit is being sought.

However, even if we were willing to pay additional money for the right to gain access to the grading plan review by the soils engineer of record, we could not do so because that report has not even been completed as of this date. Of course, Appendix D to Draft EIR 566 expressly states that a geotechnical review of the 40-scale grading plans will be prepared to accompany the grading permit application, but, for whatever reason, the grading plan review has not been finalized and is not available for any member of the public to even see it, much less study it in detail. That really puts the Society, and all other members of the public, at a tremendous disadvantage in being able to adequately comment on the Draft EIR.

As I explained to you in my earlier phone message, section 15146 of the State CEQA Guidelines requires that the degree of specificity to be found in Draft EIR 566 must be commensurate with the stage of development that is being evaluated. In other words, since the construction of grading improvements is being analyzed in conjunction with a grading permit application, the *specific* details of the grading, and the impacts and mitigation measures associated therewith, must be addressed in the Draft EIR. Moreover, under section 15147 of the CEQA Guidelines, all technical data, maps, plans, etc., which are necessary to make a "full assessment" of the environmental impacts of the project must be set forth in the appendices to the Draft EIR, and such appendices "shall be *readily available* for public examination." (Emphasis added.)

The California courts have not hesitated to enforce the above requirements by striking down EIRs which have omitted important technical information, even if the information was found to be available from other sources. As stated by our own Fourth District Court of Appeal, "whatever is required to be considered in an EIR must be *in that formal report*; what any official might have known from other writings or oral presentations cannot supply what is lacking *in the report*." (*See, Santiago County Water District v. County of Orange* (1981) 118 Cal.App.3d 818, 831; *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 727.)

As the above authorities indicate, both the grading plans and grading plan review should have been (1) set forth in the Appendices to Draft EIR 566 and (2) readily available to all members of the public during the entire 45-day comment period. Since the County will not issue any grading permit to the developer without the grading plans and the grading plan review having been approved by County staff, these documents should not have been *excluded* from the CEQA review process. However, since these documents were, in fact, omitted from Draft EIR 566 and have never been available at the

CONNOR, CULVER, BLAKE & GRIFFIN LLP

County for public review, I think it only fair that the County take quick action to correct these problems.

My proposal would be that the County request the developer to (1) complete the grading plans and the grading plan review and submit them to County staff as soon as possible and (2) revise Draft EIR 566 to not only include these documents as part of the Appendices, but also to adequately address them in Volume I of the EIR. Once the grading plans and grading plan review have been made "readily available" for public review, then a new 45-day period for submitting comments on Draft EIR 56 should be re-noticed.

Again, I apologize for burdening you with this issue in Ben de Mayo's absence, but I sincerely believe, Nick, that fundamental fairness, not to mention the strict dictates of the State CEQA Guidelines, requires the County to remedy the problems which have occurred as a result of the grading plans and grading plan review not having been available for public review prior to the expiration of the comment period on Draft EIR 566. The problems are easily corrected as I have suggested above, and I hope the County will do just that. Thank you for your courtesy and cooperation in doing what you can to make that a reality.

Very truly yours,

Edmond M. Connor

Draft Subsequent Environmental Report (DSEIR) No. 566 for the Saddleback Meadows Project, Orange County, California.

Dear Mr. Brantley:

The U. S. Fish and Wildlife Service (Service) and California Department of Fish and Game (Department) Natural Community Conservation Planning (NCCP) program staffs (i.e., "the Wildlife Agencies") have reviewed the above DSEIR. The project is located within the Southern Subregion Orange County NCCP Planning Area, near the border with the NCCP Central Subregion. The preferred project proposes the phased development of 705 manufactured, single-family residential units on a 222.9-acre site near the intersection of El Toro Road and Live Oak Canyon Road, impacting a total of about 191 acres on site and 20 acres off site. About 14% of the project site is proposed to remain as open space.

Biological resources on site include about 65 acres of coastal sage scrub (CSS), 14 acres of oak woodland, and about four acres of wetland vegetation communities The federally endangered Riverside fairy shrimp (*Streptocephalus woottoni*) is known to occur within at least seven wetlands (identified in the DSEIR as "ephemeral ponds") spread throughout the site Several plant and animal species considered sensitive by the Wildlife Agencies occur (e.g., cactus wren [*Campylorhynchus brunneicapillus*]) or may occur. The coastal California gnatcatcher (*Polioptila californica californica*) hereafter "gnatcatcher," a federally threatened species, is likely to occur on site based on the presence of CSS and gnatcatcher-occupied CSS in surrounding areas. The Quino checkerspot butterfly (*Euphydras editha quino*), a federally endangered species, may occur as well.

Along with the No Project/No Development Alternative ("Alternative 1") required by the California Environmental Quality Act (CEQA), there are four other alternatives presented in the DSEIR. Alternative '1' would avoid any adverse environmental impacts to the project site. Alternative '2' proposes 150 housing units with a minimum lot size of 20,000 feet^2, disturbing more than 138 acres. This would result in elimination of oak woodlands, CSS, and ephemeral ponds of which some rare and sensitive species are obligate residents. Noise decibel levels would increase and possibly affect wildlife in adjacent O'Neill Regional Park. Alternative '3' proposes

100 single family units on a 31.7 acre portion of the site. This alternative avoids about 191 acres of habitat, thereby appearing to allow connection between open space areas north, south, and east of the project site. However, this project alternative will impact two ephemeral ponds and CSS habitat. Alternative '4' proposes 299 housing units, disturbing about 165 acres. A wildlife corridor, narrowing to 400 feet in width and going up a nearly vertical slope, is proposed to be bisected by a road. Alternative '5' proposes 318 housing units within a development area of 113 acres, leaving about 110 acres in open space. The wildlife corridor would be the same as for Alternative '4' except that the minimum width would be about 700 feet. The proposed project appears to conflict with the earlier-adopted Foothill-Trabuco and Aliso Creek Corridor Specific Plans and also fails to describe adequate project design for maintaining corridor integrity of the Orange County NCCP Reserves. In evaluating alternatives 2-5, Alternative '3' would have the least environmental impact, but would nonetheless, substantially impact wildlife corridor integrity between subregional NCCP reserve areas in Orange County.

The Wildlife Agencies have formally commented at different stages of the proposed project. We have also met with the project applicant and their consultants, including a meeting at the project site on May 20, 1996. On June 29, 1994, the Service wrote a letter stating that project approval must be deferred until the Southern Subregion NCCP was finalized. In 1996, both agencies commented on the DEIR (No. 561). The Service letter stated that the location of this development within and adjacent to occupied habitat of rare species could compromise the NCCP reserve and its ability to function as a wildlife corridor through the direct and indirect impacts of habitat destruction, fragmentation, noise, and lighting. Our comments were based upon a project alternative, similar to alternative four, which provided more open space than the proposed preferred alternative presented in this DSEIR.

In general, the DSEIR does not adequately describe the biological resources of the project area The document only describes and analyzes impacts of the different alternatives in a superficial manner. Referring to our joint Wildlife Agency letter of January 30, 1997, responding to the Notice of Preparation, at least eight of our requested information items were completely or partially ignored, without explanation. Available data were not identified. Further, the Initial Study (p. 17) states that the scope of the EIR discussion will provide a "detailed discussion" and "[A] re-inventory of the existing unique, sensitive . . . flora and fauna within the project site . . . " Also to be provided was "[A] detailed analysis of the project's impacts to wildlife movement, including mitigation measures to avoid or reduce those impacts." Neither of these items was adequately accomplished.

The Wildlife Agencies offer the following specific information and recommendations to assist the County and the project applicant in planning for the preservation of sensitive wildlife species, habitats, and wildlife corridors within the proposed project area, and as a means to assist you in complying with pertinent statutes. Page numbers refer to the DSEIR unless otherwise noted.

1-1, paragraph 2 and 4-41, paragraph 4. Both of these statements should read as "affect."

4-41, exhibits 21, 22, 53. Interference with existing hydrology on site is shown with the construction of the preferred alternative. Impacts to "ephemeral ponds" not directly within the project footprint would also occur. Analyze these impacts further.

4-43, last paragraph. The Wildlife Agencies disagree with the conclusions that there would be ". . . no unavoidable adverse impacts to surface or groundwater hydrology" and that water quality impacts would be " . . . to less than significant levels" since current hydrological conditions support the existence of these areas. Implementation of the preferred alternative, including alteration of drainage patterns, would result in the direct loss of a minimum of seven ephemeral ponds on site.

4-110. The noise impact analysis is cursory and needs to refer to appropriate literature attributing impact to avian populations due to noise. Also, in the cases of "major airport runways" the analysis is biased by not considering adjacent land use changes in the context of the distribution of the coastal California gnatcatcher.

4-119, paragraph 2. There was no Service protocol for presence/absence of gnatcatchers in 1993 and 1994.

4-122, exhibit 50. Western spadefoot toad (*Scaphiopus hammondi*) is identified in the exhibit (and on page 4-137) as occurring on site; however, the discussion about amphibians on page 4-126 states that "[N]o amphibians were observed during the surveys of the site." Correct this discrepancy.

4-123, paragraph 2. Add that the NCCP refers to the Southern Orange County Subregion to distinguish this planning effort from other ongoing and completed efforts.

4-125, "Ephemeral Ponds." The Wildlife Agencies disagree with the assertion that "all of the ephemeral ponds were artificially created a number of years ago..." Given the geological conditions of frequent landslides in the area, these wetlands could have been "slump" or "slope" ponds that underwent human modification at a later time. These types of wetlands are known in both Orange and San Diego counties. Further information is needed in the DSEIR regarding the origin of these wetlands in the context of the proposed impacts.

As identified by Marie Simovich, Ph.D., a consultant for the former applicant, some of the on site wetlands contain a high diversity of aquatic invertebrates, strongly suggestive of the more natural origin of these wetlands. Known to occur in at least some ponds with Riverside fairy shrimp and western spadefoot are cladocerans (e.g., *Daphnia*, 2 or 3 species likely), copepods, ostracods (seed shrimp), and clam shrimp (*Cyzicus californicus*). Clam shrimp have a restricted distribution in coastal southern California. Further information is needed in the DSEIR regarding aquatic invertebrates in the context of the proposed impacts.

4-126, Invertebrates, last sentence. The DSEIR states that "[H]undreds of additional invertebrates are expected to use the site." No data are provided to support this statement. The Wildlife Agencies presume that this statement refers to the expected number of species, not the number of individuals. Please qualify and support the statement.

4-126, Amphibians. The last sentence erroneously implies that the distribution of amphibians is restricted to steep slopes. No data are provided to support this statement. The likely widespread distribution on site of western spadefoot toad, Pacific treefrog (*Hyla regilla*), and western toad (*Bufo boreas*) needs to be noted and discussed. Please revise the discussion.

4-126, Reptiles. The correct name is the orange-throated whiptail lizard. Please correct this name throughout the document (e.g., 4-138, -147).

4-130, paragraph 1. The DSEIR states that the "[Southern] subregion will incorporate public lands of the Cleveland National Forest (CNF)." We suggest that this statement be removed or properly qualified since no additional conservation benefits would occur unless the U.S. Forest Service (USFS) is a signatory to an NCCP agreement. The USFS is not participating in the Orange County Central/Coastal NCCP and has not indicated that it wishes to be a "participating landowner" in the Southern Subregion. The DSEIR should not presume that future CNF management activities will be compatible with an NCCP.

4-130, paragraph 2. The DSEIR states that the gnatcatcher is not found onsite. Surveys to current Service protocol were not done. The last gnatcatcher surveys were done in 1994. Surveys should be conducted according to Service protocol to determine the baseline status for the species. The results of these surveys will be needed to assess impacts, including the number of gnatcatchers subject to "take," in accordance with the Intra-Service Biological Opinion for the 4(d) rule.

4-130, paragraph 3. The correct name is the Central-Coastal Subregion.

4-130, paragraph 4. The DSEIR refers to the "disturbed nature of the site" in the context of fulfilling wildlife corridor "needs in the area." No additional information is provided to support this assertion. The existing landscape linkages and documented presence of mountain lion (*Felis concolor*), mule deer (*Odocoileus hemionus*), and coyote (*Canis latrans*), all of which would use a wildlife corridor within the project area, needs to be noted and discussed. Mountain lion movement through the area was not disclosed in the DSEIR. This study was undertaken by Paul Beier, Ph.D, and reported in the scientific literature. For further explanation of our request that these data be disclosed and discussed in the context of this proposed project, refer to item number eight in our joint wildlife agency letter of January 30, 1997.

4-131, exhibit 51. This exhibit is difficult to interpret since it was originally a color map of larger size. For example, gnatcatchers and cactus wrens are noted in the legend but are invisible on the exhibit. We suggest that the exhibit be redone to show only relevant information.

4-133, paragraph 3. The DSEIR says that "The fragmented nature of much of the coastal sage scrub onsite makes it low quality." However, the current gnatcatcher status is unknown and most wildlife surveys were out of date, having been conducted in 1993 and 1994. The paragraph continues by stating that the steep slopes support the highest diversity of animal species, but no data are provided to support this statement.

4-133, paragraph 3. The site also contains a habitat linkage, also qualifying it as at least "intermediate value" according the Evaluation Logic Flow Chart.

4-136, exhibit 53. One pond identified as a "potential mitigation area" is in the project footprint of the preferred alternative, as shown on exhibits 18 and 22. Since this area would be under housing and infrastructure and no longer in its present condition, please correct this discrepancy.

4-137, paragraph 3. The western spadefoot toad is a California State Species of Concern.

4-137, -139, and -148 state that the site "must be considered occupied by gnatcatcher until proven otherwise." This is inconsistent with the statement on 4-130 that the gnatcatcher is not found on site. Correct and clarify this discussion.

4-139. The distribution information for the gnatcatcher is incomplete. The species occurs in portions of Ventura, eastern Los Angeles, and San Bernardino Counties. The assertion regarding limited slope characteristics is not valid. Gnatcatchers occur on steep slopes, using them for nesting, foraging, and movement.

4-140. The wildlife agencies disagree that focused surveys for the Quino checkerspot butterfly are not warranted. The limited surveys accomplished do not support the assertion that the probability of occurrence is "low." Appropriate habitat (CSS, chaparral, and grassland) exists within the project site. Surveys consistent with the Service 1997 protocol should be completed.

4-141. The correct scientific name for the northern harrier is *Circus cyaneus*. It is properly referred to as a raptor. The accepted common name for *Agelaius tricolor* is the tricolored blackbird. The "C2 (category two)" category was discontinued by the Service in February 1996. The gnatcatcher is a California State Species of Concern.

4-144. There is no analysis of connectivity loss in this discussion of the project in relation to the NCCP Findings. However, 4-148 states that "[T]he project, as currently proposed, may hinder or preclude the preparation of the southern subregional preserve [sic], due to restricted wildlife

movement." Further on page 4-130, paragraph 3 it says, "the project site occupies a linkage area between the Central and Southern NCCP Subregional preserves [sic], where a wildlife corridor is needed." Please clarify and further analyze this crucial issue. We suggest explanatory text with an exhibit or exhibits specifically rendered.

4-145, "Ephemeral Ponds." The use of acreage by itself is inappropriate since it does not sufficiently disclose the impacts of the preferred alternative. The Wildlife Agencies suggest that the number of ponds also be used as a measure of impact. From the diagrams in the DSEIR, it appears that seven of the eight ponds identified as supporting Riverside fairy shrimp would be directly in the project footprint. The other pond would be subject to edge effects and adverse impacts to water quality. This impact is not apparent when only the acreage figure is considered.

4-147, Western spadefoot toad. The DSEIR states that the population is small in size. However, no data are provided to support this statement such as the results of a scientifically valid population survey. In the absence of data, we suggest that the statement be eliminated.

4-148, Wildlife Movement. The statement "It can not [sic] be assumed that wildlife would be able to move through the project site..." should be further explained. Further explanation is needed since it is known that there would be the virtual elimination of wildlife and their movements in a high density residential development as the preferred alternative proposes.

4-151, -152, Conceptual Mitigation Program. The last sentence on 4-151 states that the program was developed based on input from the wildlife agencies. Regarding the mitigation ratios presented, the DSEIR provides no rationale to support these ratios. Further, the position of the Wildlife Agencies is that the ratios are unjustified and inappropriately low in relation to the proposed impacts, given other mitigation agreements.

6-3, table 39. The "no project" alternative states that there would be a continuation of grazing impacts. Include that this is a discretionary landowner activity, otherwise unrelated to the proposed project.

6-4, paragraph 1. The DSEIR states that "[O]ngoing degradation of onsite biological resources related to cattle grazing operations would continue to occur." This degradation should be further described. For example, on our May 20, 1996 site visit, Wildlife Agency representatives observed cattle within some of the onsite wetlands. We also observed apparently free-ranging horses nearby. Further discussion of the presence of livestock and horses is needed in relation to impacts to Riverside fairy shrimp, other invertebrate species, and CSS. Crushing of fairy shrimp "cysts" and adverse changes to water quality are likely to occur within ponds subject to use by cows and horses. Literature references showing CSS impacts due to grazing should also be referred to and discussed.

6-4, and continuing. The discussion of biological resources impacts is cursory, allowing extremely limited comparison opportunity among the alternatives. A detailed matrix chart of alternatives versus type and amount of habitat impact (e.g., CSS, Riverside fairy shrimp) would help to synthesize the data. However, it appears that alternative three, the 100 unit alternative on 32 acres, would directly avoid seven of the eight ponds occupied by Riverside fairy shrimp, most of the loss of CSS habitat, as well as minimize impacts to wildlife movement.

8-1. The Inventory of Unavoidable Adverse Impacts should include the amount of CSS loss and the likely "take" of gnatcatchers.

Appendix C, Notice of Preparation (NOP), page 3. Note that our joint Wildlife Agency NOP commented about "Plant/Animal Life."

Appendices D (Conceptual Wetland Mitigation Plan) and E (Conceptual Upland Mitigation Plan) were missing from Appendix 'H,' the Biological Resources Assessment prepared by Sweetwater Environmental Biologists, Inc. The Assessment is a draft, dated March 20, 1997. If an updated version is available, include it in the revised DSEIR.

In conclusion, the DSEIR is inadequate. Major revisions and additions are needed, including completion of updated field surveys and a literature search. For example, the gnatcatcher discussion should include a description and analysis of the regional distribution of CSS, gnatcatcher, and cactus wrens, in relation to the project area. Vegetation maps and species locations in both digitized and hardcover format are available from the County of Orange.

The Wildlife Agencies anticipate that the issues discussed above will be included and addressed in any additional CEQA documents and be presented to the Wildlife Agencies for review and comment. Until the impact assessment and mitigation recommendations are revised to respond to our concerns, the Wildlife Agencies recommend against certification of the DSEIR as currently proposed.

The Wildlife Agencies appreciate working with the County on NCCP conservation planning issues. Lands within the proposed project area are important in conservation planning for the Southern Subregion NCCP Reserve in Orange County. The area of the proposed project is also the only linkage to the NCCP Central Subregion in Orange County. An improperly implemented project would permanently destroy the integrity of the linkage between the

Subregion reserves. If you have any questions or comments please contact Liam H. Davis, NCCP Associate Wildlife Biologist (Department) at 619-467-4207 or Robert James, Fish and Wildlife Biologist (Service) at 760-431-9440.

Sincerely,

Dear Mr. Britton:

SUBJECT: DRAFT EIR 566 FOR THE SADDLEBACK MEADOWS PROJECT
GRADING FOR RECORDED TRACT NO. 10692

The City of Mission Viejo is in receipt of the subject Draft EIR and understands the project as proposed to consist of phased development of 705 manufactured single family housing units and a 1.5 acre, neighborhood commercial center and associated infrastructure, on a 222.23 acre site on the easterly side of El Toro Road in the unincorporated territory of the County of Orange. The gross residential density is 3.17 dwelling units per acre, with minimum lot sizes of 2,630 square feet. Fourteen (14%) percent of the project site is proposed to remain in undisturbed, natural open space and 57.6% of the site will remain in total open space. In addition to the residential component, the project also proposes eight private park sites, regional riding/hiking trail connections, and a construction of a water tank site dedicated to and accepted by, the Trabuco Canyon Water District. Project implementation requires approval of a grading plan. The grading permit application (GA960048), the project subject of this Draft Environmental Impact Report, is based on Tract 10692, which was recorded December 16, 1988.

The project site is located within the Foothill/Trabuco Specific Plan and the Aliso Creek Corridor Specific Plan, and is located approximately one-half mile south of the El Toro Road/Live Oak Canyon Road intersection. Implementation of the proposed project would directly effect 191.39 acres of the project site, including remedial grading and fuel modification requirements and 19.77 acres offsite, for a total impact area of 211.16 acres.

A total of 2.6 million cubic yards of conventional grading and 8.9 million cubic yards of remedial grading would be required to implement the project.

The City of Mission Viejo has the following comments on DEIR 566 for the Saddleback Meadows Project:

GENERAL COMMENTS

The City of Mission Viejo is concerned with the numerous unavoidable adverse impacts of the subject project. These impacts are as follows:

1. Gross land use incompatibility with (1) O'Neill Regional Park, (2) the Ramakrishna Monastery, and (3) St. Michael's Abbey;

2. Major landform alteration/modification including cut and fill slopes up to 120 ft. in height;

3. Loss of 154.13 acres of onsite habitat and reduction of native habitats and sensitive and non-sensitive species dependent on those habitats, including (1) southern sycamore woodland, (2) coast live oak woodland, (3) coastal sage scrub, (4) mulefat scrub, and (5) ephemeral ponds;

4. Project and cumulative contribution to regional adverse air quality conditions, since the project is located in a non-attainment area with incremental increase in air pollution as a result of vehicle emissions;

5. Increased traffic and urban activity resulting in increased noise in the area;

6. Loss of Riverside fairy shrimp habitat (ephemeral ponds) and individuals, a federally listed endangered species; and

7. Urban landform visual impacts to (1) O'Neill Regional Park, (2) Ramakrishna Monastery, and (3) St. Michael's Abbey.

TRANSPORTATION COMMENTS

1. DEIR Transportation Analysis:
   There appears to be a major discrepancy in the Draft EIR's discussion and analysis of the transportation/circulation impacts resulting from the proposed project. This discrepancy needs to be reconciled and corrected in a revised Draft EIR document.

   As background, transportation/circulation impacts are summarized and presented in Volume 1 of Draft EIR 566. The basis of the Volume 1 discussion is stated to be a project-specific traffic study that is referenced and included in Volume 3 of the Draft EIR: Appendix F.

   Volume 1 states that the proposed project will generate 6,220 trip ends per day, with 345 vehicles per hour during the AM peak hour and 635 vehicles per hour during the

PM peak hour. In contrast, the traffic study appendix states that the proposed project will generate 8,340 trip-ends per day, with 540 vehicles per hour during the AM peak hour and 825 vehicles per hour during the PM peak hour. This represents a difference of (1) more than thirty percent on a daily basis; (2) more than fifty percent for the AM peak hour analysis; and (3) thirty percent for the PM peak hour analysis.

This inconsistency is carried forth into the specific tables and exhibits of the respective documents, where Average Daily Traffic forecasts from Existing through Year 2000 to buildout differ between the two documents. For example, page 4-56 of Volume 1 states that the projected ADT's along El Toro Road in the vicinity of the site do not exceed 30,000 vehicles per day. However, the traffic study in Appendix F: Volume 3, identifies that segments of El Toro Road do exceed 30,000 trips per day easterly of the Foothill Transportation Corridor.

Also, even though there is inconsistency between the two volumes on reported ADT and peak hour trips, the Intersection Capacity Utilization (ICU) and Levels of Service (LOS) calculations seem to be similar between the two documents. A Revised Draft EIR needs to explain which trip generation was used for the ICU and Levels of Service calculations, and the DEIR analysis needs to be carefully reviewed to accurately present the transportation impacts of the proposed project. In particular, the City of Mission Viejo will be reviewing the specific impact of project trips on the El Toro Road/Glenn Ranch Road intersection and the Marguerite Parkway/El Toro Road intersection, to determine any potential impacts and require any mitigation to maintain a Level of Service "D" performance standard, as required by the Measure M Growth Management Program.

2. Project Trip Generation:
The project traffic study identifies a residential trip distribution assumption wherein twenty-five percent of the daily traffic would enter/leave the project site using El Toro Road north of the project entrance, and twenty percent continuing along Santiago Canyon Road. The City of Mission Viejo believes this assignment is high. Please clarify the land uses that exist or are proposed north of the project site that would cause one-quarter of the project daily trips to use this segment of El Toro Road, versus using El Toro Road south of the project site to access freeways, major highways, and public facilities. A review of the Draft EIR school assumptions, for example, shows that school attendance is programmed for facilities located in Mission Viejo, Rancho Santa Margarita, and Trabuco Canyon.

The assumptions used in the project trip distribution would have a resultant impact on analyzed intersections south of the project entrance to El Toro Road, and in particular,

would increase Intersection Capacity Utilization (ICU) calculations if a greater percentage of project trips were assigned southerly along El Toro Road.

3. El Toro Road:
El Toro Road is classified as a Major Arterial Highway on the Orange County Master Plan of Arterial Highways (MPAH). A Major Arterial is defined as a six-lane highway with a divided median. The City of Mission Viejo is currently preparing improvement plans to construct El Toro Road to its master plan configuration of a *six-lane, Major Arterial facility*.

Although not specifically stated, the Draft EIR seems to indicate that El Toro Road should be reclassified from a six-lane facility to a four-lane facility. The City of Mission Viejo offers the following comments:

a. The reclassification of El Toro Road from a six-lane Major Arterial to a four-lane Primary Arterial requires the County of Orange to process an MPAH amendment, with the amendment ultimately being approved by the Orange County Transportation Authority (OCTA) board of directors.

It is the City's understanding that such an amendment has not yet been filed with OCTA. Please clarify how the timing of the El Toro Road MPAH reclassification, if proposed by the County of Orange, juxtaposes with the approval of Saddleback Meadows project application(s). Since the DEIR serves as an environmental assessment for the Saddleback Meadows recorded tract map, please clarify whether the right-of-way for El Toro Road has already been reserved for an ultimate six-lane or four-lane facility.

b. The OCTA MPAH guidance manual identifies that a multi-jurisdictional, cooperative process will be pursued with any MPAH amendment that affects more than one jurisdiction. In conjunction with that process, technical data will be prepared and reviewed by Growth Management Area (GMA) forums to determine whether there is consensus on the proposed amendment. Also, in conjunction with that process, an environmental assessment of the MPAH amendment must be completed.

Recognizing that the Saddleback Meadows DEIR is being processed in advance of a requested MPAH amendment, a multi-jurisdictional consensus of the El Toro Road reclassification has not yet been achieved. Technical issues may surface through the MPAH cooperative study process that have not yet been identified in the Saddleback Meadows DEIR. Further, inconsistencies on

project daily traffic volumes are already present in the Draft EIR. The City of Mission Viejo recommends that the transportation analysis in the Saddleback Meadows DEIR should *not* serve as the environmental documentation for the MPAH reclassification of El Toro Road, unless agreed to by representatives of the cooperative study process.

c. The City of Mission Viejo continues to retain El Toro Road, within its jurisdictional boundaries, as a six-lane Major Arterial facility. The jurisdictional boundary between the City of Mission Viejo and the County of Orange generally lies immediately east of the Glenn Ranch Road intersection at El Toro Road.

4. Glen Ranch Road/El Toro Road Intersection Improvements:
In reviewing the Intersection Capacity Utilization (ICU) projections for the Glenn Ranch Road/El Toro Road intersection, the City of Mission Viejo is concerned that the Glenn Ranch Road/El Toro Road intersection could become a bottleneck as one transitions, north to south, from a four-lane facility to a six-lane facility. This intersection must be guaranteed for maximum feasible improvement to insure that a Level of Service "D" performance standard is maintained, in compliance with Measure M Growth Management Program requirements.

The County of Orange will need to be an active participant in the maximum feasible improvement to the Glenn Ranch Road intersection, since:

a. The DEIR identifies that seventy-five percent (75%) of the project trips will use this intersection, and the intersection will experience Levels of Service F sometime between Year 2000 and Year 2020 performance unless roadway improvements are appropriately phased. The timing of El Toro Road improvements is important because the project traffic study identifies that El Toro Road can remain a two-lane facility through project build-out.

b. The County of Orange will be deeded a 7.710 acre parcel for open space purposes from the Mission Viejo Company. This parcel (a portion of Parcel 4 of PM 89-115) is located south of El Toro Road and immediately west of the Glenn Ranch Road intersection (see attached Exhibit). The City of Mission Viejo will require that appropriate rights-of-way be secured along the open space parcel frontage to achieve a major arterial cross-section and intersection improvements to Glenn Ranch Road that meet projected traffic demand.

5. El Toro Road Mitigation Measure AM4-16:
Mitigation Measure AM4-16 states that "north of the Foothill Transportation Corridor, El Toro Road can accommodate projected traffic volumes with the proposed project on four travel lanes divided by a raised or striped median. Implementation of a full Major Arterial cross-section is not needed to serve future traffic volumes. This alternative section represents a modification of the typical cross-section for a Primary Arterial. Appropriate transitions would be required between this cross section and other modified cross sections along El Toro Road south of Glenn Ranch Road."

As identified above, the City of Mission Viejo is improving El Toro Road as a six-lane facility from the FTC to Glenn Ranch Road, consistent with its MPAH arterial designation. The City of Mission Viejo recommends that Mitigation Measure AM4-16 include reference that the City of Mission Viejo review and participate in the County of Orange's development of improvement plans for El Toro Road, to insure that:

* El Toro Road is phased and constructed to achieve a roadway cross-section that effectively transitions to the proposed interim two-lane facility;

* El Toro Road can transition from a six-lane facility in the City of Mission Viejo to a four-lane facility in county unincorporated area, while achieving a Level of Service "D" performance standard at the Glenn Ranch Road/El Toro Road intersection through Year 2020.

6. Inventory of Assumed Circulation Improvements:
The project traffic study--Appendix F- -identifies a Year 2020 scenario in which levels of service at a City of Mission Viejo intersection is projected at Level of Service F: Marguerite Parkway at El Toro Road. The City's performance standard is Level of Service "D".

The Draft EIR should be revised to include a mitigation measure that requires the applicant to assess, calculate and provide a fair-share contribution to transportation/circulation improvements at all impacted City of Mission Viejo intersections.

In addition, the County of Orange proposes, through this project (DEIR), the Year 2020 improvement program of northbound dual right turn lanes at the Marguerite Parkway (NS)/El Toro Road (EW) intersection. This proposed improvement is *not* acceptable to the City of Mission Viejo. The City of Mission Viejo does not have any intersection with dual right-turn lanes; and recommends that the Draft EIR analyze an alternative improvement program that will mitigate the Level of Service "F" condition.

This concludes the City of Mission Viejo comments on the Saddleback Meadows Project Draft Environmental Impact Report (DEIR 566). The City of Mission Viejo is also reviewing the June 1997 Draft EIR No. 565 for Live Oak Plaza Project. As a result of our technical review of the Draft EIR, the City may raise additional comments or request clarification on certain issues such as transportation and other areas where there may be inconsistencies in findings or analyses. Thank you for the opportunity to comment on the document. The City would like Response to Comments on the DEIR as soon as they are available.

Sincerely,

CITY OF MISSION VIEJO

Re: Initial Comments of Trabuco Canyon Water District - Draft Subsequent Environmental Impact Report No. 566 - Saddleback Meadows Recorded Tract Map 10692, Grading Application GA960048 - SCH # 96121072

Dear Mr. Britton:

The Trabuco Canyon Water District is in receipt of the above-referenced Draft Subsequent Environmental Impact Report (the "DEIR") prepared in regard to the Saddleback Meadows Recorded Tract Map No. 10692, Grading Application GA960048 (the "Project"). Our firm represents the District as general legal counsel. The District, having reviewed the DEIR, and having consulted with us, has requested our firm to provide your office with the comments set forth herein. It is the District's understanding that the Project will involve the phased development of 705 manufactured single family residential units and a 1.7 acre neighborhood commercial center on a 222.23 acre site. This seems to correspond, generally, to the final tract map (Tract 10692) approved by the County of Orange (the "County") in 1988. However, the District has not been provided with updates of the plans for the Project and, as such, all of the comments submitted with this letter should be interpreted in that light.

The purpose of this letter is to provide to the County, on behalf of the District, various comments and matters relating to the Project, the potential impacts of the Project on the facilities of the District and the District's requested mitigation measure.

Request for Notices

Pursuant to the provisions of the California Environmental Quality Act ("CEQA") and Public Resources Code Section 21092.2, the District hereby requests that copies of all notices and other documents mailed in relation to the above-referenced Project (specifically including, but not limited to, environmental review notices) be furnished both to the District and the undersigned. If there are any fees and charges required for the provision of such notice(s), please provide our office with an invoice for such costs and we will reimburse the appropriate County department. This request for notice specifically includes, but is not necessarily limited to, notices of all hearings, proposed actions to be taken with regard to the developmental process and, in particular, any Notice of Determination prepared, furnished or filed with regard to this Project.

Background Information

We have reviewed various referenced to the Trabuco Canyon Water District, and the District's water and wastewater (sewer) facilities contained within the DEIR. In regard to such matters, we would note the following additional facts which are important for a full and complete understanding of the District's background in providing the comments set forth below. The DEIR correctly notes that two improvement agreements were entered into between the prior owner of the property and District dated September 21, 1988 (see further discussion below). It is relevant to note that in connection with those improvement agreements two performance bonds were posted in order to secure the construction of the relevant water and sewer facilities as required by the terms of those agreements.

The DEIR correctly notes that the District's Capital Improvement Charges ("CICs"), based on 705 residential units, were paid to the District. Those Capital Improvement Charges are levied as part of the District's master financial and facilities planning. Funds from the CICs were expended on various District-wide and master planned facilities in order to be able to furnish water service and water capacity to the property within Tract 10692 (the "Property").

Wastewater (sewer) treatment capacity was purchased in the Santa Margarita Water District ("SMWD") Chiquita Wastewater Treatment System by way of a pass-through payment made by the former property owner to the District and then paid to SMWD. It should be noted that the SMWD Chiquita Wastewater Treatment System is owned and operated by SMWD, and not TCWD. Specified wastewater treatment capacity (based on 705 residential units) was paid for in the Chiquita system and is now available to provide wastewater treatment service for the Property. The major wastewater trunk sewer and downstream lift station facilities were financed for the benefit Property by means of assessment district proceedings pursuant to the relevant provisions of the California Streets and Highways Code. Assessment District No. 5R of the Trabuco Canyon Water District is currently in place and levies assessments on the Property (as well as other properties within the

boundaries of the Assessment District). The major trunk sewer and downstream lift station facilities financed through the Assessment District proceedings (and bonds issued by Assessment District No. 5R secured through the levy of assessments) have been constructed. These are available to provide service to the property based on 705 residential units. However, the related facilities for this Property, identified in the improvement agreements, were not financed and have not been constructed as of this date.

As noted above, the District entered into onsite and master plan improvement agreements relative to the Property (collectively the "Improvement Agreements"). Copies of the Improvement Agreements are attached to this letter as Attachments "A" and "B" and incorporated herein by this reference. The Improvement Agreements were entered into pursuant to TCWD's Rules and Regulations which require improvement agreements to be entered into before the District will authorize, or sign off on, any tract map. Correspondingly, TCWD's approval of Tract Map No. 10692 was expressly conditioned on the terms and conditions of the Improvement Agreements, including the bonds submitted to the District to secure the terms and conditions of those agreements. The Improvement Agreements were subsequently assigned, with the District's consent, to a subsequent owner of the Property.

Subsequently, the prior owner of the Property (to whom the Improvement Agreements had been assigned) filed for bankruptcy with the Federal Bankruptcy Court. As a result of prolonged bankruptcy proceedings, the Improvement Agreements, and the corresponding performance bonds, were rejected by the debtor and this action was apparently sustained in the bankruptcy court. Correspondingly, the Improvement Agreements are now of questionable enforceability and the performance bonds have lapsed. Any building or District service assumptions based on the terms of those Improvement Agreements, or dependent on them, are thus suspect until new agreements with the District are reached. In this regard we would specifically note that the District's Rules and Regulations (see Government Code Section 31024) require improvement agreements to be entered into in order for the District to approve tract maps and for the District to provide water and wastewater service to any property within its boundaries. The District previously requested of California Quartet (the then-property owner) to undertake negotiations relative to entering into new improvement agreements relative to the Property. No response to those entreaties has been received by the District.

Water Distribution Facilities

As referenced above, the District has undertaken construction and completion of various master plan facilities in order to provide adequate water and water capacity to the Property. As noted, the District's Capital Improvement Charges were previously paid and satisfied in the identified amount. District master plan facilities have been sized based on the Property including 705 residential units. However, the District would note that it has not been provided with current

improvement plans and therefore cannot state, at this time, that all necessary water capacity for non-residential and irrigation needs is available. A re-evaluation of the Project, from an engineering perspective, by the District would be appropriate before definitive plans are finalized.

As also noted above, the Improvement Agreements relative to both master plan and in-tract water distribution facilities, including, but not limited, the water booster station identified in the DEIR, have lapsed and security for those agreements was rejected by action of the bankruptcy court. The specific facilities necessary in order to provide water transportation and distribution service within the boundaries of the Property were identified in those two (2) Improvement Agreements and are specifically enumerated in the improvement plans which were filed with the District and in the cost breakdowns which are included as part of the master plan agreement exhibits. Correspondingly, unless the Improvement Agreements are renegotiated and agreed to by the applicant, as required by the District's Rules and Regulations, and the water transportation and distribution facilities necessary in order to provide water service to the Property are designed, constructed, installed, funded and dedicated to the District as required under the District's Rules and Regulations and the previous improvement plans, the District will not be able to undertake to provide water service to the Property. The inability of the District to provide water transportation and distribution within the Property would constitute a potentially significant adverse environmental impact which would result from the Project unless adequately mitigated. Basic mitigation measures are stated within the DEIR, however, the District specifically requests that, in regard to water transportation and distribution facilities, the following mitigation measures be added to the DEIR:

1. Prior to undertaking construction of the Project the applicant shall enter into an improvement agreement(s) with the District to provide for the design, construction, installation, funding and dedication of all necessary master plan and in-tract water transportation and distribution facilities (Specifically including, but not limited to, a water booster station) as required under the District's Rules and Regulations and the tract map approval for Tract No. 10692; and

2. Pursuant to the aforementioned improvement agreement(s) and prior to receiving a certificate of occupancy for any structures located upon the Property, the applicant shall have completed, at its cost and expense, all design, construction, installation, funding and dedication of master plan and in-tract water transportation and distribution facilities as required under the District's Rules and Regulations and the tract map approval for Tract No. 10692.

Water Storage Facilities

The comments with regard to water distribution facilities, above, are generally applicable relative to water storage facilities in the context of the District. Water storage facilities are important

for the reasons of reserve water capacity, cost efficiency, fire fighting, emergency supply and system balancing.

Pursuant to determinations by the District's Board of Director, and the Rules and Regulations of the District, developers of property within the District's boundaries are required to either build and dedicate water storage facilities according the District's Rules and Regulations and standard specifications in order to provide stated levels of water storage capacity for the respective development or required to pay In-Lieu Water Storage Capacity Fees. Under the previous Improvement Agreements it was anticipated that the developer (the applicant) would in fact be building and dedicating water storage facilities to the District rather than pay the District's In-Lieu Water Storage Fee(s). It appears, based upon the description in the DEIR, that this is still intended.

On Page 3-9 of the DEIR it is indicated that the water storage tank will be constructed by the District. This is fact not the case. The prior Improvement Agreements and the District's Rules and Regulations, specify that master plan and in-tract facilities (including water storage facilities) which are to be constructed in order to service new development within the District are required to be constructed at the cost and expense of the applicant and in accordance with specified construction requirements, including, but not limited to, the District's standard specifications.

As also noted above, the Improvement Agreements relative to both master plan and in-tract water storage facilities, including, but not limited, the water reservoir identified in the DEIR, have lapsed and security for those agreements was rejected by operation of the bankruptcy court. The specific facilities necessary in order to provide water service within the boundaries of the Property were identified in those two (2) Improvement Agreements and are specifically enumerated in the improvement plans which were filed with the District and in the cost breakdowns which are included as part of the master plan agreement exhibits. Correspondingly, unless the Improvement Agreements are renegotiated and agreed to by the applicant, as required by the District's Rules and Regulations, and the water storage facilities necessary in order to provide water service to the Property are designed, constructed, installed, funded and dedicated to the District as required under the District's Rules and Regulations and the previous Improvement Plans, the District will not be able to undertake to provide water service to the Property. The inability of the District to provide adequate water storage with regard to the Property would constitute a potentially significant adverse environmental impact which would result from the Project unless adequately mitigated. Basic mitigation measures are stated within the DEIR, however, the District specifically requests that, in regard to water storage facilities, the following mitigation measures be added to the DEIR:

1. Prior to undertaking construction of the Project the applicant shall enter into an improvement agreement(s) with the District to provide for the design, construction, installation, funding and dedication of all necessary master plan and in-tract water storage facilities or, alternatively, pay the District's In-Lieu Water Storage Fees, as

required under the District's Rules and Regulations and the tract map approval for Tract No. 10692; and

2. Pursuant to the aforementioned improvement agreement(s) and prior to receiving a certificate of occupancy for any structures located upon the Property, the applicant shall have completed, at its cost and expense, all design, construction, installation, funding and dedication of master plan and in-tract water storage facilities as required under the District's Rules and Regulations and the tract map approval for Tract No. 10692.

Wastewater (Sewer) Facilities

The comments relative to water distribution facilities, in the context of the Improvement Agreements, are generally applicable to wastewater (sewer) facilities relative to the District. The existence and operational readiness of wastewater collection, transportation and treatment facilities is necessary to satisfy health and safety requirements of occupancy of development in California.

As noted above, wastewater treatment capacity has been purchased in the SMWD Chiquita Waster Water Treatment Facilities. The major wastewater trunk sewer and downstream lift station facilities for the Property have been financed and constructed. However, certain in-tract and master plan wastewater collection and transportation facilities, identified in the Improvement Agreements, and in the improvement plans filed with the District, have not yet been constructed. In this regard, the District would reference the previously approved improvement plans and the exhibits to the Improvement Agreements.

As also noted above, the Improvement Agreements relative to both master plan and in-tract wastewater facilities have lapsed and security for those agreements was rejected by operation of the bankruptcy court. Correspondingly, unless the Improvement Agreements are renegotiated and agreed to by the applicant, as required by the District's Rules and Regulations, and the wastewater facilities necessary in order to provide wastewater service to the Property are designed, constructed, installed, funded and dedicated to the District as required under the District's Rules and Regulations and the previous Improvement Plans, the District will not be able to undertake to provide wastewater service to the Property. The inability of the District to provide adequate wastewater service with regard to the Property would constitute a potentially significant adverse environmental impact which would result from the Project unless adequately mitigated. Basic mitigation measures are stated within the DEIR, however, the District specifically requests that, in regard to wastewater facilities, the following mitigation measures be added to the DEIR:

1. Prior to undertaking construction of the Project the applicant shall enter into an improvement agreement(s) with the District to provide for the design, construction,

installation, funding and dedication of all necessary master plan and in-tract wastewater facilities as required under the District's Rules and Regulations and the tract map approval for Tract No. 10692; and

2. Pursuant to the aforementioned improvement agreement(s) and prior to receiving a certificate of occupancy for any structures located upon the Property, the applicant shall have completed, at its cost and expense, all design, construction, installation, funding and dedication of master plan and in-tract wastewater facilities as required under the District's Rules and Regulations and the tract map approval for Tract No. 10692.

Financing of Water and Wastewater Facilities

Previously, the District undertook discussions with prior property owners relative to potentially providing financing for water and waste water facilities which needed to be constructed for the benefit of the Property. These financings were separate and apart from the assessment district financing referenced above. In this regard it was previously proposed to use financing under the Mello-Roos Community Facilities Act of 1982, as amended (the "Act"). However, previous developers did not pursue this means of financing. The District continues to be willing to discuss financing options relative to the water and wastewater facilities, but believes that the previous proceedings undertaken pursuant to the Act are most likely not viable for application to the current facilities at this time.

In regard to the Improvement Agreements the District notes that certain dollar figures of the construction of the facilities were provided in the exhibits and the referenced performance bonds. The District would note that nearly a decade has passed since these agreements were signed and as such, the cost to design, construct, install and dedicate the water and wastewater facilities, each as referenced above, is probably significantly increased from the figures previously used. Adequate financing for water and wastewater facilities should be secured in order to ensure that they will be designed, constructed, installed and dedicated to the District in a timely manner relative to the developmental process.

Master Plan Update

The District would note that it is currently in the process of reviewing its Master Plan of water and wastewater facilities. This may also have consequences for the District's overall financing master plan. The engineering review and evaluation of the District's Master Plan may result in some reevaluation of engineering presumptions and system requirements. At this time the District is still in the early stages of planning its Master Plan review and as such cannot provide definitive information as to any changes or reevaluations that may occur as a result of this process. However,

the District notes that this matter, inasmuch as, if the planning and development process for the Project is significantly delayed, additional information and figures may become available from the District.

Conclusion

In light of the foregoing, the District notes that the Project has the potential to impact the infrastructure facilities and systems of the District. Such mitigations are principally related to the availability of facilities, their construction, installation, dedication and acceptance prior to occupancy of any development on the property and related matters. Such potential impacts can be mitigated by way of the above suggested mitigation measures. Provided that such mitigation measures are undertaken the District has no objection to the Project. However, the District specifically notes that a failure to provide the above-requested mitigation measures could result in an adverse environmental impact(s) as a result of the Project. In such case, the District reserves its rights to protest the proceedings pursuant to Public Resources Code Section 21177 and to undertake all other legal remedies available to it.

The District specifically requests that the County of Orange, including the County Environmental and Project Management Services Department carefully review the above-referenced comments and that those comments be considered as part of the environmental process for the Project.

If you have any questions regarding this matter, please do not hesitate to contact our offices. We would be pleased to provide you with any additional information you may require.

Very truly yours,

BOWIE, ARNESON, KADI,
WILES & GIANNONE

AGREEMENT FOR DESIGNING CONSTRUCTION OF MASTER PLAN FACILITIES

Tract No. 10692

This Agreement, is dated this 21st day of September, 1988, by and between SO PAC PROPERTIES, INC., a Delaware corporation, hereinafter referred to as "Subdivider," and SANTA ANA MOUNTAINS COUNTY WATER DISTRICT, a county water district, formed and existing pursuant to Section 30000 et. seq. of the Water Code of the State of California, hereinafter referred to as "District":

R E C I T A L S:

WHEREAS, Subdivider is preparing a final map of Tract No. 10692 for acceptance and recordation by the County of Orange, and desires to obtain water and sewer services from the District for said Tract; and

WHEREAS, Subdivider is required by conditions of approval of the Tentative Map for Tract No. 10692 and by the Districts Rules and Regulations to provide the Master Plan water and sewer improvements for Tract No. 10692, as further described below (the "Master Plan Facilities"); and

WHEREAS, District requires the design, construction and dedication of the Master Plan Facilities by Subdivider as a condition of providing water and sewer service to Tract No. 10692; and

WHEREAS, Subdivider wishes to record the final map of Tract No. 10692 prior to the installation of the required Master Plan Facilities; and

WHEREAS, Subdivider desires District to approve the final map for Tract No. 10692; and

WHEREAS, District has formed Community Facilities District No. 3 (Saddleback Meadows) of the Santa Ana Mountains County Water District ("CFD No. 3") for the purpose of financing public facilities, including the Master Plan Facilities, for Tract 10692; and

WHEREAS, District desires to ensure that the Master Plan Facilities are designed, constructed and installed in accordance with District's standards and specifications and rules and regulations; and

WHEREAS, Subdivider desires to enter into this Agreement in consideration of District's approval of the final map.

NOW, THEREFORE, in consideration of the mutual covenants made herein, it is hereby agreed by and between the parties hereto that:

1. Subdivider shall, at its sole cost and expense, design, construct and install within 730 consecutive calendar days of the date of this Agreement, all of the Master Plan Facilities

described and depicted in Exhibit "A", attached hereto and made a part hereof by this reference. The design of said Master Plan Facilities shall be in conformance with sound engineering practices and shall conform to District requirements and to all state and local requirements and to the District's Rules and Regulations. The design plan shall be subject to the review of the District Engineer.

2. The estimated cost of the Master Plan Facilities is set forward in Exhibit "A", attached hereto.

3. The Performance Bond, Tract No. 10692, Bond No. _____ to secure the faithful performance of this Agreement in the amount of Three Million One Hundred Ten Thousand Four Hundred Seventy-Eight Dollars ($3,110,478) is hereby approved.

4. Subdivider agrees to notify the District Engineer in writing at least 24 hours prior to the start of construction of the Master Plan Facilities.

5. (a) If the Subdivider has not completed the construction of the Master Plan Facilities within 730 consecutive calendar days after the date of this Agreement, the District has the right to call the security referenced in Section 3, hereof, for the faithful performance and to complete construction of the Master Plan Facilities. The security shall remain in effect until 365 days after the Master Plan Facilities have been completed and accepted by the District, subject to the provisions of Section 5(b), hereof. Upon completion of the Master Plan

INITIAL HERE

Facilities, and acceptance thereof by the District, Subdivider may, after written notice to the District, and receipt of confirmation by the District, reduce the security amount to 10% of that amount required in Section 3 hereof.

(b) Notwithstanding the provisions of Section 5(a) hereof, at such time as CFD No. 3 sells bonds, and the District receives proceeds of such bond sale, the Subdivider may request, in writing, that the District release the security required under Section 3, hereof, and the District shall confirm the release of said security within 15 days after receipt of such request.

6. Subdivider shall construct the Master Plan Facilities in accordance with plans approved by the District Engineer, the District's standard specifications, the District's Rules and Regulations, and under the District's inspection.

7. The Subdivider shall indemnify and hold harmless the District, its agents, and employees from and against all claims, damages, losses and expenses, including reasonable attorneys' fees, arising out of, or resulting from, the performance of the work of constructing the Master Plan Facilities, and caused in whole or in part by any negligent act or omission of the Subdivider, contractor, or any subcontractor, anyone directly or indirectly employed by them, or anyone for whose acts any of them may be liable.

8. Subdivider hereby offers to dedicate the completed Master Plan Facilities to the District with all necessary easements and rights of way therefor.

INITIAL HERE

9. (a) It is intended that CFD No. 3 will reimburse Subdivider for the actual amount of the design, construction and related costs of the Master Plan Facilities, listed on Exhibit "A", paid by Subdivider and approved by CFD No. 3, upon delivery of bonds and receipt of the proceeds thereof. Reimbursement from bond proceeds shall occur only to the extent that costs and fees have actually been paid and such payment has been substantiated to the satisfaction of CFD No. 3 and subject to Subdivider's compliance with the requirements of this Agreement with regard to design and construction of the Master Plan Facilities.

(b) Subdivider agrees to keep records of all costs and expenses incurred by Subdivider which may be subject to the reimbursement as provided for herein. The records shall be available for inspection by District representatives at the address listed in Section 19, hereof.

10. Upon completion of the construction in accordance with the approved plans and specifications and the dedication of the necessary easements, District agrees to accept the Master Plan Facilities, whereupon the Master Plan Facilities shall become property of the District.

11. Subdivider hereby guarantees the material and the workmanship of the Master Plan Facilities for a period ending 365 days after the acceptance of the Master Plan Facilities by District, and hereby agrees to reimburse District for all costs associated with the accomplishment of necessary repairs to the Master Plan Facilities which may have been made by the District

INITIAL HERE

within the aforesaid guarantee period in the sole and absolute discretion of the District. In the event that a defect in materials and/or workmanship in the Master Plan Facilities is discovered within the above mentioned period, the District may provide notice to Subdivider requesting that the Subdivider promptly remedy such defect. Upon receipt of such notice, Subdivider shall promptly correct such defect, at its cost, at the earliest possible time. In the case of an emergency situation (where immediate action to repair or correct a defect is required), or at the District's option, the District may repair or correct such defect and thereafter bill Subdivider for the costs of repair or correcting such defect and Subdivider shall promptly reimburse the District for all such costs as provided for above.

12. Developer agrees to reimburse District, on a quarterly basis for the difference between the monthly service charges paid by the occupants of completed Development (including residences) in Tract 10692 receiving sewer service from the District and the actual operating and maintenance costs to the District arising from the provision of sewer capacity to Tract 10692 based on the Santa Margarita Water District Chiquita System operating and maintenance costs (the "Operating and Maintenance Shortfall"). The Santa Margarita Water District's 1988/1989 estimated annual budget for operation and maintenance of the Chiquita System, pro-rated for the 200,000 gallons per day (gpd) of wastewater

INITIAL HERE

capacity owned by the District on behalf of Tract 10692, is $200,000. Developer agrees to reimburse District for the Operating and Maintenance Shortfall until:

(a) Buildout and occupancy of 600 EDU's of sewer capacity development on Tract 10692;

(b) District furnishes written notice to subdivider, pursuant to Section 19, hereof, that the monthly service charges from occupied development on Tract 10692 are such that the Operating and Maintenance Shortfall is eliminated; or

(c) Ten (10) years from the date of this Agreement.

13. Upon the execution of this Agreement and subject to the terms hereof by the parties hereto, the District agrees to give its approval of said Tract Map recording prior to the construction of the Master Plan Facilities.

14. If either party brings an action or proceeding against the other party by reason of default of any term or condition of this Agreement, or otherwise arising out of this Agreement, the prevailing party in such action or proceeding shall be entitled to recover as an element of its costs of suit, and not as damages, reasonable attorneys' fees, which shall be payable whether or not such action is prosecuted to judgment. The "prevailing party" shall be the party who is entitled to recover costs of suit, whether or not suit proceeds to final judgment, and shall include, without limitation, a party who dismisses an action for recovery hereunder in exchange for payment of the sums

allegedly due, performance of covenants allegedly breached, or consideration substantially equal to the relief sought in the action.

15. The parties hereby acknowledge that Subdivider may at a later time record a Tract Map for the property concerned herein, which Tract Map may be different from that Tract Map referenced in this Agreement and may include a different development density. If Subdivider determines to do so prior to the construction of the Master Plan Facilities, then Subdivider and District shall negotiate in good faith to determine the revisions necessary to the Master Plan Facilities and any amendments which are necessary to this Agreement and to the fees and charges imposed by the District under this Agreement. If necessary, the District shall provide for a refund or credit to Subdivider for any fees and charges paid by Subdivider which are in excess of the fees and charges required under the revised Tract Map and as a result of the above mentioned negotiations. If the revised Tract Map of Subdivider provides for greater density, then Subdivider shall pay all additionally required fees and charges as required under the District's Rules and Regulations.

16. Either party to this agreement may specifically and expressly waive, in writing, any portion of this agreement, or any breach thereof, but no such waiver shall constitute a further or continuing waiver of any preceding or succeeding of the same or any other provision. A waiving party may, at any time thereafter, require future compliance by the other party

hereto with any breach or provisions that are so waived. The consent of one party to any acts by the other party for which such written consent was required shall not be deemed to imply consent or waiver of the necessity of obtaining such consent for the same or any similar acts in the future. No waiver or consent shall be implied from silence or any failure of any party to act, except as otherwise specified in this agreement. All rights, remedies, undertakings, obligations, covenants, conditions and agreements contained in this agreement shall be cumulative and no one of them shall be exclusive of any other.

17. This Agreement may not be assigned without the prior written consent of the other party hereto. Such written consent shall not be unreasonably withheld.

18. Any notice, request, demand, consent, approval or other communication required or permitted hereunder by law, shall be validly given and made only if in writing and delivered in person to an officer or duly authorized representative of the party or deposited in the United States mail, first class postage prepaid and addressed to the party for whom intended as follows:

To District:	Santa Ana Mountains County Water District Attention: J. Fred Sims 30575 Trabuco Canyon Road Suite 104 Trabuco Canyon, CA 92678
To Subdivider:	Southmark Pacific Corporation Attention: Ms. Kelli Ryan 4685 MacArthur Court, Suite 450 Newport Beach, CA 92660

Any party may, from time to time, by written notice to the other party hereto, designate a different address which shall be substituted for that above. If any notice or other document is sent by mail as aforesaid, the same shall be deemed fully delivered and received 48 hours after mailing as provided above.

19. The parties hereby understand and agree that this agreement and the attachments hereto have been negotiated and executed in the State of California and shall governed by, and construed under, the laws of the State of California.

20. No addition to, or modification of, any provision contained in this agreement shall be effective unless fully set forth in writing signed by the authorized representative of both of the parties hereto.

21. The signatories hereto represent that they have been appropriately authorized to enter into this agreement on behalf of the party for whom they signed.

IN WITNESS THEREOF, the parties hereto have executed this Agreement on the dates set opposite their respective names.

AGREEMENT FOR CONSTRUCTION OF
ONSITE WATER AND SEWER FACILITIES

Tract No. 10692

THIS AGREEMENT, dated this 21st day of September, 1988, is made by and between the SO PAC PROPERTIES, INC., a Delaware corporation, hereinafter called "Subdivider," and SANTA ANA MOUNTAINS COUNTY WATER DISTRICT, formed and existing pursuant to Section 30000 et. seq. of the Water Code of the State of California hereinafter called "District":

W I T N E S S E T H:

WHEREAS, Subdivider is preparing a final map of Tract No. 10692 for acceptance and recordation by the County of Orange, and desires to obtain water and sewer services from the District for said Tract; and

WHEREAS, Subdivider is required by conditions of approval of the Tentative Map for Tract No. 10692 to provide water and sewer improvements for Tract No. 10692; and

WHEREAS, District requires the construction and dedication of water and sewer facilities by Subdivider as a condition of providing water and sewer service to Tract No. 10692; and

WHEREAS, Subdivider wishes to record the final map of Tract No. 10692 prior to the installation of the required water and sewer facilities; and

INITIAL HERE

WHEREAS, Subdivider desires District to approve the final map for Tract No. 10692; and

WHEREAS, Subdivider has prepared and submitted to District a set of improvement plans for said facilities; and

WHEREAS, District desires to ensure that the said facilities are installed in accordance with District's standards and specifications; and

WHEREAS, Subdivider desires to enter into this Agreement in consideration of District's approval of said final map.

NOW, THEREFORE, it is hereby agreed by and between the Subdivider and District that:

1. Subdivider shall, at its sole cost and expense, construct and install within 730 consecutive calendar days of the date of this Agreement, all of the facilities shown and delineated upon the construction plans entitled "Improvement Plans, Tract No. 10692" (the "Facilities") as approved by the District Engineer and the County of Orange and on file with said County and by reference made a part of this Agreement as though fully set forth herein.

2. The cost of the Facilities is estimated to be Four Hundred Fifty-Seven Thousand Three Hundred Ninety-Four Dollars ($457,394).

3. The Subdivision Improvement Bond, Tract No. 10692, Bond No. _____ to secure the faithful performance of this Agreement in the amount of Four Hundred Fifty-Seven Thousand Three Hundred Ninety-Four Dollars Dollars ($457,394) is hereby approved.

4. Subdivider agrees to notify the District Engineer in writing at least 24 hours prior to the start of construction of the Facilities.

5. If the Subdivider has not completed construction of the Facilities within 730 consecutive calendar days after the date of this Agreement, the District has the right to call the security for faithful performance and complete construction of the Facilities. The security shall remain in effect until 365 days after the Facilities have been completed and accepted by the District. Upon completion of the Facilities, and acceptance thereof by the District, Subdivider, after written notice to, and approval from, the District, may reduce the security amount to 10% of that amount required in Section 3 hereof.

6. Subdivider shall construct the Facilities in accordance with the approved plans, the District's standard specifications and under District's inspection, and shall indemnify and hold harmless the District, its agents, and employees from and against all claims, damages, losses and expenses, including reasonable attorneys' fees arising out of or resulting from the performance of the work of constructing the Facilities, and caused in whole or in part by any negligent act or omission of the Subdivider,

Contractor, or any Subcontractor, anyone directly or indirectly employed by any of them, or anyone for whose acts any of them may be liable.

7. Subdivider hereby offers to dedicate the Facilities to the District together with necessary easements.

8. Upon completion of the construction in accordance with the plans and specifications and the dedication of the necessary easements, District agrees to accept the Facilities, whereupon the Facilities shall become property of the District.

9. Subdivider hereby guarantees the material and the workmanship of the Facilities for a period ending 365 days after the acceptance of the Facilities by District, and hereby agrees to reimburse District for all costs associated with the accomplishment of necessary repairs to the Facilities which may have been made by the District within the aforesaid guarantee period in the sole and absolute discretion of the District. In the event that a defect in materials and/or workmanship in the Facilities is discovered within the above mentioned period, the District may provide notice to Subdivider requesting that the Subdivider promptly remedy such defect. Upon receipt of such notice, Subdivider shall promptly correct such defect, at its cost, at the earliest possible time. In the case of an emergency situation (where immediate action to repair or correct a defect is required), or at the District's option, the District may repair or correct such defect and thereafter bill Subdivider for

the costs of repair or correcting such defect and Subdivider shall promptly reimburse the District for all such costs as provided for above.

10. Upon the execution of this Agreement and subject to the terms hereof by the parties hereto, the District agrees to give its approval of said Tract Map recording prior to the construction of the Facilities.

11. Prior to approval of the map for Tract No. 10692, Subdivider shall pay to District the following sums:

(1) For the costs of the District's plan review, inspection of construction and the control thereof, and for the testing of materials, the sum of $29,731, which sum shall be based upon the estimated construction cost of $457,394.

(2) A capital improvement charge in the sum of $904,475.

12. In the event District determines that land other than that within Tract No. 10692 can be served by means of the Facilities, at such time as District utilizes any capacity in the Facilities to provide water and/or sewer service to such other land, District shall determine and collect from the owners of said land a proportionate share of the cost of the design and construction of the Facilities plus interest at the maximum rate provided by law unless otherwise determined by District and District shall reimburse such amounts to Subdivider. Such reimbursement shall be made to Subdivider, and shall not be made

INITIAL

to another party, or subsequent landowner(s) without the direction of Subdivider in writing. Other than as hereinabove provided the Facilities shall be used only to provide service to Tract 10692. Such amounts as hereinabove provided shall be in addition to all other fees and charges of District.

13. If either party brings an action or proceeding against the other party by reason of default of any term or condition of this Agreement, or otherwise arising out of this Agreement, the prevailing party in such action or proceeding shall be entitled to recover as an element of its costs of suit, and not as damages, reasonable attorneys' fees, which shall be payable whether or not such action is prosecuted to judgment. The "prevailing party" shall be the party who is entitled to recover costs of suit, whether or not suit proceeds to final judgment, and shall include, without limitation, a party who dismisses an action for recovery hereunder in exchange for payment of the sums allegedly due, performance of covenants allegedly breached, or consideration substantially equal to the relief sought in the action.

14. The parties hereby acknowledge that Subdivider may at a later time record Tract Map for the property concerned herein, which Tract Map may be different from that Tract Map referenced in this Agreement and may include a different development density. If Subdivider determines to do so prior to the construction of the Facilities, then Subdivider and District shall negotiate in good faith to determine the revisions

INITIAL HERE

necessary to the Facilities and any amendments which are necessary to this Agreement and to the fees and charges imposed by the District under this Agreement. If necessary, the District shall provide for a refund or credit to Subdivider for any fees and charges paid by Subdivider which are in excess of the fees and charges required under the revised Tract Map and as a result of the above mentioned negotiations. If the revised Tract Map of Subdivider provides for greater density, then Subdivider shall pay all additionally required fees and charges as required under the District's Rules and Regulations.

15. Either party to this agreement may specifically and expressly waive, in writing, any portion of this agreement, or any breach thereof, but no such waiver shall constitute a further or continuing waiver of any preceding or succeeding of the same or any other provision. A waiving party may, at any time thereafter, require future compliance by the other party hereto with any breach or provisions that are so waived. The consent of one party to any acts by the other party for which such written consent was required shall not be deemed to imply consent or waiver of the necessity of obtaining such consent for the same or any similar acts in the future. No waiver or consent shall be implied from silence or any failure of any party to act, except as otherwise specified in this agreement. All rights, remedies, undertakings, obligations, covenants, conditions and agreements contained in this agreement shall be cumulative and no one of them shall be exclusive of any other.

INITIAL

16. This agreement may not be assigned without the prior written consent of the other party hereto. Such written consent shall not be unreasonably withheld.

17. Any notice, request, demand, consent, approval or other communication required or permitted hereunder by law, shall be validly given and made only if in writing and delivered in person to an officer or duly authorized representative of the party or deposited in the United States mail, first class postage prepaid and addressed to the party for whom intended as follows:

To District:	Santa Ana Mountains County Water District Attention: J. Fred Sims 30575 Trabuco Canyon Road Suite 104 Trabuco Canyon, CA 92678
To Developer:	So Pac Properties, Inc. Attention: Ms. Kelli Ryan 4685 MacArthur Court, Suite 450 Newport Beach, CA 92660

Any party may, from time to time, by written notice to the other party hereto, designate a different address which shall be substituted for that above. If any notice or other document is sent by mail as aforesaid, the same shall be deemed fully delivered and received 48 hours after mailing as provided above.

18. The parties hereby understand and agree that this agreement and the attachments hereto have been negotiated and executed in the State of California and shall governed by, and construed under, the laws of the State of California.

INITIAL HERE

19. No addition to, or modification of, any provision contained in this agreement shall be effective unless fully set forth in writing signed by the authorized representative of both of the parties hereto.

20. The signatories hereto represent that they have been appropriately authorized to enter into this agreement on behalf of the party for whom they signed.

IN WITNESS THEREOF, the parties hereto have executed this Agreement on the dates set opposite their respective names.

Dear Mr. Britton:

The Orange County Transportation Authority (OCTA) has reviewed the Saddleback Meadows Recorded Tract Map 10692, Grading Application GA960048. OCTA has no comments at this time.

We appreciate the opportunity to provide input on this project. If you have further questions or need additional information, please call me at 714/560-5786.

Sincerely,

Ben Jarvis

RE: Saddleback Meadows Project

To Whom It May Concern:

I am submitting this letter to comment on the proposed 705 unit mobile home park on the Saddleback Meadows stie. Not long ago approval was being sought for 318 houses on this site. Why it was not passed I don't understand. Now we are having to deal with the thought of an extremely large number of mobile homes in our very secluded and tranquil area. I was in favor of the 318 homes and even toured the site when they opened it to the public last year to show what they were proposing. Believe me my first choice would be to leave it untouched and unbuilt so we could continue to view the beautiful hillside of our rural area. But if something must be built lets have it be fewer homes with a much more aesthetic appearance that fits into the already existing areas surrounding it. Also, my concern is if 705 units are brought on-site where are all these children going to go to school? Portola Hills Elementary is already at full capacity and measures have had to be taken to accommodate its student load.

I will be following the developments and can only pray that the Planning and Development Service Department along with the County Supervisors will make fair and knowledgeable decisions regarding this 222-acre rural canyon site.

Sincerely

Re: Comments on Draft Subsequent Environmental Impact Report No. 566; Saddleback Meadows Recorded Tract Map 10692; Grading Application GA960048; State Clearinghouse No. 96121072

Dear Mr. Brantley:

On behalf of the project applicant, California Quartet, Ltd., we submit the following comments on Draft Subsequent Environmental Impact Report No. 566, Saddleback Meadows Recorded Tract Map 10692, Grading Application GA960048, prepared by Urban Vision for the Orange County Planning & Development Services Department.

Our review of Subsequent EIR 566 reveals that the project description should be supplemented to better satisfy provisions of the California Environmental Quality Act[1]. We find it deficient in at least two respects: (1) it fails to discuss economic characteristics and supporting public service facilities relating to the project site; and, (2) it fails to reference the County Board of Supervisors recent (October 1996) failure and/or refusal to approve a reduced density project alternative in lieu of Recorded Tract Map 10692.

Please note that CEQA Guidelines section 15124 provides that a project description "shall contain" "[a] general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals if any and supporting public service facilities."[2]

We consider Subsequent EIR 566 to be deficient because the project description on pages 3-1 through 3-2 fails to discuss certain significant economic characteristics of Tract Map

[1] Public Resources Code section 21000 *et seq.* ("CEQA") and the CEQA Guidelines issued by Resources Agency and located in the California Code of Regulations, sections 1500 *et seq.*

[2] California case law holds that "[a]n accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR."

10692; and does not consider the supporting public service facilities for the project site paid for by California Quartet or its predecessors-in-interest. These economic characteristics and involved supporting public service facilities are discussed below.[3]

When Tract Map 10692 was recorded in December of 1988, several contractual commitments were entered into by the predecessors-in-interest of California Quartet. These contractual commitments resulted in monies being expended for the construction of capital facilities, including a sewer treatment facility and related trunk lines that serve both Saddleback Meadows and its general vicinity.

One of the conditions of approval for Tentative Tract Map 10692 (Special Condition No. 22.), was that "[p]rior to recordation of each final map ... sewage treatment and disposal facilities will be available to serve all dwelling units. To facilitate this requirement, several subdivision improvement agreements were entered into prior to the recordation of the Final Map.

The two subdivision improvement agreements relating to Master Plan Facilities and Onsite Water and Sewer Facilities for Tract Map 10692 were entered into between the Santa Ana Mountains County Water District, now known as the "Trabuco Canyon Water District" (the "District"), and Southmark Pacific Corporation ("Southmark"), a predecessor-in-interest to California Quartet. One of these agreements executed on September 21, 1988 between Southmark and the District is entitled "Agreement for Designing Construction of Master Plan Facilities, Tract No. 10692" ("MPFA"). The "RECITALS" portion of that agreement, mandated by conditions of the Tentative Tract Map and by the District's rules and regulations, required Master Plan Water and Sewer Improvements for the Property prior to providing water and sewer service. The second subdivision agreement, entitled "Agreement for Construction of Onsite Water and Sewer Facilities, Tract No. 10692" ["Onsite Water and Sewer Facilities Agreement" ("OWSFA")], also executed on September 21, 1988 between Southmark and the District, required the construction and dedication of water and sewer facilities by the subdivider prior to the District's agreement to provide water and sewer service to the final tract. Tract Map 10692 provided a zoning capacity density of 715 equivalent dwelling units ("EDUs").

In February 1989, California Quartet's predecessor-in-interest paid $973,528.58 for the purchase of sewer treatment capacity rights for the project site in the District's Chiquita Wastewater System Facilities (the "Chiquita Facilities"). These funds were used by the District to enlarge the Chiquita Facilities to accommodate the 715 EDUs zoned for the property. Thus, California Quartet, as a successor-in-interest, succeeded to all rights and liabilities flowing from the Tentative Tract conditions and subsequent above-described

[3] An October 21, 1996 correspondence to the Orange County Board of Supervisors from California Quartet concerning the October 22, public hearing for Agenda Item No. 79, FEIR No. 561, Zone Change Case No. 95-5 and Area Plan Case No. 95-7 previously detailed the recorded tract map requirement of payment for and installation of Area capital facilities on the project site by California Quartet and/or its predecessors-in-interest.

agreements for the purchase of sewer treatment capacity in the Chiquita Facilities for the benefit of the authorized development density of the property.

Additionally, California Quartet's predecessor-in-interest was required to pay the District's Capital Improvement Charges ("CICs"). The District's CICs in effect then were $1,265.00 for each equivalent dwelling unit. The CICs for 715 dwelling units totaled $904,475.00. The District's CICs were, and are, imposed on all development within the District in accordance with the District's Master Plan, including the Water and Wastewater Master Plan, the Financial Plan and the District's Impact Fee Structure. The CICs that were paid were deposited in the District's fund and earmarked for capital improvement of water facilities, which have subsequently been constructed.

It should also be noted that California Quartet is required to pay an annual sewer /water assessment on each of Saddleback Meadows 705 legal lots. This assessment appears on individual property tax bills and totals $60,000 to $75,000 per year for the entire property. California Quartet has been making these assessment payments and paying its tax liability since the 1994-1995 tax year and has not been delinquent on any of these payments. In addition, California Quartet has paid (May 1997) all back taxes, assessments and penalties owed by its predecessor-in-interest(approximately $\pm$$1,025,000). Further, California Quartet's predecessor-in-interest made good faith payments for premiums on security and improvement bonds(with a face amount over $9,147,700[4]) for improvements on the Property, in reliance on, and as a condition of the Tract Map 10692.

In sum, the project description should be supplemented as it presently fails to disclose that California Quartet, as a consequence of Tract Map 10692 approval, made substantial expenditures for water and sewage capacity and construction of capital facilities, and entered into contractual obligations to develop the property consistent with the authorized density of Tract Map 10692.

Further, the County Board of Supervisors at the public hearing on October 22, 1996 on Zone Change Case No.95-5 and Area Plan Case No. 95-7 failed to approve any of the project alternatives discussed in proposed FEIR No. 561, including Alternative No. 4, the 100 unit alternative. The project description also is inadequate because it fails to disclose

---

[4] One of California Quartet's predecessors-in-interest, Saddleback Ventures I, entered into a public improvement agreement with the County of Orange designated as Agreement No. S988-1748. This agreement required three faithful performance/labor and materials bonds that are still in effect in the following amounts:

(1) Bond No. 112 70 80 issued by the developer's insurance company in the amount of $5,657,700, for private and public street improvements, street lighting, street drains and traffic signals;
(2) Bond No. 112 70 79 issued by the developer's insurance company in the amount of $3,240,000 for landscaping; and,
(3) Bond No. 112 70 78 issued by the developer's insurance company in the amount of 250,000 for monumentation.

this action, which indicates that the Board did not approve any of the nine reduced density alternatives to Tract Map 10692 that were analyzed in FEIR 561.

Based on the above, to remedy deficiencies in the project description, subsequent EIR 566 must be revised and supplemented with more detail concerning the economic characteristics of, and public service facilities for, Tract Map 10692 and the Board's decision to reject all reduced density alternatives in lieu of Recorded Tract Map 10692.

Very truly yours,

H. Pike Oliver

Santa Ana, Ca. 92702-4048

This project was a bad idea when it was originally corruptly approved, it has only become more evident over time what a poorly conceived project it is. Please consider the animal corridor rather than the pocket book of the proposed builder. After all the builder knew the history of the property when they bought it at "fire sale" prices. They knew about the specific plan that now protects the area from ill conceived plans. If the proposed builder did not know these things, then all the more reason to deny approval to such poor business people who would not have the foresight to research the property.

Wayne Brown

Trabuco Canyon, Ca. 92679

Manager,
OCPDS/Environmental & Project Planning Services Division
300 N. Flower St.
Santa Ana, Ca. 92702-4048

I know this project was approved long before the specific plan came into existence, but because of the way it was originally approved I think it should be looked at like it were being submitted for the first time. This project does not fit in with the area, it leaves no way for the animals to migrate and will be built on ground that will easily slide even after removing tons and tons of dirt. Please deny this builders request.

thank you

Amber Graves

Environmental Management Agency
Environmental & Project Planning
P.O. Box 4048
Santa Ana, CA 92702-4048

SUBJECT: DRAFT ENVIRONMENTAL IMPACT REPORT #566, SADDLEBACK MEADOWS DEVELOPMENT

Dear Mr. Brantley:

Thank you for the opportunity to review the Environmental Impact Report for the Saddleback Meadows Project. Last year, when the Board of Supervisors considered this project in November, City staff provided verbal comments on the project at the public hearing. The City continues to have concerns regarding the project. On April 23, 1997, the City submitted comments to the County on the Revised Notice of Preparation for DEIR #566. The City's NOP Comments were not cited or addressed in the DEIR Document. The comments identified below in this letter represent the City's previously stated concerns regarding the project. We are expecting that the County, as the lead agency, will address these comments in the "Response to Comments" Document for DEIR #566.

From the materials presented, it is clear that significant grading and remediation of the site will be necessary. According to the EIR, this grading will involve 2.5 million cubic yards of conventional grading and just under 9 million cubic yards of remedial grading. The EIR did not address the amount of off-site trucking activity which will occur as a result of the earthwork. Earthwork of this magnitude could result in the functional equivalent of half a million double-trailer truck loads of material to be moved. It is our understanding that because of the constraints of this site, a significant portion of this

DRUG USE IS LIFE ABUSE

FAX (714) 461-3511

Printed on Recycled Paper

earthen material will be required to be moved to off-site locations for stockpiling and drying prior to returning to the re-engineered and strengthened site.

The City of Lake Forest has significant concerns about the potentially tremendous increase in traffic, particularly truck traffic, that this project could have on the City. The reports indicate that the excavation and trucking may take as long as eighteen months to complete. The duration of construction is not addressed in the EIR. The City and its residents have been inundated over the last few years with significant public construction and private development outside the City, and the City and its residents have borne a disproportionate impact from this activity. A partial list of construction projects which have impacted the City are as follows: the Foothill Transportation Corridor, the El Toro Y Project (including streets and off-ramp closures), the Foothill Circulation Phasing Plan improvements, and all of the construction and on-going industrial business operations in the City's Sphere of Influence and north thereof.

Based on the impacts from these projects, our residents specifically requested that the City Council consider the adoption of truck routes within the City. The City Council has held a public hearing on this request and is actively studying the need for truck routes within the City. It is our view that approval of this project and the types of truck traffic it would generate would only further the need to establish truck routes within the City. At a minimum, the County needs to incorporate conditions of approval and environmental mitigation relative to truck traffic as it impacts the City, its residents, and its infrastructure. A financial mechanism should be established to reimburse the City for the repair and maintenance costs associated with such heavy truck traffic load on City streets.

There are other concerns the City has regarding this project, including the appropriate mitigation of the coastal sage scrub plant community (68.7 acres) and other environmentally sensitive plant and animal species. It is not entirely clear from the documentation how these environmentally sensitive areas are to be addressed. Nor is it indicated or insured that adequate safety precautions will be taken during the grading process to insure that the environmentally sensitive areas (i.e. Aliso Creek) are protected from impacts such as grading, or a grading induced landslide.

The EIR indicates that the project represents a potential conflict with the Aliso Creek Corridor Specific Plan. The potential conflict must be specified. The Aliso Creek Regional Riding & Hiking Trail is a valuable recreation resource currently used by residents of the City of Lake Forest and our Sphere of Influence. Significant impacts to Aliso Creek and the Trail, including construction impacts, should be avoided or completely mitigated.

Finally, the EIR indicates that children from the proposed project will be absorbed into the Saddleback Valley Unified School District. It is further indicated that all SVUSD schools in the project vicinity are near capacity. The Environmental Impact Report should address whether the increase in school age children associated with the project will impact Saddleback Valley Unified School District Schools within the City of Lake Forest. Specifically, identify whether enrollment or teacher student ratio will be impacted at any Lake Forest public school site.

The concerns identified above must be addressed in the Draft Environmental Impact Report. Please provide the City with a copy of the DEIR "Response to Comments" Document as soon as it is available.

Sincerely,
CITY OF LAKE FOREST

RE: **Comments on the County of Orange, Draft Subsequent Environmental Impact Report for Saddleback Meadows Project (Recorded Tract 10692) - SCAG No. I 9700347**

Dear Mr. Britton:

Thank you for submitting the **County of Orange, Draft Subsequent Environmental Impact Report for Saddleback Meadows Project (Recorded Tract 10692)** to SCAG for review and comment. As areawide clearinghouse for regionally significant projects, SCAG assists cities, counties and other agencies in reviewing projects and plans for consistency with regional plans.

The attached detailed comments are meant as administrative comments to provide guidance for considering the proposed project within the context of our regional goals and policies. SCAG's policy level review will be initiated with the presentation of the proposed Saddleback Meadows Project to SCAG's Standing Committee on Implementation (SCI) on September 4, 1997 at 11:00 am at the SCAG office in Los Angeles. You or the project developer are cordially invited to attend this meeting and answer any questions. If you have any questions regarding the attached comments, please contact Bill Boyd at (213) 236-1960. He will be contacting you with further information concerning this SCI meeting.

Sincerely,

**COMMENTS ON THE COUNTY OF ORANGE
SADDLEBACK MEADOWS PROJECT (RECORDED TRACT 10692)
DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT**

PROJECT DESCRIPTION

The Saddleback Meadows site encompasses approximately 222 acres and is located on the easterly side of El Toro Road, approximately ½-mile south of the intersection of Santiago Canyon Road/El Toro Road and Live Oak Canyon Road, in east-central unincorporated Orange County. The incorporated cities of Mission Viejo and Lake Forest lie approximately three miles to the south and southwest, with the Cleveland National Forest boundary located approximately ½-mile north of the project site. The project site is surrounded by residential development, with the Portola Hills and Foothill Ranch planned communities to the west, the Hidden Ridge/Hidden Hills community and a nursery to the south, and scattered low-density residential uses to the north and east. O'Neill Regional Park is located adjacent to the southerly boundary of the site with St. Michael's Abbey immediately to the northwest and the Ramakrisha Monastery located immediately to the southeast.

The Project site is located within the Foothill/Trabuco Specific Plan and the DEIR states that the Project is inconsistent with many of the goals, objectives and policies of the plan which generally calls for preservation of the rural character and natural habitat of the area. The site is also located within the Aliso Creek Corridor Specific Plan area, and the DEIR notes that although it incorporates regional; riding and hiking trail connections into its design, it does conflict with several other aspects of the Plan. For example, it would not preserve recreational open space or conserve natural features of the Aliso Creek Corridor as it proposes to replace an existing natural creek with a trapezonal channel. The DEIR also states that the project is in direct conflict with the Natural communities Conservation Planning Program (NCCP) in that it would disturb sensitive wildlife habitat area. The project site is also situated just north of the Foothill Transportation Corridor.

The proposed Project would construct a previously approved and recorded Tract Map 10692 which was originally approved in 1979 and recorded in 1988. The Draft SEIR notes that the Project is consistent with the approved tract map, and proposes the phased planned development of 705 manufactured single family housing units and a 1.5 acre, neighborhood commercial center and associated infrastructure. The gross residential density is 3.17 du/ac, with minimum lot sizes of 2,630 square feet. The total development footprint would affect 86 percent or about 191 acres of the project site. Thirty-nine percent of the project site is proposed to remain in open space, including community slope area. The project proposes eight private park sites; regional equestrian hiking and bicycle trail connections; and the construction of a water tank site to be dedicated to the

local water company.

Prior to the most recent submittal of a grading permit application for Tract Map 10692, the project was proposed for 318 single-family dwelling units. The Draft EIR for the Project noted that the 318-unit project was "environmentally superior" to the 705 unit project currently being proposed, the 318-unit proposal was denied. The earlier Draft EIR had identified the 705-unit project as one of the two environmentally inferior alternatives considered.

The Draft EIR identifies the following areas of controversy that have arisen in response to the Notice of Preparation and which are addressed in the DEIR:

- Land Use/Aesthetic Compatibility
- Foothill-Trabuco Specific Plan Conformance
- Emergency Access Requirements
- Wildlife Corridor Design Width
- Project Specific Afforãable Housing Requirements
- EIR Preparation Process/Procedures
- Loss of Wild Habitat
- Geophysical Stability
- Traffic/Circulation

The following alternatives to the proposed development are evaluated in the DEIR:

- Alt. 1 No Project/No Development.
- Alt. 2 Foothill-Trabuco Specific Plan Alt. A - 150 Minimum 20,000 sq. ft. lots.
- Alt. 3 Foothill-Trabuco Specific Plan Alt. B - 100 SFD Units on 31.7 acres.
- Alt. 4 OCP&DS Staff Alternative (EIR 561) - 299 SFD Units, Min. 5,000 sq. ft. lots.
- Alt. 5 Cluster/Reduced Development Footprint - 318 SFD/MFD.

INTRODUCTION TO SCAG REVIEW PROCESS

The document that provides the primary reference for SCAG's project review activity is the Regional Comprehensive Plan and Guide (RCPG). The RCPG chapters fall into three categories: core, ancillary, and bridge. The Growth Management (adopted June 1994), Regional Mobility (adopted June 1994), Air Quality (adopted October 1995), Hazardous Waste Management (adopted November 1994), and Water Quality (adopted January 1995) chapters constitute the core chapters. These core chapters respond directly to federal and state planning requirements. The core chapters constitute the base on which local governments ensure consistency of their plans with applicable regional plans under CEQA. The Air Quality and Growth Management chapters contain both core and ancillary policies, which are differentiated in the comment portion of this letter. The Regional

Mobility Element (RME) constitutes the region's Transportation Plan. The RME policies are incorporated into the RCPG.

Ancillary chapters are those on the Economy, Housing, Human Resources and Services, Finance, Open Space and Conservation, Water Resources, Energy, and Integrated Solid Waste Management. These chapters address important issues facing the region and may reflect other regional plans. Ancillary chapters, however, do not contain actions or policies required of local government. Hence, they are entirely advisory and establish no new mandates or policies for the region.

Bridge chapters include the Strategy and Implementation chapters, functioning as links between the Core and Ancillary chapters of the RCPG.

Each of the applicable policies related to the proposed project are identified by number and reproduced below in italics followed by SCAG staff comments regarding the consistency of the project with those policies.

Consistency With Regional Comprehensive Plan and Guide Policies

1. **The Growth Management Chapter (GMC)** of the Regional Comprehensive Plan contains a number of policies that are particularly applicable to this Project.

a. *Core Growth Management Policies*

3.01 The population, housing, and jobs forecasts, which are adopted by SCAG's Regional Council and that reflect local plans and policies, shall be used by SCAG in all phases of implementation and review.

SCAG staff comments. As SCAG has designated subregions, the project is situated in the Orange County subregion. Implementation of the project would result in the creation of 705 housing units. The DEIR acknowledges on page 4-3 that the project site is situated within a Regional Statistical Area that is forecasted to grow at the rate of 2.3 percent between 1995 and 2000. Although the DEIR does not identify the projected population that would be accommodated by the 720 units, it is evident that this growth can be accommodated in that forecasted by SCAG for the subregion. The project is consistent with this RCPG policy.

3.03 The timing, financing, and location of public facilities, utility systems, and transportation systems shall be used by SCAG to implement the region's growth policies.

SCAG staff comments: The DEIR contains an analysis of the relationship of the Project to this policy (18 months to complete project grading, phasing of residential units within 5

years following completion of grading, installation of all infrastructure during initial phase) on page 3-16. The Project is consistent with this RCPG policy.

b. *Ancillary Growth Management Policies*

3.04 Encourage local jurisdictions' efforts to achieve a balance between the types of jobs they seek to attract and housing prices.

SCAG staff comments. The DEIR references consistency of the Project's objective of providing affordable housing in a jobs-rich, housing-poor area on page 4-11. It notes that the project was conditionally approved in 1979 with a 66 2/3 percent affordable housing requirement in accordance with the County's Inclusionary Housing Policy. The county policy has since been rescinded, but the project is bound by the original tract map to provide a total of 470 lots to be sold in the affordable range. These lots are further broken down to include: 188 low/moderate and 282 Medium I level housing units. The Project is supportive of this RCPG policy.

3.05 Encourage patterns of urban development and land use which reduce costs on infrastructure construction and make better use of existing facilities.

SCAG staff comments. This Project would utilize existing water and sewer infrastructure that is available at the site boundary. The type of development proposed in the Project makes good use of this infrastructure as stated on pages 4-230 and 231 of the DEIR. The Project is supportive of this RCPG policy.

3.11 Support provisions and incentives created by local jurisdictions to attract housing growth in job rich subregions and job growth in housing subregions.

SCAG staff comments. See comments on policy 3.04. The Project is supportive of this RCPG policy.

3.12 Encourage existing or proposed local jurisdictions' programs aimed at designing land uses which encourage the use of transit and thus reduce the need for roadway expansion, reduce the number of auto trips and vehicle miles traveled, and create opportunities for residents to walk and bike.

SCAG staff comments. The Draft EIR on page 4-52 states that the proposed Project will generate 6,220 trip-ends per day with 345 vehicles per hour during the AM peak hour and 635 vehicles per hour during the PM peak hour. The project site is not served by an existing bus route adjacent to the site on El Toro Road. The nearest OCTA bus service (2

routes) are located 2.25 and 2.5 miles southwest of the project site, and the nearest park-and-ride facility is located 2.0 miles southwest of the site. No provisions are made to provide for transit access to the site and to reduce the reliance on the automobile. The Project will result is increased need for roadway improvements to meet projected vehicle trips and miles traveled. The Project is not supportive of this RCPG policy.

3.17 Support and encourage settlement patterns which contain a range of urban densities.

SCAG staff comments. The Project proposes that the entire site be developed for single residential use at a gross residential density of 3.17 du/acre. Alternative No. 5 (Cluster/Single Family/Multifamily) would have significantly less total acres of the site disturbed (113.0 ac versus 191.4 ac). This alternative could better achieve intent of this SCAG policy, while minimizing site disruption and preserving more open space. The Project is not supportive of this RCPG policy.

3.18 Encourage planned development in locations least likely to cause adverse environmental impact.

SCAG staff comments. The DEIR states that the proposed Project will result in the following unavoidable adverse impacts that cannot be mitigated to a level less than significant:

- Land use incompatibility impacts to O'Neill Regional Park (wildlife habitat), the Ramakrishna Monastery and St. Michael's Abbey.
- Vehicular emissions from project related traffic will have a cumulative significant air quality impact.
- Project specific and cumulative impacts to 50.3 acres of Venturan-Diegan transitional coastal sage scrub until such time as a section 4 (d) interim take is authorized.
- Development of the first large tract within the Foothill/Trabuco Specific Plan area will result in cumulative impacts to existing rural and natural open space and to a continued urbanization of foothill areas in south Orange County.
- Permanent viewshed alteration will occur with regard to the regional park, monastery and abbey and additional night lighting glare change night views from an unlit dark open space to an urban night environment.

Furthermore, the project would result in significant impacts related to slope stability, landslides, mud slides, subsidence and erosion. Mitigation measures are proposed to address these impacts, but the fact remains that the project will result in a total of 2.6 million cubic yards of conventional grading and 8.9 million cubic yards of remedial grading. Taken as a whole, the Project is not supportive of this RCPG policy.

3.19 National Forests shall remain permanently preserved and used as open space. SCAG shall support policies and actions that preserve open space areas identified in local, state, and federal plans.

SCAG staff comments. The DEIR states that the proposed Project will result in the following conflicts with local or state open space plans and policies:

- The project conflicts with the Foothill-Trabuco Specific Plan, specifically with regard to the preservation of a regionally contiguous wildlife corridor and the types of homes being proposed would be incompatible with site topography and biological resources.
- The project conflicts with the Aliso Creek Corridor Specific Plan in that it would not preserve recreational open space or conserve the natural features of the Aliso Creek Corridor as it proposes to replace an existing natural creek with a trapezonal channel.
- The project conflicts with the Natural Communities Conservation Planning Program in that it would further disturb a sensitive wildlife habitat area.

The Project is not supportive of this RCPG policy.

3.20 Support the protection of vital resources such as wetlands, groundwater recharge areas, woodlands, production lands, and land containing unique and endangered plants and animals.

SCAG staff comments. The Draft EIR identifies a number of instances where this policy is not supported:

- The loss of 50.3 acres of Venturan-Diegan Transitional Coastal Sage Scrub that, although it will not be considered a "take" under federal requirements, will when added to other losses in the area, total about 2.4% of the coastal sage scrub in the Southern Subregional NCCP program area.
- The loss of 3.8 acres of Muelfat Scrub (associated with three ephemeral ponds) and 3.3 acres of Southern Sycamore Riparian Woodland which are significant because of their values as wildlife habitats and their function as wetlands.
- The loss of 14.6 acres of Coast Live Oak Woodland (312 individual trees) which are significant because of their wildlife values, their function in watershed protection and their function as part of the planned NCCP regional wildlife corridor.
- The loss of 0.6 acres of existing Ephemeral Ponds which is significant due to the presence of the Riverside fairy shrimp which is a federally endangered species.

- Direct impacts to 1.65 acres of wetlands and 1.78 acres of "Waters of the United States" (intermittent streams and man-made stock ponds).
- Adverse, but not significant, loss of populations of two sensitive plant species, the Catalina mariposa lily and intermediate mariposa lily.
- The loss of approximately 50.3 acres of potential nesting and foraging habitat (coastal sage scrub) on and off site, including portions of areas occupied by at least 12 pairs of southern California rufous-crowned sparrows and at least six pair of coastal cactus wrens, both of which are regionally sensitive species.
- General loss of habitat for at least 63 animal species which were observed during various on-site surveys.
- Acknowledgment that "the project, as currently proposed, may hinder or preclude the preparation of the Southern Subregional NCCP Preserve, due to restricted wildlife movement corridors".

The Project is not supportive of this RCPG policy.

3.21 *Encourage the implementation of measures aimed at the preservation and protection of recorded and unrecorded cultural resources and archaeological sites.*

SCAG staff comments. The Draft EIR acknowledges that the Project is known to contain significant deposits of artifacts (four significant sites) and fossils, as well as a ranch house ruin. The project is not supportive of this RCPG policy.

3.22 *Discourage development, or encourage the use of special design requirements, in areas with steep slopes, high fire, flood, and seismic hazards.*

SCAG staff comments. The Draft EIR acknowledges that the Project site is characterized as containing ridges, ravines, and gullies with natural slope gradients ranging from nearly level along some ridge crests and valley bottoms to 1:1 (horizontal:vertical) within deeply incised gullies. The slope characteristics of the site are as follows: 95.5 acres (43% of site) is in the 0-25 percent slope category; 94.9 acres (43%) is in the 26-50 percent slope category; and, 31.8 acres (14%) of the project site has slopes in excess of 50 percent. As noted in the project description, significant grading is required to develop the site as proposed.

The Draft EIR also acknowledges that the Project is located in an area designated as a high "Special Fire Protection" area due to its combination of natural combustible vegetation, topography and weather conditions (frequent dry Santa Ana winds). Furthermore, Draft EIR notes a potential conflict between the human environment and the two main top predators of the region, coyotes and mountain lions.

The Project is not supportive of this RCPG policy.

3.23 *Encourage mitigation measures that reduce noise in certain locations, measures aimed at preservation of biological and ecological resources, measures that would reduce exposure to seismic hazards, minimize earthquake damage, and to develop emergency response and recovery plans.*

SCAG staff comments. Discussion of mitigation measures to address emergency response concerns due to seismic hazards, biological and ecological resources and other natural or manmade hazards are included in the Executive Summary of the Draft EIR. The Project is supportive of this RCPG policy.

3.24 *Encourage efforts of local jurisdictions in the implementation of programs that increase the supply and quality of housing and provide affordable housing as evaluated in the Regional Housing Needs Assessment..*

SCAG staff comments. See staff comments on policy 3.04. The Project will increase the supply and quality of affordable housing in southeastern Orange County. The Project is supportive of this RCPG policy.

2. The Regional Mobility Chapter (RMC) also has policies, all of which are core, that pertain to the proposed project. This chapter links the goal of sustaining mobility with the goals of fostering economic development, enhancing the environment, reducing energy consumption. promoting transportation-friendly development patterns, and encouraging fair and equitable access to residents affected by socio-economic, geographic and commercial limitations. Among the relevant policies in this chapter are the following:

Transportation Demand Management and Regional Transit Program Policies

4.01 *Support Promote TDM programs along with transit and ridesharing facilities as a viable and desirable part of the overall mobility program while recognizing the particular needs of individual subregions.*

4.03 *Support the extension of TDM program implementation to non-commute trips for public and private sector activities.*

4.04 *Support the coordination of land use and transportation decisions with land use and transportation capacity, taking into account the potential for demand management strategies to mitigate travel demand if provided for as a part of the entire package.*

SCAG staff comments. See staff comments on policy 3.12. SCAG's December 31, 1996 letter on the Notice of Preparation for the Saddleback Meadows project recommended consideration of these three policies in the preparation of the Draft EIR. No apparent consideration was given to the provision of TDM or transit services to meet the needs of the proposed 6,220 trip ends per day in year 2020. Mitigation measure AM 5-3 is not an air quality mitigation measure, but rather a commentary on not taking credit for mobile source emission reductions, including trip reduction programs. The Project is inconsistent with the three TDM/transit RCPG policies.

Regional Streets and Highways Program Policies

4.20 Expanded transportation system management by local jurisdictions will be encouraged.

4.23 TSM activities throughout the region shall be coordinated among jurisdictions.

SCAG staff comments. The Draft EIR notes that the Project developer will pay for signal modifications and turn lanes at the intersections of El Toro Road with Valley Vista Way and the new northern collector street serving the site. Furthermore, a mitigation measure (AM 4-16) assures that the developer will participate in existing road fee programs, including the Foothill/Eastern Transportation Corridor Fee Programs, Foothill Circulation Phasing Program, El Toro Road Fee Program and the Santiago Road Fee Program. The Project is consistent with these two RCPG policies.

Regional Non-Motorized Transportation Program Policies

4.25 The development of the regional transportation system should include a non-motorized transportation system that provides an effective alternative to auto travel for appropriate trips. The planning and development of transportation projects and systems should incorporate the following, as appropriate:

- *a* o *Provision of safe, convenient, and continuous bicycle and pedestrian infrastructure to and throughout areas with existing and potential demand such as activity areas, schools, recreational areas (including those areas served by trails), which will ultimately offer the same or better accessibility provided to the motorized vehicle.*

- *b* o *Accessibility to and on transit (bus terminals, rail stations, Park-And-Ride lots), where there is demand and where transit boarding time will not be significantly delayed.*

c o *Maintenance of safe, convenient, and continuous non-motorized travel during and after the construction of transportation and general development projects. Existing bikeways and pedestrian walkways should not be removed without mitigation that is as effective as the original facility.*

SCAG staff comments. The Draft EIR acknowledges that the Project abuts the Aliso Creek Bikeway. Mitigation measures (PDF 10-1 and 10-2) assure the construction of the Live Oak Canyon and Aliso Creek riding and hiking trails within the Project boundaries. No local bikeway or pedestrian circulation improvements are provided for in the Project design. The Project is consistent with this RCPG policy as it relates to regional bikeway and trail access but inconsistent with the policy as it pertains to local bikeways and pedestrian walkways within the Project site.

4.27 *Urban form, land use and site-design policies should include requirements for safe and convenient non-motorized transportation, including the development of bicycle and pedestrian-friendly environments near transit.*

SCAG staff comments. See previous comments on policies 3.12, 4.01, 4.03, 4.04 and 4.25. The Project is inconsistent with this RCPG policy.

3. The Water Quality Chapter (WQC) core recommendations and policy options relate to the two water quality goals: to restore and maintain the chemical, physical and biological integrity of the nation's water; and, to achieve and maintain water quality objectives that are necessary to protect all beneficial uses of all waters. The core recommendations and policy options that are particularly applicable to the Project include the following:

11.02 *Encourage "watershed management" programs and strategies, recognizing the primary role of local governments in such efforts.*

SCAG staff comments: The Draft EIR acknowledges that the project site is located within the boundaries of two primary watershed areas: 1) Aliso Creek (75% of site) and 2) Oso Creek (24% of the site). The Draft EIR on page 4-38 acknowledges that "Implementation of the proposed project will result in the introduction of impervious surfaces (streets, driveways, residential units) and will result in a **decrease in the area available for stormwater percolation** and a **substantial increase in stormwater runoff.** Implementation of the proposed project will result in **substantial landform modification,** redirecting site drainage throughout the site."[emphasis added] The Project proposes drainage improvements that mitigate drainage impacts to a level less than significant. However, the project as noted previously herein, conflicts with the Aliso Creek Corridor Specific Plan in that it "would not preserve recreational open space or conserve the natural features of the Aliso Creek Corridor as it proposes to replace an existing natural creek with a trapezonal channel". The Project does not recognize watershed management policy in the local government approved Aliso Creek Corridor Specific Plan. The Project is inconsistent with this RCPG policy.

Conclusions and Recommendations:

(1) As noted in the staff comments, the proposed Saddleback Meadows Project is consistent with or supports many of the policies in the Regional Comprehensive Plan and Guide, but is inconsistent with core policies 4.01, 4.03, 4.04, 4.27 and 11.02 and is not supportive of ancillary policies 3.12, 3.17, 3.18, 3.19, 3.20, 3.21 and 3.22. Furthermore, the Project is consistent with some aspects of core policy 4.25 and inconsistent with others, as noted in the staff comments.

(2) All mitigation measures associated with the project should be monitored in accordance with AB 3180 requirements and reported to SCAG through the Annual Reasonable Further Progress Reports.

SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS

Roles and Authorities

THE SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS is a ***Joint Powers Agency*** established under California Government Code Section 6502 et seq. Under federal and state law, the Association is designated as a Council of Governments (COG), a Regional Transportation Planning Agency (RTPA), and a Metropolitan Planning Organization (MPO). Among its other mandated roles and responsibilities, the Association is:

- Designated by the federal government as the Region's ***Metropolitan Planning Organization*** and mandated to maintain a continuing, cooperative, and comprehensive transportation planning process resulting in a Regional Transportation Plan and a Regional Transportation Improvement Program pursuant to 23 U.S.C. §134(g)-(h), 49 U.S.C. §1607(f)-(g) et seq., 23 C.F.R. §450, and 49 C.F.R. §613. The Association is also the designated ***Regional Transportation Planning Agency***, and as such is responsible for both preparation of the Regional Transportation Plan (RTP) and Regional Transportation Improvement Program (RTIP) under California Government Code Section 65080.

- Responsible for developing the demographic projections and the integrated land use, housing, employment, and transportation programs, measures, and strategies portions of the ***South Coast Air Quality Management Plan***, pursuant to California Health and Safety Code Section 40460(b)-(c). The Association is also designated under 42 U.S.C. §7504(a) as a ***Co-Lead Agency*** for air quality planning for the Central Coast and Southeast Desert Air Basin District.

- Responsible under the Federal Clean Air Act for determining ***Conformity*** of Projects, Plans and Programs to the State Implementation Plan, pursuant to 42 U.S.C. §7506.

- Responsible, pursuant to California Government Code Section 65089.2, for ***reviewing all Congestion Management Plans (CMPs) for consistency with regional transportation plans*** required by Section 65080 of the Government Code. The Association must also evaluate the consistency and compatibility of such programs within the region.

- The authorized regional agency for ***Inter-Governmental Review*** of Programs proposed for federal financial assistance and direct development activities, pursuant to Presidential Executive Order 12,372 (replacing A-95 Review).

- Responsible for reviewing, pursuant to Sections 15125(b) and 15206 of the CEQA Guidelines, ***Environmental Impact Reports*** of projects of regional significance for consistency with regional plans.

- The authorized ***Areawide Waste Treatment Management Planning Agency***, pursuant to 33 U.S.C. §1288(a)(2) (Section 208 of the Federal Water Pollution Control Act)

- Responsible for preparation of the ***Regional Housing Needs Assessment***, pursuant to California Government Code Section 65584(a).

- Responsible (along with the San Diego Association of Governments and the Santa Barbara County/Cities Area Planning Council) for preparing the ***Southern California Hazardous Waste Management Plan*** pursuant to California Health and Safety Code Section 25135.3.

Re: Draft EIR #566
Saddleback Meadows Development

Dear Mr. Brantley:

In response to the above Draft EIR #566 indicating that approval of this project would have significant impacts on the district's provision of adequate school facilities unless mitigation is provided, we would like to provide some information for your consideration:

This project is proposed for 705 manufactured single family housing units. Most of the similar projects in our district have "adults only" restrictions; however, of the one existing project we identified as accepting children, following are the student generation factors:

K-6 =	.2264	= 160
7-8 =	.0566	= 40
9-12 =	.0755	= 54
K-12 =	.3585	= 254 students

As we have no district standard for manufactured housing, the above is our prediction for the impact of this project on our district.

Currently, students in this general area are assigned to Portola Hills Elementary, Rancho Santa Margarita Intermediate and either El Toro High School or Trabuco Hills High School. ALL of these schools are filled to capacity and either do have now or will have by fall, 1997 added a number of relocatable buildings to house enrollment exceeding the capacity of their original construction.

Per the current practice of the County of Orange regarding other projects, the district requests that this project be conditioned to require that the proponent, California Quartet, Inc., meet with district staff to review the impact and necessary mitigation measures needed as a result of this project.

Peter A. Hartman
District Superintendent

Re: Saddleback Meadows DEIR 566

Dear Mr. Brantley:

The California Department of Parks and Recreation (CDPR), Los Lagos District office has reviewed the above referenced document; thank you for the opportunity to provide comments.

The CDPR is a trustee agency as defined by CEQA. In addition, a defining tenant of our mission is to help to preserve the state's extraordinary biodiversity. As the office responsible for the stewardship of the natural and cultural resources of Chino hills State Park, we have an interest and concern about land use decisions in the geographic area as they relate to our mission and responsibilities under CEQA.

We view the maintenance of a functional system of interconnected wildland areas throughout the region as vitally important to the preservation of biodiversity. The Santa Ana mountains and the Puente-Chino Hills are an interdependent ecological system. The health of each area is integral to the other. CHSP is located in the Puente-Chino Hills adjacent to the northern end of the Santa Ana Mountains. The Santa Ana Mountains provide a valuable source of genetic material that helps to maintain the health and diversity of CHSP's plant and animal populations.

The importance of the two areas to each other continues to increase as they each become smaller, more isolated, and more fragmented by surrounding development. Fragmentation and isolation portends massive ecosystem collapse that could render all of our other regional conservation efforts nearly pointless.

Given the importance of the Santa Ana Mountains to the maintenance of the diversity of life in CHSP and the Puente-Chino Hills, we are concerned about the potential isolating and fragmenting effects of projects in the vicinity of the mountain range, and conserved lands within it such as the Cleveland National Forest and O'Neill Regional Park. We believe that development adjacent to these protected wildland areas should be designed in a manner that will preserve functional biological corridors and buffer protected lands from more intensive land uses.

After reviewing the alternatives for the project, it appears that Alternative 3 is the most responsible one. It limits development to the western side of the project, thereby protecting connectivity between O'Neill Regional Park and the Cleveland National Forest. It also places new development next to existing residential and commercial areas while providing a significant buffer to the park and forest. It appears that all of the other alternatives in some way fragment the National Forest from the Regional Park, and reduce the buffer to existing wildland.

In the final development decision, we believe it is incumbent on the lead agency to approve an alternative that is responsible to the invaluable natural resources found in the Cleveland National Forest, the County Regional Parks, and throughout the surrounding Region. We appreciate the consideration given to buffers and corridors in the environmental review, and we encourage their full protection. Thank you for the opportunity to comment. If you have any questions, please contact Geary Hund, Doreen Ferguson or myself at (909) 657-0676.

Sincerely,

Bill Berry

RE: Draft EIR 566 for Saddleback Meadows

Dear Mr. Brantley:

We have reviewed Draft EIR 566 (the DEIR) and comment as follows:

1. DEIR MUST IDENTIFY FEASIBLE MITIGATION MEASURES AND PROJECT ALTERNATIVES

A bizarre disclaimer precedes the body of this DEIR at page 3-8:

> It is therefore understood that the environmental analyses and evaluations contained in this document are largely informational, and not prescriptive in nature in that mitigation measures which would alter features of the final recorded tract map can not be implemented to reduce all project impacts to a level of insignificance. This is attributable primarily to the physical limitations of the site and the inability to deviate from the final recorded tract map. Accordingly, any findings of significant impacts must be offset through the issuance of a statement of Overriding Considerations.

Does this mean that some or all of the mitigation measures listed in the DEIR are "largely informational" and "can not be implemented"? If so, those mitigation measures should be identified, because CEQA requires the EIR to set forth <u>feasible</u> mitigation measures and alternatives to reduce or eliminate the project's identified significant environmental impacts to the extent feasible. Please identify for the decision makers which mitigation measures "can not be implemented," and which can be implemented.

Further, in stating that "any findings of significant impacts must be offset through the issuance of a statement of Overriding Considerations," the disclaimer implies that the County lacks any discretion to deny the grading permit. As explained below, however, the County may deny the grading permit, or approve an alternative to it.

2. THE COUNTY HAS DISCRETION TO DENY THE PROJECT OR APPROVE AN ALTERNATIVE PROJECT.

As acknowledged in the DEIR, the Foothill/Trabuco Specific Plan explicitly mandated environmental review of the project under CEQA, requiring an Initial Study and "additional environmental documentation" "[p]rior to the issuance of any grading permit for the subject property." (FTSP §III.3.2(c).) This provision implies discretion--preparing environmental documentation would simply waste time and paper if it could not be acted upon. CEQA Guidelines classify the issuance of a building permit as discretionary if local ordinance--in this case the FTSP (enacted in 1991 by ordinance)--contains "any discretionary provision." (CEQA Guidelines §15268(b).) §III.3.2(c) recited above appears to constitute such a "discretionary provision" in this case.

As the court noted in Friends of Westwood v. Los Angeles (1987) 191 Cal.App.3d 259, 266-268, preparing environmental documentation for a purely ministerial project would be futile since the approving agency has no discretion to modify such a project to eliminate or reduce environmental impacts.

Nor does any statute or regulation say that the granting of a grading permit is necessarily ministerial. That depends on the particular circumstances. (CEQA Guidelines §15268(a).) The Westwood court held that "doubt whether a project is ministerial or discretionary should be resolved in favor of the latter characterization." (Id. at 191.)

Also, the court in Day v. Glendale (1975) 51 Cal.App.3d 817, 824, held that CEQA may apply even to a governmental approval involving virtually no discretion if that approval "is the only point at which the environmental impact of the project may be publicly considered...."--certainly the case here.

The County's Grading Code also appears to contain several "discretionary provisions" under §7-1-821, "Denial of permit." It says, in part especially

pertinent to this project: "If, in the opinion of the Building Official, the land area for which grading is proposed is subject to geological or flood hazard to the extent that no reasonable amount of corrective work can eliminate or sufficiently reduce the hazard to human life or property, the Grading Permit and the Building Permits for habitable structures shall be denied." (O.C. Grading Code, §7-1-821, emphasis added.) Another paragraph provides for denial of the grading permit if the project "cannot be designed in accordance with" the "Orange County General Plan, Specific Plans, Zoning Code or other rules, regulations, or conditions applicable to the project." (§7-1-821(d).) Still another says the "Building Official may require plans and specifications to be modified in order to mitigate anticipated adverse environmental effects of proposed grading projects." (§7-1-821(c).) These ordinances, then, provide considerable discretion for the County in granting or denying the proposed grading permit.

Finally, and contrary to the disclaimer, CEQA provides for reducing or avoiding a project's significant environmental impacts through adoption of an alternative project. The DEIR in fact sets forth two alternative projects, numbers 3 and 4, which mitigate every one of the project's identified significant environmental impacts while still attaining its objectives. (DEIR page 6-22.) The DEIR contains no evidence that either of these two alternatives is not feasible.

3. DEVELOPMENT COSTS MAY RENDER THE PROJECT ITSELF INFEASIBLE.

In making required CEQA determinations, the decision makers will have to compare the project's feasibility with that of the available alternatives. Unfortunately, the DEIR supplies little or no evidence on which to base such findings.

The feasibility of the preferred project, however, seems dubious at best. On the one hand, several factors limit the selling price of the 708 housing units, including the County's affordable housing requirements (Condition 19 of recorded tract map), small lot size, crowded design, and the low market value of manufactured units. The $155,000 average per unit selling price used in the DEIR's fiscal impact report seems unduly optimistic, especially since much larger, conventional houses across El Toro Road have assessed valuations averaging only $200,000 to $250,000.

On the other hand, development costs seem unusually high, due primarily to the extensive amount of required grading (11.5 million cubic yards, DEIR page 4-22). Even for a project having much less grading than proposed here, Larry L. Simon estimated $44 million in site preparation costs in an August 1990 report prepared for Imperial Federal Savings Association (No. RTC-90-000042), or $62,000 per units in site preparation costs alone. Land and construction costs, plus per-unit fees for roads, tollways, bridges, schools, etc. would of course add to the project's costs.

The DEIR should contain the best available information on the feasibility of this project and its alternatives so that the decision makers can make a reasoned choice.

4. THE GRADING PLAN MUST BE PROVIDED FOR REVIEW.

The DEIR seems to contain only a "conceptual" and mostly illegible grading plan" (DEIR page 4-23). Since the project is a grading permit, involving a phenomenal amount of grading,, the grading plan itself must be included in the DEIR to allow the public and responsible agencies to review it.

The grading plan must indicate the location of the 19.77 acres of "offsite grading" (DEIR page 3-8).

We consider this omission sufficiently serious to require supplementation of the DEIR and an extension of the comment period.

5. A FULL FAITHFUL PERFORMANCE BOND SHOULD BE REQUIRED.

Given the project's questionable feasibility and extensive geological instability, it remains a prime candidate for failure during the 18-month grading process. We note that two previous owners and would-be developers of this site went bankrupt. The EIR must assess the potential safety problems resulting from a half excavated site: drainage and erosion, collapse of adjacent properties, collapse of El Toro Road, etc., as well as the possible financial liability to the County in the event of abandonment. As a mitigation measure, the County must impose as a condition of approval of any grading a full faithful performance bond sufficient to restore the site to a safe condition.

6. DEIR MUST ANALYZE REAL EFFECTS ON CIRCULATION--NOT INTERSECTION LEVELS OF SERVICE.

The DEIR analyzes the project's impacts on traffic and circulation by listing the level of service expected at various intersections around the project. These levels of service, based on the number of lanes, roadway geometry, and traffic volumes, generally indicate how many signal changes it will take to get through an intersection.

The County must stop using this methodology, because it does not measure the true impact on transportation--i.e., on people trying to get from one place to another. Not surprisingly, typical developer-prepared EIR's invariably conclude, as does this one, no significant impact on the region's traffic and circulation. Only minor road widenings, restriping traffic lanes, and installation of more traffic signals are normally deemed necessary to avoid such significant impacts.

And yet, the average travel times have dramatically increased in the region, due mainly to the proliferation of traffic signals. For example, in 1983, there were no traffic signals on El Toro Road from Cook's Corner to Trabuco Road. By 1997, there were seven. While each one may operate at level of service "D" or better, they collectively can (and often do) add several minutes to a trip which used to take only five minutes.

The average trip time more effectively measures and summarizes the project's true impact on "traffic and circulation" than does simply tabulating the expected levels of service at a growing number of signalized intersections, and will more realistically reflect the inevitable and increasing conflicting movements of vehicles generated by the sprawling suburban development in this region.

Under CEQA, EIRs must be written in plain language so that the public can understand the potential effects of a project. This DEIR's traffic analysis fails this requirement, as explained above. Typical travel times, with and without the project, should be included in the DEIR.

7. DEIR MUST ASSESS THE ACTUAL IMPACT ON SCHOOLS.

The DEIR gives short shrift to the project's impacts on schools--a single sentence affirming the obvious, that the project would send "400 additional students into the currently overcrowded Saddleback Valley Unified School District." (DEIR page 4-220.) As mitigation,

it proposes only the payment of required school fees of $1.72 per square foot of residential (page 4-224), and then somehow concludes that "[n]o unavoidable adverse impacts would occur to education services" (page 4-226).

This conclusion cannot be supported by the available evidence. As the school district has repeatedly verified, the state-required fees do not suffice to provide required school facilities in the region. The DEIR must list the school facilities to be impacted by the project, describe the existing conditions at these facilities, and then assess the expected impact of the project on each.

These comments are made on behalf of the Rural Canyons Conservation Fund, Ray Chandos as an individual, Bruce Conn as an individual, Sherry Meddick as an individual, and any other person opposed to this project as proposed. These comments and any references contained herein are hereby incorporated into the official record of proceedings of this project and its successors.

Sincerely,

Ray Chandos

Re: Saddleback Meadows; Draft Subsequent EIR No. 566

Dear Mr. Brantley:

This office, and the undersigned in particular, represent St. Michael's Abbey ("Abbey"). As you may be aware, the Abbey is a landowner adjacent to the proposed Saddleback Meadows Project ("Project") for which the above-referenced Draft Subsequent Environmental Impact Report ("DSEIR") has been prepared. The Abbey will be directly affected by this Project.

The Abbey opposes the Project as currently proposed, for many of the same reasons already expressed in connection with the processing of Environmental Impact Report No. 561. That EIR was the subject of numerous letters from our office, raising various objections to CEQA, land use inconsistencies, and other problems with the Project. The provisions of those letters are incorporated herein by reference, and we would request that copies of them be made a part of the administrative record in the processing of this DSEIR.

The Abbey believes there are a number of legal, environmental, planning, and other defects in the currently proposed Project. This letter, and the items incorporated herein by reference, constitute the Abbey's comments under CEQA public comment procedures for DSEIR No. 566.

For ease of reference, the comments are grouped under separate subject headings below.

RUTAN & TUCKER, LLP
ATTORNEYS AT LAW
A PARTNERSHIP INCLUDING PROFESSIONAL CORPORATIONS

1. The Project description and public review of the Project are flawed.

At the outset, the Abbey must note that there is significant confusion regarding exactly what is the Project being reviewed. The Project chronology at DSEIR 2-8 and 2-9 indicate the catalyst for the preparation of this DSEIR was an application for a Phase I grading plan. The Project description at DSEIR 3-1, et seq., seems to indicate the Project is the actual construction of a 705-unit affordable housing project. This project includes a 1.5 acre neighborhood commercial center, which is referenced at DSEIR 3-1, but not analyzed further in other sections of the DSEIR. Moreover, DSEIR 3-15 lists approval of a grading plan and issuance of a grading permit as included within the discretionary actions covered by the environmental review.

Given this, an obvious question arises. Where is the grading information? Neither the DSEIR nor the grading study attached as Appendix D includes any specific grading plan. In fact, page 4 of the grading study indicates that the report was conducted at what it terms a "EIR level," and that more detailed evaluation would occur during 40-scale grading plan review. Given the imminence of the grading activities, and their role as the entire cause for the environmental processing, this is inadequate. Title 14, California Code of Regulations § 15147[1] requires an EIR to include technical information "sufficient to permit full assessment of significant environmental effects by reviewing agencies and members of the public." This Project appears to be at a "construction project" level, as that term is used in CEQA Regs. § 15146(a), and consequently deferred analysis of the full range of all effects from the massive grading proposed is inappropriate.

Further, I am advised that the 40-scale grading plan, and other information required to determine and assess the specific impacts of the proposed grading, has not been publicly available, even up until a few days prior to the announced deadline for submission of DSEIR comments. This is a "construction phase" project proposal; it is not a general plan or program EIR. Consequently, all of the specifics of the grading proposal should have been formulated, and available for public review and comment, prior to Project approval. The DSEIR has failed to follow this process. Attached as Appendix "A" is a listing of all "mitigation measures" which defer analysis on various topics until the time of grading permits. Obviously, no grading permit can issue without a specific grading plan, yet that plan was not proffered for public review and comment. Given the large number of other analyses which hinge on the grading information, such information certainly constitutes "significant new information" as that term is used in CEQA Regs. § 15088.5, without which full, adequate public review is impossible. The DSEIR

[1] Cited herein as "CEQA Regs."

RUTAN & TUCKER, LLP
ATTORNEYS AT LAW
A PARTNERSHIP INCLUDING PROFESSIONAL CORPORATIONS

therefore must be re-noticed and recirculated after all the appropriate grading and other information has been available for the full comment period.

2. Analysis and incorporation of mitigation measures is improperly deferred.

No doubt in large part due to the failure to have specific grading information available, an entire host of items which require environmental analysis has been improperly deferred. Appendix "A" hereto is a chart of deferred analyses listing the various mitigation measures purportedly imposed upon the Project, but which actually reveal that fundamental aspects of the environmental impacts of the Project as yet remain unaddressed. These include key items like mitigation of impacts on endangered species such as the Riverside Fairy Shrimp, impacts on the California Gnatcatcher, acoustical analyses, street configurations and lines of sight, drainage studies, and design of storm drain improvements, to name a few.

The environmental impacts of these components of the Project are neither described or assessed, and no readily identifiable mitigation standard for these impacts is adopted. Given this, the conclusions regarding mitigation of the related impacts to a level of nonsignificance is unsupported by any evidence in the record, and therefore fails to meet the standards imposed upon the lead agency under CEQA Regs. § 15091(b).

3. The available grading information demonstrates the Project should not proceed.

Although incomplete, what grading information is included in the DSEIR clearly indicates the Project should not proceed. The entire Project area is underlain by landslides, and excavations reveal heavy seepage (DSEIR 4-31; Appendix D, p. 7). In addition, the oldest and deepest landslides on the property are merely projected from "necessarily limited exploratory borings." (Appendix D, p. 8, 16.) This is hardly the type of area which is suitable for the projected 11.5 million cubic yards of direct and remedial grading.

Incredibly, the DSEIR identifies 4" to 6" of settlement likely over the graded area. It finds such impacts insignificant, based upon a wildly optimistic presumption that settlement will occur at uniform rate, and occur evenly over a well-distributed area. (DSEIR 4-33.) With all due respect, the courts are filled with multi-party landslide cases, involving millions of dollars of damage, on ground settlement which is considerably less extensive. This effect must be regarded as significant, and must be mitigated.

Indeed, the grading information in the DSEIR is contradictory. At page 4-24, it is indicated that no blasting is anticipated. Mitigation measure AM 2-33 contemplates blasting of hard cemented sandstone beds, however. If the Project proponent and its consultants cannot at

RUTAN & TUCKER, LLP
ATTORNEYS AT LAW
A PARTNERSHIP INCLUDING PROFESSIONAL CORPORATIONS

this phase even uniformly identify the grading measures needed, how is the County or the reviewing public to accurately determine the grading impacts from this proposal?

Last December, the Board determined this site was not appropriate for a 318-unit development. The comments already submitted by St. Michael's Abbey on grading and soils matters in connection with EIR No. 561 remain fully applicable here, are incorporated herein by reference, and show grading impacts will be significant. These effects remain unmitigated. Obviously, the site remains unsuitable for the far more intense 705-unit proposal now proposed.

4. Seismic impacts are improperly assessed.

Appendix D, page 11, seems to dismiss seismic risks to the site, with a generalized discussion of risks inherent throughout Southern California. Given the grading constraints on the property, a more particularized discussion of potential faulting and its potential impacts on the proposed Project are required. Specifically, DSEIR 4-20 lacks any discussion of the El Modena or Norwalk faults, both of which appear sufficiently proximate to the Project site to create seismic disturbances.

5. The DSEIR contains a number of improper or vague mitigation measures.

In order to meet legal requirements, a mitigation measure must have a readily identifiable, performance-based standard which must be met. A number of the mitigation measures in the DSEIR fall short of this requirement.

For example, AM 2-22 merely contains advisory language that certain types of rock are "best not incorporated" in fills. AM 2-27 contains only recommendations, and no requirements. AM 2-45 calls for "precautions in respective expanse of soils," which is vague, and should be further specified.

Mitigation measure SC 2-4 simply cannot be met. The DSEIR recognizes the incompatibility of the Project with O'Neill Regional Park. (See DSEIR 4-12.) The degree of required grading eliminates any compatibility with natural land characteristics of adjacent open space areas, making compliance with this mitigation measure impossible.

6. A number of significant environmental impacts are improperly addressed.

The DSEIR is also rife with inaccurate or contradictory information in assessing environmental impacts, and concludes they are insignificant. For example, the hydrology study listed in Appendix L appears to have been done for a 318-unit proposal, not the 705-unit

RUTAN & TUCKER, LLP
ATTORNEYS AT LAW
A PARTNERSHIP INCLUDING PROFESSIONAL CORPORATIONS

proposal listed in the project description. (See hydrology map and "Discussion" text in Appendix L.) DSEIR 4-39 contains an admission that the drainage analysis is inadequate, in stating that it may need to be updated after review of the 40-scale rough grading plans. The preliminary master plan of storm drain improvements listed in PDF 3-1 (DSEIR 4-41) references a tentative map 15230, not the Project, and is essentially unreadable. This map gives no legible reflection of what drainage facilities will be built where, and no narrative or other graphic summary providing any further explanation appears in the DSEIR. All these studies need to be redone to analyze the Project now proposed.

Regarding noise, DSEIR 4-110 assesses noise from a projected 3,780 daily Project trips. DSEIR 4-52 indicates the daily trip projection is 6,220. The conclusions regarding vehicular noise are therefore suspect, and should be redone. In addition, DSEIR 4-113 indicates that air conditioning units are standard for housing projects, but fails to require such units as a mitigation measure for exterior noise. This should be included as a mitigation measure. In addition, the entire acoustical analysis appears to be deferred (see DSEIR 4-115). It should be conducted now.

Most strikingly, the DSEIR completely "ducks" impacts to the Riverside Fairy Shrimp, Coastal Sage Scrub habitat, and the California Gnatcatcher. DSEIR 4-152 indicates 105 acres of off-site mitigation will be required, but the availability or location of this mitigation property receives no discussion. DSEIR 4-157 delays the Gnatcatcher survey until some future time, and fails to provide the County or the reviewing public sufficient information to determine Gnatcatcher impacts from the Project whose approval is sought.

DSEIR 4-199 indicates a population generation estimate of 2.57 persons per household. The fiscal study, in Appendix G, page 22, uses 2.4. This inconsistency should be reconciled.

Regarding transportation, the DSEIR notes the nearest bus stop is between 2.25 and 2.5 miles from the Project site (DSEIR 4-52.) This is completely inconsistent with the proposed affordable nature of the housing development, whose residents are likely to be more heavily reliant on public transportation. Extension of service or alternative project locations should therefore be analyzed. There is no separate analysis of the traffic, noise, or air quality impacts of the buses which will be required to transport the estimated 399 additional students which will come from the Project, to already overcrowded schools. (DSEIR 4-218.) More fundamentally, the DSEIR appears to simply "will away" the impacts to the local schools from these additional students, all the while acknowledging current classrooms are overcrowded. DSEIR 4-216 contains a number of ambiguous conclusions regarding impacts on sheriff, fire, education, and library services. The double negative wording of these sentences seems to indicate each may have a significant impact, none of which is mitigated.

7. The alternatives analysis is insufficient.

CEQA Regs. § 15126(d)(5)(B) calls for review of alternative locations, or a finding regarding the infeasibility of alternative locations. The DSEIR fails to address alternative locations.

The alternatives discussion contains inappropriate language suggesting some sort of legal obligation for the County to refund various payments, many of which we understand were made by the Project applicant's predecessor in interest, and not the applicant itself. While we have not conducted a legal analysis of these somewhat unusual claims, we have been informed that many of the water and other development impact credits resulting from these previous payments are fully transferrable, and could be marketed by the owner of the Project at any time. Consequently, the statement regarding any obligation for refunds in the event of consideration of a "No Project" alternative appears incorrect factually, let alone irrelevant to the environmental analysis the DSEIR purports to be undertaking.

The DSEIR makes clear that the "No Project" alternative is the environmentally superior choice. Consistent with prior representations it has made, however, the Abbey has no objection to the 100-unit proposal, currently listed as Alternative 3. The Abbey believes this represents a sound balance between the environmental constraints on the site, and the Project proponent's desire for some degree of development on the property.

8. The DSEIR's land use planning presumptions are inaccurate.

Although not precisely related to environmental impacts, the DSEIR contains a number of statements regarding land use entitlements the Abbey believes are inaccurate. The proposed Project is not, as the DSEIR asserts, essentially exempt from the Foothill Trabuco Specific Plan ("FTSP"). (DSEIR 4-4, 4-11.) The Growth Management Element of the County's General Plan was last revised on October 19, 1993, after the adoption of the Foothill Trabuco Specific Plan in 1991. This element is the self-described "key resource document for growth management concerns." Subsection (E)(6) requires that all new development within the Foothill Trabuco Specific Plan planning area "shall be rural in character, and shall comply with the policies of the [Foothill Trabuco Specific Plan] . . . in order to maintain a buffer between urban development and the Cleveland National Forest." The Project is clearly contrary to these goals, does not comply with FTSP standards, and is therefore inconsistent with the General Plan.

Moreover, the Project is not "exempt" from FTSP requirements even under the terms of the Specific Plan. Section 3.2(c) of the Bridlewood Residential District Requirements specifically indicates CEQA review is required prior to the issuance of grading permits for the

RUTAN & TUCKER, LLP
ATTORNEYS AT LAW
A PARTNERSHIP INCLUDING PROFESSIONAL CORPORATIONS

previously-approved map. Consequently, additional discretionary review and approval was specifically contemplated prior to the time the Project was to be implemented. Any contention of "vested rights" from the filing of the map is therefore inapposite.

In addition, there is some question regarding the validity of the map in the first instance, given the chronology which the DSEIR lists. The map was apparently approved in December of 1979, and recorded some nine years later, in December, 1988. The chronology points out that the last stay was granted only until July 24, 1986. There is no indication, at least in the chronology, that the County approved any further extension. What was recorded therefore very may well have been an expired map, which would vest no development rights whatsoever, regardless of any claimed FTSP "exceptions."

9. Conclusion.

Even without all the defects listed above, the DSEIR concludes a number of significant impacts are unmitigated, including land use impacts and grading impacts. Given this, the Project approval will require a Statement of Overriding Considerations, which the Abbey believes is wholly insupportable in this context.

While advocacy of affordable housing is laudable, the prior history of this project raises question as to whether such housing will ever be built pursuant to this proposal. Further, the inaccessibility of the site and the instability of its soils make it peculiarly inappropriate for high density residential development of any type, including affordable units.

Put simply, the Project is inconsistent with the Abbey and the neighboring Ramakrishna Monastery. With all due respect to housing needs, the Abbey submits that the roles the Abbey and Monastery play, and the services they provide, are unique assets in Orange County. The Abbey would hope that the County would value these assets more than another in what many consider to be all-to-common residential developments, and not issue a Statement of Overriding Considerations condoning the Project's inconsistency with surrounding land uses.

Whether seriously proposed in its own right, however, or merely as a backdrop to make a previously-rejected project appear more palatable, the DSEIR is insufficient to support the Project approval sought. For this reason, the Abbey respectfully requests the County to fail to certify the DSEIR, and to reject any grading applications, or other development permits, which may be sought pursuant to it.

APPENDIX A

CHART OF MITIGATION MEASURES WHICH DEFER ANALYSIS UNTIL GRADING PERMIT

Measure	Deferred Analysis
SC 2-2	Geotechnical Report.
SC 2-3	Conformity of grading with Grading Plan.
SC 2-4	Compatibility of grading with natural land characteristics of open space.
SC 2-5	Approval of offsite grading.
SC 2-6	Compliance with Grading Plan fill soils and shrinkage/bulking pattern.
SC 2-10	Conformance of proposed grading with Grading Plan's slope heights, slope ratios, and pad elevations.
SC 2-11	Assure affected adjoining landowners have given consent for offsite grading/drainage.
SC 2-12	Determine if vector control measures are necessary.
SC 2-13	Prepare Water Quality Management Plan.
SC 2-16	Determine back cut failure guidelines.
SC 3-2	Provide drainage study for impact on existing drainage facilities.
SC 3-3	Design surface drainage improvements.
SC 3-8	Submit Water Quality Management Plan.
SC 3-9	Identify best management practices for on-site pollution runoff.
SC 3-10	Obtain coverage under NPDES Permit.
SC 4-8	Assure adequate site distance for street intersection.
SC 5-2	Demonstrate compliance with SCAQMD dust suppression requirements.
SC 6-2	Provide acoustical analysis for meeting noise mitigation requirements.

SC 6-9	Produce evidence of compliance of grading and construction activities to County's Noise Control Ordinance.
SC 6-10	Produce evidence that grading equipment has properly functioning mufflers.
SC 6-11	Produce evidence that stockpiling/vehicle storage areas will be located as far as practicable from dwellings.
SC 7-2	Obtain Streambed Alteration Agreement from CDFG.
SC 7-3	Obtain 404 Permit from ACOE.
SC 7-4	Provide NCCP accounting summary of Coastal Sage Scrub impact.
SC 7-5	Obtain USFWS approvals for Coastal Sage Scrub impacts.
SC 7-7	Assure compliance with Federal Endangered Species Act.
SC 7-8	Submit landscape and tree preservation plan.
SC 7-11	Conduct Gnatcatcher survey to determine if this endangered species will be impacted.
SC 7-12	Provide appropriate measures to mitigate impact on wildlife movement.
SC 7-14	Prepare mitigation plan for Riverside Fairy Shrimp.
SC 8-6	Design privately maintained landscape areas.
SC 8-9	Design graded areas to be compatible with natural landform characteristics.
SC 9-1	Retain certified archaeologist to survey site for cultural resources.
SC 9-5	Identify all potential archeological sites.
SC 9-9	Retain certified paleontologist for survey site.
SC 9-18	Retain historian to implement final mitigation measures.
SC 11-8	Determine if vector controls are necessary.
SC 11-12	Submit preliminary plans for private streets.

Subject: Saddleback Meadows – Comments on Draft Subsequent EIR 566

Dear Mr. Brantley:

SFC Consultants (SFC) has reviewed the Saddleback Meadows Draft Subsequent EIR 566 ("DSEIR 566" or "EIR") for CEQA compliance and consistency. SFC understands that the County of Orange required DSEIR 566 to be prepared as a result of a grading permit application having been submitted by the developer of the Saddleback Meadows project for the construction of grading improvements for 705 manufactured single family dwelling units with concomitant infrastructure and utilities on approximately 222 acres.

Before getting into the details of the EIR adequacy, some very basic concerns about this DSEIR 566 should be enumerated. First, although the filing of the grading permit application appears to have been the event which triggered the preparation of DSEIR 566, the 40-scale grading plans upon which the permit application is based have not been made available for public review, nor has the geotechnical review of those plans been made available. In addition, these materials have not been addressed in or made a part of DSEIR 566. As a result, a full assessment of the construction level impacts of the project has not been done as required by CEQA.

Second, whether or not the project analyzed in this DSEIR 566 is a grading plan application or the basic development plan, it is extremely important for this EIR to provide as much detail as possible in discussing environmental impacts and providing relevant mitigation measures. Gathering further information and complying with resource agencies in the future is not proper mitigation. However, this type of mitigation is listed throughout the EIR. Exactly 51 of the 200 EIR mitigation measures are based on "Prior to Grading Permit" timing. It is important for the Planning Commission to realize that at this late stage in the development, many of the required mitigation measures should be formulated and be subject to public scrutiny now, not at a later date after the EIR has already been certified.

Third, the geotechnical section of the EIR is also riddled with references to "gathering future information as mitigation measures". This may be acceptable if the environmental issue remains significant after mitigation; however, the EIR states that the geotechnical mitigation will mitigate any future and unknown impacts to less than significant levels. This is not a realistic conclusion considering future unknown impacts. A geotechnical review of the grading plans is the mechanism with which we can be assured that the mitigation measures recommended will actually work.

Telephone: (714) 859-5852 Fax: (714) 581-2577 Email. sfc@pacbell net

Fourth, the traffic section of the DSEIR arbitrarily limits its review and impact analysis of intersections to the El Toro Road/ Santa Margarita Parkway intersection and intersections to the north thereof. No analysis has been presented for critical intersections to the south. Also, there is no indication in the traffic study if the traffic calculations have been adjusted to account for the difference in projected use versus actual use of the Foothill Corridor. Published reports indicate that the San Joaquin Corridor's projected usage was overestimated by nearly 50%. The DSEIR should include all intersections that will be impacted by 705 units, including El Toro Road and the San Diego Freeway (I-5), and especially if the Foothill Corridor estimates are similarly overstated. In addition, not withstanding the requirements of CEQA Guidelines Section 15130(b)(1)(B), the DSEIR fails to provide a cumulative analysis of the traffic impacts from the reuse of the El Toro MCAS as a commercial airport. It is also not clear from the DSEIR if the regional traffic model utilized for the project impacts, and cumulative project impacts, actually incorporate the regional changes to the traffic resulting from a commercial airport at El Toro.

Fifth, the DSEIR provides a baseline discussion of the impacts from the El Toro MCAS fly-overs. However, the impact section of the EIR fails to identify a noise analysis or potential CNEL contours as a result of the base reuse plan as an active commercial airport. No mitigation measures are included for a multiple fly-over commercial airport. Notwithstanding the requirements of CEQA Guidelines Section 15130(b)(1)(B), the DSEIR fails to provide a cumulative analysis of the noise impacts from the reuse of the El Toro MCAS as a commercial airport or the regional traffic noise associated with the commercial airport. The DSEIR states "Depending upon future site re-use, aircraft noise may or may not be an important issue." The aircraft noise from a commercial airport at El Toro will be an important issue and must be addressed in the DSEIR.

Sixth, it is also important to note that the biological mitigation for ACOE and CDFG coordination may change the site plan, which would then require a revised EIR. If site plan redesign is not feasible, then the EIR should point out where the off site mitigation locations will be. In addition, the EIR indicates in several places that mitigation measures cannot be implemented by changes to the grading plan because this proposed project is a legally recorded tract map. However, under the Federal Endangered Species Act, all "take" must be accommodated, regardless of tract recordation or not.

Seventh, the alternatives in the EIR should reflect alternative grading scenarios together with the comparable grading impacts associated with them. DSEIR 566 alternatives currently compare alternative land uses or densities, although these tend to be limited to different grading scenarios. Also, CEQA requires an alternative location to be discussed. This issue is missing in the EIR and should be included.

Eighth, the EIR mitigation measures are also plagued with the word "should" instead of "shall". "Should" mitigation measures will become "shall" upon certification of the EIR. If the lead agent is not sure of a mitigation measure's applicability at this stage of approval, then perhaps the lead agent does not really want to implement important mitigation measures, but simply provide the necessary environmental paper work for a recorded tract map.

Finally, the Planning Commission should keep in mind, that this recorded map for 705 units does not tie the County to instant EIR certification, in which CEQA simply becomes a necessary evil. CEQA allows for a public agency to not approve a project as proposed, if there are feasible alternatives or mitigation measures available that would substantially lessen any significant effects that the project would have on the environment (CEQA Guideline Section 15021). The Planning Commission can only override unavoidable adverse impacts if it finds that there are legitimate social, economic, or other considerations which truly outweigh such impacts. Simply implying that affordable housing is an overriding consideration is insufficient to justify the significant environmental effects of the project.

I look forward to your timely response. Please call me at my office if you have any questions.

Sincerely,

SFC Consultants

COMMENTS TO DRAFT SEIR 566

The following comments are listed in same order as the EIR sections for convenience:

Section 1.0 Executive Summary

CEQA Guidelines Section 15161 indicates that "The EIR shall examine all phases of the project including planning, construction, and operation". A phased project must be evaluated in light of each phase. The first sentence of Section 1.0 Executive Summary, Subsection 1.1, page 1-1, describes the project as "the phased development of 705 manufactured single family housing units..." yet the EIR states on page 3-16, Section 3.4 Project Phasing that grading will occur in one phase. This statement, in turn, appears to be at odds with the reference (in Table 3 on page 2-8 of the EIR) to the developer's submittal of an application for "Phase I Grading Plan" on December 3, 1996. Therefore is the grading being phased, or is the construction being phased? If the grading is phased, a phasing plan should be submitted with the EIR distribution and review. DSEIR 566 should describe what the grading phases are, including how much grading in Phase I, II, III etc. A Phasing Plan should be included as part of this DSEIR, and not just be made another condition of approval. Moreover, if residential construction is also being phased in addition to the grading, this needs to be spelled out and addressed in the DSEIR. The Planning Commission cannot certify a DSEIR having such piece-meal information on grading and phasing.

Section 2.0 Introduction

Technical error: Page 2-7, Table 3 chronology of June 13, 1984: Ordinance 3486 should read – Ordinance 3468.

Section 3.0 Project Description

Page 3-8, first paragraph. The project description indicates that the removal of the mandated Inclusionary Housing Program requirements could undermine the County-wide calculations used to eliminate the affordable housing mandate. This statement on the surface may seem valid enough, but there is no factual evidence in the EIR to support such speculation. Instead of mere speculation, the DSEIR should include a thorough discussion of housing issues, including the possibility of eliminating the need for affordable units and allowing for a more environmentally sensitive project to be considered.

Page 3-8, Project Features, indicates that a 1.4 million-gallon water tank would be required for this project of 705 units. EIR 561, which analyzed 318 units, also required a 1.4 million-gallon water storage tank. The quantity of fire flow, and stored water necessary for the 705 units therefore appears inconsistent. If two 1.4 million-gallon tanks, or one 2.8 million gallon tank are required, this would significantly increase either the size of the tank location for two tanks, or the amount of grading and screening that would be needed for an increased tank size. The water tank site is owned by the Trabuco Canyon Water District, however, Mr. Bruce Bonner, General Manager of the

District was not aware of the discrepancy, and was planning to comment on the EIR for the proper information. Without the proper water storage available for 705 units, the project could not be developed and the DSEIR could not be certified. The extent of grading for the increased tank size and its location must be addressed in the DSEIR. Changing the size of the tank size will also require an amendment to the original Recorded Tract Map. Once the County receives this information, a revised section for review and comment by the public should be prepared.

Page 3-16, Project Phasing: Project grading is noted as being implemented in one phase, but this does not square with the fact that the developer has only submitted 40-scale grading plans for "Phase I" of the project which, apparently, only involves a portion of the proposed 705 units. This inconsistency should be resolved because, obviously, if the grading is to occur in several stages, instead of in "one phase," then the grading impacts would occur over a much longer period of time than the 18-month estimate set forth in the DSEIR.

Moreover, if the EIR shows and states the grading in one phase, then the entire grading plan at 40 scale should be made part of the Appendices to the EIR or, at the very least, the grading plans (and the geotechnical reports needed to fully understand them) should be incorporated by reference so that members of the public could review them. Either solution will require DSEIR 566 to be revised and recirculated in accordance with CEQA Guidelines Section 15088.5.

The Project Description has inaccurately depicted the project phasing. CEQA Section 15126 requires a complete project description, including all phases, and should be included for review with this DSEIR. Since it appears that the grading will be in phases, this project description is not consistent with CEQA Guidelines Section 15126 and cannot be certified as adequate.

Section 4.0 Existing Conditions, Project and Cumulative Impacts, Mitigation Measures and Level of Significance After Mitigation:

Section 4.1 Land Use/Housing

Notwithstanding the requirements of CEQA Guidelines section 15126(c), the EIR makes no attempt to explore feasible measures to mitigate land use impacts to surrounding areas. Suggested land use mitigation should include: Setback criteria, buffer zones of vegetation, pet restrictions, ridgeline protection, project phasing coupled with an Annual Monitoring Report under Zoning Code section 7-9-103.2(a)(12) to identify imbalances between development and infrastructure, etc. These new mitigations should be included in a revised draft EIR and recirculated for public review and input.

CEQA Guidelines Section 15131 (b) expressly recognizes that construction can adversely impact religious practices: "if the construction of a road and the resulting increase in noise in an area disturbed existing religious practices in the area, the disturbance of the religious practices could be used to determine that the construction and use of the road and the resulting noise would be significant effects on the environment". While the Land Use/Housing section of the EIR indicates

that the impacts would remain significant, unavoidable and adverse, there is no attempt to mitigate impacts on surrounding religious uses to any level at all.

Section 4.2 Soils and Geology

Although SFC was not able to gain access to any of the current grading plans at the County, SFC has learned that, for a price, the developer made copies of such plans available to certain interested parties and that the plans showed only half of the grading that is proposed for the 705-unit project. As stated above, if the rough grading (including all remedial grading) is to be accomplished in one phase, then the plans showing all the grading work to be performed should be made available for public review and DSEIR 566 should be revised and recirculated to incorporate such plans and all related geotechnical reports. This is particularly important with respect to the remedial grading improvements, (which account for the vast majority of the rough grading operations) because mitigation measures, such as shear keys, cannot be properly evaluated without the grading plans and soils reports, and cannot be constructed in a piecemeal fashion without the risk of slope instability.

Page 4-16, Ground Water: It appears from the State Water Resources Board map of wells in the area that there are at least five wells located northerly, westerly and southerly of the site and landslide areas. These wells depend on the groundwater supplies to remain in operation. During remedial grading, perched groundwater and saturated zones will be encountered (according to the geotechnical study). This excess groundwater will require pumping to a point to where the bottom layer of the 120-foot key cut will need to be cleaned out. The EIR does not discuss the high probability that this excessive pumping may impact groundwater and groundwater recharge to these surrounding wells. Impacts to groundwater and surrounding wells is considered a significant impact in CEQA Guidelines Appendix G(h) and (i). The EIR provides neither discussion of this important issue, nor any mitigation for potential impacts to these wells. While the EIR preparer, or the geotechnical engineer for the project, may speculate that the surrounding wells are being fed by Aliso Creek or "other groundwater", **there is no factual basis to support the conclusion that there will be "no significant groundwater impact" caused by project grading and development.** The Planning Commission must be provided with complete information on this issue before passing on the adequacy of DSEIR 566, and gathering groundwater information during remedial grading for future decisions, and complying with the water resource agencies, is not the proper way to proceed.

Page 4-24, last two paragraphs. These paragraphs state that "unfavorable conditions *(i.e. "some ground water")* can be mitigated by implementing corrective grading concepts". Yet the DSEIR only speculates on the mitigation necessary to truly lessen future impacts to the development from groundwater and postpones for future analysis whatever specific mitigation measures might eventually be proposed by the soils engineer for the project (see page 4-25). This is not in keeping with CEQA.

Once the shear keys are cut on the project site, the DSEIR indicates that subdrains will be required. Subdrains and dewatering facilities are permanent features, and are notoriously

unreliable. This was the case in the Hidden Hills development located immediately adjacent to the south of this site, and is the proposed location of the emergency access to Saddleback Meadows. In this study, the buttress subdrains failed, or in most cases the subdrains were missing and groundwater backed up behind the buttress fill, severely impacting the residences and infrastructure.[1] To truly mitigate geotechnical impacts to less than significant levels, and to a degree that will ensure the Planning Commission that CEQA has been satisfied, additional detailed recommendations should be included in this DSEIR prior to certification. In addition, if in fact the subdrains are only to work temporarily, the DSEIR does not explain to where these subdrains will drain. It is presumed that these features will drain to Los Alisos Creek, which is shown as a blue line on the USGS Quad Map. The EIR should discuss the impact of a permanent alteration to the flow of Los Alisos Creek. A higher degree of specificity on this important issue is required prior to EIR certification.

Page 4-25, Mitigation Measure 2-1, state that "A comprehensive remedial grading mitigation plan has been designed to stabilize the project site..." yet on page 4 of the G.A. Nicoll and Associates report in Technical Appendix D, Mr. Nicoll's firm indicates that "a more detailed evaluation" of slope stability issues has yet to be completed and will be conducted as part of the geotechnical review of the 40-scale grading plans. This underscores the fact that only vague and general "concepts" about grading mitigation measures are referenced in DSEIR 566 even though CEQA Guidelines Section 15146 would require a much more detailed and specific discussion of grading impacts and mitigation at this construction-level stage of the project. The mitigation measures listed in this section of the DSEIR are general, boilerplate statements about what information is yet to be gathered and they **do not** represent "a comprehensive remedial grading mitigation plan". The seminal question which remains unanswered is whether DSEIR 566 is intended to be used as the environmental documentation to support the issuance of one or more grading permits for the project or does the County intend to require yet another Supplemental EIR to be prepared to address the grading mitigation measures which are still being analyzed by the project soils engineer? If DSEIR 566 is intended to support the issuance of grading permits, then the construction-level plans and reports necessary for the permits to be issued must be in the EIR itself, instead of being the subject of speculation as to what will be determined at some future date.

Page 4-27, Mitigation Measure 2-3. This mitigation is unnecessarily vague as to who the "decision-maker" is (the Board of Supervisors? the Planning Commission? someone else?), and it is also misleading for the public. CEQA Guidelines Section 15162 states that a subsequent EIR is necessary if "Substantial changes are proposed in the project..." (In this case any substantial change to the grading plan). If the applicant "deviates" from the recorded tract map grading to such an extent that the project has changed and a new application must be submitted per the zoning code, then a subsequent EIR will be required for pubic review of the changed project. In addition, as the current geotechnical mitigation measures are worded, a subsequent EIR would be

[1] *Nolte and Associates, Inc. Geotechnical Study for Seepage, Slope and Pavement Distress, Portion of Tentative Tract 12272, Orange County, California, 1993;and Geotechnical Report of Slope and Street Repair, and Subdrain Installation, A Portion of Tentative Tract 12272, Orange County, California. Both prepared for EPAC Housing Corporation.*

required if conditions are exposed during grading which are significantly different from those described in the project description or geotechnical report. As indicated on page 16 of the Nicoll report: "In the event that during construction, conditions are exposed which are significantly different from those described in this report, they should be brought to the attention of the Soil Engineer." Preparing a Subsequent EIR for changed conditions during remedial grading would not be feasible, therefore sufficient detail must be included with the DEIR and recirculated for public review. The mitigation measure should be revised to reflect this change.

Page 4-27, Mitigation Measure 2-4, is not enforceable unless the Planning Commission requires that the EIR show how the graded areas will be compatible with natural land characteristics of the adjacent open space. Future gathering of information is not proper mitigation for a significant impact.

Page 4-29, Mitigation Measure 2-16, the back cut failure guidelines should be provided now for a construction-level grading permit application EIR. This project is already approved with a recorded map. Therefore, a higher level of detail is essential to demonstrate the overall feasibility of the recommended grading techniques. The criterion the project applicant has to follow is to mitigate impacts to less than significant levels and demonstrate that the mitigation measures are adequate under CEQA. The DSEIR has not accomplished this yet.

Page 4-29, Mitigation Measure 2-20. Ponding will be necessary as part of the dewatering process and within Best Management Practices for Regional Water Quality Control Board requirements. This mitigation measure should be amended to reflect actual ponding that will be necessary and the possibility of Vector Control Permits.

Page 4-31, Mitigation Measure 2-34. Ironically, this so-called "mitigation measure" provides more detailed information regarding groundwater problems and dewatering than any discussion set forth in the text of DSEIR 566. Although page 4-24 of the text merely alludes to "some" ground water that might be encountered during grading, this mitigation measure paints a far more graphic and alarming picture, **"Heavy seepage was encountered, as indicated on the Boring Logs, at multiple elevations. Consequently, considerable water can be expected within planned excavations, typically reaching maximum discharge within 2 to 5 days after exposure. Additional nuisance water is foreseen in nearly all major cuts decreasing in volume with time, and being less at higher elevations as well as in cuts made late in the year."** As indicated above, groundwater wells are located adjacent to the site and landslide areas. Impacts to surrounding groundwater and groundwater wells from required pumping and dewatering are not even discussed in the text of the DSEIR, yet this mitigation measure appears to expect it. Again, the DSEIR does not, but certainly should, discuss the extreme likelihood that this excessive pumping may impact groundwater wells and groundwater recharge to these surrounding wells. Impacts to groundwater and surrounding wells are considered a significant impact under CEQA. The Planning Commission must be provided with enough factual information before it is asked to certify this EIR. Gathering groundwater information during remedial grading is not proper mitigation. To truly mitigate geotechnical and groundwater impacts to less than significant levels,

and to a degree that will ensure the Planning Commission that CEQA has been satisfied, additional detailed recommendations on grading, dewatering and impacts to groundwater and groundwater wells should be included in this DSEIR prior to EIR certification. This DSEIR requires a higher degree of specificity on this important issue prior to EIR certification.

Page 4-33, Section 4.2.7 of **the DEIR should be changed to read "Implementation of this proposed project, with the mitigation measures outlined above will result in unavoidable adverse geotechnical impacts."** At a minimum, there are significant groundwater impacts and slope stability issues that have not been adequately discussed or mitigated in DSEIR 566 and revision and recirculation of the DSEIR is in order to allow public comment on these matters when they are completed.

Within the Technical Appendix D, page 4, Mr. Nicoll's firm indicates that this geotechnical review is for an EIR level of analysis, and that subsequent analysis will be necessary. However, the "EIR level" soils report in Appendix D does not provide the required specificity for the considerations outlined in the DSEIR, including impacts of dewatering during and following construction, slot cutting or staged excavation to assure on-going support of landslide masses to be stabilized, backcut and forecut slope inclinations, and dewatering criteria. A grading plan review report should include all recommendations and geotechnical criteria necessary to undertake and complete all remedial grading improvements and measures, and it should be included as part of DSEIR 566 and circulated to the public. The Planning Commission cannot, without uncertainty, approve this project under the premise that the impacts are mitigated to less than significant levels. If planning staff chooses to amend the DSEIR to show that significant grading impacts will remain after mitigation, then the introduction of new information will trigger recirculation of the EIR per CEQA Guideline Section 15088.5(a).

Section 4.3 Water/Hydrology

EIR 566 appears to utilize the hydrology map from EIR 561 without changing the underlying site plan. While the existing drainage will not change regardless of the site plan, the post development drainage will change from EIR 561 to EIR 566. DSEIR 566 does not include post development drainage calculations. The DSEIR needs to correlate existing versus post-development change in cfs and % in order for the Planning Commission to base its decision on the storm drain improvement plans that were approved in 1988. This subsequent EIR should incorporate all pertinent information and re-verify the prior calculations and not rely solely on County approvals from 1988.

Page 4-39, Table 10 does not correspond with Exhibit 22 as far as proper labeling of the storm drains. If there are not accurate, the Planning Commission should require updated concepts to verity mitigation measures.

Page 4-38 The EIR states that alterations of the rate of flow of groundwater or impacts to groundwater quality are considered to be insignificant. The geotechnical report indicates that

groundwater and saturated zones will require dewatering during grading and excavation of the sheer key. Groundwater from these slide planes will require pumping for an undetermined period of times (as demonstrated in Mitigation Measure 2-34). At least five (5) groundwater wells are located near this project site, directly in the path of the groundwater flow. The geotechnical report has completely disregarded the impacts that may be incurred downstream during construction dewatering. **This EIR section should consider impacts to groundwater as significant**, otherwise the Planning Commission should not certify this EIR with an incorrect impact finding.

Page 4-41, Mitigation Measure 3-1 indicates that the master drainage concept is included as Appendix L. However, upon closer evaluation of the site plan in Appendix L, it appears that the post development calculations are for the smaller 318 units (EIR 561) project. This EIR cannot be certified as adequate with erroneous information pertaining to a much smaller project.

Page 4-42, Mitigation Measure 3-5. How and why is this mitigation important to reducing hydrologic impacts to less than significant levels? What if the upstream and down stream property owners do not sign or agree to a letter of consent? Does the Manager, PDS/Subdivision and Grading Services Division override the property owner and allow consent? The mitigation measure is not enforceable and does not reduce impacts in any way. It should be deleted.

Page 4-42, Mitigation Measure 3-6 indicates participation in a Master Plan of Drainage prior to issuance of any building permits. Preparing a master plan of drainage after the grading has been completed does not allow the County or the public to comment on proper hydrologic calculations. As indicated in the above comment to mitigation measure 3-1, the master drainage concept included in Appendix L was prepared for the smaller 318 units (EIR 561). The master plan of drainage should be submitted with and incorporated into the DSEIR for recirculation and public review.

Page 4-42, Mitigation Measure 3-7 indicates that impacts to the site's hydrology shall be reduced to a level of insignificance through engineering design and construction techniques. However, the mitigation measures and analysis leading to the measures must be commensurate with the specificity required for a construction-level grading permit application EIR. There is no guarantee that implementation of this mitigation measure will result in insignificant impacts to this environmental issue. Therefore **this impact should be changed to potentially significant after mitigation** because the mitigation measure is not specific enough to conclude otherwise. The mitigation measure is too speculative for future hydrology of a site, particularly with the wrong hydrology report in the DEIR. In addition, there is no timing associated with implementation of this mitigation measure.

Page 4-43, Section 4.3.7 indicates that implementation of the proposed mitigation measures would result in no unavoidable adverse impacts to groundwater hydrology, yet there is no information on impacts to downstream wells from excessive dewatering to support the less than significant impact. This conclusion should be changed to **potentially significant impacts will result after**

implementation of the mitigation measures. In addition, the new information associated with the new finding will require recirculation of DSEIR 566.

Section 4.4 Transportation/Circulation

The traffic section of the DSEIR unfairly limits its review of intersection impacts to El Toro Road/ Santa Margarita Parkway and north. No explanation is given in the DSEIR for this limiting factor, and no analysis is included for the intersections along El Toro south to the San Diego Freeway (I-5). The DSEIR should include all intersections that will be impacted by 705-unit project. This lack of analysis raises another unanswered question: Have the traffic calculations been adjusted to account for the difference in projected use versus actual use of the Foothill Corridor? (The San Joaquin Corridor's projected usage was substantially overestimated by nearly 50%). This difference in projected use versus actual use should be incorporated into the project and regional buildout traffic calculations of the area. With an over estimation of the Foothill Corridor usage, there will need to be an analysis and discussion of traffic along El Toro Road from the Foothill Corridor south to the San Diego Freeway. The intersection of El Toro at the 5-Freeway north and south is virtually impassable during peak hours and the addition of Saddleback Meadows will only exacerbate this growing problem.

Notwithstanding the requirements of CEQA Guidelines Section 15130(b)(1)(B), the DSEIR fails to provide a cumulative analysis of the traffic impacts from the reuse of the El Toro Marine Corp Air Station as a commercial airport. In addition, it is not clear from the DSEIR if the regional traffic model utilized for the project impacts, and cumulative project impacts, actually incorporates the regional changes to the traffic resulting from a commercial airport at El Toro. CEQA Guidelines Section 15130(b)(1)(B) provides the cumulative impact elements necessary for an adequate discussion include: "A summary of projections contained in an adopted general plan or related planning document (in this case the Draft Reuse Plan EIR) which is designed to evaluate regional or areawide conditions. Any such planning document shall be referenced and made available to the public at a location specified by the lead agency." The El Toro Reuse Plan and EIR should be included in the regional analysis and cumulative impacts, incorporated by reference, and made available for public review during the recirculation process. Without such an analysis, **the DSEIR cannot conclude that this traffic issue will have less than significant impacts.**

It appears as though the traffic study has distributed residential trips to the commercial area from the project internally via Valley Vista Way. The traffic analysis does not take into account that Valley Vista is closed to through traffic and is to be used as an emergency access only. According to the grading plan, the only way to the commercial area will be from either El Toro Road or Valley Vista. If Valley Vista is to be blocked off, all trips in the traffic study that were to use Valley Vista will now use El Toro Road. This inconsistency should be resolved.

Review of the traffic count data shows that the information was gathered after schools in the District had been let out for summer. Updated counts should be included after school has started, but before the Christmas holiday season.

Page 4-52, Traffic Impact Modeling section of DSEIR 566 indicates that the proposed project of 705 units will generate 6,220 trip-ends per day with 345 vehicles per hour during the AM peak hour and 635 vehicles per hour during the PM peak hour. However, the Traffic Report in Technical Appendix E states on page 27 that "The Saddleback Meadows (TT-10692) development is projected to generate a total of approximately 8,340 trip-ends per day with 540 vehicles per hour during the AM peak hour and 825 vehicles per hour during the PM peak hour". **Why is there nearly a 25% discrepancy with respect to trip-end figures?** Even with the inclusion of passby/diverted trip reductions (as calculated on Table 4, page 29 of the Traffic Report in Appendix E), the total project trip-ends is 7,530, nearly 20% greater than what is stated in the DSEIR. The traffic section of the DSEIR should be reanalyzed and recirculated for public review.

Page 4-52, Section 4.4.2 Effects Found To Be Insignificant. This section concludes that the proposed project would not result in insufficient parking capacity onsite or offsite. This is not consistent with the traffic report in Appendix E which indicates on page 10 that "Verification of adequate parking should be analyzed for the project in conjunction with approval of the site plan." The site plan for Saddleback Meadows is already approved. Lack of available parking for high density housing such as this is the number one Home Owner Association complaint and the subject of many homeowner lawsuits against the developer. The DSEIR should discuss what constitutes a significant parking impact, however, in order to do that, parking verification must be performed first. In order for the traffic engineer's recommendation to be consistent with the DSEIR's finding of insignificance for this parking issue, a parking analysis for the site should be performed prior to certification.

Page 4-82, Mitigation measures 4-12 and 4-13 seem to contradict each other. MM 4-12 requires the applicant to design and construct roadway improvements for El Toro Road, including deceleration lanes and entrance pockets, whereas MM 4-13 requires the applicant to provide only a cash deposit for the difference in cost of designing and constructing the roadway improvements of the project compared to the costs associated with the ultimate configuration of El Toro Road. The question that remains, therefore, is whether the project has to pay for or build its fair share of the traffic improvements to El Toro Road?

Page 4-83, Mitigation measure 4-15 states that "Verification of adequate parking shall be analyzed for the site in conjunction with approval of the site plan". This mitigation measure should be revised based on the comments from page 4-52, Section 4.4.2.

None of the mitigation measures listed in the traffic section of the DSEIR provides for reasonable contributions to the regional impacts on traffic from the proposed El Toro commercial airport.

Section 4.5 Air Quality

Page 4-94, Mobile Source Impacts. The Air Quality section for Mobile Source Impacts has based its calculation on 5,410 daily vehicle trips, the DSEIR traffic section states a calculation of 6,222 daily trips, while the Traffic Report in Appendix E of the DSEIR states a daily trip calculation of

8,340, a total difference of 35%. Therefore it would appear that the air quality calculations are underestimated. Any CEQA calculations that differ by a factor of 10%, let alone 35% or more, cannot be considered similar and therefore, the Air Quality analysis should be updated with the proper information before certification by the Planning Commission.

Page 4-110; It appears that the applicant has chosen to utilize the project related vehicle trips from the previous noise study prepared for 318 units (EIR 561), rather than updating EIR 566 to reflect more than double the number of units associated with the manufactured housing project. This study should be updated with the proper information pnor to certification of the EIR.

Page 4-118, Section 4.6.7 indicates that the project in conjunction with proposed mitigation measures would not result in any unavoidable adverse operational impacts. However, the EIR fails to analyze the noise impacts the project would have, at buildout, on the surrounding religious organizations to the north and south of the site.

Section 4.6 Noise

Notwithstanding the requirements of CEQA Guidelines Section 15130(b)(1)(B), the DSEIR fails to provide a cumulative analysis of the noise impacts from the reuse of the El Toro Marine Corp Air Station as a commercial airport or the noise from traffic associated with the commercial airport. Once this information has been included in this DSEIR, this document should be recirculated for public review.

Page 4-102, Baseline Noise Levels. The Noise section of the DSEIR provides a baseline discussion of the current impacts from the El Toro MCAS fly-overs which exist at present, but the impact section of the EIR fails to identify potential CNEL contours as a result of the base reuse plan as an active commercial airport.

Page 4-103, the first paragraph discusses an area of proposed open space as the project location where the 62 dB CNEL contour falls. This may have been true for the previous EIR 561, however, page 7 of the noise study provided in Appendix G states that the 62dB CNEL location is in an area of proposed commercial development. The proper location of the 62 dB CNEL should be verified prior to EIR certification.

Technical Error: Page 4-103, first paragraph, last sentence: The DSEIR incorrectly uses the 62 dB CNEL as "over productive". Correct terminology from the Noise Study, page 7, first paragraph: the use of 62 dB CNEL is "overpredictive".

Page 4-103, third paragraph, states "Depending upon future site re-use, aircraft noise may or may not be an important issue." **The aircraft noise from a commercial airport at El Toro <u>will be an important issue.</u>** Nowhere else in the DSEIR is the El Toro MCAS reuse discussed or incorporated by reference. No commercial aircraft noise impact analysis is provided. The DSEIR should include project related noise impacts as a result of the El Toro reuse plan as a commercial

airport and traffic related impacts. Once this information has been included in this DSEIR, the document should be recirculated for public review.

Page 4-103, fourth paragraph indicates that individual fly-over events may be noise intrusive and mitigation has been provided. However, neither the baseline discussion, impact analysis nor the mitigation measures in the DSEIR include mitigation for a multiple fly-over commercial airport.

Section 4.7 Biological Resources

The Planning Commission should be aware of a note that was included on the preliminary grading plans, that indicates: "Upon issuance of the grading permit by the County, the County will inform the USFWS of the issuance of this permit and any related activity that may potentially involve a CSS "take" resulting from the associated grading activities". This note on the grading plan takes the mitigation monitoring responsibility out of the hands of the County and impermissibly transfers it to the developer and its grading contractor. The note, a copy of which is attached, is an attempt to sidestep the need for coordinating the CDFG and USFWS permits prior to issuance of the grading permit.

No grading permit should even be considered for issuance unit <u>after</u> the gnatcatcher study has been completed per USFWS protocol. Under the Federal Endangered Species Act, all "take" must be accommodated regardless if a recorded tract map is involved. This is a grading permit level of detail EIR, and thus, the studies included should reflect CEQA Guidelines Section: 15146: "The degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR." (i.e. grading plan permit). Section 15146 (a) states: "An EIR on a construction project will necessarily be more detailed in the specific effects of the project than will be an EIR on the adoption of a local general plan or comprehensive zoning ordinance because the effects of the construction can be predicted with greater accuracy". If USFWS decides that project modifications or on-site mitigation is required, then the final tract map will have to be changed any way.

Between the time when EIR 561 and EIR 566 were both prepared, there seems to have been a change in the vegetation communities on the site, or the biology reports are inconsistent between last year's EIR and this year's EIR. Both EIR 561 and 566 are based on the same site and the same biological study, yet the numbers of plant species have changed without new field work. The only updated biological fieldwork was done April 1996 for the western spadefoot toad. The following discrepancies between the two biological reports prepared for this EIR need to be rectified: EIR 561 indicated 119 plant species where EIR 566 indicates 110; what were the previous other 9 plant species and where are they now?; were any of these 9 disappearing plant species sensitive? EIR 561 indicates 70 native plant species on site, yet EIR 566 indicates 73 native plant species. Were three more native plant species planted in a year or is EIR 566 incorrect? EIR 561 originally indicated 49 non-native species and now EIR 566 indicates only 39 non-native species. Without new fieldwork having been conducted by the consultant, which

biology report is correct? Both Figure 5 in EIR 566 technical appendix and Figure 3 in EIR 561 technical appendix show the same vegetation, yet the vegetation quantities have changed.

Page 4-126, Amphibians. This section states that "No amphibians ere observed during surveys of the site", yet Exhibit No. 50 on page 4-122 lists the Western Spadefoot Toad as present. This discrepancy should be corrected.

Page 4-125, Ephemeral Ponds. The section states that "All of the ephemeral ponds were artificially created a number of years ago..." Given the geological conditions of frequent landslides in the area, these wetlands could have been "slump" or "slope" ponds that underwent human modification at a later time. Further information is needed in the DSEIR regarding the origin of these wetlands.

Page 4-148 of EIR 566, Coastal California Gnatcatcher, indicates that no gnatcatcher survey has been performed with USFWS protocol. Specific surveys for presence or absence must be performed at this level of detail for this construction stage in the project. Combined with the disturbing note on the grading plans, the County will lose the ability to monitor any mitigation for the CCG. In order for this EIR to be deemed adequate under CEQA Guidelines Section 15126 (c), the focused CCG survey must be performed prior to certification of this EIR.

Page 4-148, Raptor Foraging Habitat: Whatever consultant recommended to the developer that project slopes would constitute sufficient raptor foraging habitat did not determine this through any consultation with either CDFG or the USFWS. Consultation on appropriate impact significance should be reflected in this DSEIR prior to certification.

Page 4-151, Section 4.7.6, commences its discussion on mitigation measures by stating as a "given" that there is supposedly no ability on the part of the County to "deviate from the final recorded tract map." However, no legal or factual support is given for this statement, and it appears to be directly at odds with CEGA Guidelines Section 15041 which provides that the "lead agency for a project has the authority to require changes in any or all activities involved in the project in order to lessen or avoid significant effects on the environment." If this statement, which appears to be an excuse for not doing a complete mitigation analysis, is based on some unstated legal assumptions about the rights of the developer, then this analysis should be explained in detail in DSEIR 566 to let the public know why CEQA is not being complied with fully.

Page 4-153, Mitigation Measures SC 7-1 through 7-7 and measures 7-11 through 7-14 would appear to be of no value in light of the note placed on the preliminary grading plans. In addition, although EIR 561 provided the mitigation plans as a component of the EIR, DSEIR 566 only provides mitigation in the form of conditions to prepare mitigation plans in the future. The level of detail of the mitigation measures should be commensurate with the level of detail in a recorded tract map. Therefore this EIR does not adequately satisfy CEQA Guidelines Section 15126 (c) requirements at this time. Gathering further information and complying with resource agencies in

the future is not proper mitigation. Biological mitigation for ACOE and CDFG coordination may change the development plan, which would then require a revised EIR.

Page 4-153, Mitigation Measure 7-2 states that a 1603 application has been submitted to CDFG. What is the status of the application? Has CDFG acknowledged receipt of the application? Was the application deemed complete by CDFG? What additional information did CDFG ask for? This future mitigation would hold more credence as a CEQA mitigation measure if more detail were known about the 1603 permit for this project. CDFG has a very limited staff and processing of the permit may take upwards of nine months to a year or more to complete. Is the County going to wait a year for the 1603 permit prior to issuing the grading permit, as indicated in the mitigation? Or will they issue the preliminary grading permits to allow the site to be radically altered prior to the issuance of the 1603 permit?

Page 4-153, Mitigation Measure 7-3 states that the applicant will obtain the necessary individual or nationwide permit... According to Page 4-146, second paragraph, the biological consultant states that an individual permit will be necessary. The mitigation measure should accurately state the proper permit necessary. As with the 1603 permit, has the applicant submitted an application for a 404 permit? Has the ACOE acknowledged receipt of the application? Was the application deemed complete by the ACOE? What additional information did the ACOE ask for? The ACOE has even fewer staff than the CDFG, and processing of the permit may take more than a year to complete. Is the County going to wait a year for the 404 permit prior to issuing the grading permit, as indicated in the mitigation? Or will they issue the preliminary grading permits to allow the site to be permanently stripped of sensitive biological resources prior to the 404 permit being issued?

Page 4-153, Mitigation Measure 7-4 states that the applicant is to provide a summary in acres of coastal sage scrub to be impacted, but this has already been stated in Table 30 of the DSEIR. The mitigation measure only serves to lead the reader back to the beginning of the Impacts section of the DSEIR. The mitigation measure should be specific and consistent with the biological consultants recommendation of "The dedication and long-term preservation of 22.9 acres of habitat of Saddleback Meadows, revegetation of 46.5 acres of Veturan-Diegan transitional coastal sage scrub on site and contribution of the Orange County NCCP".

Page 4-153, Mitigation Measure 7-5 states that the applicant shall provide proof that the appropriate Federal approvals required for impacts to Coastal Sage Scrub have been obtained from the USFWS. This mitigation measure is misleading because it fails to state what permit is needed. USFWS may impose additional mitigation measures as part of its review process. In order to assure that USFWS mitigations do not conflict with any other measures in the DSEIR, the consultation with USFWS should be conducted prior to certification of the DSEIR. As with the 1603 and 404 permit, has the applicant submitted a request for USFWS consultation or filed an application? Has the USFWS acknowledged receipt of the application? Was the application deemed complete by the USFWS? What additional information did USFWS ask for? The USFWS has the fewest staff of all three agencies, and processing of the permit and consultation may take more than a year to complete. Is the County going to wait a year for the Section 10a permit prior to

issuing the grading permit, as indicated in the mitigation? Or will they issue the preliminary grading permits to allow clearing and grubbing of the site prior to the 10a permit?

Page 4-154, Mitigation Measure 7-6 could in effect override mitigation measure 7-5, if the Administrator, Planning and Zoning so desired. This mitigation measure should be deleted.

Page 4-154, Mitigation Measure 7-7. If there are additional permits required by the USFWS, the DSEIR should list those specific permits. Consultation with the USFWS, as indicated on page 4-151 last paragraph of the DSEIR, states that input has been received from the USFWS. Why didn't the EIR preparer ask what additional permits may be necessary for native vegetation?

Page 4-155, Mitigation Measure 7-8, F, states that an experienced nursery or other landscape contractor shall care for the transplanted trees for only six (6) months. The biological report states on page 49, second paragraph, **"In order to ensure the success of mitigation, the Project proponent should enter into a five year secured agreement with the County of Orange to cover the Projected cost to install, monitor, and report on the mitigation Project. This agreement will be in the form of a 100 percent bond."** This extremely important mitigation measure is found nowhere in the DSEIR. If the DSEIR does not reflect the recommendations of the expert biologist, then mitigation measure 7-8 F is ineffective and invalid. The DSEIR cannot be certified without amending this measure to reflect the biologist's recommendation.

Page 4-157, Mitigation Measure 7-11 states that the applicant shall provide additional evidence that onsite CSS habitat is not occupied by California Gnatcatchers. The survey for the CCG should be performed now to rule out any occupied habitat. What the mitigation measure is trying to say is that if CCG is found on site, the applicant will be required to file an application for a Federal Section 10(a)(1)(B) permit. If CCG is found, the USFWS will commences their consultation and additional mitigation measure may be imposed by the USFWS. **In order to assure that USFWS mitigations do not conflict with any other measures in the DSEIR, the CCG survey should be performed prior to certification of the DSEIR.** The mitigation measure should accurately state the proper permit necessary. As with the 1603 and 404 permit, has the applicant submitted a request for USFWS consultation or filed an application for a Section 10a permit? Has the USFWS acknowledged receipt of the application? Was the application deemed complete by the USFWS? What additional information did USFWS ask for? The processing of the permit and consultation may take more than a year to complete. Is the County going to wait a year for the Section 10a permit prior to issuing the grading permit, as indicated in the mitigation? Or will they issue the preliminary grading permits to allow clearing and grubbing of the site prior to the 10a permit?

Page 4-158, Mitigation Measure 7-12, is not enforceable as a mitigation measure. The mitigation for the wildlife movement corridor should be included as part of the DSEIR for public review. The mitigation measure should list the onsite or off site options for the movement corridor. This measure should be deleted, and an alternative mitigation measure should be provided.

Page 4-158, Mitigation Measure 7-14. This measure in not enforceable as a mitigation measure. The relocation and establishment of a mitigation plan should be included as part of this DSEIR as it was with EIR 561.

Page 4-158, Mitigation Measure 7-15. This measure is not enforceable not does it further minimize impacts with wording such as **"Where possible..."**, "Lighting within development projects adjacent to conserved habitat **"should"** be selectively placed...", ..."lighting from homes abutting conserved habitat **"should"** be screened...", and, "These lighting restrictions **"should"** be incorporated into the project's CC&R's". All of these "should" mitigation will become "shall" upon certification. If the Planning Commission is not sure that it wants to implement these measures, they should either be deleted them or change all "shoulds" to "shalls".

Page 4-159, Section 4.7.7 Unavoidable adverse impacts. Under CEQA Guidelines Section 15126(c) all mitigation must be enforced that will "minimize the significant effects" prior to EIR certification. The comment that the County will issue a letter of insignificance once the Interim Loss Habitat Mitigation Plan is approved has no meaning in terms of CEQA. The public has a right to review the ILHMP prior to EIR certification. Also, the second bullet item under this same section discusses future mitigation. A future survey is not mitigation according to the Federal EPA. This is a recorded tract map and a construction level grading permit application EIR. The biological report in the EIR should be the basis of any biological opinion.

Section 4.8 Aesthetics

Page 4-174. Although aesthetic impacts will remain significant, even after mitigation, the Project Design Feature mitigation measures 8-1 through 8-4 are only standard conditions of approval for any development project. Mitigation measure 8-1 requires public utilities to be undergrounded, but the County would require this "Design Feature" anyway. Mitigation measures 8-2 and 8-3 would only truly be design features if the applicant were required to underground all drainage swales. This is more costly, but in order for these aesthetic mitigation measures to be compatible with the biological mitigation of the manufactured slopes providing rapture foraging habitat, the cost would be justified by both mitigations that would be accomplished.

Page 4-174, Mitigation Measure 8-4 in not enforceable as a Project Design Feature. If the Trabuco Canyon Water District owns the tank site, the District will be responsible for the landscape screening, not the developer or the County. This mitigation measure should include additional monetary compensation to the Water District for additional landscape screening.

Section 4.9 Cultural/Scientific Resources

Page 4-178. The DSEIR makes no attempt to analyze either the direct or indirect environmental impacts of the project on the religious or sacred uses within the potential impact area. In this case,

the potential impact area extends outside of the property boundary. This important issue should be discussed in the DSEIR prior to certification.

Section 4.12 Public Services

Page 4-216, Section 4.12.2, Effects Found to be Insignificant. The EIR preparer should look at this section again. The EIR incorrectly reads, "The Initial Study prepared for the proposed project did **not** identify any (sheriff, fire, education, and library) related effects as **insignificant**". Therefore, all the effects were significant.

Page 4-217, Section 4.12.3, Fire. The 1.4 million-gallon tank was the same quantity tank utilized in EIR 561 for 318 homes. The EIR should reflect the proper fire flow amount for 705 units and the proper tank size or number. New impacts to the tank site will require recirculation of the EIR prior to certification.

Page 4-222, Mitigation Measure 12-4, should be corrected to reflect the proper tank size.

Section 4.13 Utilities and Service Systems

Page 4-235, Water. While the project description indicates the need for a 1.4 million-gallon tank, the Draft EIR Section 4.13.6, does not mention the need to fire flow storage for a 1.4 million-gallon tank. With the inconsistency between the two EIRs, this EIR is not certifiable under CEQA unless the information presented to the Planning Commission is accurate, factual and current.

Section 6.0 Alternatives to the Proposed Project

The EIR has failed to identify an alternative location for this project, and is therefore inconsistent with CEQA. DSEIR 566, without a discussion of an alternative location cannot be certified as adequate. Should the Final EIR for 566 choose to include an alternative location analysis, the EIR should be recirculated with the new information for public review. Section 15126 (B) 2 states that "If the lead agency concludes that no feasible alternative locations exist, it must disclose the reasons for this conclusion, and should include the reasons in the EIR". However disclosure, at this time, of a new location would constitute new information and require recirculation of the DEIR.

50. STOCKPILING AND/OR VEHICLE STAGING AREAS SHALL BE LOCATED AS FAR AS PRACTICABLE FROM DWELLINGS.

51. EROSION CONTROL DEVICES WILL BE MODIFIED AS NEEDED AS THE PROJECT PROGRESSES. AND PLANS OF THESE CHANGES SUBMITTED FOR PLAN CHECK AS REQUIRED.

52. THE PLACEMENT OF ADDITIONAL DEVICES TO REDUCE EROSION DAMAGE WITHIN THE TRACT IS LEFT TO THE DISCRETION OF THE FIELD ENGINEER.

53. A GUARD WILL BE POSTED ON THE SITE WHENEVER THE DEPTH OF WATER IN ANY DEBASIN EXCEEDS TWO (2) FEET.

54. MITIGATION:

A) PRIOR TO THE ISSUANCE OF A GRADING PERMIT, A NOTE SHALL BE PLACED ON THE GRADING PLAN WHICH STATES THE FOLLOWING:

ON MARCH 25, 1993, THE U.S. FISH AND WILDLIFE SERVICE (USFWS) LISTED THE CALIFORNIA GNATCATCHER AS A "THREATENED SPECIES". THE FEDERAL ENDANGERED SPECIES ACT (ESA) PROHIBITS ANYONE FROM "TAKING A GNATCATCHER, WHICH INCLUDES KILLING, HARMING, OR HARASSING THE SPECIES. NO COASTAL SAGE SCRUB VEGETATIVE RESOURCES SHOULD BE REMOVED WITHOUT APPROVAL FROM THE USFWS. ISSUANCE OF THIS PERMIT BY THE COUNTY OF ORANGE DOES NOT MEAN OR IMPLY THAT THE PROPOSED DEVELOPMENT IS IN COMPLIANCE WITH THE ENDANGERED SPECIES ACT. IT IS THE RESPONSIBILITY OF THE PROPERTY DEVELOPER TO CONSULT WITH AND RESOLVE A "TAKE" ISSUE WITH AND OBTAIN THE APPROPRIATE PERMITS FROM THE USFWS.

IT SHOULD ALSO BE NOTED THAT ANY PERSON WHOSE ACTIVITIES RESULT IN A "TAKE" IN ACCORDANCE WITH SECTION 9 OF THE ESA MAY BE SUBJECT TO CRIMINAL PROSECUTION AND THAT A "TAKE" MAY RANGE FROM REMOVAL OF COASTAL SAGE SCRUB SUCH AS CLEARING, GRUBBING, MOWING, FUEL MODIFICATION, DISCING, TRENCHING, OR OTHER RELATED CONSTRUCTION ACTIVITIES, TO THE OPERATION OF EQUIPMENT OR THE MERE PRESENCE OF CONSTRUCTION PERSONNEL IN CLOSE PROXIMITY TO COASTAL SAGE SCRUB RESOURCES THAT MAY CONSTITUTE HARASSMENT THROUGH THE GENERATION OF DUST, NOISE, ETC.

UPON ISSUANCE OF THE GRADING PERMIT BY THE COUNTY, THE COUNTY WILL INFORM THE USFWS OF THE ISSUANCE OF THIS PERMIT AND ANY RELATED ACTIVITY THAT MAY POTENTIALLY INVOLVE A CSS "TAKE" RESULTING FROM THE ASSOCIATED GRADING ACTIVITIES. ALL QUESTIONS AS TO WHETHER OR NOT YOUR PROJECT MAY BE IN VIOLATION OF THE ENDANGERED SPECIES ACT SHOULD BE DIRECTED TO THE U.S. FISH AND WILDLIFE SERVICES AT (619) 431-9440.

BIOLOGICAL RESOURCES

B) All grading activities shall be avoided within the drip line (outer edge of the tree canopy) of any oak tree designated for in-place preservation.

C) Storage of heavy equipment or building materials shall not occur within 25 feet of any oak tree area.

D) Temporary fencing shall be placed around individual trees and oak woodlands to be preserved for the duration of construction. Fencing shall be placed at the drip line of oak trees and shall not constitute an impediment to wildlife circulation.

VIA HAND DELIVERY

Re: Saddleback Meadows/Comments on DSEIR 566

Dear Mr. Brantley:

As you know, our firm represents the Vedanta Society of Southern California (the "Society") which, for over five decades, has owned and maintained the Ramakrishna Monastery (the "Monastery") in an area of Trabuco Canyon which is immediately adjacent to the southeastern portion of the Saddleback Meadows property (the "Property"). On behalf of the Society, and pursuant to the 10-day extension of time granted in the August 12 letter which I received from Tom Mathews, Director of the Orange County Planning & Development Services Department (the "Department"), we are submitting written comments on Draft Subsequent Environmental Impact Report No. 566 ("DSEIR 566" or the "DSEIR").

A. Regrettably, The Society Is Compelled To Submit Its Comments Under Protest.

The Society must note for the record that it is submitting its comments under protest because of the Department's refusal to accommodate the Society's request, as set forth in my letters of August 6 and 8, 1997, that the Society, and all members of the public, be provided with adequate time to comment on DSEIR 566 *after* the grading plans and the grading plan review which are the subject of Grading Application GA960048 (the

"Grading Application") have been made a part of DSEIR 566 and the DSEIR has been recirculated for public comment Because of the Department's decision to deprive the public of access to the very documents upon which the Grading Application is based, i.e., the 40-scale grading plans and the detailed review of those plans by the soils engineer of record, the geotechnical consultants engaged by the Society to comment on DSEIR 566 have been thwarted in their efforts to fully and properly assess the adverse environmental impacts and feasible mitigation measures associated with the rough grading operations for the construction of the 705 units of manufactured housing which were supposedly authorized by Final Tract Map 10692 (the "Tract Map")

If we were at the general plan amendment stage or the zone change stage in the development of the Saddleback Meadows project (the "Project"), the Society could better understand the Department's decision not to make the grading plans and the grading plan review available to the public in connection with a CEQA analysis of the Project, but, since we are now at the "point of no return" in the Project and the scrapers and bulldozers are about to be unleashed to permanently alter the topography, and to forever destroy the environmentally sensitive features of the Property, there seems to be no justification for withholding from the public *any* of the important documents that the County of Orange will necessarily rely upon in deciding whether to grant the Grading Application and to issue a grading permit to Aradi, Inc., dba California Quartet (the "Applicant").

The Department need look no further than the front cover page of DSEIR 566 to see that "Grading Application GA960048" is the subject of the DSEIR. Accordingly, if the Department intends to recommend that DSEIR 566 be certified by the Planning Commission and be used as the environmental documentation to support the granting of the Grading Application, then -- in equity and in good conscience -- the Department must "play fair" and share with the public all of the documents needed to fully assess the impacts and mitigation measures associated with the Grading Application.

Although more will be said about this point below, suffice it to say at this juncture that the Society will attempt to do the best that it can with the limited information which the Department has made available to date. Most of the soils reports referenced in DSEIR 566 are of little help in analyzing the grading impacts of the Project because they are based upon a 318-unit project which was *not* approved by the Planning Commission or the Board of Supervisors and which does *not* involve the same extent of mass grading, or the same remedial grading improvements, required for the construction of the 705-unit manufactured housing Project which is the subject of the Grading Application Moreover, the *only* soils report in the DSEIR which addresses the 705-unit Project expressly concedes that it is *incomplete* and that the most important aspects of the remedial grading operations for the 705-unit Project will be analyzed *later* in connection with the grading

plan review that is to "accompany' the Grading Application (*See*, DSEIR 566, Appendix D, p 4, ¶ 4.)

Without being allowed access to the basic documents that will, in fact, "accompany" the Grading Application, it is hardly fair that the Society, or any other members of the public, be required to submit comments on the adequacy of the environmental documentation prepared to evaluate the effects of the Grading Application. However, the Society will endeavor to do so without waiving its objections to the inherent unfairness of the CEQA review process that is currently being conducted by the Department The Society urges the Department to reconsider its decision to push ahead with the review of DSEIR 566 without allowing the public to see documents which are crucial to the approval of the Grading Application. Indeed, the Society believes that the fairness and disclosure problems which presently exist can easily be corrected by simply recirculating DSEIR 566 after all of the grading plans and the grading plan review have been made a part of the DSEIR or, at the very least, have been incorporated by reference in the DSEIR and have been made available for public review.

Of course, the Society also believes that, if the Department persists in its refusal to make important project documents available to the public, a court of law would certainly find that the Department's actions in this regard were exceedingly unfair and not at all in keeping with either the letter or the spirit of CEQA.

B. <u>DSEIR 566 Fails To Comply With The Specificity Requirements Of CEQA Guidelines Section 15146</u>.

The Society will give credit where credit is due and will commend the Department for determining that a Subsequent EIR under CEQA Guidelines section 15162 would have to be prepared and certified before the Grading Application submitted by the Applicant in December 1996 could be approved.

In requiring the preparation of a Subsequent EIR, the Department was not only complying with the dictates of the Foothill/Trabuco Specific Plan (*see*, FTSP, p. III-20, § III.D.3.2c), but it was also adhering to the legal analysis set forth in the landmark case of *Day v. City of Glendale* (1975) 51 Cal.App.3d 817 In *Day*, the Court of Appeal held that a grading permit application is a "project of mixed ministerial-discretionary character [which] should be treated as a discretionary project" for purposes of CEQA review, especially in cases in which the applicable grading code affords staff a great deal of discretion in issuing, or conditioning the issuance of, a grading permit (51 Cal.App.3d at pp. 823-824)

However, having correctly determined that a Subsequent EIR should be prepared, the Department must now ensure that the environmental documentation prepared by the Applicant's consultant fully complies with the requirements of CEQA and the State CEQA Guidelines which govern the preparation and review of a construction-level EIR. Unfortunately, in its present form, DSEIR 566 does not comply with these requirements because it postpones for *future* analysis the specific details of the very activity which it was supposedly prepared to address, i.e., the rough grading of the Project

There can be no doubt that DSEIR 566 was supposed to analyze the impacts and mitigation measures relating to the Grading Application. As stated on page 2-8 of DSEIR 566, the Department determined, on December 16, 1996, that "a Subsequent EIR is required to evaluate the effects of the *grading application*" (Emphasis added) In addition to what is stated in the DSEIR, Mr. Mathews also confirmed in his August 12 letter to me that the Applicant's grading permit application was "the *initiating activity* which resulted in the determination that Draft EIR 566 be prepared" (Emphasis added.)

Since it is clear, therefore, that the Grading Application was the project approval which *initiated* and *necessitated* the preparation of DSEIR 566, it is only logical that the DSEIR analyze the impacts of the rough grading operations not in mere general and conceptual terms, but in the *specific* and *detailed* terms that CEQA requires CEQA Guidelines section 15146 is very explicit on this point and requires far more specificity than is evidenced in DSEIR 566. As stated in section 15146, "[a]n EIR on a construction project will necessarily be *more detailed* in the *specific effects* of the project than will be an EIR on the adoption of a local general plan or comprehensive zoning ordinance because the *effects of construction* can be predicted with greater accuracy." (Emphasis added.)

CEQA Guidelines section 15146 further provides that the degree of specificity required in an EIR must correspond to "the degree of specificity involved in the underlying activity which is described in the EIR." What this means with reference to DSEIR 566 is that, since the DSEIR was expressly prepared to evaluate the effects of the Grading Application, the *specific details* of the rough grading activities for the construction of the 705-unit Project must be analyzed in DSEIR 566. In order to do that, of course, the documents which County staff will necessarily review and comment on *before* approving the Grading Application -- which will include, at a minimum, the grading plans and the geotechnical review of those grading plans -- must be made a part of, or at least incorporated by reference into, the DSEIR so that all the detailed information that is available to the County is likewise made available to the public through the CEQA review process.

C. **DSEIR 566 Fails To Comply With The Technical Detail Requirements Of CEQA Guidelines Section 15147.**

In the letter which I sent to you on August 8, 1997, a copy of which is attached as Exhibit "A" hereto and is incorporated herein, the point was made that both California case law and the provisions of CEQA Guidelines section 15147 make it abundantly clear that all technical data, maps, plans, diagrams, etc., which are necessary to make a "full assessment" of the environmental impacts of the project being evaluated must be contained in the EIR or in the Appendices thereto In this case, therefore, since DSEIR 566 was expressly prepared to evaluate the environmental effects of the Grading Application, the 40-scale grading plans and the geotechnical review of those plans should have been made part of the DSEIR *before* it was circulated for public comment.

In his August 12 letter to me, Mr Mathews disagreed with the above-stated position and stated that "[s]ufficient detailed grading and geotechnical information is available in the Draft EIR." This is simply not the case. Indeed, without the grading plans and the geotechnical grading plan review which G.A. Nicoll indicates will "accompany" the Grading Application, the information regarding grading impacts and mitigation measures in DSEIR 566 is entirely inadequate. The only grading plan set forth in the DSEIR is a *conceptual* grading plan which has been photocopied and reduced to such a level that it is completely unreadable. Although the DSEIR makes reference to soils reports that were prepared in connection with DEIR 561, these reports were prepared in connection with a *different* project and do *not* address the same rough grading operations involved in constructing the 705 units of manufactured housing which are the subject of the Grading Application

The *only* soils report referenced in DSEIR 566 which addressed the 705-unit Project is the one found in Appendix D to the DSEIR. However, that report makes no bones about the fact that it was only "prepared at an EIR level" (whatever that means). In fact, the Geotechnical Environmental Impact Report prepared by G.A. Nicoll & Associates, dated March 14, 1997, expressly states that a "*more detailed evaluation* of the slope stability, including analysis of buttress backcuts and forecuts, individual cut slope buttresses, etc., will be conducted during the 40-scale grading plan review to accompany the grading permit application " (Appendix D, p. 4, ¶ 4; emphasis added.)

The March 1997 report prepared by Nicoll & Associates also states at page 16 that "*[c]omplete details* of the corrective grading will be illustrated in the final geotechnical report for the site, which will be submitted for *grading plan permitting* purposes." This is obviously a concession by the soils engineer of record for the Project that more detailed geotechnical analysis must be performed before the County will be in a position to approve the Grading Application and issue a grading permit to the Applicant.

The question which naturally arises, therefore, is *why* is DSEIR 566 being processed for certification *before* this more detailed information has been made available to the County?

The above question must be answered by the Department and cannot be dismissed as a mere hypertechnical inquiry relevant only to lawyers and judges Indeed, the question goes to the very heart of the problem facing anyone who tries to determine -- *without* the benefit of the 40-scale grading plans for the entire Project and the geotechnical review of those plans -- how extensive, how costly, and how time-consuming the grading operations for the Project will be.

D. Important Details Regarding The Nature And Extent Of The Proposed Grading Must Be Provided In Order To Determine The Cost And Duration Of The Grading And To Ascertain Whether The Affordable Housing Condition Imposed On The Project Is Still Achievable.

Without knowing certain basic details regarding the nature and extent of the millions and millions of cubic yards of corrective or "remedial" grading that will need to be undertaken in constructing the Project -- such as, for example, the estimated depth of the removals (possibly up to 120' deep in places!), the limits of the backcut that may be left open at any one time without increasing the risk of slope failure beyond the 10% estimated failure rate, the recommended procedures for controlling groundwater encountered during excavation, etc. -- it is *not* possible to develop a reliable estimate of the cost or duration of the grading activities to be performed at the Project site.

According to section 4.2 of DSEIR 566, all of the rough grading at the Project is to be "completed in one *continuous* phase." (DSEIR, at p. 4-22, emphasis added.) Assuming this is true,[1] then all of the persons living in close proximity to the Property, including the monks at the Monastery, the priests and students at St. Michael's Abbey, and the residents of the Hidden Ridge and Portola Hills developments, would be keenly interested in knowing how many months or *years* they could expect to be subjected to the noise, dust, diesel smells, and bare-dirt conditions which would be caused by the veritable army of large earth-moving equipment (e.g., scrapers, dozers, blades, compactors, trucks, etc.) that would have to be deployed at the Project site.

However, without being allowed access to the 40-scale grading plans for the entire Project and the grading plan review containing all of the soils engineer's

[1] After being compelled to make separate arrangements with the Applicant to pay for copies of the 40-scale grading plans relating to the Grading Application, the Society was surprised to learn that the plans made available by the Applicant cover only a *portion* of the Project referred to as "Phase I." This would clearly seem to suggest that the statement in DSEIR 566 that all grading will be completed in one continuous phase is not true.

specifications and recommendations for undertaking the proposed 8.9 million cubic yards of remedial grading work, including the construction of buttresses, shear keys, stabilization fills, and subdrain systems, no grading contractor in Orange County could even begin to estimate the amount of labor, material, and equipment that would be required to rough grade the Project in one continuous phase. In fact, to even project an average daily production rate for the remedial grading operations without knowing the soils engineer's recommendations contained in the grading plan review would be nothing short of wild speculation.

Interestingly, without providing any explanation or breakdown of any kind, the Applicant's consultant has projected an average daily production rate of 30,000 cubic yards per day for the "total project-related grading," amounting to 11.5 million cubic yards. (DSEIR, at p 4-22.) Based on this projected rate, it has been estimated in DSEIR 566 that all of the rough grading at the Project "would require approximately 18 months to complete" (Id.) To say the least, this estimate strains credulity, and raises serious questions about whether the duration of the Project grading has been purposely understated in the DSEIR.

Since almost 80% of the grading (8.9 out of a total of 11 5 million cubic yards) will consist of slow, costly, and very difficult remedial work to stabilize the proposed slopes by means of landslide shear keys, buttresses, and stabilization fills, it is nothing short of incredible that anyone could even suggest that this work -- which will involve deep slot-cutting that will have to be performed by using special excavating equipment and extremely conservative backcutting procedures -- could be accomplished at anything close to 30,000 cubic yards per day on *average*.

In fact, the Society has engaged the chief estimator of a local grading contracting firm as a consultant, but, without having access to all the grading plans and to the grading plan review to know what the soils engineer will be recommending regarding how the remedial grading work will have to be performed at the Project, he has been unable to formulate any reasonable estimates of the time or cost that will be involved in the grading -- except to note that the 18-month projection set forth in DSEIR 566 appears to be grossly *underestimated*, possibly by a factor of 100% or more.

The reason that it is important to know the approximate *cost* of the rough grading is that, unless one knows what kind of dollars are involved, one cannot determine whether the measures proposed in DSEIR 566 to mitigate the geotechnical hazards at the site (e.g., landslide shear keys, buttresses, stabilization fills, etc) are truly *feasible*, within the meaning of CEQA section 21061.1, and can be "accomplished in a successful manner within a reasonable period of time, taking into account economic . factors" In other words, the costs of the remedial grading work could turn out to be so prohibitively

expensive in light of the economics of the Project that the mitigation measures proposed in the DSEIR might not be feasible and thus could not be used to "substantially lessen" the significant impacts of the grading, within the meaning of CEQA Guidelines section 15091.

Moreover, without knowing the *cost* of the proposed mitigation measures for the grading (i.e., the 8.9 million cubic yards of remedial work), one cannot determine whether the economics of the Project would make it even remotely possible for the Applicant to meet the 66.6% affordable housing requirement which was imposed as a condition of approval on the Tract Map when it was originally approved in 1979. Although there is a passing reference to this requirement on page 4-11 of DSEIR 566, there is no discussion of whether the requirement of selling 470 of the 705 units of manufactured housing "in the affordable range" would be achievable, even in part, considering the cost of developing the Project at today's prices for labor, equipment, and material.

For CEQA compliance purposes, it is imperative that a comprehensive discussion regarding the feasibility of achieving the affordable housing requirement be included in DSEIR 566 and that the document then be recirculated so that the public can see and comment on what evidence there might be, if any, to support any proposed findings or statement of overriding considerations prepared by the Department which attempted to cite the affordable housing component of the Project as a "benefit" which might outweigh the unavoidable adverse impacts of the Project, within the meaning of CEQA Guidelines section 15093.

If the Department were to supply the Society with the information it has requested -- specifically, the 40-scale grading plan for the *entire* Project and the geotechnical review of all the grading plans -- the Society would be willing to perform the economic analysis necessary to determine whether it would be economically feasible, in light of land acquisition and debt service costs, taxes, planning costs, grading costs, and construction costs, for the Applicant to develop 705 units of manufactured housing and to sell two-thirds of these units as affordable housing. This analysis could then be made a part of DSEIR 566 and the document could be recirculated for public review and comment

E. <u>The Discussion Of Soils Impacts And Grading Mitigation Measures In DSEIR 566 Is Seriously Deficient And Fails To Address Significant Adverse Impacts Which Will Be Caused By The Rough Grading</u>.

To assist it in analyzing and commenting on the "Soils and Geology" section of DSEIR 566, the Society has engaged the services of Kenneth R. King, a registered civil engineer, and John R. Byerly, a registered geotechnical engineer.

Unfortunately, the assistance provided by these two consultants has been severely limited due to their inability to obtain access to the 40-scale grading plans and the accompanying grading plan review.

Despite not being able to review the essential documents relating to the Grading Application, Messrs King and Byerly have nonetheless found serious deficiencies in how important geotechnical issues have been analyzed, or overlooked, in DSEIR 566. In the hope that DSEIR 566 will be revised and recirculated with the appropriate documentation and a more complete analysis of the true impacts and feasible mitigation measures associated with the rough grading of the Project, the Society is providing the comments received to date from Messrs. King and Byerly.

1. **Comments From Ken King.**

Attached as Exhibit "B" hereto and incorporated herein by reference is a copy of Mr King's preliminary review of section 4 2 "Soils and Geology" of DSEIR 566 The Society requests that each of the points raised in Mr. King's report be carefully considered and responded to by the Department. In addition, the Society asks that DSEIR 566 be revised and recirculated with the information necessary to address the deficiencies cited in Mr. King's report, particularly with respect to the failure of the DSEIR to analyze the devastating and potentially irremedial impacts which the excavation and dewatering activities will have on the water wells surrounding the Project site.

A recent article appearing in the *Los Angeles Times*, a copy of which is attached as Exhibit "C" hereto and is incorporated herein by reference, supports the concerns raised by Mr King, for it reports on how the tunneling and dewatering activities for the construction of the Los Angeles subway system have dried up local streambeds and so drastically depleted groundwater resources that once lush plants and vegetation have died off. DSEIR 566 should address whether the environmental parade of horribles discussed in the *L.A. Times* article could occur as a result of the grading activities to be undertaken in constructing the Project. This requires a careful study -- not simply a response to comments -- and the Society requests that it be undertaken *before* any further action is taken to process the Grading Application.

2. **Comments From John Byerly.**

The comments received from Mr Byerly regarding section 4.2 of DSEIR 566 may be summarized as follows:

(a) Perched groundwater was encountered in the geotechnical investigations on this site at various elevations in many of the test borings by G.A. Nicoll

& Associates and others. DSEIR 566 alludes to "potential dewatering activities." Remedial grading will require the construction of buttresses and extensive shear keys, involving an estimated 8.9 million cubic yards of earth The excavations for the shear keys will surely intercept water bearing soil and bedrock layers The potential effect of the disruption of these water bearing layers on water wells located downstream of this project site has not been evaluated in the DSEIR.

(b) During construction, dewatering will remove significant quantities of groundwater and discharge the collected water into existing surface drainage systems The potential impact of the discharge of the removed groundwater, including turbidity, chemical water quality, and potential for erosion and pollution of streams and other riparian areas subject to regulation by state and federal authorities has not been addressed in the DSEIR.

(c) When the shear keys are completed, they will provide a permanent barrier to the lateral transmission of the presently existing groundwater flow The groundwater will tend to accumulate behind the shear keys, and could surface unless permanent dewatering systems are provided The analysis of the practicality of permanent dewatering systems, whether passive or requiring well points and pumps, and the long term effect of dewatering system discharge has not been evaluated in the DSEIR.

(d) Approximately 2.6 million cubic yards of excavation is estimated to "achieve planned elevations and profiles." An additional 8.9 million cubic yards of remedial grading is also described, including 7.5 million cubic yards for shear key and buttress construction. The DSEIR concludes that this grading "would not result in any impact on the stability of adjacent properties." While engineering analysis may show that the *completed* grading improvements would not have an adverse impact on the stability of adjacent property, the actual *construction* of these grading improvements may have immense impacts on neighboring properties such as the Monastery and the Abbey. For example, the excavation for shear keys will remove support for existing landslide masses, and will expose landslide shear planes. No discussion of the details of assuring adequate support for the landslides extending onto adjacent properties during the excavation and backfilling of shear keys has been provided in the DSEIR.

(e) Currently, both the Monastery and the Abbey are experiencing ongoing distress due to land slippage. As such, the risk of activating existing landslides and triggering catastrophic land movement on these adjacent properties, particularly during the shear key excavation and backfill process, should be addressed in great detail in the DSEIR.

(f) An average daily grading rate of 30,000 cubic yards per day is projected in the DSEIR. However, it is inconceivable that the excavation and filling for the shear keys and buttresses, which constitute at least two-thirds of the total grading anticipated for the Project site, can be accomplished at a grading rate of anything more than 10,000 cubic yards per day at best. Even at the rate of 10,000 cubic yards per day (which is *optimistic* because, if wet material is required to be top-loaded, then only a rate of 5,000 cubic yards per day could be achieved), the grading for the shear key and buttress construction alone will require 35 months to complete -- which is nearly *twice* the duration estimated in the DSEIR. This extended period of grading will also expose the inherently unstable conditions at this site during grading to at least three, if not four, rainy seasons and this has not been accounted for in the DSEIR.

(g) Appendix D of DSEIR 566 ("Geotechnical Environmental Impact Report") presents a brief commentary regarding the geotechnical conditions at this site, and a brief review of recommendations for mitigating and remediating adverse conditions. The County of Orange Grading Manual (Board of Supervisors Resolution No. 81-1358) and current geotechnical practice require a geotechnical review of 40-scale grading plans to be prepared by the developer's geotechnical consultant. The grading plan review report is required when there is a need for an updated preliminary report. The original preliminary geotechnical investigation was performed in 1994, but was done in connection with a different project that involved less extensive grading. Subsequent investigations have focused on EIR issues, and have not provided the required specificity to analyze the significant effects of the grading, including impact of dewatering during and following construction, slot cutting or staged excavation to assure ongoing support of landslide masses to be stabilized, backcut and forecut slope inclinations, and groundwater water control criteria. The grading plan review report should include all recommendations and geotechnical criteria necessary for a grading contractor to prepare a bid to accomplish the rough grading, and this report should be made part of the DSEIR.

(h) Proposed mitigation measure AM-47 on page 4-33 of the DSEIR references total settlements of 4 to 6 inches or more in some areas, and suggests "the degrees and rates of settlement shall be analyzed during the final design phase." The grading plan review report is an appropriate document for this analysis. However, the report should be prepared now, instead of later, and should be made part of the DSEIR.

(I) A cursory review of the "Phase I" grading plans for a portion of the Project underscores the need for access to the grading plan review. For example, with respect to the proposed buttress excavation near the intersection of El Toro Road and the proposed main entrance road to the Project (Saddleback Meadows Drive), the main question to be answered by the grading plan review is how much back slope can be open at any one time to ensure only the 10% slope failure rate predicted in the DSEIR?

(j) Since the remedial grading quantities are 3.5 times greater than the onsite cut/fill quantities, a large, accessible area will be needed for stockpiling and drying operations, but the grading plans are silent on this point Will off-site areas be needed for stockpiling and for processing wet material? Another question to be answered is how will the slope rights beyond the limits of grading shown on sheet 4 of 13 of the grading plans be obtained in order to construct the buttress? These questions must be answered before the Grading Application can be approved, and thus they should be addressed in the DSEIR.

In conclusion, the Society sincerely hopes that, in light of the important questions and issues raised above regarding the geotechnical impacts of the Project, the Department will request the Applicant to substantially revise and supplement the "Soils and Geology" section of DSEIR 566 so that the DSEIR can be recirculated for public review and comment once all of the grading plans and the grading plan review have been made part of the DSEIR. At that point, the Society and its consultants will be in a much better position to understand and comment on the true environmental effects of the proposed grading and the feasibility of the mitigation measures designed to lessen such impacts Thank you in advance for the Department's anticipated cooperation in this regard

Very truly yours,

Edmond M. Connor

Re: Saddleback Meadows/Draft EIR 566
Request for Re-Noticing of Public Comment Period

Dear Nick:

This will confirm this afternoon's telephone conversation during which you kindly agreed to provide my client, the Vedanta Society of Southern California (the "Society") with an extension of time, to and including next Friday, August 15, 1997, within which to submit comments on Draft EIR 566. You explained that you had consulted with John Buzas and had concluded that, since various County personnel were unavailable to make a final decision on the requests set forth in my August 6 letter to Messrs. Brantley and Greiman, a three-day extension of time seemed to be an appropriate "stop-gap" remedy under the circumstances.

I understand that, when the appropriate personnel are available at the County next week, I will receive a definitive answer to the requests set forth in my August 6 letter. I certainly appreciate receiving the three-day extension, but my firm and the Society's geotechnical consultants still need more time to review the grading plans and the grading plan review before any of us will be in a position to submit comments on Draft EIR 566. Although the public review provisions of CEQA and the State CEQA Guidelines would suggest that we should not have been required to do so, we have already been compelled to make separate arrangements with, and to pay money to, the

developer's agent to obtain the right to review the grading plans for which a grading permit is being sought.

However, even if we were willing to pay additional money for the right to gain access to the grading plan review by the soils engineer of record, we could not do so because that report has not even been completed as of this date. Of course, Appendix D to Draft EIR 566 expressly states that a geotechnical review of the 40-scale grading plans will be prepared to accompany the grading permit application, but, for whatever reason, the grading plan review has not been finalized and is not available for any member of the public to even see it, much less study it in detail. That really puts the Society, and all other members of the public, at a tremendous disadvantage in being able to adequately comment on the Draft EIR.

As I explained to you in my earlier phone message, section 15146 of the State CEQA Guidelines requires that the degree of specificity to be found in Draft EIR 566 must be commensurate with the stage of development that is being evaluated. In other words, since the construction of grading improvements is being analyzed in conjunction with a grading permit application, the *specific* details of the grading, and the impacts and mitigation measures associated therewith, must be addressed in the Draft EIR. Moreover, under section 15147 of the CEQA Guidelines, all technical data, maps, plans, etc., which are necessary to make a "full assessment" of the environmental impacts of the project must be set forth in the appendices to the Draft EIR, and such appendices "shall be *readily available* for public examination." (Emphasis added.)

The California courts have not hesitated to enforce the above requirements by striking down EIRs which have omitted important technical information, even if the information was found to be available from other sources. As stated by our own Fourth District Court of Appeal, "whatever is required to be considered in an EIR must be *in that formal report*; what any official might have known from other writings or oral presentations cannot supply what is lacking *in the report*." (*See, Santiago County Water District v. County of Orange* (1981) 118 Cal.App.3d 818, 831; *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 727.)

As the above authorities indicate, both the grading plans and grading plan review should have been (1) set forth in the Appendices to Draft EIR 566 and (2) readily available to all members of the public during the entire 45-day comment period. Since the County will not issue any grading permit to the developer without the grading plans and the grading plan review having been approved by County staff, these documents should not have been *excluded* from the CEQA review process. However, since these documents were, in fact, omitted from Draft EIR 566 and have never been available at the

County for public review, I think it only fair that the County take quick action to correct these problems.

My proposal would be that the County request the developer to (1) complete the grading plans and the grading plan review and submit them to County staff as soon as possible and (2) revise Draft EIR 566 to not only include these documents as part of the Appendices, but also to adequately address them in Volume I of the EIR. Once the grading plans and grading plan review have been made "readily available" for public review, then a new 45-day period for submitting comments on Draft EIR 56 should be re-noticed.

Again, I apologize for burdening you with this issue in Ben de Mayo's absence, but I sincerely believe, Nick, that fundamental fairness, not to mention the strict dictates of the State CEQA Guidelines, requires the County to remedy the problems which have occurred as a result of the grading plans and grading plan review not having been available for public review prior to the expiration of the comment period on Draft EIR 566. The problems are easily corrected as I have suggested above, and I hope the County will do just that. Thank you for your courtesy and cooperation in doing what you can to make that a reality.

Very truly yours,

Edmond M. Connor

AN INDEPENDENT REVIEW OF THE DRAFT SUBSEQUENT EIR No. 566 FOR THE SADDLEBACK MEADOWS PROJECT

INTRODUCTION:

The purpose for this report is to document the results of a review of engineering and geotechnical data provided in Section 4.2 SOILS AND GEOLOGY of the Draft Subsequent EIR No. 566.

COMMENTS:

1. Page 4-19 Ground Water - Ground water will be exposed as the deep shear keys excavated. Dewatering will be required. The impact of dewatering this land mass has not been addressed. Several issues which must be addressed include the following:
   a. The northerly, westerly and southerly sides of the project site are ringed by water wells. These wells depend on the ground water supplies for their very existence. There is a high probability that the excavation and dewatering of the slide plane shear keys will dry up the surrounding wells. Once drained, these wells will never come back.
   b. Dewatering of the shear keys will become a permanent operation. To avoid build-up of water behind the shear keys, it is mandatory that permanent dewatering facilities be installed. It is presumed that these dewatering facilities will drain to Los Alisos Creek, which is shown as a blue line on the USGS Quad Map. The impact of a permanent alteration to the flow in Los Alisos Creek has not been addressed.

2. Page 4-22 Grading, last two paragraphs - The proposed average daily grading of 30,000 cubic yards/day does not meet the test for reasonableness. The bulk of the 11.5 million cubic yards of earth moving takes place in the slide plane shear key excavations, as much as 120 feet deep, with ground water flowing in from the uphill side. The soil must be excavated, hauled up the slope to the top, spread for drying, re-excavated, hauled to the bottom of the trench, and compacted. If the true rate of earth moving is 12,000 cubic yards/day, the 18 month designated time frame for earthwork becomes 44 months, or 3.7 years. The impact of 3.7 years of heavy earth moving equipment next door to the Ramakrishna Monastery and St. Michael's Abbey has not been addressed.

3. Page 4-29 AM 2-16 - Remedial grading of the buttresses and shear keys is proposed in a simplistic fashion without any consideration of the risks to adjoining properties. Several issues related to remedial grading need to be addressed:
   a. The mere act of excavation a deep trench in front of a slide plane which is already known to be active is potential suicide. Removal of the confining soils may trigger the slide to move. Once the landslide is allowed to move, the slide takes on a life of its own. There is no way for man to stop it.
   b. Back cut failures have been estimated at 10%. This failure rate is not realistic in a deep trench with water bearing strata at numerous locations along the cut face. The magnitude of back cut failures will directly impact the quantity of earth to be moved, the time it takes to complete the grading, and the risk to adjoining properties. A realistic assessment of back cut failures and related consequences must be addressed.

4. Page 4-29 AM 2-18 - The installation of permanent subdrain systems is mandatory at stability fills and shear keys. The consequences of installing these drain systems have been ignored:
   a. The impact on adjoining water wells.
   b. The impact on Los Alisos Creek.

5. Page 4-31 AM 2-32 - Subsidence shall be assumed as ¾ to 1½ inches for grading design purposes. This is in direct conflict with Page 4-33 AM 2-47 which predicts settlements of 4 to 6 inches or more. Settlements of 4 to 6 inches or more are a virtual guarantee for lawsuits.

LOS ANGELES TIMES

Tunneling Is Drying Up L.A. Canyons, Experts Caution

SUNDAY, AUGUST 10, 1997

Subway: Waterfall, streams vanish as MTA pumps out water. Agency admits concern but also cites lack of rain.

By FRANK CLIFFORD and RICHARD SIMON
TIMES STAFF WRITERS

LOS ANGELES—Even in Los Angeles, where ocean beaches and snowcapped mountains are part of the everyday landscape, a 50-foot waterfall in the neighborhood is a wonder to behold.

At least it was. The waterfall, which spilled from a rock precipice high over John Chickering's house in Nichols Canyon in the Hollywood Hills, has dried up. So have several streams that watered the canyon and the hills nearby that residents say had run uninterrupted for at least 50 years.

Although it has been a dry year, some fear that the weather has less to do with it than the subway.

The drying up of springs and streams in Nichols Canyon and neighboring hillsides over the last few months, experts say, is evidence that boring subway tunnels through the splintered, porous bedrock of the Hollywood Hills just west of Cahuenga Pass is having a much greater impact on the natural environment than predicted.

For the thousands of people like Chickering living in the verdant hills above the subway route, the of the streams is more than a matter of aesthetics. The year-round flow supports deep-rooted trees and plants that retard the spread of fire and bolster the slopes against erosion and mudslides. The lush vegetation also supports deer, coyotes and a variety of smaller animals.

"It was unbelievable," Chickering said. "I looked out of my window one morning, and the falls were no more. The water had stopped. It was like a curse. Then I remembered the subway and what people had been saying about all the underground pumping going on."

As powerful pumps drain the advancing tunnels of unwanted moisture at a rate of nearly 1 million gallons a day, the water table that fed the waterfall and the streams, as well as the area's abundant vegetation and wildlife, dropped as much as 134 feet, officials say.

Pumping has been draining an untapped water source—the Hollywood basin—of up to one-third of its annual capacity. Virtually all the water pumped out of the tunnels winds up in Santa Monica Bay.

The area most affected by the pumping is a stretch of canyons and hillsides between Laurel Canyon and the Cahuenga Pass that includes one of the city's most popular urban parks, 133-acre Runyon Canyon.

The tunneling, which is passing 165 feet to 900 feet under the Santa Monica Mountains on its way from Universal City to Hollywood, has gone more slowly than expected. The boring machines are expected to reach Hollywood this fall.

Late in July, MTA consultants noted "a substantial decrease" in the water flowing from two streams in Runyon Canyon.

Nichols Canyon, where three year-round streams have dried up, is just to the west. The beauty of the area—which has been the subject of paintings by artist David Hockney—has not been lost on MTA officials.

"It's spectacular. The water comes down from two different directions. If you've driven up Nichols Canyon, part of it looks like a rain forest," said James Sowell, the MTA's manager of environmental compliance.

Los Angeles County supervisor and MTA board member Zev Yaroslavsky, who represents the area, points out that some of the streams in the area dry up every year and that this year is an especially dry one.

"We haven't had any rain since January. You can find dry creek beds and brown hillsides all over the Santa Monica Mountains," Yaroslavsky said.

"But some of the problem is undoubtedly due to the tunneling," he added.

Although MTA officials say they aren't sure what is causing the springs and streams to dry up, they are paying to replace a portion of the lost flow with water from the Los Angeles Department of Water and Power.

"You can acknowledge an effect without having any clue as to what the cause is," Sowell said. "We are responding to the community's concerns. They see MTA as the cause. . . . We're attempting to be good neighbors."

Replacing the Flow

In recent weeks, the MTA began tapping into several mains, allowing up to 34 gallons per minute of DWP water to flow into the stream beds and over Chickering's waterfall.

Chickering and his neighbors say the supplemental flow is a thin stream compared to what it was.

"It's enough water to provide an illusion of normalcy," said Nichols Canyon Assn. President Herschel Gilbert. "But it doesn't replenish natural flows, even at this time of year. And if the springs don't come back, these canyons will lose the rich array of plants and animals that make them special."

Unfortunately, there is no record of what the normal flow has been, according to Yaroslavsky's office.

"People are saying everything should be returned to normal, but nobody knows what normal is," said Howard Katz, a land-use lawyer retained by Yaroslavsky to monitor the impact of the tunneling.

The pumping beneath the Hollywood Hills is part of the ongoing dewatering of the subway route that in the past has sucked out as much as 380 million gallons a year.

That's about the same amount of water consumed by 2,300 families in a year.

The loss of that water in a city frequently battling other communities over water rights has not gone unnoticed by state officials, who asked the MTA to look into ways to conserve the water that the agency is pumping into the ocean.

In a study conducted last year, the MTA stated that it would be prohibitively expensive to recycle water into the hills.

Transit officials made up their minds more than a decade ago that tunneling under the Hollywood Hills wouldn't have much of an environmental consequence.

"By confining ground-water control activities to the immediate area of excavation, the Metro Rail project will avoid potential adverse impacts on urban flora ca by lowered water table," said t project's environmental impact r port.

MTA officials now say that a impact from pumping will be te porary and predict that affect stream flows will resume after t excavation is done.

But officials also acknowled that some dewatering will contin indefinitely to relieve hydrosta pressure on the tunnel walls.

And no one, including the MT is certain what the effects of th pumping will be.

Effect on Plants Could Be Severe

But if the water table does r rise and perennial streams do r come back, the effects on t adjacent hills could be severe, a cording to a consultant hired by coalition of residents.

The most deeply rooted tre and plants, among them Weste sycamore, acacia, laurel sumac a

'I looked out of my window one morning, ar the falls were no more. . . . Then, I remembered the subwa and what people had been saying about all th underground pumping going on.'

JOHN CHICKERING
Lives in Nichols Canyon

California holly—which stabili the steep hillsides—would be har pressed to survive. In addition, lu canyon bottoms that depend year-round stream flows will l the verdure that has made the oases for wildlife.

"The flora which draws its wat from the springs will be severe stressed," said a 1996 report MHB Technical Associates of S Jose.

"Effects could include increas dieback of deep-rooted plants li laurel sumac, which could result increased erosion, slides and floo ing," said the report. "Mamm and some bird life will eith migrate, diminish in abundance die."

PUMPING: Streams Drying Near the Subway Tunneling

The study predicted that if the water table was lowered by more than 50 feet, streams in Runyon Canyon and adjacent canyons "would most certainly dry up."

Armed with those findings, the neighborhood coalition sued the MTA to require the agency to conduct another environmental impact report. The suit was settled last year, with the MTA agreeing to take a variety of measures to prevent the underground pumping from harming streams, plants or wildlife.

All along, MTA officials said they could seal water out of the tunnels by using grout to plug fractures in the rock. After the consent decree, the agency augmented the grouting operation, working both ahead of and behind the tunnel-boring machines.

In early March, about nine months after the MTA had begun tunneling under the hills, Chickering first noticed a change in the waterfall that spilled dramatically down a stairway of rocky ledges to a stream flowing to the mouth of Nichols Canyon at Hollywood Boulevard, about two miles south.

By midsummer, the falls, the stream and two tributary streams in Nichols Canyon had dried up.

For the first time, the free-flowing water supply that ran the length of the three-mile canyon had stopped, said Gilbert, who has lived in the canyon for 47 years.

Meanwhile, two canyons away, Vivian Harrison was observing a similar phenomenon. A spring that bubbled out of the ground on her property for the 23 years she has lived there had suddenly gone dry.

MTA May Spend $50,000 a Year

Officials estimate that the MTA will spend about $50,000 a year replacing water that nature used to supply to Chickering's waterfall, Harrison's spring and two other streams.

In addition, the MTA is watching at least 30 other streams in the area. Some are seasonal and dry up every year during the summer and fall.

But the MTA is not promising to monitor springs or supply replacement water indefinitely.

Agency officials say they are hopeful that once the tunneling is finished and the rock walls are thoroughly grouted, there won't be any more need to pump. The drawdown will cease, and with the help of winter rains, springs and streams will be recharged.

"A lot depends on the effectiveness of the grouting program," said Sowell, who conceded that figuring out where to grout is something of a guessing game. "It's a difficult art. It's not a science, by any means."

And what will the agency do if the springs don't return?

The consent decree requires the MTA to take remedial action for five years. After that, Sowell said, "we have the option to continue to grout over time. What is a reasonable amount of time? We're going to try to get a handle on that."

Yaroslavsky took a harder line.

"If the tunnels have to be pumped forever and that causes a problem, why assume we couldn't pump the water back up into the hills? I wouldn't have any reservation in requiring that."

AL SEIB / Los Angeles Times

Vivian Harrison, above, sits at now-dry site of a spring that had flowed freely for at least 23 years. Below, a creek bed in Nichols Canyon that recently went dry.

AL SEIB / Los Angeles

Herschel Gilbert, president of Nichols Canyon Assn., walks near 50-foot waterfall in John Chickering's backyard that had dried up until the MTA gan using city water to partially replenish the f

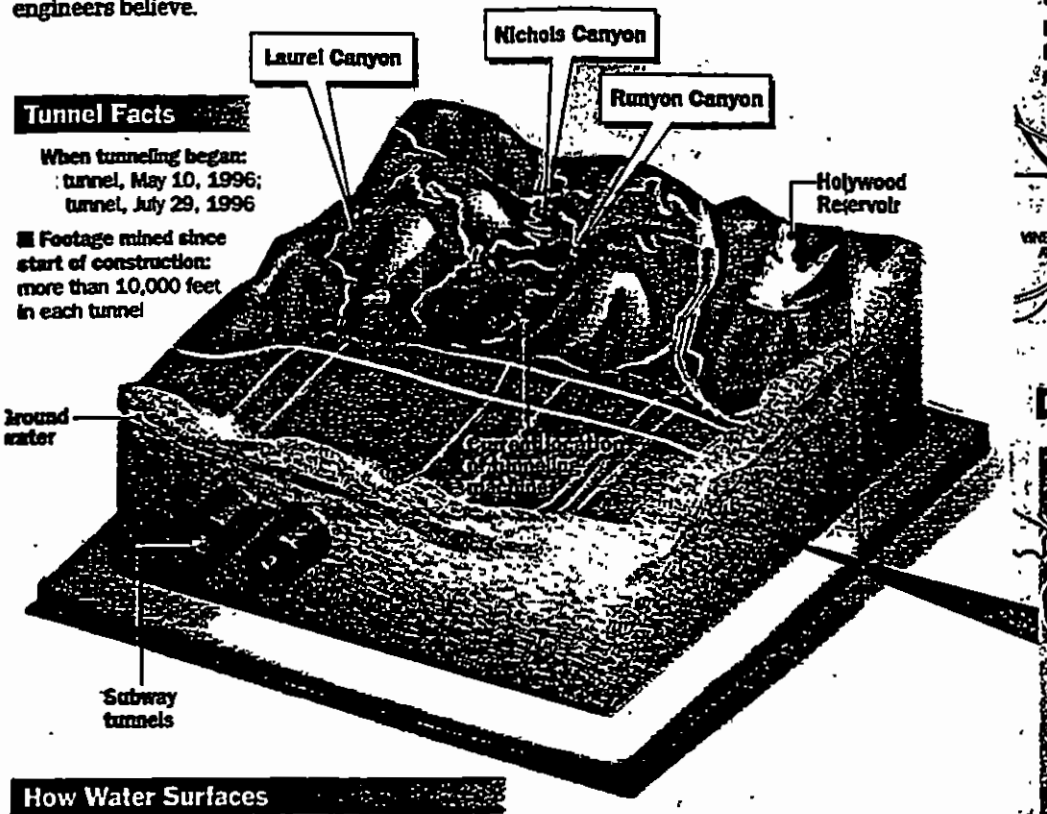
Water and the Subway

A drop in ground water levels near construction of the MTA's Red Line is suspected to have caused some natural waterfalls and springs to cease flowing. The MTA is replenishing the falls, pumping fresh water through a pipe at the site. When tunnel construction is finished, ground water levels will return to normal, MTA engineers believe.

Tunnel Facts

When tunneling began:
tunnel, May 10, 1996;
tunnel, July 29, 1996

■ Footage mined since start of construction: more than 10,000 feet in each tunnel

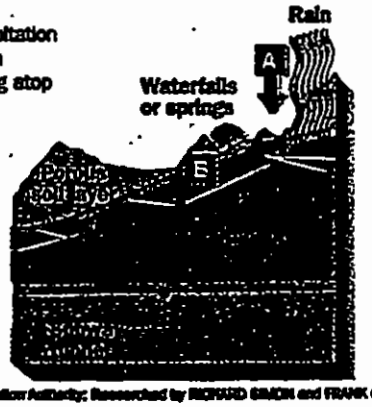


How Water Surfaces

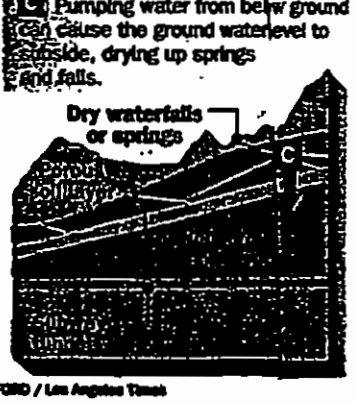
The MTA is pumping 850,000 to 1.5 million gallons of water per day from its tunnel sites. This water flows into drainage channels and on to the L.A. River, eventually emptying into the ocean. Here's how a change in ground water levels can affect springs:

A Water from precipitation seeps down through porous soil, collecting atop a nonporous layer.

B Pushed by gravity or pressure, water flows underground, surfacing through cracks or faults.



C Pumping water from below ground can cause the ground water level to recede, drying up springs and falls.



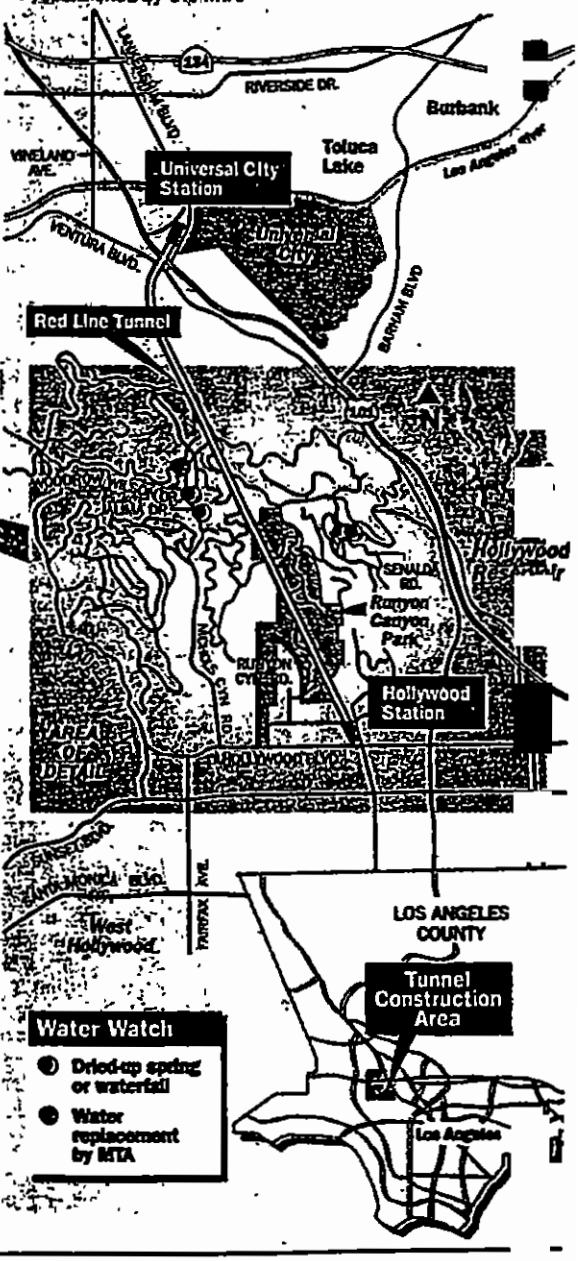
Source: Metropolitan Transportation Authority; Researched by RICHARD SIMON and FRANK CLIFFORD / Los Angeles Times

The MTA's Monitoring Program

MTA workers had been monitoring 37 streams in the vicinity of tunnel construction and are now widening the monitoring area.

■ The level of the water table above the tunnels has dropped as much as 134 feet since the start of construction.

■ Of the 37 streams and springs under observation, five have dried up. In several locations, water is being replenished by the MTA.



County of Orange
Planning & Development Services Department

THOMAS B. MATHEWS
DIRECTOR

300 N. FLOWER ST.
THIRD FLOOR
SANTA ANA, CALIFORNIA

MAILING ADDRESS:
P.O. BOX 4048
SANTA ANA, CA 92702-4048

TELEPHONE:

August 12, 1997

Vedanta Society of Southern California
c/o Connor, Culver, Blake & Griffin, LLP
Mr. Edmond M. Connor, Attorney
2600 Michelson Drive, Ste. 1450
Irvine, California 92612

Subject: Saddleback Meadows DEIR 566 - Request for an Extension of Time

Mr. Connor:

This letter is a followup to your correspondence to offices of the Planning & Development Services Department and County Counsel dated August 6 and August 8, 1997. You have requested a 30-day extension of time to submit comments on Draft EIR 566, based upon your position that the grading plans for the proposed project have not been available for your consideration. You also recommended that a new 45-day review be established for the project with copies of grading plans and grading plan review be provided to the public.

The Planning & Development Services Department has reviewed your request in light of the California CEQA Statutes and Guidelines and County of Orange environmental procedures. This review has led to the following conclusions:

1. Although a grading permit application is the initiating activity which resulted in the determination that Draft EIR 566 be prepared, grading is only a part of the issues addressed in the CEQA document. The County's CEQA action will consider the whole of the action, which in this case, is the development of a 705-unit manufactured housing subdivision and small retail site on the 222± acre site. Other major considerations include the impacts to biological resources and land use compatibility.

2. Sufficient detailed grading and geotechnical information is available in the Draft EIR. On Page 2-5 of Draft EIR 566, the County incorporates by reference, Draft EIR 561. In Section 4.2, Soils and Geology, beginning on Page 4-13 of Draft EIR 566, the discussions are based upon Volume 2 Technical Appendices of DEIR 566, Appendix D, and the extensive Geotechnical Reports and investigations contained in Draft EIR 561, Volume 2 Technical Appendices, Appendix D, which are specifically incorporated into the current project. The Vedanta Society was provided all three volumes of Draft EIR 561 during the circulation of that document.

3. Draft EIR 566, including the geotechnical information from Draft EIR 561, Appendix D of Volume 2, Technical Appendices, meets standard practice of the County of Orange, which requires sufficient grading information for a planning decision. The planning level of detail includes the location of landslides, faults and other geological hazards, the types of soil and proposed grading concepts being considered. The 40-scale grading plans which you request are the level of detail required for consideration by the Subdivision and Grading Services Division. Such detail is premature at this time.

Based upon the foregoing, we feel that sufficient grading information is and has been available to the public to make comments on the adequacy of Draft EIR 566 in addressing the grading impacts related to the proposed project. Therefore, we must deny the request for an extension of time to review Draft EIR 566.

Please note, however, that, in the spirit of cooperation and your special request in light of the contiguity of your client's property with the Saddleback Meadows site, and the apparent time pressures you and your client are suffering, the County will accept and respond to your late comments, provided they are received by our offices no later than 4:00pm on August 22, 1997.

Thank you for your interest and participation in the planning process. If you have questions or need additional clarification regarding this letter, please contact Ray Brantley at (714) 834-3763.

Very truly yours,

Thomas B. Mathews, Director

1.0 EXECUTIVE SUMMARY

1.1 PROJECT SYNOPSIS

The project proposes the phased development of 705 manufactured single family housing units and a 1.5 acre, neighborhood commercial center and associated infrastructure, on a 222.23 acre site on the easterly side of El Toro Road. The gross residential density is 3.17 du/ac, with minimum lot sizes of 2,630 square feet. Fourteen (14%) percent of the project site is proposed to remain in undisturbed, natural open space and 57.6% of the site will remain in total open space. In addition to the residential component, the project also proposes eight private park sites, regional riding/hiking trail connections, and construction of a water tank site dedicated to and accepted by, the Trabuco Canyon Water District. Project implementation requires the approval of a grading plan. The grading permit application (GA960048) is based on Tract 10692, which was recorded December 16, 1988.

The project site is located within the Foothill/Trabuco Specific Plan and the Aliso Creek Corridor Specific Plan approximately ½-mile south of the El Toro Road/Live Oak Canyon Road intersection. Implementation of the proposed project would directly effect 191.39 acres of the project site, including remedial grading and fuel modification requirements and 19.77 acres offsite, for a total impact area of 211.16 acres.

A total of 2.6 million cubic yards of conventional grading and 8.9 million cubic yards of remedial grading would be required to implement the project.

The project site is designated as "Bridlewood Residential District" in the Foothill-Trabuco Specific Plan and "1B", Suburban Residential, in the Countywide General Plan Land Use Element. Project site zoning is "S", Specific Plan.

Table 5 summarizes major features for the proposed project and current surrounding residential developments:

1.2 EXECUTIVE SUMMARY

A summary of the environmental impact analysis, mitigation measures, level of significance after mitigation and the mitigation monitoring program is shown on pages 1-3 through 1-64.

1.3 PROJECT ALTERNATIVES

Pursuant to CEQA, the Subsequent EIR must assess a reasonable range of alternatives to the project action or location (Section 15126 {d} of the CEQA Guidelines). The discussion must focus on opportunities for eliminating any significant adverse environmental effects, or reducing them to a level less than significant "...even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly..." (Section 15126 {d}{1} of the CEQA Guidelines).

The EIR must identify an environmentally superior alternative among other alternatives. As with cumulative impacts, the discussion of alternatives is governed by the "rule of reason". The EIR need not consider an alternative whose effect cannot be reasonably ascertained, or does not contribute to an informed decision making and public participation process.

The following alternatives to the proposed project are evaluated in this Subsequent Environmental Impact Report.

- **Alternative No. 1 - No Project/No Development.** Alternative No. 1 examines the impacts/benefits of not proceeding with the proposed project. This alternatives is required under Section 15126{d}{2} of the CEQA Guidelines, and warrants further analysis.

- **Alternative No. 2 - Foothill-Trabuco Specific Plan - Staff Alternative A.** Alternative No. 3 was included in the Foothill-Trabuco Specific Plan as Staff Alternative "A", and proposes 150 minimum 20,000 sf lots. Under this alternative, 138 acres of the site would be disturbed by grading requirements.

- **Alternative No. 3 - Foothill-Trabuco Specific Plan - Staff Alternative B.** Alternative No. 4 was also included in the Foothill-Trabuco Specific Plan, as Staff Alternative "B", and proposes limiting development to 100 single family detached dwelling units on a 31.7 acre portion of the site.

- **Alternative No. 4 - 299 Unit Single Family Housing Alternative.** This alternative is the proposed project recommended by the OCP&DS staff during public hearings for EIR 561.

- **Alternative No. 5 - Cluster/Single Family/Multifamily Residential:** Alternative No. 5 evaluates a 318 detached and attached unit project, within a reduced development impact area (110.5 ac). Benefits of this alternative would include a substantial increase in undisturbed open space, including a wider wildlife corridor.

Table 1
PROJECT ALTERNATIVES AND GRADING SUMMARY

Alt. No.	Alternative Description	Onsite Acres of Disturbance	Offsite Acres of Disturbance	Total Acres of Disturbance
1	No Project/No Development	0.0 ac	0.0 ac	0.0 ac
2	150 SFD - 20,000 sf Lots	158.0 ac	6.6 ac	144.6 ac
3	100 SFD - 30 Acres	31.7 ac	2.5 ac	34.2 ac
4	299 Unit Single Family Housing	156.6 ac	7.86 ac	164.46 ac
5	Cluster/Single Family/Multifamily (318 DU)	110.5 ac	2.5 ac	113.0 ac

Table 2
SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

4.1 LAND USE	
Standard Conditions of Approval	
SC 1-1	Prior to the issuance of any building permits for residential construction, the developer shall comply with Board of Supervisors Resolution 82-1368 (Buyer Notification Program) which requires the developer to prepare a map denoting the existing and proposed land uses, arterial highways, and public facilities within the surrounding area for the approval of the Manager, Current Planning Services . The map content, display, and distribution shall be in accordance with the Buyer Notification Program guidelines approved by the Board of Supervisors and available at the Development Processing Center.
SC 1-2	Prior to the issuance of any certificates of use and occupancy, the developer shall provide evidence to the Manager, PDS/Building Inspection Services Division, that the Department of Real Estate has been notified that the project area is within the boundaries of a Community Facilities District (CFD), and will be subject to special taxes for public facilities and/or services.

4.1 LAND USE		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
Impact: Land Use Compatibility Implementation of the proposed project may result in potential land use compatibility impacts to O'Neill Regional Park, the Ramakrishna Monastery and St. Michael's Abbey, prior to mitigation.	No additional mitigation measures are proposed.	**Land Use:** Implementation of the proposed project would result in unavoidable adverse impacts to land use and wildlife habitat.

4.2 SOILS AND GEOLOGY

Project Design Features

PDF 2-1 A comprehensive remedial grading mitigation plan has been designed to stabilize the project site, in accordance with OCPDS requirements. The plan is depicted in Exhibit 22, included in Appendix D and proposes measures including shear keys, buttresses, removals/recompaction to reduce hazards associated with landslides, erosion and subsidence.

Standard Conditions of Approval

SC 2-2 Prior to the issuance of a grading permit, the applicant shall submit a geotechnical report to the Manager, PDS/Subdivision and Grading Services Division, for approval. The report shall include the information and be in a form as required by the Grading Manual.

SC 2-3 Prior to the issuance of any grading permits, the Manager, PDS/Subdivision and Grading Services Division, shall determine if the proposed grading complies with the grading illustrated in the plans approved by the decision-maker with regard to grading concepts, slope heights, slope ratios, and pad elevations and configuration. Significant deviations shall be reviewed by the decision-maker for a finding of substantial conformance. Failure to achieve such a finding will require processing a revised application per Orange County Zoning Code Section 7-9-139 and 7-9-150.

SC 2-4 Prior to the issuance of the first grading permit, for projects located immediately adjacent to or including portions of regional parks, significant open space corridors, or other environmentally sensitive areas, the project proponent shall provide evidence acceptable to the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Harbors Beaches & Parks Division, that graded areas will be compatible with natural land characteristics of the adjacent open space areas including techniques to enhance a smooth and gradual transition, urban edge treatment plans and incorporating view enhancement through architectural and design techniques.

SC 2-5 Prior to the issuance of any grading permit, offsite grading and/or drainage shall be conducted in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-6 Prior to the issuance of a grading permit, substantial compliance with the following shall be certified by a registered engineer in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division:

- Fill soils shall be placed in layers that are less than 8 inches thick and moisture-conditioned generally 1- to 2-percent above optimum moisture content. The existing diatomaceous soils should be moisture-conditioned to 125-percent of optimum moisture content.

4.2 SOILS AND GEOLOGY

Standard Conditions of Approval

- For preliminary earthwork computations, the following shrinkage/bulking factors are recommended for the onsite material (these do not include handling losses): Bedrock - 5% bulking; slopewash - 5% shrinkage; and Other Soils - 15% shrinkage. Grading plans shall include an area where finish grades can be raised or lowered to accommodate changes in actual material quantities.

- Dewatering shall be achieved using sumps and pumps located strategically within the excavated area. However, the excavation shall be carefully observed; if the conditions warrant, supplementary dewatering provisions shall be made. It is the responsibility of the contractor to provide an adequate dewatering system during construction.

Seismic

SC 2-7 Conformance with the Uniform Building Code and Orange County codes will insure that seismic considerations are incorporated into the structural designs. All recommendations of the geotechnical report shall be incorporated and utilized in the final construction plans for the parcels in a manner meeting the approval of the Manager, PDS/Building Permit Services Division. Larger buildings, structures with extraordinary architectural configurations, or those of tilt-up construction may require seismic analysis.

SC 2-8 The seismic exposure of the site shall be considered in the design of the proposed structures in a manner meeting the approval of the Manager, PDS/Building Permit Services Division.

SC 2-9 Geologic inspections shall be required during site grading for each parcel to confirm the absence of major faults in the local area in a manner meeting the approval of the Manager, Subdivision Grading.

SC 2-10 Prior to the issuance of any grading permits, if review of the grading plan for this property by the Manager, PDS/Subdivision and Grading Services Division, indicates significant deviation from the proposed grading illustrated on the approved tentative tract map, specifically with regard to slope heights, slope ratios, and pad elevations and configuration, the plan shall be reviewed by the Subdivision Committee for a finding of substantial conformance. Failure to achieve such a finding will require processing a revised tentative tract map; or, if a final tract/parcel map has been recorded, a new tentative tract/parcel map or a site development permit application per Orange County Zoning Code Section 7-9-139 and 7-9-150. Additionally, a new environmental assessment and determination is required.

4.2 SOILS AND GEOLOGY
Standard Conditions of Approval
SC 2-11 Prior to the issuance of any grading permit, and if determined necessary by the Manager, PDS/Subdivision and Grading Services Division, a letter of consent, in a form approved by the Manager, PDS/Subdivision and Grading Services Division, suitable for recording, shall be obtained from the affected property owners for offsite grading and/or dramage. The owner/applicant shall record said letters of consent for offsite drainage and/or cross-lot drainage prior to recordation of the tract/parcel map or prior to the issuance of any grading permit, whichever comes first.
SC 2-12 Prior to the issuance of any preliminary grading permits, the subdivider shall request that the Vector Control District initiate the survey process of the tract/parcel map site to determine if vector control measures are necessary. If warranted, such measures shall be conducted by the developer in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.
SC 2-13 Prior to the issuance of any grading permits, a Water Quality Management Plan (WQMP) shall be submitted to and approved by the Manager, PDS/Subdivision and Grading Services Division. The WQMP shall identify, at a minimum, the application and incorporation of those routine structural and non-structural BMPs outlined in the Countywide NPDES Drainage Area Management Plan (DAMP) Appendix G detailing implementation of BMPs not dependent on specific land uses, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.
SC 2-14 Prior to the issuance of any grading or building permits, the applicant shall provide, in accordance with criteria supply by EMA, a "Hazardous Materials Assessment" and a "Disclosure Statement" covering the property (both fee and easement) which will be offered for dedication to the County of Orange, for review and approval by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Monitoring Programs Division.

4.2 SOILS AND GEOLOGY		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
Impact: Slope Stability/Grading Implementation of the proposed project, prior to the application of mitigation measures would result in significant impacts related to slope stability, landslides, mud slides, subsidence and erosion.	The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division. **Grading** AM 2-15 Multiple cuts and fills (2.6 million cubic yards) to achieve planned elevations and profiles, and associated access roadways shall be required. AM 2-16 Remedial grading (8.9 million cubic yards) to stabilize the proposed slopes by means of buttresses, shear keys, and stabilization fills shall be required. Back cut failure guidelines shall be provided to the Grading Services Division prior to issuance of grading permits. AM 2-17 Removal (clean out) of all or major portions of the graben materials and softer alluvium and colluvium under most of the variable thickness fills shall be required. AM 2-18 Installation of appropriate subdrain systems within natural drainage courses and within stability fills prior to fill placement shall be required. AM 2-19 Adequate foundation and slab subgrade conditioning for the proposed development, including over excavation, capping and measures related to expansive soils shall be required. AM 2-20 Achieving suitable surface gradients to preclude ponding anywhere onsite and to control water run-off via paved/closed drainage devices shall be required.	

4.2 SOILS AND GEOLOGY			
Potential Significant Effects of the Proposed Project			
Potential Project Impacts	**Additional Mitigation Measures**		**Unavoidable Adverse Impacts**
Impact: Slope Stability/Grading Implementation of the proposed project, prior to the application of mitigation measures would result in significant impacts related to slope stability, landslides, mud slides, subsidence and erosion.	**Compaction**		None.
	AM 2-21	Wherever structural fills are to be placed, the upper 6 to 8 inches of the exposed subgrade (after stripping and/or over excavation/clean-out) shall first be scarified and reworked. In general, the dry density of the in-situ (native) material shall be at least 85 percent of maximum. In the event that lower densities are determined by field testing to exist, the depth of over excavation will be determined onsite, given due consideration to the geology of the exposed material, as well as its relative location. It is at present expected that typical depths of over excavation will be on the order of 4 to 5 feet.	
	AM 2-22	Fill shall be placed in lifts of 6 to 8 inches (loose) in thickness. Rocks exceeding 4 inches in maximum dimension are best not incorporated within the upper fill zone (say 3 feet) where foundations and most utility systems are expected to be housed.	
	AM 2-23	In all fill areas where active gradients are steeper than 5:1 (horizontal:vertical), those surfaces shall be prepared to receive fill by excavating standard keyways and benches in a stair-step configuration.	
	AM 2-24	Any loosening of reworked or in-place (native material, consequent to weathering and/or passage of construction traffic, shall be made competent.	
	AM 2-25	Temporary fills, typically associated with access ramps built to accommodate grading equipment shall be subject to removal when their use is discontinued.	
	AM 2-26	The depths of excavation shall be subject to onsite monitoring by the Soil Engineer, normally during the actual removal operations. Any surface or subsurface obstructions, or questionable material encountered during grading, shall be brought immediately to the attention of the Soil Engineer, for his determination as to proper exposure, removal and/or processing as directed.	

4.2 SOILS AND GEOLOGY		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Mitigation Measures**	**Unavoidable Adverse Impacts**
	Material Selection	
	AM 2-27 After the site has been stripped of any debris, vegetation and organic soils, such exposed onsite shall be considered satisfactory for reuse in the construction of onsite fills, provided the organic content does not exceed 3% by volume. It is recommended that highly expansive soils not be placed within the upper 4 to 5 feet thick zone underlying final pad and street grades. More importantly, no such soil is to be placed (as backfill)within a horizontal distance equal to the wall height immediately behind retaining walls.	
	AM 2-28 Any objectionable material, as determined by the Soil Engineer, shall be subject to relocation in deeper fill areas or removal offsite.	
	AM 2-29 All borrow sites shall be approved by the Soil Engineer/Geologist prior to onsite delivery. This will permit the timely allocation of such available materials for use on the project site.	
	Compaction Requirements	
	AM 2-30 Reworking/compaction shall include water addition or drying-out as needed, to bring the soils close to their optimum moisture content. All such reworked soils, placed as structural fills, shall be densified to achieve at least 90 percent relative compaction with reference to the laboratory compaction standard. The optimum moisture content and maximum dry density, for each identified soil type, will be determined in the laboratory in accordance with ASTM Test Designation D1557.	
	Shrinkage/Subsidence	
	AM 2-31 For preliminary earthwork computations, an approximate (overall) shrinkage factor of 12 percent shall be required, for the existing site soils. The above value does not include allowance for stripping nor handling losses.	

4.2 SOILS AND GEOLOGY		
Potential Project Impacts	**Mitigation Measures**	**Unavoidable Adverse Impacts**
	AM 2-32 Subsidence shall be assumed as 3/4 to 1-1/2 inches for grading design purposes. **Excavating Conditions** AM 2-33 Excavation of onsite soils shall be accomplished with standard heavy duty earthmoving or trenching equipment. Some hard cemented sandstone beds were encountered during the field exploration on portions of the site and some minor, isolated blasting may be required to remove these hard materials. AM 2-34 Heavy seepage was encountered, as indicated on the Boring Logs, at multiple elevations. Consequently, considerable water can be expected within planned excavations, typically reaching maximum discharge within 2 to 5 days after exposure. Additional nuisance water (seepage) is foreseen in nearly all major cuts decreasing in volume with time, and being less at higher site elevations as well as in cuts made late in the year. All nuisance water shall be accommodated in accordance with County requirements. **Expansion Potential** AM 2-35 Onsite materials are considered to be moderately expansive, generally. Soils of high and low expansivity are expected to comprise less than 25% of the overall pad areas. The expansivity of the actual soils placed within structural areas shall be verified during grading, prior to construction. **Utility Trenching** AM 2-36 The typical walls of temporary construction trenches shall stand nearly vertical, with only minor sloughing, provided the total depth does not exceed 4 to 5 feet. Shoring of excavation walls and/of flattening of side slopes may be required, if greater depths are necessary.	

4.2 SOILS AND GEOLOGY		
Potential Project Impacts	**Mitigation Measures**	**Unavoidable Adverse Impacts**
	AM 2-37 Trenches shall be located so as not to impair the bearing capacity nor settlement under planned foundations. As a guide, trenches shall be aligned perpendicular to foundations, and the Structural Engineer so informed to modify the foundation at the crossing, as needed. All other trenches shall observe a lateral off-set equal to their total depth. AM 2-38 Existing soils shall be utilized for trench backfill, provided they are essentially free of organic materials and oversized materials (rock, gravel, etc. in excess of 1-inch maximum size, unless within an approved soil matrix). Alternately, select granular materials (sand equivalent of 30 or greater) may be imported as backfill. Compaction should be accomplished entirely by mechanical means, subject to onsite assessment during pipeline installation. **Surface Drainage** AM 2-39 Positive surface gradients shall be provided away from slope tops per approved grading plans and adjacent to the future buildings, so as to direct surface water run-off away from structural areas and toward suitable discharge facilities. **Sulphate Content** AM 2-40 The soils sulphate content shall be ascertained during the concluding stages of rough grading, and the type of cement to be used determined at that time. **Grading Control** AM 2-41 All grading and earthwork shall be subject to on-going testing and observation by the applicants geotechnical consultant, including engineers, engineering geologists and/or technicians.	

4.2 SOILS AND GEOLOGY			
Potential Project Impacts	**Mitigation Measures**		**Unavoidable Adverse Impacts**
	Slabs-on-Grade		
	AM 2-42	Concrete slabs shall be founded on approved (reworked) in-place soils and/or on properly compacted fill. The subgrade shall be proof-rolled just prior to construction to provide a firm, unyielding surface, especially if the surface has been disturbed by the passage of time and/or exposure to construction traffic.	
	AM 2-43	Floor slabs shall be at least 4 inches thick. The Finished Floor Level should be at least 6 inches above highest adjacent exterior grade. Joints shall be provided.	
	AM 2-44	If flooring that would be affected by moisture is to be used, the slab shall be underlain by 2 inches of sand, with a 10-mil plastic sheet between the sand and the subgrade.	
	AM 2-45	Precautions in respect of expansive soils shall be taken.	
	Foundations		
	AM 2-46	The proposed structures shall be supported on conventional spread footings, supported into approved compacted fill and/or reworked native material.	
	Long Term Settlements		
	AM 2-47	The grading concept, as presently proposed, includes several areas where deep fill will result, exceeding 50 feet in depth. These soil masses may experience significant settlements, with time, of 4 to 6 inches or more. Such downward movements can be tolerated by most improvements, provided these occur at a reasonably uniform rate and rather evenly over a well distributed area. However, the degrees and rates of settlement shall be analyzed during the final design phase.	

4.2 SOILS AND GEOLOGY		
Potential Project Impacts	**Mitigation Measures**	**Unavoidable Adverse Impacts**
	Phasing of Earthwork AM 2-48 Unstable Ground Initial stability evaluations have determined that several natural slopes subject to grading are inherently unstable. Removals, therefore, shall be planned and carried out with care in order to minimize deep-seated, in-construction failures. Statistically, about 10 percent of back cuts for buttresses will fail during grading. Allowances for schedule and budget contingencies should be made. AM 2-49 Required Clean-Out Work Prior to improving the gross stability of hillsides, clean-out work will be necessary along their lowest (toe) elevations. Whereas such selective removals are essential prior to placement of additional fill, this process can trigger undesired slippage. Therefore, selective unloading of the slide mass shall be required before stabilization can effectively begin. AM 2-50 Slide Unloading Where existing slope faces are marginally safe in their present condition, the higher portions of each such slide shall require removals toward the top, prior to clean-out, and subsequent loading at the toe.	

4.3 WATER/HYDROLOGY	
Project Design Features	
PDF 3-1	A master drainage concept has been incorporated into the project design to mitigate hydrology impacts to existing OCP&DS requirements and standards. The master drainage concept, shown in Exhibit 22 and contained in its entirety in Appendix L of this EIR, proposes a series of storm drains, catch basins, inlet/outlet structures, energy dissipators and slope drains to control project drainage.

4.3 WATER/HYDROLOGY
Standard Conditions of Approval

SC 3-2 Prior to the issuance of any grading permits, the applicant shall, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division:

a. A drainage study determining the effect the proposed development and associated drainage patterns will have on existing drainage facilities.

b. Mitigate either by on-site retardation or by providing improvements appropriately to impacted existing drainage facilities.

SC 3-3 Prior to the issuance of any grading permits, the applicant shall in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division:

a. Design and convey construction funds for surface drainage improvements; and

b. Design all necessary storm drain facilities extending to a satisfactory point of disposal for the proper control and disposal of storm runoff; and

c. Dedicate the associated easements to the County of Orange, if determined necessary.

SC 3-4 Prior to the issuance of any certificates of use and occupancy, said improvements shall be constructed in a manner meeting the approval of the Manager, PF&R/Construction Division.

SC 3-5 Prior to the issuance of any grading permit, and if determined necessary by the Manager, PDS/Subdivision and Grading Services Division, a letter of consent, in a form approved by the Manager, PDS/Subdivision and Grading Services Division, suitable for recording, shall be obtained from the upstream and/or downstream property owners permitting drainage diversions and/or unnatural concentrations.

SC 3-6 Prior to issuance of any building permits, the applicant shall participate in the applicable Master Plan of Drainage in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division, including payment of fees and the construction of the necessary facilities.

SC 3-7 Potential for the proposed project to impact the site's hydrology shall be reduced to a level of insignificance through engineering design and construction techniques incorporated into the project in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

4.3 WATER/HYDROLOGY

Standard Conditions of Approval

Water Quality

SC 3-8 Prior to issuance of building permits, or grading permits, whichever come first, permit applicant shall submit for approval of the Manager, PDS/Subdivision and Grading Services Division, a Water Quality Management Plan (WQMP) specifically identifying Best Management Practices (BMPs) that will be used onsite to control predictable pollutant runoff. This WQMP shall identify at a minimum the routine structural and non-structural measures specified in the Countywide NPDES Drainage Area Management Plan (DAMP) Appendix which details implementation of the BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, lessee, etc.); and, shall reference the location(s) of structural BMPs.

SC 3-9 Prior to the issuance of precise grading permits or building permits, whichever comes first, the applicant shall submit and obtain approval from the Manager, PDS/Subdivision and Grading Services Division, of a Water Quality Management Plan (WQMP) specifically identifying Best Management Practices (BMPs) that will be used on-site to control predictable pollutant runoff. This WQMP shall identify, at a minimum, the routine, structural and non-structural measures specified in the Countywide NPDES Drainage Area Management Plan (DAMP) Appendix which details implementation of BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association shall reference the location(s) of structural BMPs.

Flood Plain Elevation

SC 3-10 Prior to issuance of any grading permits, the applicant shall submit evidence to the Manager, PDS/Subdivision and Grading Services Division, that the applicant has obtained coverage under the NPDES statewide General Stormwater Permit from the State Water Resources Control Board.

Easements

SC 3-11 Prior to the issuance of any certificates of use and occupancy, the applicant shall not grant any easements over any property subject to a requirement of dedication or irrevocable offer to the County of Orange or the Orange County Flood Control District, unless such easements are expressly made subordinate to the easements to be offered for dedication to the County. Prior to granting any of said easements, the subdivider shall furnish a copy of the proposed easement to the Manager, PDS/Subdivision and Grading Services Division, for review and approval. Further, a copy of the approved easement shall be furnished to the Manager, PDS/Building Inspection Services Division, prior to the issuance of any certificate of use and occupancy.

4.3 WATER/HYDROLOGY		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
Impact: Increased Runoff Implementation of the proposed project will result in the introduction of impervious surfaces (streets, driveways, residential units) and will result in a decrease in the area available for stormwater percolation and a subsequent increase in storm flow runoff. **Impact: Increased Downstream Erosion** Discharge of increased and concentrated runoff volumes into onsite natural drainage courses would result in increased erosion and associated sedimentation, primarily due to the unsuitable condition of drainage course banks. **Impact: Increased Urban Runoff Pollution** Urban runoff (oil, cleaning products, pesticides, etc.) associated with proposed onsite streets, driveways, and manufactured slopes would discharge into onsite drainage courses ultimately ending up in the Pacific Ocean. **Impact: Alteration of Natural Site Drainage** Implementation of the proposed project will result in substantial landform modification, redirecting site drainage throughout the site.		None

4.4 TRANSPORTATION/CIRCULATION

Project Design Features

PDF 4-1 The onsite circulation system is proposed as to accommodate project related traffic generation, including design of the entry street as a Collector roadway with a curb-to-curb width of 58 feet at its intersection with El Toro Road. This provides for two 12-foot exiting lanes and two 12-foot entering lanes with a 10-foot median. The entry's cross-section shall be maintained for approximately 160 feet where it could then be transitioned to a standard 40-foot wide curb-to-curb width Collector roadway. Secondary emergency only access will be provided via a gated connection to existing Valley Vista Way. Minimum fire access roadway width of 28 feet shall be required.

PDF 4-2 The entry street will be designed with a traffic signal and a southbound left-turn pocket and northbound right-turn lane. The applicant shall provide a cash deposit for the design and construction of the traffic signal.

PDF 4-3 All weather access to the proposed water tank shall be provided by the applicant. This access shall be designed with a minimum 28 foot width and a maximum grade of 10%.

SC 4-4 Prior to the issuance of any building permits, the applicant shall participate in design, construction, and/or financing of the cost of a traffic signal in the project vicinity in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 4-5 Prior to the issuance of building permits, the applicant shall pay fees for the Major Thoroughfare and Bridge Fee Program listed below, in a manner meeting the approval of the Manager, PF&RD/Program Division.

a. Foothill Circulation Phasing Program

b. Prior to recordation of a final tract map, the subdivider shall enter into an agreement with the County of Orange for participation in a fee program (if adopted by the Board of Supervisors) for implementation of the Foothill/Eastern Transportation Corridor. Said agreement shall provide that:

1. The fee shall be $158.00 per trip end times the County standard trip end generation rate for the type of development proposed, times the number of units (footage) proposed, or the fee payable under the program, whichever is less.
2. Subdivider's obligation to pay fees would arise only after the County establishes the fee program, prior to issuance of building permits.
3. Subdivider's obligation to pay the fee would be extinguished if the fee program were not established within three (3) years of the date of issuance of the first building permit for subject development.
4. Subdivider shall furnish surety bond, letter of credit, money or such other security approved by the Director, PF&RD, to assure payment of the fees related to subject development.
5. This condition shall be void if a trial court of competent jurisdiction, in a final judgement, or an appellate court, if the matter is appealed, sets aside a condition imposed by the County which was substantially the same as said condition.

c. El Toro Road

d. Santiago Canyon Road

SC 4-6 Building permit issuance shall be phased in accordance with the Foothill Circulation Phasing Plan (FCPP) Development Phasing Plan, and shall also be subject to any other Board of Supervisors approved growth management phasing plan pertaining to the timely provision of public services and facilities.

4.4 TRANSPORTATION/CIRCULATION

Standard Conditions of Approval

SC 4-7 Building permit issuance shall be phased in accordance with any Board of Supervisors approved Growth Management Phasing Plan perfaining to the timely provision of public services and facilities.

SC 4-8 Prior to the issuance of any grading permits, adequate sight distance shall be provided at all street intersections per Standard Plan 1117, in a manner meeting the approval of the Manager, PF&R/Program Division. This includes any necessary revisions to the plan such as removing slopes or other encroachments from the limited use area.

SC 4-9 Prior to the issuance of any certificates of use and occupancy, the developer shall construct the approved internal circulation improvements in a manner meeting the approval of the Manager, PF&R/Construction Division. Further, a copy of the approved plans shall be furnished to the Manager, PDS/Building Inspection Services Division, prior to the issuance of any certificates of use and occupancy.

SC 4-10 When monuments exist which control the location of subdivisions, streets or highways, or provide survey control, the monuments shall be located and referenced prior to any street construction or relocation, and shall be reset after construction as required by Section 8771 of the Business and Professions Code, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 4-11 Prior to issuance of a building permit, the applicant shall pay a cash fare share contribution for the design and construction of improving Santiago Canyon Road from Live Oak Canyon Road to Jamboree Road, in a manner meeting the approval of the Manger, PF&R/Programs Division. In addition, the applicant shall participate in the Santiago Canyon Road Safety Improvement Program.

SC 4-12 Prior to issuance of a building permit, the applicant shall design and construct roadway improvements to El Toro Road including a deceleration lane and a left turn pocket into the project entrance based on a 60 mph minimum design speed in a manner meeting the approval of the Manager, PF&RD/Program Division.

SC 4-13 Prior to issuance of a building permit, the applicant shall provide a cash deposit for the difference in cost of designing and constructing the roadway improvements proposed with the project as compared to the costs associated with the ultimate configuration of El Toro Road, as determined by PDS/Environmental & Project Planning Services Division, all in a manner meeting the approval of the Manager, PF&R/Programs Division.

4.4 TRANSPORTATION/CIRCULATION		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
Impact: Circulation Implementation of the proposed project would require a traffic signal at the intersection of El Toro Road and the primary project access road. Project generated traffic will add to cumulative regional traffic impacts.	The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations in a manner meeting the approval of the Manager, Transportation Planning. AM 4-14 The El Toro Road turn lane improvements needed at the Project Entrance to serve Year 2020 conditions shall be completed in conjunction with development. AM 4-15 Traffic signing/striping should be implemented in conjunction with detailed construction plans for the project. Verification of adequate parking should be analyzed for the project site in conjunction with approval of the site plan. AM 4-16 The project shall participate in existing road fee programs, including the Foothill/Eastern Transportation Corridor Fee Programs, Foothill Circulation Phasing Program (FCPP), El Toro Road Fee Program and the Santiago Road Fee Program. Both existing traffic patterns and SCTM traffic projections for Years 2000 and 2020 indicate the attraction of Glenn Ranch Road, Portola Parkway, and the Foothill Transportation Corridor (SR-241) for increased traffic volumes in the project study area. North of the Foothill Transportation Corridor, El Toro Road can accommodate projected traffic volumes with the proposed project on four travel lanes divided by a raised or striped median. Implementation of a full Major Arterial cross-section is not needed to serve future traffic volumes. This alternative section represents a modification of the typical cross-section for a Primary Arterial. Appropriate transitions would be required between this cross-section and other modified cross-sections along El Toro Road south of Glenn Ranch Road.	None.

4.5 AIR QUALITY
Project Design Features
No air quality PDF's have been proposed.
Standard Conditions of Approval
SC 5-1 Grading and excavation shall be halted during periods of high winds meeting the approval of the Manager, EA, Subdivision and Grading Services Division. According to AQP Measure F-4, high winds are defined as 25 mph or greater. This level occurs only under unusually extreme conditions, such as Santa Ana wind conditions. Notations in the above format, included with other notations on the front sheet of grading plans, will be considered as adequate evidence of compliance with this condition.
SC 5-2 Prior to issuance of grading permits, the project applicant shall demonstrate measures to ensure compliance with SCAQMD Rule 403, and shall identify the dust suppression measures, such as regular watering, which shall be implemented to reduce emissions during construction and grading in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division. This will help reduce the short-term impacts from particles which could result in nuisances that are prohibited by Rule 403.

4.5 AIR QUALITY		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
Impact: Construction Related Air Emissions Potentially significant impacts were identified from dust generated by surface disturbance and from construction equipment operations. **Impact: Cumulative Vehicle Air Emissions** Vehicular emissions from project related traffic should be identified as having a cumulatively significant air quality impact.	The following additional mitigation measures (AM) shall be implemented and enforced through the provision of existing codes and regulations: AM 5-3 As previously noted, no credit was taken for mobile source emissions reductions either from technology improvements (reformulated gasoline, alternative fuels and/or electric cars), nor from transportation behavior modification in response to programs such as South Coast AQMD Reg. XV or by the trip reduction programs. These programs will mitigate the identified significant growth-related cumulative air quality impact to some extent. Because the projected effectiveness of such programs and because the time frame for technology development is uncertain, the degree of possible mitigation can not be quantified with certainty. Similarly, the buildout date for Saddleback Meadows will depend on economic forces that can not be predicted. The following discussion structures the recommended mitigation as comprehensively as possible, but quantification of mitigation effectiveness is speculative at currently known levels of detail. AM 5-4 Contractors will comply with SCAQMD Rule 403. AM 5-5 Contractors will utilize measures to prevent dirt from being tracked, washed, blown or otherwise conveyed onto paved roadways, and will wash or sweep the construction access points at El Toro Road on a routine basis on a frequency specified by the County of Orange as well as whenever dirt is visible more than 50 feet from the access point independent of the routine clean-up schedule. AM 5-6 Trucks hauling dirt on public roads to and from the site will be covered or will maintain a six inch differential between the maximum height of any hauled material and the top of the haul trailer. Haul truck drivers will water the load prior to leaving the site to prevent soil loss during transport.	**Construction Related Air Emissions:** None. **Cumulative Vehicle Air Emissions:** Unavoidable adverse until compliance with basin wide AQMP.

4.5 AIR QUALITY		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
	AM 5-7 Construction management procedures required by the County of Orange and other jurisdictions shall be implemented. Contractor personnel responsible for supervision and the appropriate actions to be taken for the following measures shall be identified: • Cessation of activities during a Stage-2 smog episode. Call 1-800-242-4022 for the daily forecast. • Truck routes and schedules for receipt of materials shall be coordinated with County of Orange staff. • Where feasible, on-road vehicles and off-road equipment shall be turned off and subsequently restarted if the anticipated duration of idling is expected to exceed five (5) minutes. AM 5-8 Graded surfaces used for off-road parking, materials lay-down or awaiting future construction shall be stabilized for dust control as needed. Frequently accessed unpaved areas shall be paved as early as possible to minimize dirt trackout to public rights of way. AM 5-9 Equipment will be maintained in proper tune to prevent visible soot from reducing light transmission through the exhaust stack exit by more than 20 percent for more than three (3) minutes per hour and use low-sulfur fuel as required by SCAQMD regulation. Flag persons and appropriate traffic control devices will be used as needed to minimize construction activity interference with off-site traffic. AM 5-11 Implementation of the above measures is expected to maintain construction activity air quality impacts at less than significant levels.	

4.5 AIR QUALITY		
Potential Significant Effects of the Proposed Project		
	Operational Activities: • Traffic flow at the project access will be maintained at acceptable levels of service through mitigation measures identified in the project traffic study. • 220v electric power for future use to charge electric-powered vehicles will be made available in homeowner garages. AM 5-12 Emissions calculations and the corresponding ambient air quality impact assessment for project-related construction and Saddleback Meadows operations presumed compliance with SCAQMD rules regarding dust control. The potential for additional emissions reduction beyond the mandatory requirements of existing rules and regulations was evaluated based on Appendix 11 of the SCAQMD Air Quality Handbook which quantifies reduction potential of a variety of project construction and operation emissions control measures. Dust emissions can be controlled from their 50 percent control assumed for Rule 403 compliance by an additional 50-80 percent of the uncontrolled fraction. The net effective dust control level is therefore 75-90 percent. Unless the entire project site is under simultaneous massive grading, attaining the optimum level of dust control will maintain dust impacts at less than significant levels. Operational emissions reduction from mobile sources of 5 percent of their non-TCM implementation level can not reduce the substantial emission level to less than the SCAQMD advisory level significance thresholds. A number of secondary considerations were identified, however, that would either allow for a finding of an individually less than significant air quality impact.	

4.6 NOISE
Project Design Features
No PDF mitigation measures are proposed.
Standard Conditions of Approval

SC 6-1 All residential lots and dwellings shall be sound attenuated against present and projected noise which shall be the sum of all noise impacting the project so as not to exceed a composite interior standard of 45 dBA CNEL all habitable rooms and a source specific exterior standard of 65 DBA CNEL in outdoor living areas. Evidence prepared by a County-certified acoustical consultant, that these standards will be satisfied in a manner consistent with Zoning Code Section 7-9-137.5, shall be submitted as follows:

a. Prior to the issuance of grading permits, as determined by the Manager, PDS/Building Permits Services Division, the applicant shall submit an acoustical analysis report to the Manager, PDS/Building Permits Services Division, for approval. The report shall describe in detail the exterior noise environment and preliminary mitigation measures. Acoustical design features to achieve interior noise standards may be included in the report, in which case it may also satisfy "B" below.

b. Prior to the issuance of any building permits for residential construction, the applicant shall submit an acoustical analysis report describing the acoustical design features of the structures required to satisfy the exterior and interior noise standards to the Manager, PDS/Building Permits Services Division, for approval along with satisfactory evidenced which indicates that the sound attenuation measures specified in the approved acoustical report have been incorporated into the design of the project.

c. Prior to the issuance of any building permits, the applicant shall show all freestanding acoustical barriers on the project's plot plan illustrating height, location and construction in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 6-2 Prior to the issuance of grading permits, as determined by the Manager, PDS/Building Permits Services Division, an acoustical analysis report shall be submitted to the Manager, PDS/Building Permits Services Division, for approval. The report shall describe in detail the exterior noise environment and preliminary mitigation measures. Acoustical design features to achieve interior noise standards may be included in the report in which case it may also satisfy SC 6-3 below.

SC 6-3 Prior to the issuance of any building permits for residential construction, an acoustical analysis report describing the acoustical design features of the structures required to satisfy the exterior and interior noise standards shall be submitted for review and approval to the Manager, PDS/Building Permits Services Division, along with satisfactory evidence which indicates that the sound attenuation measures specified in the approved acoustical report have been incorporated into the design of the project.

4.6 NOISE

SC 6-4 Prior to the issuance of any building permits, all freestanding acoustical barriers must be shown on the project's plot plan illustrating height, location and construction in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 6-5 Prior to the issuance of any certificates of use and occupancy, the developer shall produce evidence acceptable to the Manager, PDS/Building Inspection Services Division, that information stating this property is subject to the overflight, sight, and sound of aircraft operating from (El Toro Marine Corps Air Station) has been provided to the Department of Real Estate of the State of California for inclusion into the Final Subdivision Public Report.

SC 6-6 Prior to the issuance of any certificates of use and occupancy, the applicant shall post aircraft noise impact notification signs in all sales offices associated with new residential development located within an aircraft 63 dB CNEL contour. The number and location of said signs shall be as approved by the Manager, PDS/Building Permits Services Division.

SC 6-7 Prior to the issuance of any building permit, an aviation easement over this property shall be offered for dedication to the County of Orange in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 6-8 Prior to the sale, lease or rental of any structure or portion thereof, the applicant/owner shall provide to each prospective purchaser, lessee, or tenant a notice and statement of acknowledgment that the property is subject to overflight, sight, and sound of aircraft operating from (El Toro Marine Corps Air Station). The form and method of distribution of said notice and statement of acknowledgment shall be as approved by the Manager, PDS/Building Permits Services Division.

A. Prior to the issuance of any grading permits, the proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division, that:

(1) all construction vehicles or equipment, fixed or mobile, operated within 1000 feet of a dwelling shall be equipped with properly operating and maintained mufflers.

(2) All operations shall comply with Orange County "Codified Ordinance Division 6 (Noise Control); and

(3) Stockpiling and/or vehicle staging areas shall be located as far as practicable from dwellings.

B. Notations in the above format, appropriately numbered and included with other notations on the front sheet of grading plans, will be considered as adequate evidence of compliance with this requirement.

SC 6-9 Prior to issuance of any grading permits, the project proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division that excavation, grading and other construction-related activities shall be restricted to daytime hours as promulgated in the County's Codifide of Ordinance Division 6 (Noise Control).

4.6 NOISE
Standard Conditions of Approval
SC 6-10 Prior to issuance of any grading permits, the project proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division that all construction equipment, stationary or mobile, shall be equipped with properly operating and maintained mufflers. SC 6-11 Prior to the issuance of any grading permits, the project proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division, that: a) All construction vehicles or equipment, fixed or mobile, operated within 1,000-feet of a dwelling shall be equipped with properly operating and maintained mufflers. b) All operations shall comply with Orange county Codified Ordinance Division 6 (Noise Control). c) Stockpiling and/or vehicle staging areas shall be located as far as practicable from dwellings. Notations in the above format, appropriately identified and included with other notations on the front sheet of grading plans, will be considered as adequate evidence of compliance with this condition.

4.6 NOISE		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
Impact: On and Offsite Noise Impacts Implementation of the proposed project would result in short-term construction related impacts to adjecent land uses including: 1) St. Michael's Abbey; 2) Ramakrishna Monastery; 3) Hidden Ridge planned community. No significant long-term on or offsite noise impacts are anticipated with this project.	The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations, in manner meeting approval of the Manger, Building Permits. AM 6-12 Prior to the issuance of Building Permits, all operative windows exceeding 6 sq ft. of glazing shall be rated SR=25 or greater.	None.

4.7 BIOLOGICAL RESOURCES

Project Design Features No Project Design Features are proposed.

Standard Conditions of Approval

SC 7-1 Pursuant to Section 711.4 of the Fish and Game Code, the applicant shall comply with the requirements of AB 3158, prior to the filing of the Notice of Determination for the project, in a manner meeting the approval of the Manager, PDS/Environmental and Project Planning Services.

SC 7-2 Prior to the issuance of any grading permits, the applicant shall obtain a Streambed Alteration Agreement covering the affected water courses and wetland areas within the proposed project area from the California Department of Fish and Game. A 1603 Streambed Application has been submitted to CDFG. All streambed alteration activities shall be carried out in accord with the requirements of an approved Streambed Alteration Agreement.

SC 7-3 Prior to the issuance of any grading permits, the applicant shall obtain the necessary individual or nationwide permit (pursuant to Section 404 of the Federal Clean Water Act) covering all affected wetland areas from the U.S. Army Corps of Engineers, Los Angeles District. All wetland areas shall be subject to the specifications of the 404 permit as determined by the Corps of Engineers. A copy of the 404 permit shall be submitted with the first grading permit application for the proposed project to the Manager, PDS/Subdivision and Grading Services Division.

SC 7-4 Prior to the issuance of any grading permits, as required by participation in the Natural Community Conservation Planning/Coastal Sage Scrub (NCCP) agreement signed by the County on May 1, 1992, the project applicant shall provide an accounting summary, in acres or portions thereof, of coastal sage scrub scheduled to be impacted by removal through grading in a manner meeting the approval of the Administrator Planning & Zoning. (See Section 4.7.3.)

SC 7-5 Prior to the issuance of a grading permit, the applicant shall provide proof that the appropriate Federal approvals required for impacts to Coastal Sage Scrub have been obtained from the U.S. Fish and Wildlife Service, in a manner meeting the approval of the Administrator, Planning & Zoning and Manager, PDS/Grading Services Division, in consultation with the Administrator, Planning & Zoning.

SC 7-6 Notwithstanding the tentative map, no grading shall occur within the Natural Community Conservation Plan (NCCP) enrolled area except as in a manner meeting the approval of the Administrator, Planning and Zoning.

SC 7-7 Prior to the issuance of any grading permit, approval of any activity that involves removal of any native vegetation from subject site including clearing, grubbing, mowing, discing, trenching, grading, fuel modification, or other related construction-related activities, the applicant shall obtain written proof from the U.S. Fish and Wildlife Service that said activity complies with the Federal Endangered Species Act. This evidence shall be submitted to the Manager, PDS/Subdivision and Grading Services Division, for review and approval, in consultation with the Administrator, Planning and Zoning.

4.7 BIOLOGICAL RESOURCES

Standard Conditions of Approval

SC 7-8 Prior to the issuance of grading permits the applicant shall submit a landscape and tree preservation plan to the Manager, PF&R/Harbors Beaches and Parks Division, for review and approval in accordance with the following guidelines:

A. To the maximum extent feasible, all existing native and exotic trees and other significant vegetation shall be preserved in conjunction with any development activity.

B. A tree preservation plan shall be prepared by a landscape architect for all development projects which identifies the location, size and species of all trees having a trunk diameter of 5 inches or greater (measured at four and one-half feet above ground level) and shrubs having a trunk or branch diameter of 3 inches or greater. The plan shall show which plants are proposed for removal and where transplanted and/or replacement plants will be located. Tree preservation plans shall be approved prior to issuance of grading permits, or where grading permits are not required, prior to issuance of building permits.

C. Trees removed in accordance with an approved tree preservation plan shall be replaced by a combination of transplanting to another location on the subject property and/or replacement by a combination of 1 and 15-gallon plants at a minimum ratio of 5:1. The following sliding scale shall also be used for trees to determine if more than the minimum number of replacement trees are required.

Tree Replacement Scale

Trunk Diameter (inches) of Tree Removed At 4½ Feet Above Ground Level	Total Number of Replacement
5 to 11	5 (1-15 gal / 4-1 gal)
12 to 17	7 (1-15 gal / 6-1 gal)
18 to 23	10 (2-15 gal / 8-1 gal)
24 to 35	12 (2-15 gal / 10-1 gal)

Any oak exceeding 35 inches in diameter should be preserved, transplanted or replaced in accordance with the provisions outlined in Section E of the mitigation measure. In the event that all required replacement trees will not fit on the property, increase in container size will be considered in conjunction with reductions in replacement quality.

D. Significant shrubs removed in accordance with an approved tree preservation plan should be replaced by a combination of transplanting to another location on the subject property and/or replacement by 5-gallon plants at a minimum ration of 3:1.

E. All other plants not specified in Guidelines C and D above that are removed in accordance with an approved tree preservation plan should be either transplanted to another location on the subject property or replaced by 15-gallon plants for trees and 5-gallon plants for shrubs at a minimum ration of 1:1. The two 35" + oak trees impacted by project implementation, will be mitigated by an enhanced replacement ratio (5-15 gal/10-1 gal) to the satisfaction of the Manager, PF&R/Harbors Beaches and Parks Division.

4.7 BIOLOGICAL RESOURCES	
Standard Conditions of Approval	
F.	All transplanting of trees shall be performed by an experienced nursery or other landscape contractor, who shall care for the trees for at least six months after transplanting.
G.	Prior to issuance of final certificates of use and occupancy, all transplanted or replacement trees and shrubs shall be installed in accordance with the tree preservation plan.
H.	Oak trees shall not be subjected to increased runoff from irrigation systems, impermeable surfaces, storm drain discharge, etc.
I.	Natural drainage courses and natural grades in proximity of, and providing seasonal irrigation to oak trees shall not be altered.
J.	Grading, placement of fill, storage of building materials and heavy equipment, structural development, and hardscape (e.g., roads, sidewalks, patio slabs and pool decks) shall be prohibited within the drip line (outer edge of branches) of any tree. During grading and construction operations, all trees shall be temporarily fenced off with chain link fencing to protect such areas.
K.	Use of pre-emergent weed killers shall be prohibited within 10 feet of the drip line of any individual tree and within any natural drainage course which seasonally irrigates trees.
L.	Use of soil sterilizers shall be prohibited because they kill everything in the soil.
SC 7-9	Specify areas/lots to be dedicated or irrevocably offered to the County in fee or easement for landscape maintenance purposes, scenic or resource preservation purposes or resource replacement shall be landscaped, equipped for irrigation, and improved in accordance with an approved plan as stated below:
	a) Preliminary Plan -An agreement shall be entered into and financial security posed guaranteeing landscape improvements and the maintenance thereof based on a preliminary landscape plan showing major plant material and uses, with a cost estimate for the landscape improvements. The preliminary plan and cost estimates shall be reviewed and approved by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Harbors Beaches and Parks Division. Said plan shall take into account the previously approved landscape plan for AP 95-7, the EMA Standard Plans for landscape areas, adopted plant palette guides, applicable scenic and Specific Plan requirements, Water Conservation Measures contained in Board Resolution 90-487 (Water Conservation Measures), and Board Resolution 90-1341 (Water Conservation Implementation Plan).

4.7 BIOLOGICAL RESOURCES	
Standard Conditions of Approval	
	b) Detailed Plan - Prior to the issuance of any building permit(s), a detailed landscape plan shall be submitted to and approved by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Harbors Beaches and Parks Division. Detailed plans shall show the detailed irrigation and landscaping design.
	c) Installation Certification - Prior to the issuance of final certificates of use and occupancy and the release of the financial security guaranteeing the landscape improvements, said improvements shall be installed and shall be certified by a licensed landscape architect or licensed landscape contractor, as required, as having been installed in accordance with the approved detailed plans. Said certification, including an irrigation management report for each landscape irrigation system, and any other required implementation report determined applicable, shall be furnished in writing to the Manager, PF&R/Construction Division, and the Manager, PDS/Building Inspection Services Division, prior to the issuance of any certificates of use and occupancy.
SC 7-10	Prior to the issuance of precise grading permits, landscaping for privately maintained areas shall be designed in accordance with a plan. The plan shall be certified by a licensed landscape architect or a licensed landscape contractor, as required, as taking into account approved preliminary landscape plan (if any), EMA Standard Plans, area plan 95-7, scenic corridor and Specific Plan requirements, Grading and Excavation Code erosion control requirements, Subdivision Code, Zoning Code, and conditions of approval, Water Conservation Measures contained in Board Resolution 90-487 (Water Conservation Measures) and Board Resolution 90-1341 (Water Conservation Implementation Plan). Said plan shall be reviewed by the future homeowners association and be reviewed and approved by the Manager, PDS/Subdivision and Grading Services Division.
SC 7-11	Prior to the issuance of grading permits, the applicant shall provide additional evidence that the onsite coastal sage scrub habitat is not occupied by California gnatcatchers, in accordance with current USFWS protocol (7 in season/9 out of season pass surveys) to the satisfaction of the USFWS and the Administrator, Planning and Zoning. Should occupied coastal sage scrub habitat be identified onsite by the surveys consultation shall be initiated with the USFWS, and a coastal sage scrub/gnatcatcher mitigation plan shall be developed to the satisfaction of the USFWS and the Administrator, Planning and Zoning prior to the issuance of grading permits.
SC 7-12	Prior to the issuance of grading permits, the applicant shall provide appropriate measures to mitigate the project related impacts to onsite wildlife movement, to the satisfaction of the USFWS, CDFG and the Administrator, Planning and Zoning. Mitigation shall consider onsite as well as offsite mitigation options, and established fee programs.

4.7 BIOLOGICAL RESOURCES	
Standard Conditions of Approval	
SC 7-13	Prior to the issuance of grading permits, the applicant shall provide assurances to the satisfaction of the County NCCP coordinator and the Administrator, Planning and Zoning, that the proposed project will participate in the NCCP planning process and not preclude the finalization of the Southern Subregional reserve component of the NCCP.
SC 7-14	Prior to the issuance of grading permits, the applicant shall prepare a relocation and establishment mitigation plan, designed to mitigate impacts to Riverside fairy shrimp/pond habitat, wetlands, and southern sycamore woodland, to the satisfaction of the Administrator, Planning and Zoning, in consultation with USFWS and CDFG. Mitigation shall consider onsite as well as offsite mitigation options, as well as, established fee programs.

4.7 BIOLOGICAL RESOURCES			
Potential Significant Effects of the Proposed Project			
Potential Project Impacts		**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
Impact: Sensitive Vegetation Project implementation would result in the direct impact to: 1) 50.30 acres of Venturan-Diegan transitional costal sage scrub; 2) 14.6 acres of coast live oak woodland; 3) 9.9 acres of southern sycamore riparian woodland; 4) 3.8 acres of mulefat scrub; and 5) 0.60 acres of ephemeral pond. **Impact: Sensitive Animals** Implementation of the proposed project would result in direct impacts to the Riverside fairy shrimp, a Federal endangered species. In addition, impacts to the orange-throated whiptail, coastal whiptail, coastal cactus wren, and Southern California rufous-crowned sparrow.	AM 7-15	The following recommendations are proposed to further minimize some of the proposed impacts. • Where possible, bulbs of individual Catalina Mariposa Lily and Intermediate Mariposa Lily that are to be impacted shall be dug up and transplanted to a suitable habitat with similar soil, slope exposure, etc. • Lighting within development projects adjacent to conserved habitat should be selectively placed, shielded, and directed away from that habitat. In addition, lighting from homes abutting conserved habitat should be screened with vegetation, and large spotlight-type lighting that may affect conserved habitat should be prohibited. These lighting restrictions should be incorporated into the project's CC&Rs.	Project specific and cumulative impacts to coastal sage scrub would remain an unavoidable adverse impact until such time as a section 4(d) interim take is authorized.

4.7 BIOLOGICAL RESOURCES		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
Impact: Wildlife Movement Implementation of the proposed project would conflict with existing wildlife movement corridors, as depicted in the Foothill-Trabuco Specific Plan. **Cumulative Impacts:** Cumulative impacts to coastal sage scrub habitat, oak woodland and sycamore riparian habitat is considered significant.		

4.8 AESTHETICS	
Project Design Features	
PDF 8-1	All public utilities shall be situated underground.
PDF 8-2	Where feasible, drainage devices (terrace drains, benches, and intervening terraces) shall be bermed and placed in swales.
PDF 8-3	Concrete drainage swales and other similar drainage infrastructure shall be tinted with an appropriate earth tone to effectively conceal them from surrounding view.
PDF 8-4	The water tank shall be bermed, landscaped and painted to blend with the surrounding environment.

Standard Conditions of Approval	
SC 8-5	Prior to the issuance of any building permits, an agreement shall be entered into and financial security posted guaranteeing landscape improvements and the maintenance thereof based upon a detailed landscape plan showing landscape design and irrigation with a cost estimate for the landscape improvements approved by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Harbors Beaches & Parks Division. Said plan shall take into account previously approved landscape plan(s), PF&RD Standard Plans for landscape areas, adopted plant palette guides, applicable scenic and specific plan requirements, water conservation measures contained in Board Resolutions 90-487 (Water Conservation Measures), and 90-1341 (Water Conservation Implementation Plan).
SC 8-6	Prior to the issuance of preliminary grading permits, landscaping for privately maintained areas shall be designed in accordance with a plan certified by a licensed landscape architect or a licensed landscape contractor, as required, as taking into account approved preliminary landscape plan(s), PF&RD Standard Plans, area plan 95-7 scenic corridor and Specific Plan requirements, Grading and Excavation Code erosion control requirements, Subdivision Code, Zoning Code, and conditions of approval, Water Conservation Measures contained in Board Resolutions 90-487 (Water Conservation Measures) and 90-1341 (Water Conservation Implementation Plan). Said plan shall be reviewed and approved by Manager, PDS/Building Permits Services Division, Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Harbors Beaches & Parks Division, Environmental and Projects Planning Division.
SC 8-7	Prior to the issuance of certificates of use and occupancy and release of financial security, applicant shall install the approved landscaping and irrigation system and shall have a licensed landscape architect or licensed landscape contractor, as applicable, certify that it was installed in accordance with the certified plan. Said certification, including an irrigation management report for each landscape irrigation system, and any other implementation report determined applicable, shall be furnished in writing to the Manager, PDS/Building Inspection Services Division, prior to the issuance of any certificates of use and occupancy.
SC 8-8	Prior to issuance of any building permit, the applicant shall demonstrate that all exterior lighting has been designed and located so that all direct rays are confined to the property in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

4.8 AESTHETICS		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
Impact: Aesthetic Impact to Surrounding Land Use Implementation of the proposed project, prior to application of the recommended mitigation measures would result in potential aesthetic impact to the following surrounding land use: O'Neill Regional Park, Ramakrishna Monastery, St. Michael's Abbey. These significant impacts would be related to the following visible project features: 1) grading, including cut and fill slopes; 2) units; 3) drainage improvements; 4) native vegetation removal; and 5) night lighting.	The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations: AM 8-9 Prior to issuance of any grading permit, the project proponent shall provide evidence to the Manager, PDS/Subdivision and Grading Services Division that indicates that graded areas will be compatible with natural landform characteristics. Criteria to achieve the desired effect shall include: a) Recontouring the existing landforms to provide a smooth and gradual transition between graded slopes and existing grade while preserving the basic topographic character of the site. b) Variation and combination of slopes 2:1, 3:1 and 4:1 to create a more natural character wherever possible within the graded areas. c) Attempting to balance between cut and fill within the overall area to eliminate an offsite and import/export situation. d) Obscuring slope drainage structures with a variety of plant materials. e) Incorporation of architectural and design techniques into the project in order to minimize grading and enhance offsite views (e.g., split levels, clustering). f) Preservation of visual opportunities from hillsides by providing for panoramic views from selected locations (e.g., view corridors, sensitive landscape placement).	As the first large tract proposed within the Specific Plan area, the project will contribute to the cumulative impacts to existing rural and natural open space, and to a continuing urbanization of foothill areas in south Orange County.

4.8 AESTHETICS		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Mitigation Measures**	**Unavoidable Adverse Impacts**
	AM 8-10 Manufactured slopes shall be replanted with vegetation native to the site to blend the new topography with existing natural on site vegetation, immediately following precise grading operations. AM 8-11 Fuel modification areas shall be planted with fire resistant vegetation. AM 8-12 Use of the California Sycamore or other species similar to trees currently existing onsite shall be used in appropriate common area and street landscape locations where feasible. AM 8-13 Common area landscaping and habitat transition zones shall utilize the FTSP recommended plant palette (appendix E) when selecting plant material. AM 8-14 Slope landscaping shall occur as soon as feasible after grading and be maintained by the applicant until a homeowners association has been organized and assumes long term maintenance responsibility. **Light and Glare** AM 8-15 Prior to issuance of any certificate of use and/or occupancy, the potentially adverse impact of night lighting on surrounding land use shall be mitigated to the satisfaction of the Manager, PDS/Subdivision and Grading Services Division by the following measures: a) Street lights shall only be installed at intersections and as required to insure public safety. b) Low intensity halogen street lamps shall be used. c) Street lights shall be shielded to direct the light beam downward and to avoid direct glare into open space areas and adjacent property.	Permanent viewshed alteration will occur even after the incorporation of the recommended mitigation measures. In addition, night lighting glare will change night views from an unlit dark open space area to an urban night environment.

4.9 CULTURAL/SCIENTIFIC RESOURCES

Project Design Features

No project design features were included in this project.

Standard Conditions of Approval

Archaeology

SC 9-1 Prior to the issuance of any grading permit, a County-certified archaeologist shall be retained by the applicant to complete a literature and records search for recorded sites and previous surveys. In addition, a field survey shall be conducted by a County-certified archaeologist unless the entire proposed project site has been documented as previously surveyed in a manner which meets the approval of the Manager, PF&R/Harbors Beaches and Parks Division. A report of the literature and records search and the field survey shall be submitted to and approved by the Manager, PF&R/Harbors Beaches and Parks Division. Mitigation measures may be required depending upon the recommendations of this report. This mitigation measure has been completed as part of the Draft EIR.

SC 9-2 Prior to issuance of any grading permit, a county-certified archaeologist shall be retained by the applicant to perform a subsurface test level investigation and surface collection as appropriate. The test level report evaluating the site shall include discussion of significance (depth, nature, conditions and extent of the resources), final mitigation recommendations and cost estimates and shall be approved by the Manager, PF&R/Harbors Beaches and Parks Division. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis.

SC 9-3 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified archaeologist has been retained to conduct pre-grade salvage excavation of the archaeological resources in the permit area. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis. A final report of the salvage operation shall submitted to and approved by the Manager, PF&R/Harbors Beaches and Parks Division, prior to any grading.

SC 9-4 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified archaeologist has been retained, shall be present at the pre-grading conference, shall establish procedures for archaeological resource surveillance, and shall establish, in cooperation with the project developer, procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of the artifacts as appropriate. If the archaeological resources are found to be significant, the archaeological observer shall determine appropriate actions, in cooperation with the project developer, for exploration and/or salvage. The archaeologist shall submit a follow-up report to the Manager, PF&R/Harbors Beaches and Parks Division, which shall include the period of inspection, an analysis of any artifacts found and the present repository of the artifacts. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis. These actions, as well as final mitigation and disposition of the resources, shall be subject to the approval of the Manager, PF&R/Harbors Beaches and Parks Division.

4.9 CULTURAL/SCIENTIFIC RESOURCES		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	Additional Mitigation Measures	Unavoidable Adverse Impacts

Impact: Archaeological and Paleontological Resources Cultural, archeological and paleontological resources are non-renewable in character and can be lost forever unless adequate mitigation measures are taken to ensure their recovery and preservation. The project is known to contain significant deposits of artifacts and fossils, as well as a ranch house ruin circa 1920.	**Additional Mitigation Measures** The following additional mitigation measures (AM) shall be implemented and enforced through the provision of existing codes and regulations in a manner acceptable to the Manager, PF&R/Harbors Beaches and Parks Division Facilities. AM 9-5 Prior to site grading the project site shall be examined by a qualified archeologist, all potential archeological sites identified, and surface collection and documentation of artifacts be conducted. AM 9-6 As indicated by the project archeologist, sites warranting further study shall be disced to ascertain the extent and significance of the deposit. If the project archeologist determines that a site is potentially of cultural worth, then additional excavation in a manner determined by the project archeologist shall occur prior to further grading or construction activities at these locations. AM 9-7 During initial grading, the project site shall be monitored by a qualified archeologist who shall have the authority to order a temporary cessation of grading activities and take appropriate action to preserve any culturally significant materials if uncovered. AM 9-8 If human remains of Native American origin are encountered during the project the County Coroner's Office and the Native American Heritage Commission shall be contacted for preservation and protection of the remains. **Paleontology** SC 9-9 Prior to the issuance of any grading permit, a County-certified paleontologist shall be retained by the applicant to complete a literature and records search for recorded sites and previous surveys. In addition, a field survey shall be conducted by a County-certified paleontologist unless the entire proposed project site has been documented as previously surveyed in a manner which meets the approval of the Manager, PF&R/Harbors Beaches and Parks Division. A report of the literature and records search and field survey shall be submitted to and approved by the Manager, PF&R/Harbors Beaches and Parks Division, Future mitigation shall depend upon the recommendations of the report. This mitigation measure has been completed.	None.

4.9 CULTURAL/SCIENTIFIC RESOURCES			
Potential Significant Effects of the Proposed Project			
Potential Project Impacts	**Mitigation Measures**		**Unavoidable Adverse Impacts**
	SC 9-10	Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified paleontologist has been retained by the applicant to conduct pre-grade salvage and prepare a catalogue of the exposed resources. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis. The paleontologist shall submit a follow-up report for approval by the Manager, PF&R/Harbors Beaches and Parks Division, for review and approval, which shall include methodology, an analysis of artifacts found, a catalog of artifacts, and their present repository. This mitigation measure has been completed.	
	SC 9-11	Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified paleontologist has been retained to observe grading activities and salvage and catalogue fossils as necessary. The paleontologist shall be present at the pre-grading conference, shall establish procedures for paleontological resource surveillance, and shall establish, in cooperation with the project developer, procedures for temporarily halting or redirecting work to permit sampling, identification, and evaluation of the fossils. If major paleontological resources are discovered, the paleontologist shall determine appropriate actions, in cooperation with the project developer, which ensure proper exploration and/or salvage. Excavated finds shall be offered to the County of Orange, or its designee, on a first-refusal basis. The paleontologist shall submit a follow-up report for approval by the Manager, PF&R/Harbors Beaches and Parks Division, which shall include the period of inspection, a catalogue and analysis of the fossils found, and present repository of the fossils. These actions, as well as final mitigation and disposition of the resources, shall be subject to approval by the Manager, PF&R/Harbors Beaches and Parks Division.	

4.9 CULTURAL/SCIENTIFIC RESOURCES		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
	Additional Mitigation Measures The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations in a manner acceptable to the Manager, a Coastal and Historical Facilities. AM 9-12 A qualified paleontologist shall be retained to perform periodic inspections of excavations and, if necessary, salvage exposed fossils. The frequency of inspections will depend on the rate of excavation, the materials being excavated, and the abundance of fossils. Initially, monitoring shall be on a full time basis in all excavations because of the high potential for the discovery of fossils in all the rock units present in the study area. AM 9-13 The paleontologist shall be allowed to divert or direct grading in the area of an exposed fossil to facilitate evaluation and if necessary, salvage. AM 9-14 To recover small fossils, it will be necessary to collect sediment samples from promising horizons discovered during grading monitoring for processing through fine mesh screens. Once the samples have been screened, they will be examined microscopically for small fossils. AM 9-15 Fossils shall be prepared to the point of identification and catalogued before they are donated to their final repository. AM 9-16 All fossils collected should be donated the County of Orange's designated repository. AM 9-17 A report detailing the results of these efforts, listing the fossils collected, and naming the repository shall be submitted to the lead agency at the completion of the project.	None.

4.9 CULTURAL/SCIENTIFIC RESOURCES		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Mitigation Measures**	**Unavoidable Adverse Impacts**
	Historical Resources SC 9-18 Prior to issuance of a grading permit, project applicant shall provide written evidence to Manager, PF&R/Harbors Beaches and Parks Division that an historian has been retained by the applicant to implement final mitigation measures. A final report shall be submitted to and approved by the Manager, PF&R/Harbors Beaches & Parks Division prior to any alteration of the historical site area. SC 9-19 Development adjacent to a place, structure, or object of historic significance shall be designed so that permitted uses and architectural design will protect the visual setting of the historic site. Such design shall be submitted to and approved by the Manager, PF&R/Harbors Beaches & Parks Division prior to any alteration of the historical site area.	None.

4.10 RECREATION	
Project Design Features	
PDF 10-1	The Live Oak and Aliso Creek riding and hiking trail shall be located on the Project Site as shown in Exhibit 7 and Exhibit 63 Site Plan.
PDF 10-2	Live Oak Canyon Trail shall be constructed onsite, connecting O'Neill Regional Park to the Aliso Creek riding and hiking trail, as shown in Exhibit No. 7, Site Plan.
PDF 10-3	Eight onsite private parks shall be constructed as shown on Exhibit 7 Site Plan, to offset project demand.

4.10 RECREATION	
Standard Conditions of Approval	
SC 10-4	The developer or his assigns and successors in interest shall maintain offered park site(s) until such time as the County or its designer accepts the offer of dedication, all in a manner of meeting the approval of the Manager, PF&R/Harbors Beaches & Parks Division.

4.10 RECREATION		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
Impact: Local Park Demand Implementation of the proposed project, prior to mitigation would result in significant impact to existing local park demand. The Foothill/Trabuco Specific Plan indicates that a proposed view park is to be located on a prominent ridge top near the northeast corner of the site. Current plans do not include provisions for this park.	The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations: AM 10-5 Prior to the first building occupancy, the applicant shall pay all park mitigation as required by the Department Manager, PF&R/Harbors Beaches & Parks Division. AM 10-6 Prior to final building occupancy the applicant shall dedicate and construct all required regional trail connections and improvements as approved and required by the Department Manager, PF&R/Harbors Beaches & Parks Division.	None.

4.11 HAZARDS	
Project Design Features	
PDF 11-1	Implement a comprehensive fuel modification program in accordance with Section 27 of Appendix II-A of the 1994 Uniform Fire Code as adopted by County Ordinance 3954 (the Wildland Urban Interface Task Force report was not adopted and is not enforced by the OCFA). Exhibits 9 and 64 illustrate the fuel modification zones and, although adequately described, it should be noted that the distances are horizontal measurements rather than vertical and, therefore, may actually be larger zones as measured vertically up or down a slope (based on topography).
PDF 11-2	Incorporate the use of native, low fuel plant species into the landscape plan for both manufactured slope areas and remedial grading areas where appropriate as approved by the OCFA.
PDF 11-3	Provide for the construction of a water tank off site to ensure adequate on site water supply and OCFA fire flow requirements. The minimum fireflow requirements for this project of 1500 gpm for a minimum of 2 hours at 20 psi residual pressure. This flow must be available 24 hours per day .
PDF 11-4	Wet and dry utilities shall be constructed on opposite sides of the project streets to minimize land closure during maintenance periods.
PDF 11-5	Residential structures shall be constructed of fire-resistant material, including but not limited to "Class A roof assemblies", closed eaves and offsets, double paned or dual glazed windows, and the exterior walls of structures will be constructed of " 1-hour fire resistant materials", and all structures will have fire sprinklers.
PDF 11-6	All residential structures shall be required to have automatic interior fire sprinkler systems.
PDF 11-7	The interface area between residential lots and open space areas within the project boundary shall be wrought iron fenced to minimize intrusion of wildlife into the built portions of the project site.
Standard Conditions of Approval	
SC 11-8	Prior to the issuance of any preliminary grading permits, applicant shall request that the Manager, HCA/Environmental Health, determine if vector control measures are necessary. If warranted, such measures shall be conducted by the developer in a manner meeting the approval of the Manager, HCA/Environmental Health.
SC 11-9	Prior to the issuance of any building permits for combustible construction, a letter and plan from the developer shall be submitted stating that water for fire fighting purposes and an all weather fire access road shall be in place before any combustible materials are placed on the site. Said letter shall be approved by the Fire Chief prior to the issuance of any building permits.

4.11 HAZARDS	
Standards Conditions of Approval	
SC 11-10	Prior to the issuance of any building permits on those lots determined applicable by the Fire Chief, plans for an automatic fire sprinkler system shall be submitted to and approved by the Fire Chief prior to installation. This system shall be operational prior to the issuance of a certificate of use and occupancy.
SC 11-11	Prior to the issuance of any building permits, the applicant shall submit a detailed letter of intended use for each building to the Fire Chief for review and approval.
SC 11-12	Prior to the issuance of any grading permits, preliminary plans for all street and courts, public or private, shall be submitted to and approved by the Fire Chief. The plans shall include the plan view, sectional view, and indicate the width of the street or court measured flow line to flow line. All proposed fire apparatus turnarounds shall be clearly marked.
SC 11-13	Prior to the issuance of any certificates of use and occupancy, street improvement plans with fire lanes shown shall be submitted to and approved by the Fire Chief. The plans shall indicate the locations of red curbing and signage, and provide a drawing of the proposed signage with the height, stroke and color of lettering and the contrasting background color.
SC 11-14	Prior to the issuance of any grading permits, construction details for any emergency access gate shall be submitted to and approved by the Fire Chief Contact the Orange County Fire Department at (714)744-6623 for a copy of the "Guidelines for Fire Department Emergency Access".
SC 11-15	Prior to the issuance of any grading permits, a fuel modification plan and program shall be submitted and approved by the Fire Chief in consultation with the Manger, Environmental and Project Planning. The Planning and Development Section shall be contacted at 744-0403 for requirements to be met and clearance of this condition. The plan shall indicate the proposed means of achieving an acceptable level of risk to structures by vegetation, include the method (mechanical or hand labor) for removal of flammable vegetation and provide for the planting of drought tolerant fire resistant plants.
SC 11-16	Prior to the issuance of any building permits, the developer shall have completed, under the supervision of the Fire Chief, that portion of the approved fuel modification plan determined to be necessary by the Fire Chief before the introduction of any combustible construction material into the project area.
SC 11-17	Prior to the issuance of any certificates of use and occupancy, the remaining fuel modification shall be installed and completed under the supervision of the Fire Chief. Further, the installed fuel modification shall be established to a degree meeting the approval of the Fire Chief.

4.11 HAZARDS		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
Impact: Wildfire Due to topography, biology, and weather conditions the project site is located in an area classified as a "Special Fire Protection Area" by the Orange County Fire Authority. **Impact: Emergency Access** Only one main access roadway can be provided to the eastern portion of the site which is of concern since this roadway can become obstructed in emergency situations creating an impact to public safety. **Impact: Wildlife Interaction** Conflict between wildlife and project residents and pets is an associated project risk due to the proximity of wild areas to the subject site.		**Wildfire Impacts:** None. **Emergency Access:** None. **Wildlife Interaction:** None.

4.12 PUBLIC SERVICES	
Project Design Features	
Sheriff	
PDF 12-1	The Orange County Sheriff's Department shall be consulted during final project design to minimize security related impacts.
Fire	
PDF 12-2	Implement a comprehensive fuel modification program in accordance with the guidelines established by the Wildland Urban Interface Task Force, July 1994, as approved by the Orange County Fire Authority (OCFA).
PDF 12-3	Incorporate the use of native, low fuel plant species into the landscape plan for both manufactured slope areas and remedial grading areas where appropriate as approved by the OCFA.
PDF 12-4	Provide for the construction of a 1.4 million gallon water tank offsite to ensure adequate onsite water supply for water supply and fire flow use.
PDF 12-5	Wet and dry utilities shall be constructed on opposite sides of the project streets to minimize land closure during maintenance periods.
PDF 12-6	Residential structures shall be constructed of fire resistant material as approved by the OCFA. In addition, no ventilation openings shall be allowed on the side of residential structures facing natural areas.
PDF 12-7	OCFA shall have the ability to enter the property through the secondary access road located off of Valley Vista Way.

4.12 PUBLIC SERVICES	
Project Design Features	
Education	
No PDF proposed.	
Library	
PDF 12-8	The developer shall pay any development fees required by the County of Orange Development Fee Program for libraries.
Solid Waste	
No PDF proposed.	
Standard Conditions of Approval	
SC 12-9	Prior to issuance of building permits, the applicant shall pay development fees for general County facilities if an applicable fee program has been adopted by the Board of Supervisors pursuant to Section 7-9-700 through 7-9-713 of the Codified Ordinances of the County of Orange, and such fee program is in effect at the time of issuance of building permits, all, in a manner meeting the approval of the Manager, PDS/Environmental and Project Planning Services.
Sheriff	
SC 12-10	Prior to the issuance of the first building permit, the project proponent shall enter into an agreement to (a) participate in funding the provision of the Saddleback Sheriff's Station; and (b) fund the provision of patrol and investigator cars needed to serve the project.

4.12 PUBLIC SERVICES	
Standard Conditions of Approval	
Fire	
SC 12-11	Prior to the issuance of any certificates of use and occupancy, all onsite fire protection devices, including fire sprinklers, fire hydrants, alarm systems and fire suppression facilities, shall be installed and maintained in good condition by the property owner in a manner meeting the approval of the Fire Chief.
SC 12-12	Prior to issuance of any building permits for combustible construction, a plan from the developer shall be submitted to and approved by the Fire Chief indicating that water for fire fighting purposes and an all weather fire access road shall be in place before any combustible materials are placed on the site.
SC 12-13	Prior to issuance of certificates of use and occupancy, emergency access shall be constructed in a manner meeting the approval of the Fire Chief.
SC 12-14	The approved fuel modification plan shall be installed prior to the issuance of building permits, under the supervision of the Fire Chief, and completed prior to the issuance of any use and occupancy permits. The CC&R's shall contain provision for maintaining the fuel modification zones including the removal of all dead and dying vegetation and the inspection and correction of any deficiencies in the irrigation system three times a year.
SC 12-15	Prior to the issuance of any grading permits, as part of the area plan, a fuel modification plan and program shall be submitted and approved by the Fire Chief. Contact the Wildland Fire Defense Planning Section at 744-0498 for requirements and clearance of this condition. The plan shall indicate the proposed means of achieving an acceptable level of risk to structures by vegetation. Include the method (mechanical or hand labor) for removal of flammable vegetation and the planting of drought tolerant fire resistant plants.

4.12 PUBLIC SERVICES	
Standard Conditions of Approval	
SC 12-16	Prior to the issuance of any grading permits, the applicant shall submit a list of the quantities of all hazardous, flammable and combustible materials, liquids or gases. These materials shall be classified according to the "Orange county Fire Department Chemical Classification Handout", including a summary sheet listing each hazard class, the total quantity of chemicals stored per class and the total quantity of chemicals used in that class, all in a manner meeting the approval of the Fire Chief.
SC 12-17	Prior to the issuance of any certificate of use or occupancy, all fire hydrants shall have a "Blue Reflective Pavement Marker" indicating its location on the street or drive per the Orange County Fire Authority Standard. On private property these markers are to be maintained in good condition by the homeowners association.
SC 12-18	Prior to the issuance of any building permits, plans for the automatic fire sprinkler system shall be submitted to and approved by the Fire Chief prior to installation. The system shall be operational prior to the issuance of the certificate of use and occupancy.
SC 12-19	Prior to the issuance of any grading permit, street improvement plans with fire lanes shown shall be submitted to and approved by the Fire Chief indicating the locations of red curbing and signage. Provide a drawing of the proposed signage with the height, stroke and color of lettering and the contrasting background color. The CC&R's shall contain a fire lane map, provisions which prohibit parking in the fire lanes, and a method of enforcing fire lane requirements by the homeowners association.
Education	
SC 12-20	Prior to the issuance of building permits, the applicant shall pay all applicable school fees required in accordance with State law. Current school impact fees are $1.72 per square-foot of residential.
Library	
No Standard Conditions of Approval Mitigation Measures proposed.	

4.12 PUBLIC SERVICES

Standard Conditions of Approval

Solid Waste

SC 12-21	The potential for the proposed project to impact solid waste collection and disposal has been reduced to a level of insignificance through engineering design and construction techniques. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.
SC 12-22	Prior to the issuance of any building permits, a plot plan delineating the capacity, number, and location of all proposed solid waste collection areas shall be submitted to the Manager, HCA/Environmental Health, for review and acceptance. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.
SC 12-23	Prior to the approval of a building permit the applicant shall submit a Recycling/Source Reduction Plan to the Manager, PDS/Environmental and Project Planning Services Division, for review and approval. Said plan shall provide a strategy to facilitate compliance with waste diversion levels as mandated by AB 939, and may include elements which demonstrate commitment to a project specific operation, coordination with existing local or regional programs, and the use of recycled materials during and following construction of the project. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.
SC 12-24	Prior to the issuance of any certificates of use and occupancy, the applicant shall provide verification that the solid waste plan delineating the capacity, number, and location of all proposed solid waste collection areas, previously reviewed and accepted by the Manager, HCA/Environmental Health, has been implemented/incorporated into the project, in a manner meeting the approval of the Manager, PDS/Building Inspection Services.
SC 12-25	Prior to the approval of a Site Development Permit the applicant shall submit a Recycling/Source Reduction Plan to the Manager, EMA/Project Planning Services Division, for review and approval. Said plan shall provide a strategy to facilitate compliance with waste diversion levels as mandated by AB 939, and may include elements which demonstrate commitment to a project specific operation, coordination with existing local or regional programs, and the use of recycled materials during and following construction of the project.
SC 12-26	Prior to the issuance of any certificates of use and occupancy, the applicant shall provide verification that the solid waste plan delineating the capacity, number, and location of all proposed solid waste collection areas, previously reviewed and accepted by the Manager, HCA/Environmental Health, has been implemented/incorporated into the project, in a manner meeting the approval of the Manager, PDS/Building Inspection Services Division.

4.12 PUBLIC SERVICES		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Additional Mitigation Measures**	**Unavoidable Adverse Impacts**
Impact: Public Services **Sheriff:** Based on an officer/population ratio of 2:1000, three additional officers would be required by the project, however, no significant impact is anticipated. **Fire:** The project site is located within an area classified as a "Special Fire Protection Area" by the OCFA. Because the project is designed with numerous lots being served by a single access road the OCFA has expressed concern that public safety will be compromised should this road become impassable. **Education:** Implementation of the proposed project would add 399 additional students to an already overcrowded school system.		Sheriff: None. Fire: None. Education: None. Library: None. Solid Waste: None.

4.12 PUBLIC SERVICES		
Potential Significant Effects of the Proposed Project		
Potential Project Impacts	**Mitigation Measures**	**Unavoidable Adverse Impacts**
Library: Implementation of the proposed project would result in additional demand for library services in the project area, however this increase is not considered significant. **Solid Waste:** The project adds to the cumulative waste generation demand for the County.		

4.13 PUBLIC UTILITIES AND SERVICE SYSTEMS

Project Design Features

Water

PDF 13-1 The new booster pump station shall be paid for by the applicant and designed and function according to TCWD's guidelines and standards.

PDF 13-2 Operational capacities and pressure parameters for design of the booster pump station (approved by OCFA) shall be determined at design stage and should incorporate but not be limited to the following requirements:

- It shall meet the maximum day demand for the "stand alone" zones of Saddleback Meadows with an operating time of 24 hours and without its largest unit in service.
- It shall be designed with a back-up generator for the booster pump, as well as fuel and maintenance provisions.
- It shall incorporate the typical 3 or 4 pump system with an alternating state sequence
- It shall pump from TCWD's El Toro Road zone (1,165 feet HWL) to the storage facility (reservoir) proposed.
- It shall have the ability to refill the proposed reservoir, if it were empty, within 72 hours while also providing for maximum day demands on the water system during that time.

PDF 13-3 Water conservation measures to be implemented consist of water-conserving features in the design and construction of residential homes and uses, plus use of drought-tolerant plant materials in the slope and streetscape plantings. Proposed water conservation measures also include:

- Supply line pressure: Water pressure greater than 50 pounds per square inch (psi) reduced to 50 psi or less by means of pressure-reducing valves.
- Ultra-low-flush toilets: 1.5 gallon-per-flush toilets installed in all new construction.
- Landscape with low-water-using plants wherever feasible.

4.13 PUBLIC UTILITIES AND SERVICE SYSTEMS	
Project Design Features	
	• Grouping of plants of similar water use to reduce over-irrigation of low-water-using plants. • Extensive use of mulch as top cover to improve water-holding capacity of the soil. • Installation of efficient irrigation systems that minimize runoff and evaporation, and maximize the amount of water reaching plant roots. Drip irrigation, soil moisture sensors, and automatic irrigation systems are proposed methods of increasing irrigation efficiency.
PDF 13-4	All design and landscape features shall comply with TCWD's guidelines and standards.
Wastewater	
PDF 13-5	All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.
Electricity	
PDF 13-6	All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.
Natural Gas	
PDF 13-7	All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.
Cable	
PDF 13-8	All utilities shall be installed by Cox Cable in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.
Communications	
PDF 13-9	All utilities shall be installed by the applicant in accordance with Department/County requirements, per the requirements outlined on the Final Tract Map.

4.13 PUBLIC UTILITIES AND SERVICE SYSTEMS			
Potential Project Impacts	**Standard Conditions and Mitigation Measures**		**Unavoidable Adverse Impacts**
All utility providers have indicated that increased service demands created by the project are within present or projected operating capacities.	**Water**		
	SC 13-10	Prior to the issuance of any building permit(s), the applicant shall provide a report to the Manager, PDS/Building Permits Services Division, indicating that plans showing the location of all proposed reclaimed water lines used to irrigate open spaces, parks, and other landscaped areas, have been submitted to and approved by the Trabuco Canyon Water District.	None
	SC 13-11	Prior to the issuance of building permits, water conservation measures shall be incorporated into the development design plans and which shall be submitted for approval to the Trabuco Canyon Water District.	None
	Wastewater		
	SC 13-12	Prior to the issuance of a certificate of use and occupancy, sewer lines, connections, and structures shall be installed in a manner meeting the approval of the Manager, HCA/Environmental Health. A. All waste water facilities and line shall be constructed and maintained to meet TCWD standards and requirements. B. All sewer lines shall be underground facilities. C. The project shall comply with all State of California Health and Safety Codes.	None
	Electricity		
	SC 13-13	Prior to the issuance of a building permit, project proponent shall consult with the local gas and electric companies regarding feasible energy conservation features that should be included in the design of the proposed project. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.	None

4.13 PUBLIC UTILITIES AND SERVICE SYSTEMS			
Potential Project Impacts	**Standard Conditions and Mitigation Measures**		**Unavoidable Adverse Impacts**
	SC 13-14	Prior to the issuance of a building permit, the project proponent shall incorporate passive or natural heating and cooling opportunities in the design of the proposed project including but not limited to the following: solar energy use; thermal insulation; tinted or solar reflective glass; orientation to sunlight; use of deciduous trees in landscaping; installation of roof fans; utilize fluorescent lighting, switches and thermostat, utilize time-controlled lighting; and, utilize AC units with 100% outdoor air economize. A note on the building plans and certified by a licensed engineer shall substantiate that the features have been incorporated into the building plans in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.	
	Natural Gas		
	SC 13-15	The applicant shall provide for all lines and mains necessary to provide natural gas to the project.	None
	SC 13-16	The applicant shall obtain all required permits and follow all SCG, State and County regulations and requirements regarding natural gas service.	None
	Cable		
	No standard condition requirements.		None
	Communications		
	SC 13-17	Applicant shall comply with the requirements of the California Public Utilities Commission and Pacific Bell Telephone Company for the provision of telephone service.	None

2.0 INTRODUCTION

2.1 PURPOSE OF THE SUBSEQUENT EIR

The purpose of this Draft Subsequent Environmental Impact Report (SEIR) is to provide substantive information to the decision makers (Planning Commission), responsible and trustee agencies, and the public regarding the potential adverse environmental effects associated with implementation of the proposed project and related actions. Section 15162 of the CEQA guidelines states:

(a) *When an* EIR has been *certified or a negative declaration adopted for a project* no *subsequent* EIR shall be prepared *for that project unless the lead agency determines, on the basis of substantial evidence in the light of the whole record, one or more of the following:*

1) *Substantial* changes are proposed in the project which will require *major* revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental *effects or a substantial increase in the severity of previously identified significant effects;*

2) Substantial changes occur with respect to the circumstances under which the project is undertaken, which will require *major* revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental *effects or a substantial increase in the severity of previously identified significant effects; or*

3) New information of substantial importance, which was not known and could not have been known *with the exercise of reasonable diligence,* at the time the previous EIR was certified as complete or the Negative Declaration was adopted, shows (sic) any of the following:

(A) The project will have one or more significant effects not discussed in the *previous* EIR *or negative declaration;*

(B) Significant effects previously examined will be substantially more severe than shown in the *previous* EIR;

(C) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, *but the project proponents decline to adopt the mitigation measure or alternative; or*

(D) Mitigation measures or alternatives which *are considerably different from those analyzed* in the *previous* EIR would substantially *reduce* one or more significant effects on the environment, *but the project proponents decline to adopt the mitigation measure or alternative.*

(b) *If changes to a project or its circumstances occur or new information becomes available after adoption of a negative declaration, the lead agency shall prepare a subsequent EIR if required under subsection (a). Otherwise the lead agency shall determine whether to prepare a subsequent negative declaration, and addendum, or no further documentation.*

(c) If the project was approved prior to the occurrence of the conditions described in the subsection

(a) the subsequent EIR *or negative declaration* shall be prepared by the public agency which grants the next discretionary approval for the project. In this situation no other Responsible Agency shall grant an approval for the project until the subsequent EIR has been *certified or subsequent negative declaration adopted.*
(d) *A subsequent EIR or subsequent negative declaration shall be given the same notice and public review as required under Section 15087 or Section 15072. A subsequent EIR or negative declaration shall state where the previous document is available and can be reviewed.*

In addition, the EIR identifies mitigation measures to reduce potential adverse impacts to a less than significant level and evaluates alternatives to the proposed project which would result in less adverse environmental effects than the proposed project. Mitigation measures will be incorporated into conditions of approval and serve as the basis for the mitigation monitoring program.

This Subsequent EIR will also be used by the agencies identified in Section 3.2 during project review and issuance of discretionary permits.

The Draft EIR has been prepared in accordance with the California Environmental Quality Act (CEQA), California Public Resources Code Section's 21000, et seq, the State CEQA Guidelines, Title 14, California Code of Regulations 15000, et seq, and the Orange County Planning and Development Services (PDS), "EIR Handbook - Guidelines for Preparing Environmental Impact Reports," July '91.

2.2 ENVIRONMENTAL PROCEDURES

On December 24, 1996 the Orange County Planning and Development Services Department (PDS) issued a Notice of Preparation (NOP) initiating the pre-circulation review period during which interested parties were requested to provide comments on the scope and content of the Draft EIR. On February 6, 1997, the PDS issued a revised NOP to the same parties. The NOP was revised to include a description of the commercial component of the project and an updated description of project alternatives. A list of NOP commentators and a summary of their comments are included in Appendix C of the Draft Subsequent EIR. The Initial Study circulated with the Notice of Preparation identified the following twelve (12) environmental factors to be evaluated in the Draft EIR:

- Land Use and Planning
- Geophysical
- Water
- Transportation/Circulation
- Air Quality
- Noise
- Population & Housing
- Energy & Mineral Resources
- Biological Resources
- Aesthetics
- Cultural\Scientific Resources
- Recreation
- Hazards
- Public Services/Utilities
- Utilities & Service Systems

The following public agencies submitted comments on the NOP:

- City of Mission Viejo, Community Development, 1/27/97
- City of Lake Forest, Community Developments Departments, 4/23/97

- Southern California Association of Governments, Intergovernmental Review, 12/31/96 2/13/97
- Southern California Association of Governments, 1/10/97
- Southern California Gas Company, 1/10/97, 2/18/97
- State of California, Dept. of Fish & Game, 1/30/97, 3/7/97, 3/12/97
- State of California, Governor's Office of Planning & Research, 12/31/96
- State of California, Dept. of Transportation, 1/21/97, 3/5/97
- Trabuco Canyon Water District, 1/21/97, 2/25/97
- Transportation Corridor Agencies, Environmental Services, ½/97
- United States Marine Corps, 1/7/97, 2/26/97
- U.S. Fish and Wildlife Service, 1/30/97, 3/7/97

A complete list of responsible and trustee agencies who received the NOP is included in Appendix C.

The following private organizations and individuals submitted comments on the NOP:

- Diequeno/Coastal Gabrieleno, Jim Velasques, 3/7/97
- Donald Finn, 2/26/97
- VerLyn Jensen Esq.(St. Michael's Abbey), 3/5/97
- James Loeper, Dawn Loeper, 2/17/97
- Charles Mitchell & Associates (Vedanta Society), 1/27/97
- William D. Ross Esq., 2/28/97
- Rutan & Tucker LLP, David B. Cosgrove Esq.(St. Michael's Abbey), 1/3/97
- Bernard Siegel, Cynthia Siegel, 2/28/97
- Vedanta Society of Southern California, Richard Jennings, 1/20/97
- Elizabeth Wallace (Portola Hills), 3/10/97

A summary of NOP comment letters is contained in a matrix in Appendix C of this document. Issues raised include the following:

- EIR Preparation
- MCAS El Toro Noise Impacts
- Land Use Compatibility
- Extensive Grading
- Wildlife Movement
- Endangered Species
- Mitigation Measures
- Road Access
- Air Quality
- Noise and Glare
- Fuel Modification Requirements
- Housing Affordability Guidelines
- Soil Erosion
- Aesthetics/Visual Impacts
- School Overcrowding
- Park Facilities
- Traffic Generation
- Overburdened Public Services
- Remedial Grading
- Water Quality
- Inconsistency with Other Plans
- Findings in Previous EIR
- Geophysical Stability
- Cumulative Impacts
- Inadequate Water Supply

Although not specifically addressed in the current set of NOP comments, a number of letters received from private organizations and individuals concerning the preceding EIR identified preparation process as a concern. Of particular concern is the issue of who can prepare an EIR. Section 21082.1 of the Public Resources Code states:

> *(a) Any draft environmental impact report, environmental impact report, or negative declaration prepared pursuant to the requirements of this division shall be prepared directly by, or under contract to, a public agency.*
>
> *(b) This section is not intended to prohibit, and shall not be construed as prohibiting, any person from submitting information or other comments to the public agency responsible for preparing an environmental impact report, draft environmental impact report, or negative declaration. The information or other comments may be submitted in any format, shall be considered by the public agency, and may be included, in whole or in part, in any report or declaration.*
>
> *(C) The lead agency shall do all of the following:*
>
> *(1) Independently review and analyze any report or declaration required by this division.*
>
> *(2) Circulate draft documents which reflect its independent judgement.*
>
> *(3) As part of the adoption of a negative declaration or certification of an environmental impact report, find that the report or declaration reflects the independent judgement of the lead agency.*

In Friends of La Vina v. County of Los Angeles (2d Dist. 1991) 232 Cal. App. 3d 1446 [284 Cal. Rptr. 171], the court analyzed CEQA Guidelines Section 15084, subdivision (d), which expressly allows agencies to "accept a draft prepared by the applicant, a consultant retained by the applicant, or any other person", recognizing that the same provision requires the agency to subject such a draft to its "own review and analysis." The Court added that any document released to the public must "reflect the independent judgement" of the agency, and that the agency is "responsible for the adequacy and objectivity of the Draft EIR." The Court held that this standard of "independent review," which has been cited in previous published CEQA cases, is consistent with the statutory language. (The 1991 amendments to section 21082.1 now require agencies to "independently review and analyze any report or declaration" required by CEQA, to "circulate documents which reflect their independent judgement," and to find, in approving a negative declaration or certifying a Final EIR, that the document in question "reflects the independent judgement of the lead agency.")

As lead agency, the County of Orange Planning & Development Services Division, although allowing the project applicant to contract for a consultant for the preparation of the Draft Environmental Impact Report and proposed responses to public comments, retains at all stages of the proceedings the right to independently evaluate the information set forth.

Following completion of the Draft Subsequent EIR, the document will be circulated to the State Clearinghouse, Office of Planning and Research, and responsible and trustee agencies for review and

comments. All comments received on the Draft Subsequent EIR will be responded to and incorporated into the Final Subsequent EIR. The Response to Comments document will be recirculated to commenting agencies and individuals at least ten (10) days prior to conducting a public hearing on the project.

2.3 INCORPORATION BY REFERENCE

In accordance with Section 15150 of the CEQA Guidelines, the Draft Subsequent EIR hereby incorporates analysis contained in the following documents by reference:

- Foothill-Trabuco Specific Plan Final EIR No. 531, December 1991, SCH No. 9001143;
- Saddleback Meadows Final EIR No. 059, May 1978;
- EIR No. 061 [Final EIR for Glenn Ranch (Portola Hills) dated November 13, 1979];
- EIR No. 439 [Final Focused EIR for the Morton W. Herrmann property (Hidden Ridge, dated December 12, 1984)]; and,
- FEIR No. 459 [Final Program EIR for Portola Hills (Glenn Ranch) dated December 17, 1986].
- DEIR No. 561 [Draft EIR for Saddleback Meadows dated October 1995, SCH No. 95081033]

Incorporation by reference assists in reducing the size of EIRs through including descriptive materials which do not contribute directly to the analysis at hand. The above noted documents are available for review at the Orange County Planning & Development Services Department/ Environmental and Project Planning Division.

The Foothill/Trabuco Specific Plan EIR evaluated the environmental effects of implementation of the Specific Plan on a programmed level consistent with the development goals, objectives and policies of the Specific Plan. The EIR contains a full scope analysis of environmental factors associated with the project area. The Foothill-Trabuco Specific Plan EIR states:

> *EIR 531 has been prepared as a Program EIR as part of a tiered EIR process. "Tiering," according to CEQA, means the coverage of general matters and environmental effects in an EIR prepared for a policy, plan, program or ordinance followed by narrower or site-specific EIRs which incorporate by reference the discussion in any prior EIR (CEQA Section 21068.5). Subsequent environmental documentation, if necessary, required for subsequent discretionary approvals (area plans, site plans, use permits, subdivision maps, etc.) will rely on the finding in EIR 531 as the basis for more detailed analysis and will incorporate these findings and all supporting documentation by reference. An Initial Study will be conducted per CEQA for each subsequent discretionary approval to determine whether additional*

environmental documentation is needed.

This Subsequent Environmental Impact Report contains a focused and specific analysis of impacts on the environment associated with implementation of the project.

2.4 BACKGROUND

The proposed project is the culmination of planning efforts with the County of Orange over a eighteen (18) year period. The following chronology identifies key dates in the projects' history:

Table 3
SADDLEBACK MEADOWS PROJECT CHRONOLOGY

DATE	PROJECT RELATED EVENT
August 8, 1978	- The Orange County Board of Supervisors adopted GPA 78-1, Item 4, the "Saddleback Meadows Mobile Home Subdivision" which granted a change in the Land Use Element designation for the site from 5.4 Other Open Space to 1.22 Medium Low Density Residential and 2.1 Local Commercial. Maximum number set at 617 dwelling units. Triggering mechanism to revert land use designation to original after 2 years commenced. EIR 059 certified.
February 6, 1979	- Board adopted Site Plan conditions as requirements for implementing the subject amendment. Draft EIR 059, which was the CEQA documentation for the site plan, identified major grading impacts as project related impacts; these impacts were also shown on grading plans for Tentative Tract Map TT10692, prepared for the project.
March 7, 1979	- Zone change application, Tentative Tract Map and Initial Study requests submitted to County for a maximum of 617 mobile home units and a neighborhood convenience commercial center on the project site.
March 29, 1979	- Determination of requirement for an EIR transmitted to applicant by Environmental Services Division (ESD).
June 5, 1979	- Appeal of EIR requirement by Cliff Russell, representing Worthington/McNiff.
June 11, 1979	- The Orange County Planning Commission denied the appeal. Supplemental EIR required for proposed 617 unit tentative tract map.
June 25, 1979	- Zone Change 79-24 submitted to County. The project proposed at this time consisted of 617 units.
August 7, 1979	- Revised Tentative Tract Map was submitted to the County for Screencheck reflecting some design modifications requested by County staff as well as an increase of 145 dwelling units added to the project by the proponent.
August 17, 1979	- Revised Tentative Tract Map and Supplemental Environmental Information

submitted to Environmental Services (ESD). Submittal raised many questions with ESD in that the project had been revised substantially with a 23.5% increase in total number of units and intensity of land use.

August 21, 1979 - Revised Zone Change 79-24 received by the County reflecting the revised project proposal of 762 units, with 25% in affordable range.

November 28, 1979 - Revised TT10692 filed with Environmental Management Agency depicting 727 lots, including 714 residential lots, 1 commercial lot and several open space and utility lots.

December 13, 1979 - TT10692 approved by the Planning Commission with recommendation that Zone Change ZC79-24 be approved by Board of Supervisors.

January 9, 1980 - Saddleback Meadows properties placed in the PC "Planned Community" District and adopted by Board of Supervisors, Ordinance Number 3177. Final EIR 203 certified.

October 28, 1981 - Two year extension of time to record to expire December 12, 1983 approved by the Subdivision Committee.

December 7, 1981 - Appeal to deny two year extension of time affirmed by Planning Commission. One year extension of time to record to expire December 12, 1982 granted by Planning Commission.

November 17, 1982 - An additional one year extension of time to record to expire December 12, 1983 approved by Subdivision Committee.

July 13, 1983 - Saddleback Meadows Planned Community District Regulations amended by Planning Commission, and adopted by Board of Supervisors, Ordinance Number 3398 (ZC82-63P).

October 26, 1983 - Third one year extension of time to record approved.

June 13, 1984 - Saddleback Meadows Planned Community District Regulations amended by Planning Commission, and adopted by Board of Supervisors, Ordinance 3486 (ZC84-3P).

October 24, 1984 - 589-day stay of time in which to record a final tract map approved by Subdivision Committee. Expiration date extended to July 24, 1986.

July 24, 1986 - Water district could not provide sewer service; recordation not allowed until sewer capacity available.

September 21, 1988 - Execution between Southmark and the Trabuco Canyon Water District of "Agreement for Designing Construction of Master Plan Facilities, Tract No. 10692";

September 21, 1988 - Execution between Southmark and the Trabuco Canyon Water District as a

		document entitled "Agreement for Construction of Onsite Water and Sewer Facilities, Tract No. 10692";
December 16, 1988	-	Tract Map 10692 recorded.
February, 1989	-	Payment of $973,528.58, purchase of sewer treatment capacity rights in Trabuco Canyon Water District's Chiquita Wastewater System Facilities by predecessor to Applicant;
1989	-	Payment by predecessor to applicant to the Trabuco Canyon Water District in the amount of $904,475.00 for capital improvement charges based on the Equivalent Density Units of Recorded Tract No. 10692;
December 10, 1991	-	Foothill/Trabuco Specific Plan approved and Final EIR 531 certified by Orange County Board of Supervisors. The Specific Plan incorporated the Saddleback Meadows Planned Community Regulations as the Bridlewood Residential District.
April, 1994	-	Grading Permit Application GA940031 submitted for Phase I, Grading (98.3 acres) of the site.
August, 1994	-	Initial Study completed and Environmental Impact Report Determination Letter is issued.
August 11, 1994	-	Letter of Appeal filed with County.
November, 1994	-	Appeal Hearing postponed to January 7, 1995.
January 31, 1995	-	Applicant withdraws appeal. Planning Commission directs applicant to develop a more compatible project in response to public testimony, staff concerns, and Planning Commission's direction.
July 27, 1995	-	Revised 318-unit Site Development Plan, zone change and area plan submitted to County of Orange.
August 11, 1995	-	Notice of Preparation circulated for EIR 561
October 17, 1995	-	Screencheck Draft EIR 561 submitted to OCPDS for review.
July 30, 1996	-	Orange County Planning commission recommended EIR 561 for certification and recommended applications for Vesting Tentative Tract Map No. 15230, area plan 95-7 and zone change 95.5 be denied.
October 22, 1996	-	Board of Supervisors denied project and did not certify EIR 561.
December 3, 1996	-	Applicant submitted application for Phase 1 Grading Plan for 705 unit Tract 10692 (GA960048).
December 16, 1996	-	EMA determined that a Subsequent EIR is required to evaluate the effects of the

grading application.

December 24, 1996 - Notice of Preparation issued for Subsequent DEIR 566.

February 6, 1997 - Notice of Preparation re-issued for Subsequent DEIR 566.

2.5 MATRIX OF PROJECT APPROVALS

All relevant actions, responsible agencies and decision making bodies which have discretionary or advisory authority over the proposed project are shown in Appendix A. In addition to the County of Orange, the following agencies have regulatory authority over various aspects of the proposed project:

- U.S. Army Corps of Engineers
- U.S. Fish & Wildlife Service
- California Department of Fish & Game
- California Regional Water Quality Control Board
- South Coast Air Quality Management District

2.6 RELATED PROJECTS

The California Environmental Quality Act (CEQA) requires that all EIRs consider the environmental impacts of a project, along with the impacts from other projects in the vicinity. These impacts, referred to as cumulative impacts, are defined as the "effects of two or more individual effects that, when considered together, are considerable or which compound or increase other environmental impacts. The discussion should include either a list of past, present and reasonably anticipated future projects producing related or cumulative impacts or a summary of projections contained in an adopted General Plan or related planning document that is designed to evaluate regional or areawide conditions." (CEQA, Section 15355).

The County has determined that one related project (Live Oak Plaza, PA 960095) has been identified within the Foothill-Trabuco Specific Plan which would contribute to cumulative impacts. In the surrounding area, the following related projects have been identified. Exhibit 1 identifies the location of these related projects.

- Portola Hills Planned Community Buildout
- PA 11 GPA - 625 du - City of Mission Viejo

2.7 AREAS OF CONTROVERSY

Several potential areas of controversy were identified by NOP response letters. Following is a listing of these areas of controversy and the location where these are evaluated and analyzed in this DEIR:

- Land Use/ Aesthetic Compatibility - Section 4.8
- Foothill-Trabuco Specific Plan Conformance - Land Use, Section 4.1

- Emergency Access Requirements - Public Services, Section 4.13
- Wildlife Corridor Design Width - Biological Resources, Section 4.8
- Project Specific Affordable Housing Requirements - Land Use/Housing, Section 4.1
- EIR Preparation Process/Procedures - Introduction, Section 2.0
- Loss of Wildlife Habitat/NCCP Reserve, Section 4.7
- Geophysical Stability, Section 4.2
- Traffic/ Circulation, Section 4.4

2.8 MITIGATION MEASURE STRUCTURE

Mitigation measures identified in Sections 1.0, 4.0 and 7.0 of this Draft Subsequent EIR are included in one or more of the following three categories, 1) Project Design Features (PDF), 2) Standard County Conditions (SC), or 3) Additional Mitigation Measures (AM). Each mitigation measure is identified with one of these acronyms. All mitigation measures outlined in Sections 4.0 and 7.0 are also included in the Mitigation Monitoring Program, set forth in Section 9.0 of the DEIR.

The environmental analyses and evaluations contained in this document are largely informational, and not prescriptive in nature in that mitigation measures which would alter features of the final recorded tract map cannot be implemented to reduce all project impacts to a level of insignificance. This is attributable primarily to the physical limitations of the site and the inability to deviate from the final recorded tract map. Accordingly, any findings of significant impact must be offset through the issuance of a Statement of Overriding Considerations.

Project Design Features

Specific design features of the project proposed by the applicant to reduce potential environmental impacts are referred to as project design features (PDF). The PDFs that apply to each environmental topic are listed in each sub-section of Section 4.0. These features provide mitigation through avoidance, reduction or offset of impacts. Because these features are part of the project design, they do not constitute additional mitigation measures, but are in effect mitigation through project design. In order to ensure accountability for implementation, the PDFs specify timing mechanisms, responsible parties, and other related information, as appropriate.

It should be noted, environmental documentation for previously approved Tract Map No. 10692 and/or the Foothill-Trabuco Specific Plan may have identified relevant mitigation measures and conditions of approval to reduce and/or avoid potential significant impacts. These mitigation measures and other conditions of approval imposed in connection with prior approvals have been incorporated into the design of the proposed project as PDFs.

N

2-11.

When a significant impact occurs, and the PDF does not mitigate the impact to a level of insignificance, the EIR will identify that impact as being significant and, in addition to the PDF, will either 1) identify mitigation measures proposed by the County to mitigate the impact; 2) note that responsibility for mitigation of this impact rests with another Responsible or Trustee Agency; or 3) identify the significant impact as an "unavoidable adverse impact, which will necessitate the adoption of a Statement of Overriding Considerations if the project is approved."

The Orange County PDS will ensure compliance with all PDFs through its standard procedures for the approval of permits and applications. The Mitigation Monitoring and Reporting Program, which must be adopted with the Final EIR, will include specific implementation components, similar to mitigation measures, for each PDF.

Standard Conditions of Approval and Mitigation Measures

The EIR also lists Standard Conditions of Approval and additional project specific mitigation measures for reduction of project impacts. Standard Conditions (SC) include project requirements mandated by the County of Orange and State and federal agencies with authorization for environmental regulations. Standard Conditions typically include project compliance with the County of Orange Standard Conditions of Approval, the Uniform Building Code, South Coast Air Quality Management District, school fees, Alquist-Priolo Act, requirements and other standard measures for hillside residential development projects, various development fees including fire, sheriff, schools, parks and transportation.

Additional Mitigation Measures

Project specific mitigation measures are prescribed as necessary to further mitigate project impacts beyond the mitigation provided by the PDFs and applicable Standard Conditions. For those impacts with no County Standard Conditions, project specific mitigation measures, will be imposed to reduce project impacts to the maximum extent possible. Each environmental factor evaluated in Section 4.0 provides a conclusion as to whether or not the project impacts are mitigated to below the level of significance with the combination of available PDFs, Standard Conditions and additional mitigation measures.

2.9 EFFECTS FOUND NOT TO BE SIGNIFICANT

As required in CEQA Guidelines, Section 15128, this Subsequent EIR identifies effects of the project determined to be insignificant or less than significant. The Initial Study conducted by the County of Orange (included in Appendix A) determined that certain environmental effects, including secondary effects, of the project will not be significant. Therefore, they are not discussed in detail in this EIR. The effects found not to be significant or less than significant in the Initial Study are summarized below, and briefly discussed in each topical section. All other environmental topics required by CEQA are analyzed for potential impacts in the EIR.

Population

The proposed project is not expected to cumulatively exceed adopted regional or local population projections. It will not induce substantial growth in the immediate area either directly or indirectly, nor extend major infrastructure into a previously undeveloped area. The project would not displace existing housing.

Energy and Mineral Resources

The Saddleback Meadows project site is primarily in a natural state. None of the site's potential mineral resources have been disturbed. Previous EIR Nos. 059, 203 and 531 did not identify energy and/or mineral resources on the site. The Orange County General Plan/Foothill-Trabuco Specific Plan does not designate the site as having a potential for mineral resources.

3.0 PROJECT DESCRIPTION

3.1 GEOPHYSICAL SETTING

The project site is situated on 222.23 acres of vacant land located on the easterly side of El Toro Road, approximately ½-mile south of the intersection of Santiago Canyon Road/El Toro Road and Live Oak Canyon Road, in east-central unincorporated Orange County. The incorporated cities of Mission Viejo and Lake Forest lie approximately three (3) miles to the south and southwest, with the Cleveland National Forest boundary located approximately ½-mile north of the project site. Aliso Creek is located adjacent to the northwest portion of the project site. In addition, a small strip of County owned land is located between the project site and El Toro Road.

The project site is surrounded by residential development, with the Portola Hills and Foothill Ranch planned communities to the west, the Hidden Ridge/Hidden Hills community and a nursery to the south, and scattered low-density residential uses to the north and east. O'Neill Regional Park is located adjacent to the southerly boundary of the site with St. Michael's Abbey immediately to the northwest and the Ramakrishna Monastery located immediately to the southeast. The project's location in relationship to the surrounding land uses is shown in Exhibit 2. Regional location and vicinity maps are shown in Exhibits 2 and 4 respectively. Regional aerial photographs are shown in Exhibit 3 and aerial site photographs in Exhibit 5. Onsite elevations range from 1,000 feet near El Toro Road to 1,550 near the eastern portion of the site (see Exhibit 6).

3.2 PROJECT DESCRIPTION

The proposed project would construct the previously approved and Recorded Tract Map 10692. The project was originally approved in December of 1979 and recorded in December of 1988. The original project has been re-analyzed in consideration of changed circumstances and new information on environmental significance not previously considered.

The proposed project, is consistent with Tract Map No. 10692, and proposes the phased development of 705 manufactured single family housing units and a 1.5-acre, neighborhood commercial center and associated infrastructure, on a 222.23-acre site on the easterly side of El Toro Road. The gross residential density is 3.17 du/ac, with minimum lot sizes of 2,630 square feet.

The following Plans have ben approved associated with Recorded Tract Map 10692:

- Tract 10692 Record of Survey 5/88
- Improvement Plans for Widening of El Toro Road - Tract 10692 - Approved 11/17/88 Encroachment Permit No. 88-14451-RT
- Preliminary Grading Plan for Tract 10692 - Prepared 4/1/94, Revised 1/12/95 (Phase Only)
- OCPDS Plans for construction of Aliso Creek Channel - Facility J01 - 11/16/88

- OCPDS - Private Storm Drain Improvements for Tract 10692 - 11/15/88 Encroachment Permit No. 88-00728-FC, tributary to Aliso Creek.
- Street Improvement Plans
  - Recorded Streets - (Quiet Creek Terrace, Grassland Terrace, Oak Grove Terrace, Scenic Canyon Terrace, Indian Summit, Quail Run, Priory, Wildflower and Ridgecrest Way.

The project site is located within the Foothill/Trabuco Specific Plan and the Aliso Creek Corridor Specific Plan approximately ½-mile south of the El Toro Road/Live Oak Canyon Road intersection. The project site is designated as "Bridlewood Residential District" in the Foothill-Trabuco Specific Plan and "1B, Suburban residential, in the Countywide General Plan Land Use Element. Project site zoning is "S", Specific Plan.

As discussed previously, Tract Map 10692 was recorded (after a series of extensions) in December of 1988. Since project approval preceded the adoption of the Foothill-Trabuco Specific Plan (FTSP) by several years, the project is exempt from its goals, objectives and policies in relation to the area designated as "Bridlewood Residential District", as per the FTSP itself. The Foothill Trabuco Specific Plan references this project as follows:

As long as the site is developed in accordance with the existing Saddleback Meadows Planned Community zoning (Zone Change 84-3P) and Recorded tract 10692, the project site shall be exempt from all of the Regulations and Guidelines included in this Specific Plan other than those provided for by this District.[1] (Emphasis added)

The Bridlewood Residential District is established to recognize the existing zoning and tract map approvals for the Bridlewood (Saddleback Meadows) property which permit the development of 705 manufactured homes on the site. While the Board of Supervisors does not believe that these approvals are consistent with the Goals and Objectives of the Specific Plan, the property owner has recently declared bankruptcy. A legal stay precludes the Board of Supervisors from taking any action related to the property that would affect its value. However, the provisions of this District require that the Specific Plan be amended to determine an appropriate density cap and District Regulations for the property in the event that it cannot be developed in a manner which is consistent with the approved zoning and tract map.

Prior to the most recent submittal of a grading permit application for Tract Map 10692, the project site was proposed for 318 single-family dwelling units. Proposed FEIR 561 was prepared to evaluate environmental impacts resulting with this development proposal. It is noted in DEIR 561 that though the 318-unit project was identified as "environmentally superior" to the 705 unit project currently being proposed, the 318-unit proposal was denied. No action was taken to certify Proposed FEIR 561 at the time of the denial of the 318 unit project. Furthermore, EIR 561 identified the currently proposed 705-unit project (Alternative No. 2 in Proposed FEIR 561) as one of two environmentally inferior alternatives considered.

The project site can be presently serviced by sewer lines and treatment capacity predicated on the density authorized by Recorded Tract Map 10692.

Existing Topography

EXHIBIT No. 6

It is therefore understood that the environmental analyses and evaluations contained in this document are largely informational, and not prescriptive in nature in that mitigation measures which would alter features of the final recorded tract map can not be implemented to reduce all project impacts to a level of insignificance. This is attributable primarily to the physical limitations of the site and the inability to deviate from the final recorded tract map. Accordingly, any findings of significant impacts must be offset through the issuance of a Statement of Overriding Considerations. Additionally, to the extent that the County included Tentative Tract Map 10692 in its determination to provide adequate affordable housing in 1979, the removal of the mandated Inclusionary Housing Program (IHP) requirements could undermine the County-wide calculations used to eliminate the affordable housing mandate.

Project Features

The proposed project, consistent with Final Tract Map 10692, would construct 705 manufactured single-family detached dwelling units on minimum 2,630 square foot lots as shown in Exhibit 7. Gross density would be 3.17 du/ac.

Project implementation would directly affect 156.55 acres of the project site, not including remedial grading and fuel modification requirements. Total development footprint area would affect 86 percent or about 191.39 acres of the project site. In addition to onsite grading 19.77 acres of offsite area would be used for access road construction and remedial grading, fuel modifications, water tank site, creek channel and slope area. A total of 2.6 million cubic yards of conventional grading and 8.9 million cubic yards of remedial grading would be required to implement the project. Areas disturbed by remedial grading activities, outside of lots/manufactured slope, are proposed to be landscaped with native-compatible plant materials. Project features are summarized in Table 4.

Thirty-nine percent (39%) of the project site is proposed to remain in open space, including community slope area. In addition to the residential component, the project also proposes commercial uses; eight private park sites; regional equestrian, hiking, and bicycle trail connections; and construction of a water tank site dedicated to and accepted by, the Trabuco Canyon Water District. Table 4 presents project land uses, by acreages and percentages. Proposed bicycle trail would be located along El Toro Road and would connect with the existing underground crossing. Hiking and equestrian trails would be provided along the southern perimeter, connecting with the neighboring O'Neill Regional Park. The equestrian trail would also continue along El Toro Road. It is expected that these trails would ultimately connect with the County's regional system. A 1.5-acre commercial pad would be located along El Toro Road near Valley Vista Way.

As part of the proposed project, the portion of Aliso Creek adjacent to the project site will be fully improved with a concrete trapezonal channel and its associated maintenance road, in accordance with improvement plans prepared for Recorded Tract Map No. 10692.

A 1.4 million gallon water tank and associated access road is proposed offsite adjacent to the northeast corner of the project site to provide water service to the proposed project. The water tank site is currently owned by the Trabuco Canyon Water District. This water tank site was dedicated under the Recorded Tract Map 10692. The water tank is proposed to be 29-feet tall, bermed, and

painted a complimentary color to the surrounding landscape. The water tank would be constructed by Trabuco Canyon Water District.

Project access will be off of El Toro Road; a second gated access at Valley Vista Way will also be provided. The entry street will be designed as a Collector roadway with a curb-to-curb width of 58 feet at its intersection with El Toro Road. This provides for two 12-foot exiting lanes and two 12-foot entering lanes with a 10-foot median. The Collector cross-section should be maintained for approximately 160 feet where it could then be transitioned to a standard 40-foot wide curb-to-curb width Collector roadway. The entry street will be designed with a traffic signal and a southbound left-turn pocket and northbound right-turn lane. Onsite circulation is proposed with a primary spine street and a series of cul-de-sacs.

Discretionary Actions

Approval of a grading plan and issuance of a grading permit are required.

The following discretionary permits and clearances are required prior to project implementation:

Agency		Permit
• California Department of Fish & Game	-	1603 Streambed Alteration Agreement
• U.S. Fish & Wildlife Service	-	Section 7 Consultation/4(d) Rule
• U.S. Army Corps of Engineers	-	Section 404 Permit Action
• California Regional Water Quality Control Board	-	NPDES Construction Stormwater Discharge Permit
• California Regional Water Quality Control Board	-	Section 401 Water Quality Certification
• South Coast Air Quality Management District	-	Authority to Construct/Operate Permit

3.3 DEVELOPMENT OBJECTIVES

The following objectives have been established for the proposed project to serve as a basis for comparing alternative development plans and for the evaluation of associated environmental impacts.

- Develop a residential community which implements recorded Tract Map No. 10692 for the construction of 705 manufactured housing units.

- Minimize visual affects on surrounding properties to the extent feasible given the constraints of Recorded Tract Map No. 10692, through the provision of perimeter open space lots and landscape screening.

- Remediate and provide geotechnical stabilization for onsite landslide areas affecting the proposed development area.

- Implement the policies contained in the General Plan and the Air Quality Management Plan to the extent feasible given the constraints of Recorded Tract Map No. 10692.

- Minimize adverse effects on surrounding properties, O'Neill Regional Park and Aliso Creek through the provision of buffer/setback zones and design features, to the extent feasible given the constraints of Recorded Tract Map No. 10692.

- Conduct preliminary grading and stabilization for the ultimate El Toro Road right of way.

- Create a fire safe community through incorporation of an area-wide fuel modification program.

- Provide trail connections to the regional riding and hiking trail system, to the extent feasible given

the constraints of Recorded Tract Map No. 10692.

3.4 PROJECT PHASING

Preliminary project grading is proposed to be implemented in one phase. Project grading would require approximately 18 months[2] to complete. All grading, including remedial grading will be completed in one phase and be balanced onsite. Residential units are planned to be constructed in a series of phases based on market demand. The water tank will be completed prior to Phase I models. Project buildout is estimated to occur approximately five (5) years after completion of grading. Primary infrastructure (roads, water/sewer mains, and utility stub-outs) will be completed in Phase I. Resource enhancement and riding/hiking trail construction will be completed prior to the final phase of the proposed project.

Table 5
SURROUNDING PROJECT COMPARISON SUMMARY

Feature	Proposed Project	Portola Hills	Hidden Hills Hidden Ridge

4.0 EXISTING CONDITIONS, PROJECT AND CUMULATIVE IMPACTS, MITIGATION MEASURES, AND LEVEL OF SIGNIFICANCE AFTER MITIGATION

4.1 LAND USE/HOUSING

4.1.1 EXISTING ENVIRONMENTAL SETTING

Existing and Planned Land Use

The project site is currently functioning as natural open space with the exception of the remains of an abandoned ranch structure, geotechnical investigation and cattle grazing activities. A mobile home is located onsite in support of the cattle grazing. Approximately 50 percent of the project site is currently being utilized for cattle grazing activities. Existing surrounding land uses are shown in Exhibit 14 and summarized in Table 6.

Table 6
SURROUNDING LAND USE SUMMARY

Direction	Land Use
North	St. Michael's Abbey, Cooks Corner, Natural Open Space, Cleveland National Forest, Live Oak Plaza, and low density residential.
South	Hidden Hills and Hidden Ridge Developments, O'Neill Park, and Ramakrishna Monastery
East	Low Density Single-Family Residential, Church and Natural Open Space
West	Portola Hills Planned Community and Aliso Creek

North

St. Michael's Abbey is located on a 35-acre parcel north and west of the project site and contains the following facilities: a church, prep school/dormitory, abbey, refectory, library, a swimming pool, small sports field and associated parking areas. In addition to Abbey facilities, a vacant single-family dwelling unit is located in the eastern portion of the property. The abbey was constructed in 1960 and opened as a prep school in 1961. The prep school serves grades 9-12 and has a current enrollment of approximately 75 students.[1]

[1] *Personal communication, Farther Vincent - St. Michael's Abbey - 9/8/95.*

Cook's Corner is located at the northeast corner of the intersection of El Toro Road, Santiago Canyon Road, and Live Oak Canyon Road. Cook's Corner is a popular restaurant/bar attracting large crowds on the weekends.

Directly north of the project site, south of Cleveland National Forest, is private property referred to as the Edgar 4-S Ranch South. The property is primarily natural open space, with scattered large lot single-family dwellings. Live Oak Plaza is also located to the north.

South

To the south land uses include the existing Hidden Ridge/Hidden Hills development, O'Neill Regional Park and the Ramakrishna Monastery. Hidden Ridge/Hidden Hills contains 230 residential detached and attached dwelling units on 74 acres. Gross residential density is 3.1 dwelling units/acre. The Hidden Ridge/Hidden Hills community is not included in the Foothill-Trabuco Specific Plan.

O'Neill Regional Park was first opened in 1948 and provides a variety of recreational opportunities including active day use areas, overnight camping, wilderness hiking areas and interpretive programs. The park encompasses approximately 2,000 acres, with the northern third of the acreage located within the Foothill-Trabuco Specific Plan The portion of the park adjacent to the project site is designated as wilderness area and contains the Live Oak Trail, providing for connection from park headquarters to the Aliso Creek Trail and points west.

The Ramakrishna Monastery is located adjacent to the southeast portion of the project site and was constructed in 1942. (Note: Building constructed in 1942, the Ramakrishna's took over the site in 1946.) The monastery facilities include a series of structures for worship, residence area, a kitchen, and storage facilities. Additional features include shrine areas, hiking trails, a small reservoir, gardens and parking area. A portion of the views of the project site from the monastery are screened by mature pine and oak trees.

East

The area east of the site is visually screened by a major ridgeline and consists of natural open space, scattered single-family dwelling units and a church. Access to this area is provided off of Live Oak Canyon Road.

West

West of the project site is the Portola Hills Planned Community, of which the residential component is primarily built out. Ultimately the community will have 2,200 detached and attached dwelling units, a County fire station, elementary school, and natural open space. The gross residential density is 1.6 dwelling units per acre. The Portola Hills Planned Community is not located within the Foothill-Trabuco Specific Plan.

Table 5 in Section 3.2 contains a comparative statistical analysis of existing surrounding developments. As shown, both Portola Hills and Hidden Hills/Ridge have a lower gross density than

the proposed project.

In addition, a small strip of County owned land is located between the projects western boundary and El Toro Road.

Orange County General Plan

Land Use Element

The Orange County General Plan Land Use Element (Adopted June, 1982), designates the project site as 1B (Suburban Residential - 0.5 to 18 du/ac). The Community Profile, which is not a part of the General Plan, designates the site as 1.2 low density residential (0.5 to 2.0 du/ac.) In addition to the Land Use Element, the project site is subject to policies contained in the Circulation Element, Housing Element, Public Services and Facilities Element, Noise Element, Recreation and Safety Element.

Housing Element

The Orange County General Plan Housing Element was adopted September 13, 1993 and is a comprehensive statement of broad and specific policies to facilitate development of housing in the County. The project site is located in Regional Statistical Area (RSA) 43-C. RSA 43-C had a 1995 population of 190,700 with a year 2000 population projection of 212,700 (2.3 percent growth). RSA 43-C had a 1995 jobs to housing ratio of 3.80, the highest in the County.

In 1979, the County adopted the Inclusionary Housing Program (IHP), which required developers to provide 25 percent of all new dwellings within the affordable category (i.e., 120 percent or less of median income). In 1983, the IHP was replaced by the Housing Opportunities Program (HOP), which phased out mandatory requirements over a three-year period in favor of voluntary compliance with affordable housing objectives encouraged by County incentives and market forces. Adoption of the HOP did not rescind prior approvals of mandatory affordable housing requirements placed on projects as conditions of approval under the IHP.

A total of 26,907 mandatory affordable units have been required to date as part of General Plan amendments or zone changes. The vast majority of these (24,268) are found within planned communities, with the remainder scattered in conventionally-zoned parcels.

The previously approved and recorded Final Tract Map 10692 was required in the IHP/HOP to provide 66 2/3 percent of total construction as affordable housing (mobile homes). Since it was an original Condition of Approval, this requirement still applies to the project even though the County-mandated affordable housing requirements have since been rescinded

Foothill-Trabuco Specific Plan

In December 1991, the Foothill-Trabuco Specific Plan was adopted by the County Board of

Supervisors, and replaced the Foothill-Trabuco Feature Plan. This action converted the then policy level Foothill-Trabuco Feature Plan into a regulatory-zoning level Specific Plan. The Specific Plan sets forth goals, policies, land use district regulations, development guidelines, and implementation programs designed to preserve the area's rural character and to guide future development in the Foothill-Trabuco area.

To facilitate planning efforts, three (3) individual planning areas were created within the overall Specific Plan Area: 1) Upper Aliso Planning Area; 2) Trabuco Canyon Planning Area, and 3) Plano Trabuco Planning Area. The project site is located within the Upper Aliso Planning Area and is designated, the "Bridlewood Residential District".

While the Foothill-Trabuco Specific Plan was adopted with the intent of guiding future land use within the Specific Plan area, its approval post-dated that of Tract Map 10692 by some 12 years. Accordingly, the current project, originally approved in 1979, is effectively exempt from the provisions of the Foothill-Trabuco Specific Plan.

The following passages are excerpted from the Land Use Regulations section of the Specific Plan:

> *As long as the site is developed in accordance with the existing Saddleback Meadows Planned Community zoning (Zone Change 84-3P) and Recorded tract 10692, the project site shall be exempt from all of the Regulations and Guidelines included in this Specific Plan other than those provided for by this District.*[2] (Emphasis added)

> *The Bridlewood Residential District is established to recognize the existing zoning and tract map approvals for the Bridlewood (Saddleback Meadows) property which permit the development of 705 manufactured homes on the site. While the Board of Supervisors does not believe that these approvals are consistent with the Goals and Objectives of the Specific Plan, the property owner has recently declared bankruptcy. A legal stay precludes the Board of Supervisors from taking any action related to the property that would affect its value. However, the provisions of this District require that the Specific Plan be amended to determine an appropriate density cap and District Regulations for the property in the event that it cannot be developed in a manner which is consistent with the approved zoning and tract map.*[3]

Aliso Creek Corridor Specific Plan

The Aliso Creek Corridor Specific Plan (concept) was adopted in July 1978 and outlines open space and recreational policies and programs for Aliso Creek and proximal surrounding areas, from it's headwaters in the Cleveland National Forest to its outlet into the Pacific Ocean at Laguna Beach. The goals of the Aliso Creek Corridor Specific Plan area as follows:

- The preservation of the natural character of the Aliso Creek Corridor from the forest to the sea, including the creek course and banks, irreplaceable resources and environmental features.
- The utilization of the Aliso Creek Corridor as an organizer for various systems including, but not limited to, recreation, circulation, public service and development.
- The provision of opportunities to provide for alternative means of transportation and recreation within the Aliso Creek Corridor utilizing bicycle, pedestrian, and equestrian trails, while minimizing conflicts with vehicular traffic along and across the corridor.
- The utilization of the Aliso Creek Corridor as a regional recreation/open space amenity providing a variety of recreation opportunities.
- Provision of a well-organized program designed to implement the Aliso Creek Corridor Specific Plan.

The project site is partially located within the Aliso Creek Corridor Specific Plan, with the Specific Plan's boundary formed by the Aliso Creek watershed limits. The site is located within Planning Unit 5 and more specifically Sub-area 33. Sub-area 33 is designated for open space and recreation land uses. In addition, the Concept Plan shows a regional bike trail onsite.

Zoning

The entire project site is currently zoned "S"-Foothill-Trabuco Specific Plan with "SR"-Sign Restriction overlay district. The Bridlewood/Saddleback Meadows Residential District was established within the Foothill-Trabuco Specific Plan, adopted December, 1991, to recognize the existing zoning and tract map approvals for the Bridlewood/Saddleback Meadows property.

4.1.2 EFFECTS FOUND TO BE INSIGNIFICANT

The following land use/housing effect was found to be less than significant, as determined by the Initial Study contained in Appendix C of this EIR:

- The project will not displace existing housing

4.1.3 PROJECT IMPACTS

Land Use Compatibility

Project implementation would construct manufactured single-family detached dwelling units, streets, slopes and associated infrastructure on the currently vacant project site. Minimum lot size for the proposed project would be about 2,630 sf., which is smaller than the 3,000 sf. and 5,000 sf. required for the neighboring Portola Hills and Hidden Ridge single family detached residential communities, respectively. Both Hidden Ridge and Portola Hills also have attached residential units. A comparison of surrounding project gross densities is shown in Table 5 of Section 3. As shown, the proposed project has a somewhat higher gross density than surrounding area projects.

O'Neill Regional Park is located adjacent to and directly south of the proposed project. The portion of the park adjacent to the site is primarily devoted to wilderness activities. As a result, implementation of the proposed project would not be compatible with existing and planned park uses.

The Ramakrishna Monastery is also located adjacent to the southern boundary of the project site. This religious facility is occupied by seven resident monks and serves a limited number of visitors. Due to the contemplative purposes for which this facility exists, the proposed project would not be compatible with the Ramakrishna Monastery.

Scattered estate density residential land uses are located adjacent to the eastern and northern project boundaries, although they would be physically separated from the proposed project by an intervening ridgeline. These surrounding areas contain minimum one and 2.5-acre lots, and would not be considered compatible with the proposed project.

St. Michael's Abbey is located north and west of the project site and functions as a religious and educational facility. Introduction of the proposed project adjacent to the Abbey would result in a land use incompatibility. The incompatibility between the proposed project and the Ramakrishna Monastery and St. Michael's Abbey is partially offset by some natural open space buffering and topographic landscape screening.

Orange County General Plan

Land Use Element

The proposed project is in conformance with all elements of the County General Plan, including the Land Use Element, Noise Element, Transportation Element, Housing Element, Growth Management Element, Safety Element, Public Services and Facilities Element, Recreation Element, and Resource Element.

Housing Element

The proposed project would supply 705 manufactured single-family residential dwelling units into RSA 43-C, a jobs-rich, housing-poor area. This represents a significant addition to the County's

existing stock of affordable housing units. This is noteworthy because the project was conditionally approved in 1979 with a 66 2/3 percent affordable housing requirement in accordance with the County's Inclusionary Housing Program (IHP). Although this mandate has since been rescinded, the original affordable housing requirements are still attached to Final Recorded Tract Map 10692.[4] As per the Conditions of Approval originally placed on Tentative Tract 10692, a total of 470 lots are to be sold in the affordable range. This figure is further broken down as follows: 188 low/ moderate, and 282 Medium I, as defined by the County.

Foothill-Trabuco Specific Plan

As stated above, the project is inconsistent with many of the goals, objectives, and policies of the Foothill-Trabuco Specific Plan which generally calls for the preservation of the rural character and natural habitat of the Foothill-Trabuco area. The proposed site has been designated "Bridlewood Residential District" by and was made a part of the Specific Plan. Accordingly, the project is exempt from provisions of the Specific Plan. The Specific Plan reads as follows:

> *The Bridlewood (Saddleback Meadows), Lyon Ranch (Saddleback Community Church), Santiago Ranch and Zadeh properties currently have approved or recorded tract maps in effect. Except in the event that proposed development on these individual properties cannot be found consistent with previous approvals, the subject properties shall be exempt from all of the Regulations and Guidelines included in this Specific Plan and shall be subject to the zoning in effect at the time of . . . project approval.*[5]

Although the project is deemed exempt from the goals, objectives and policies of the Foothill-Trabuco Specific Plan, there are certain features of the project which attempt to satisfy community amenities and standards for development. Specifically, these include the incorporation of riding, hiking and bicycle trails, and eight private park sites. Additionally, as required by the original Conditions of Approval, the project also adds significantly to the County's supply of affordable housing stock and helps alleviate the sub-region's current jobs/housing imbalance.

Conversely, the proposed project conflicts with the Foothill-Trabuco Specific Plan specifically with regard to the preservation of a regionally contiguous wildlife corridor. Furthermore, the Specific Plan states that the type of homes being proposed would be incompatible with site topography and biological resources. The Specific Plan reads as follows:

> *It is recognized that the Specific Plan Area, due to its steep terrain and sensitive biological resources, is inappropriate for the provision of affordable housing. The provision of (high*

---

[4] *It is noted that the County's prior decision to withdraw its own affordable housing mandate may have been based, in part, on the premise that sufficient affordable housing units already existed, or were planned County-wide. However, to the extent that the County included Tentative Tract Map 10692 in its determination to provide adequate affordable housing in 1979, the removal of the mandated IHP requirements could jeopardize the County-wide calculations used to eliminate the mandate.*

[5] *Ibid. p. III-4*

density) affordable housing conflicts with the goals and objectives of the Specific Plan which include maintaining the rural character of the area, providing a buffer between urban development and the Cleveland National Forest and preserving significant biological resources and natural landforms.[6]

Aliso Creek Corridor Specific Plan

The proposed project does incorporate regional riding and hiking trail connections into its design, however, it does conflict with several other aspects of the Aliso Creek Corridor Specific Plan. For example, the project would not preserve recreational open space or conserve the natural features of the Aliso Creek Corridor as it proposes to replace an existing natural creek with a trapezonal channel. Similarly, the project is in direct conflict with the Natural Communities Conservation Planning Program (NCCP) in that it would further disturb a sensitive wildlife habitat area.

Zoning

The proposed project is in conformance with County zoning standards. No conflicts would result.

Impact Significance Criteria

The effects of a project on existing or planned land uses are considered to be significant if the proposed project conflicts with one or more of the following:

A. Conflicts with General Plan land use or zoning designations or policies;

B. Conflicts with existing or planned land uses onsite or adjacent to the project site, e.g., disrupts the physical arrangement of an established community or causes development within or adjacent to open space preserved for habitat value;

C. Results in conversion of prime agricultural land to non-agricultural uses, or impairs the productivity of prime agricultural land;

D. Causes significant urban growth.

These criteria are derived from the County PDS Environmental Analysis Checklist (Initial Study is contained in Appendix C).

4.1.4 SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the proposed project would result in significant land use compatibility impacts to O'Neill Regional Park, the Ramakrishna Monastery St. Michael's Abbey, and surrounding residential communities. The project would also conflict with policies of the Aliso Creek Corridor Specific Plan.

---

[6] *Ibid. P. III-1*

4.1.5 CUMULATIVE IMPACTS

Implementation of the proposed project in conjunction with the identified related projects, would result in additional urban intensity development within and adjacent to the Foothill-Trabuco Specific Plan area.

4.1.6 MITIGATION MEASURES

Standard County Conditions and Mitigation Measures

SC 1-1 Prior to the issuance of any building permits for residential construction, the developer shall comply with Board of Supervisors Resolution 82-1368 (Buyer Notification Program) which requires the developer to prepare a map denoting the existing and proposed land uses, arterial highways, and public facilities within the surrounding area for the approval of the Manager, PDS/Current Planning Services Division. The map content, display, and distribution shall be in accordance with the Buyer Notification Program guidelines approved by the Board of Supervisors and available at the Development Processing Center.

SC 1-2 Prior to the issuance of any certificates of use and occupancy, the developer shall provide evidence to the Manager, PDS/Building Inspection Services Division, that the Department of Real Estate has been notified that the project area is within the boundaries of a Community Facilities District (CFD), and will be subject to special taxes for public facilities and/or services

4.1.7 UNAVOIDABLE ADVERSE IMPACTS

Implementation of the proposed project, with the implementation of the above outlined mitigation measures, would result in unavoidable adverse impacts to land use compatibility.

4.2 SOILS AND GEOLOGY

Geotechnical studies have been prepared for the proposed project by G.A. Nicoll and Associates and are included in Appendix D of this Draft EIR in their entirety. In addition, a Phase I Environmental Assessment has been prepared for the proposed project by Centec Engineering and is included in Appendix O. This section of the Draft EIR summarizes the findings of the following studies:

- G.A. Nicoll and Associates, Geotechnical Environmental Impact Report for Draft EIR No. 566 for Final Tract Map 10692, Saddleback Meadows Development, Orange County, California, March 14, 1997.

- G.A. Nicoll and Associates, Geotechnical Environmental Impact Report, Tentative Tract No. 15230, El Toro Road, Orange County, California, November 27, 1995.

- G. A. Nicoll and Associates, Progress Report, Grading Limits/Quantities, Saddleback

Meadows, Orange County, California, November 6, 1995.

- G.A. Nicoll and Associates, Supplemental Geotechnical Investigation - Saddleback Meadows, Tentative Tract 10692, County of Orange, California, September 1995.

- G.A. Nicoll and Associates, Geotechnical Investigation - Saddleback Meadows, Tentative Tract 10692, County of Orange, California, January 6, 1994.

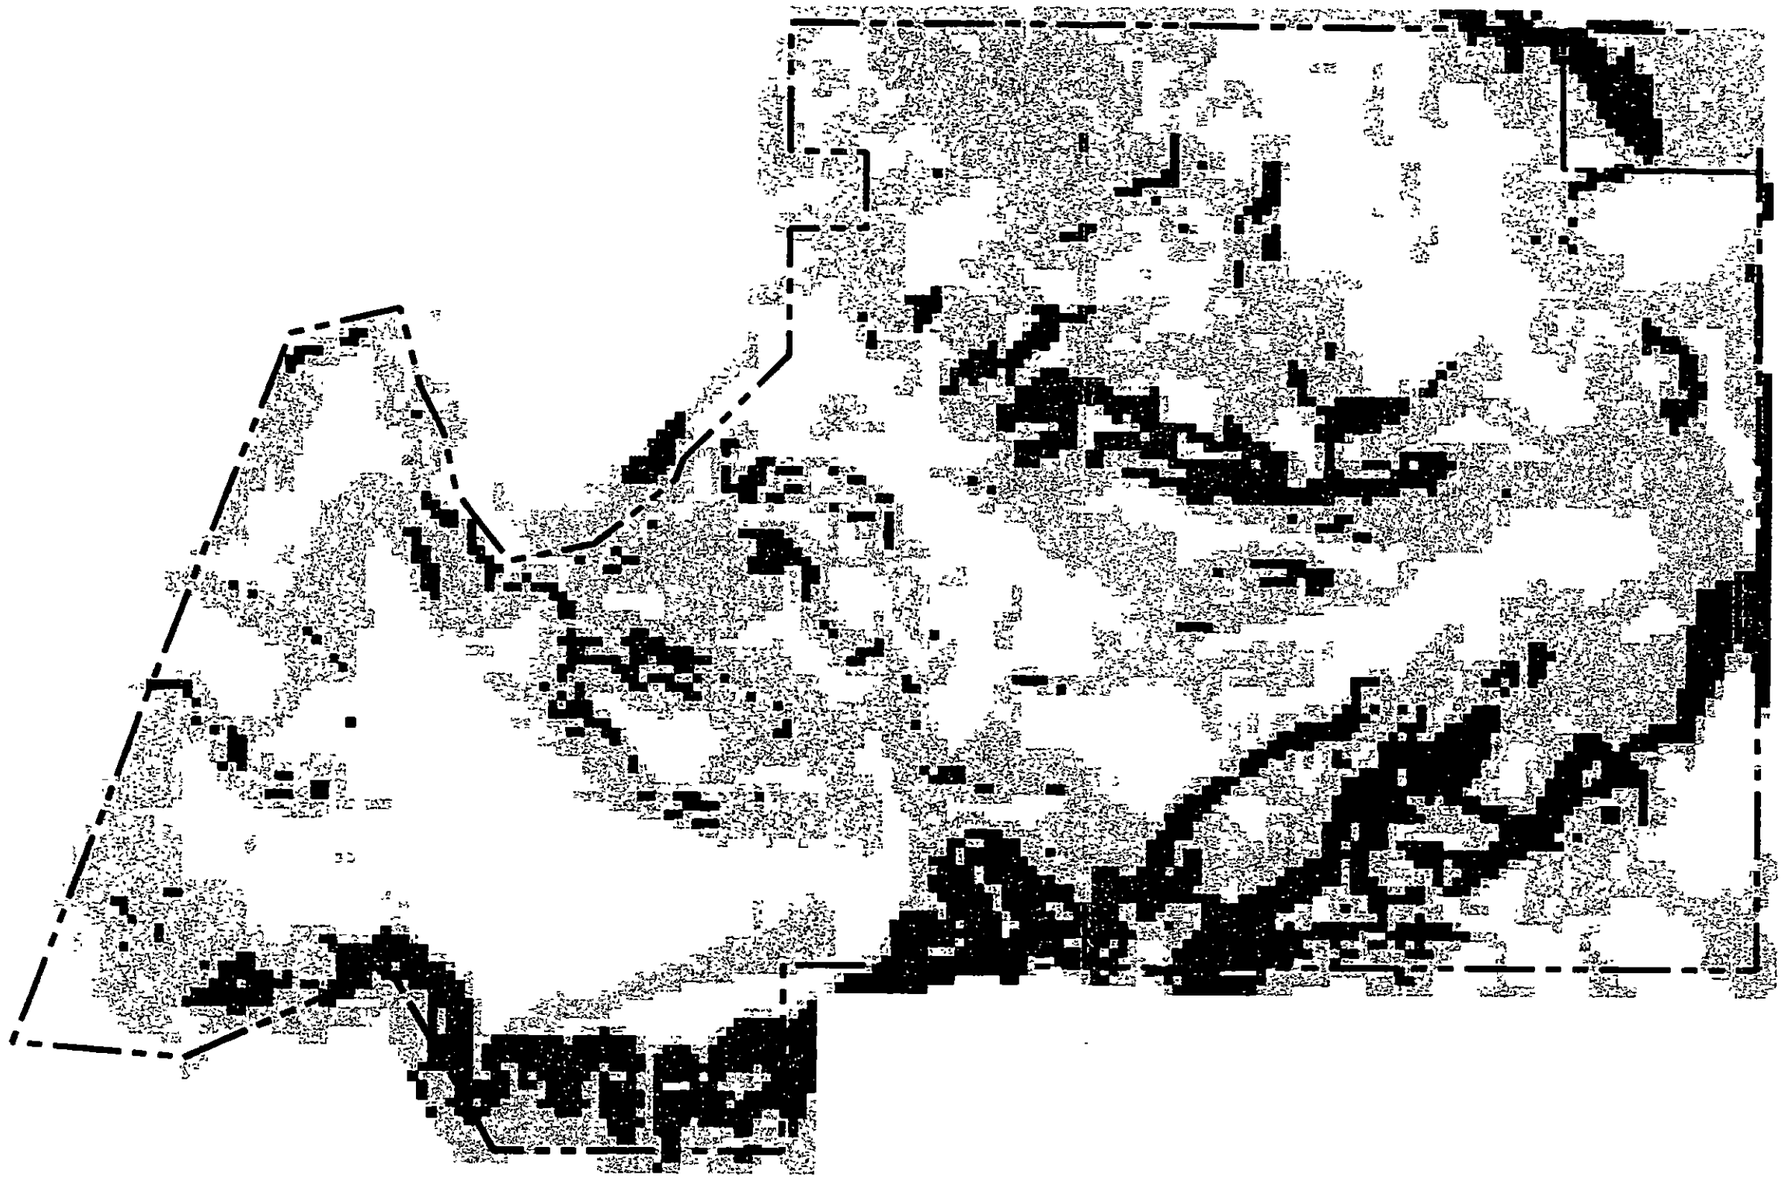
4.2.1 EXISTING ENVIRONMENTAL SETTING

The project site has been subjected to numerous geotechnical investigations since the mid 1970's, associated with a variety of development proposals. The above investigations build upon this analysis (13 studies) and evaluate the geotechnical aspects of the proposed project in detail.

The project site is located within a re-entrant of Canada De Los Alisos. Ridges, ravines and gullies form the dominant physiographic features, providing moderate to high topographic relief. Elevations above Mean Sea Level range from approximately 1,000 to 1,550 feet. Natural slope gradients range from nearly level along some ridge crests and valley bottoms to 1:1 (horizontal: vertical) within deeply incised gullies. The site drains generally toward the west and southwest into Aliso Creek and Oso Creek tributaries of San Juan Creek. A slope map is shown in Exhibit 15.

As shown on the Slope Map in Exhibit 15, 95.5 acres or 43 percent of the project site is in the 0-25 percent slope category, 94.9 acres or 43 percent is in the 26-50 percent slope category and 31.8 acres or 14 percent of the project site has slopes exceeding 50 percent.

Man-made structures on the property include an abandoned ranch house, barn and related structures; several ponds for watering livestock were constructed during the period the ranch was operated, which are still in use for grazing livestock.



SLOPE ANALYSIS

- 0% to 25% : 43% - 95.5 Acres
- 25% to 50%: 42.7% - 94.9 Acres
- 50% and greater: 14.3% - 31.8 Acres

N

Slope Map

EXHIBIT No. 15

The subject site is located within Canada De Los Alisos in the low coastal foothills of the Santa Ana Mountains. These hills are part of the Peninsular Ranges Geomorphic Province and are generally underlain by sedimentary bedrock of Tertiary Age.

Onsite bedrock consists of a thick sequence of interbedded, fine- to coarse-grained sandstone and siltstone of the Tertiary Age Vaqueros-Sespe Undifferentiated and Sespe Formations. Ancient to active landslides underlie much of the project area. Recent and older alluvial deposits are confined to the major gullies and Aliso Creek drainage. Topsoil and colluvium mantel the bedrock and landslides throughout most of the site. Fill soils underlie areas where man-made features, such as roads and berms associated with livestock ponds, were constructed. Existing onsite geology is shown in Exhibit 16.

Earth Materials

Sespe Formation (TS)

The late Eocene to early Miocene Sespe Formation is generally confined to the northwest corner of the tract where it is in fault contact with the undifferentiated Vaqueros-Sespe Formation. These rocks, where they were observed, consisted of red-brown to gray sandstone and interbedded, greenish-gray, clayey siltstone.

Vaqueros-Sespe Formation, Undifferentiated (TVS)

The bedrock underlying the majority of the site exhibits characteristics similar to both the Vaqueros and Sespe Formation. Therefore, these rocks have been classified together as an undifferentiated formation. The rocks consisted of a rhythmic sequence of orange-brown, red-brown, gray to gray-green, sandstone and siltstone with thin interbeds of bentonite-like clay and less weathered volcanic ash and/or tuff. The bentonitic clay beds are generally very soft and plastic in consistency, whereas the sandstone and siltstone units were more often found to be dense and stiff, respectively. Occasionally, fossil-rich beds consisting mainly of broken clam shells were encountered.

Landslide Material (Qls)

The site is occupied by an interrelated collection of active and inactive slides. The extent of the slides is comparable to other sites in the general area which have accommodated residential development, such as the nearby Portola Hills Site. Between prehistoric and recent times, it appears that there were several episodes of slide movement. The larger slides generally failed as block slides, usually along 3- to 12-inch thick clay beds. Some of the smaller, more recent slides have failed as rotational-type failures, following oversteepening of the flanks of major drainage. The characteristics of the observed landslide materials varied from a soft, intensely fractured, sheared and weathered condition to nearly intact, unweathered blocks of displaced, interbedded sandstone and siltstone.

Disturbed Older Alluvium [Qls (Qalo)

Disturbed Older Alluvium is present along the east side of El Toro Road at the toe of the major slides. This material consists of disturbed sand, silt and clay layers containing some gravel that were mixed with blocks of displaced sandstone and siltstone during landsliding.

Older Alluvium (Qalo)

Quaternary Alluvium Deposits are present along the lower portions of the slopes located on the west side of the project site. These deposits consist of moist to wet, moderately dense to loose/soft, silty sand, sandy silt, sandy clay, clay and occasional layers of gravel.

Alluvium (Qal)

Alluvium of recent origin is present in Canada De Los Alisos and its tributaries that enter the project site. The Alluvium consists of interbedded deposits of predominately sand and silt with some clay and layers of gravel. These soils range from dry to wet and are generally poorly consolidated. Alluvial depths range from less than one foot to approximately 12 feet in the tributary drainage, to roughly 20 feet in Canada De Los Alisos which borders the site on the west.

Soil Slumps (Ss)

A number of soil slumps are present. These features represent downhill movement and slumping of topsoil, colluvial soil and weathered bedrock material generally to a depth of 5 to 10 feet.

Structural Geology

The project site is bordered on the north and south by generally west to northwest trending prehistoric faults. Between these faults, the bedding appears to be warped gently downward, resulting in generally southwest-dipping strata in the central and northern portions of the site and northeast-dipping bedding in the southern areas. Bedding planes under landslides dip at shallow angles (predominantly 6-17 degrees). This synclinal feature, which appears asymmetric, probably governed the configuration and direction of movement of the landslides on the subject property.

Fracturing or jointing was most prevalent in the landslide blocks and in areas within close proximity to faults. Nearly vertical open fractures were observed in some borings. Jointing, in general, dips steeply (between 45 and 90 degrees).

Colluvium (Qcol)

Colluvial deposits cover most of the slopes on the site to average depths of 2 to 3 feet. Within depressions related to landsliding and along the margins of ancient landslides, colluvial depths

N

Geotechnical Resources

EXHIBIT No. 16

range from 15 to over 40 feet. The colluvium consists of brown to black, most to very moist, soft to stiff, some areas, the colluvial deposits contain cobble to boulder-size cemented sandstone class.

Fill (Fill)

The soil placed in association with the construction of cattle watering ponds and/or access roads on the subject property is considered Uncertified Fill. The method and effort of compaction is not known. Fill placed essentially on St. Michael's Priory property for landslide stabilization is certified fill. However, since the certified fill is outside the subject property, no distinction between the two types of fill was made on the Geologic Map. Fill is also present beneath the completed portion of El Toro Road.

Ground Water

Ground water occurs on the site as free ground water within the alluvial deposits and bedrock, and as perched ground water within the various landslide blocks. The amount of ground water observed in several of the borings indicates that potential dewatering activities may require coordination with the Regional Water Quality Control Board.

Seismicity

Seismic risk in Southern California is a well recognized factor, and is directly related to geologic fault activity. Seismic damage potential depends on the proximity to active or potentially active fault zones, and on the type of geologic structures. In relative terms, seismic damage is generally less intense in consolidated formations, i.e., bedrock, than in unconsolidated materials, such as alluvium.

In Southern California, most of the seismic damage to man-made structures results from ground shaking and to a lesser degree from liquefaction and ground rupture caused by earthquakes along active fault zones. In general, the greater the magnitude of the earthquake, the greater the potential damage.

Seismic hazards at this site are attributed to ground shaking as a result of an earthquake epicentered on a nearby active fault. Ground rupture is not expected to occur on the property as a consequence of regional faults.

Exhibit 17 shows the geographical relationships of the site with respect to major earthquakes and active faults in Southern California. Regional seismicity is summarized in Table 7.

Hazardous Materials

No hazardous or toxic materials have been identified onsite.

Table 7
REGIONAL SEISMICITY

Fault System	Magnitude	Approximate Distance From Site in Miles
Fort Tejon	8.0+	70
Newport/Inglewood	6.3	15
Sierra Madre	6.5	35
San Gabriel	6.5	40
Raymond Hill	7.0	50
Tujunga	6.5	50
San Andreas	8.3	50
Cucamonga	6.5	40
Northridge	6.7	70

Some areas of the project site are underlain by unconsolidated alluvium which tends to amplify earthquake produced ground motion. However, these materials are planned to be removed within proposed structural areas of the site. Nevertheless, buildings should be designed to resist seismic lateral loads.

The potential for liquefaction at the site is considered to be relatively low, since poorly consolidated materials are to be removed.

4.2.2 EFFECTS FOUND TO BE INSIGNIFICANT

The following geotechnical effects were found to be less than significant as determined by the Initial Study/Environmental Assessment contained in Appendix C of this EIR. These factors are not evaluated in this EIR.

- The project site does not contain any active or potentially active faults. Onsite fault rupture hazards are considered insignificant.

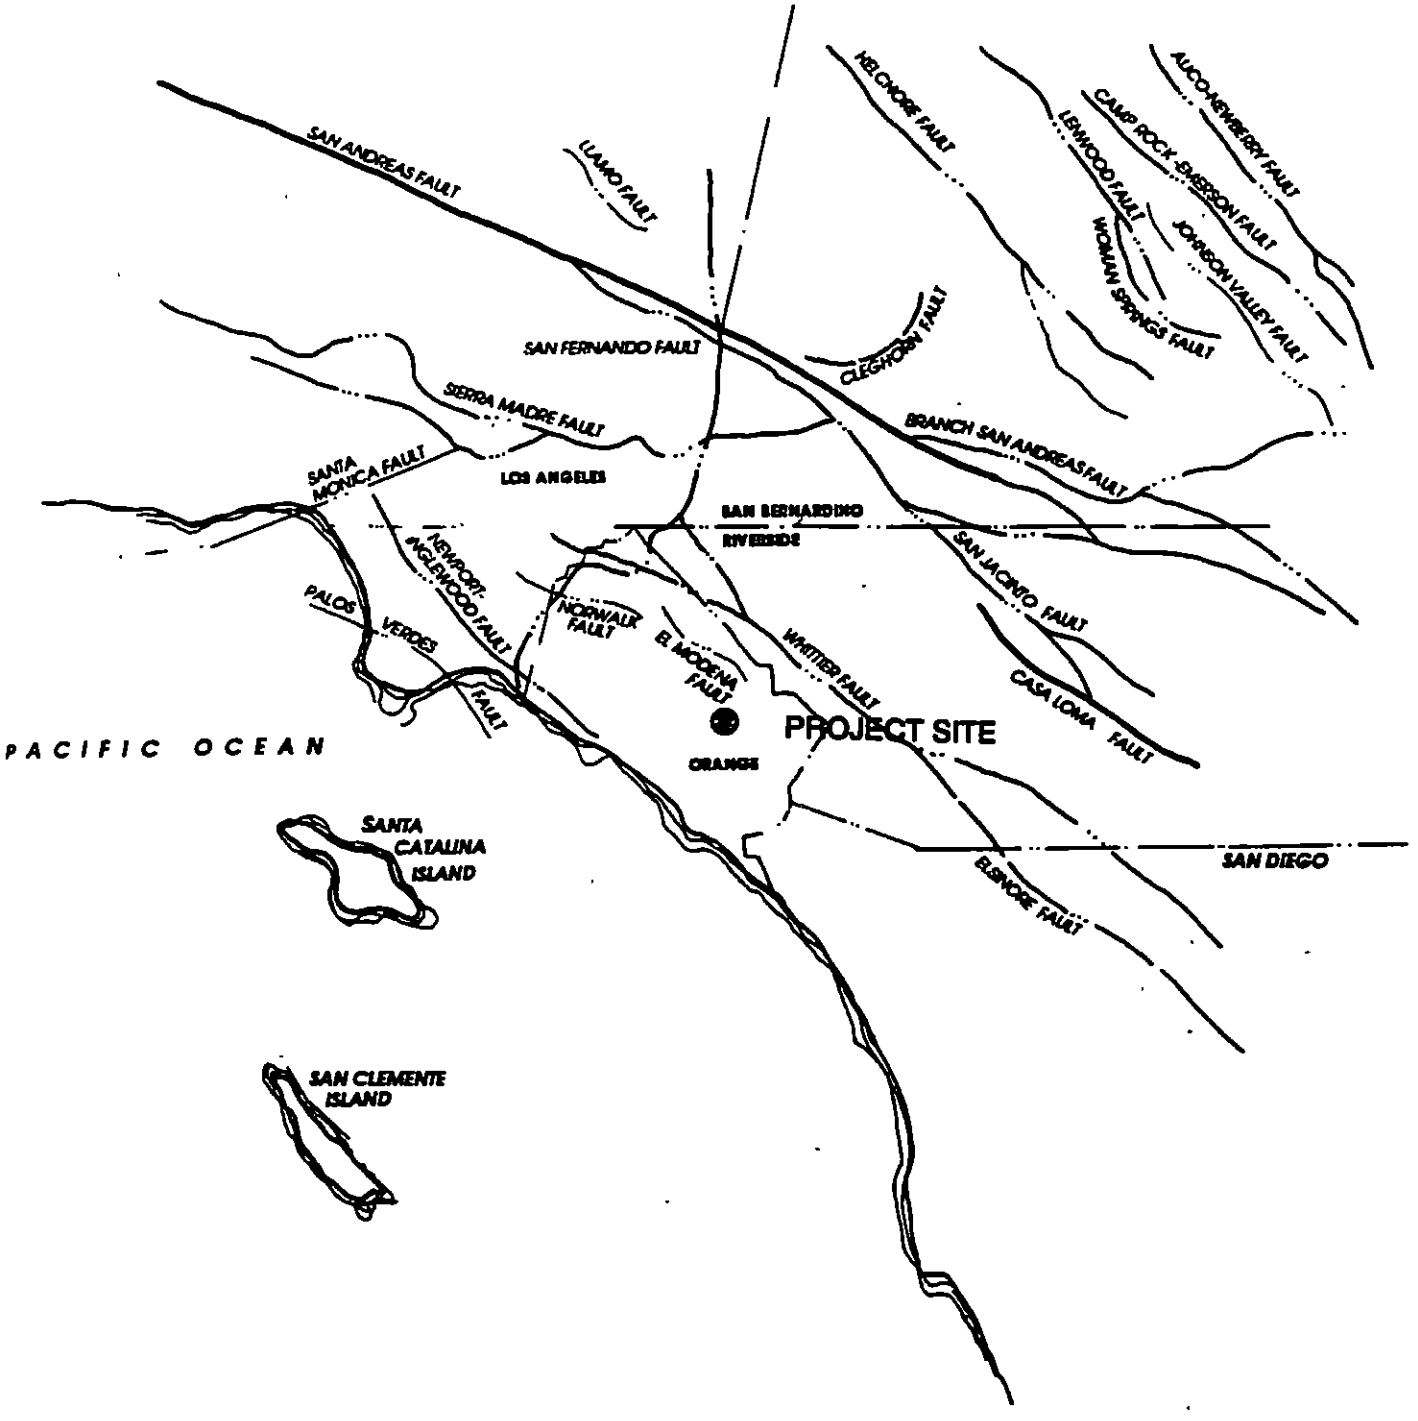
- The project site is not located adjacent to the Pacific Ocean or a large body of water and as such, is not subject to seiche or tsunami hazards.

4.2.3 PROJECT IMPACTS

Grading

Implementation of the proposed project will require the following grading actions:

- Multiple cuts and fills (2.6 million cubic yards) to achieve planned elevations and profiles, and associated access roadways.



SADDLEBACK MEADOWS -
RECORDED TRACT MAP 10692
DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT 566

URBAN VISION

County of Orange P&DS
Scale: N/A
Source: N/A

N

Regional Seismicity

EXHIBIT No. 17

- Remedial grading (8.9 million cubic yards) to stabilize the proposed slopes by means of buttresses, shear keys, and stabilization fills;

- Removal (clean out) of all or major portions of the graben materials and softer alluvium and colluvium under most of the variable thickness fills;

- Installation of appropriate subdrain systems within natural drainage courses and within stability fills prior to fill placement;

- Adequate foundation and slab subgrade conditioning for the proposed development, including overexcavation, capping and measures related to expansive soils;

- Achieving suitable surface gradients, to preclude ponding anywhere onsite and to control water run-off via paved/closed drainage devices.

The conceptual grading plan is shown in Exhibit 18, with the limits of remedial grading depicted. Remedial grading volumes are summarized in Table 8.

Table 8
REMEDIAL GRADING QUANTITIES

Landslide Shear key	6,763,900 cy
Removals	1,315,210 cy
Buttresses	762,030 cy
Pad Over Excavation	40,440 cy
Total	**8,881,580 cy**

Implementation of the proposed remedial grading features, including removals/cleaners, buttress construction, subdrain systems, and temporary stockpiling would not result in any impact to the stability of adjacent properties.

Based on average daily grading of 30,000 cubic yards/day, total project-related grading (11.5 million cubic yards) would require approximately 18 months to complete. All preliminary grading would be completed in one continuous phase.

Geotechnical Conditions

The document entitled "Geotechnical Environmental Impact Report for Draft EIR No. 566 for Final Tract Map 10692 Saddleback Meadows Development" concludes that the site is geotechnically suitable for the proposed project. This conclusion is based on the following conditions:

1. Onsite bedrock and large landslide blocks have low settlement potential.

2. There is sufficient low to non-expansive materials to generate select fills

3. Onsite liquefaction is not expected.

4. Bedrock can be excavated; no blasting is anticipated.

5. Grading east of the Abbey property will produce fill in the gully area which will stabilize slopes on the Abbey property.

6. No known active faults are present at the site and surface rupture during earthquakes is not expected.

7. Planned remedial grading will reduce the potential for earthquake-induced landsliding.

8. The site does not lie within the 100-year flood zone.

9. Subsidence at the site due to fluid withdrawal should not occur since no major ground water aquifers or petroleum reservoirs are known to underlie the site.

10. Site grading will reduce the potential for surficial erosion and the consequential siltation of nearby Alisos Creek.

The geotechnical report also describes several unfavorable geotechnical conditions that could compromise the site's ability to support the project. Mitigation measures are recommended however, to correct these conditions and ensure that future development would be adequately supported. The geotechnical report identifies the following conditions as being unfavorable: presence of unstable landslides, occurrence of some moderately to highly expansive soils and bedrock units, and presence of adverse bedding conditions and some ground water.

These unfavorable conditions can be mitigated by implementing corrective grading concepts, such as the construction of buttresses and shear keys, placement of expansive materials in deep fills, buttressing of cut slopes where necessary, construction of canyon subdrains and back drains to minimize or eliminate the affects of ground water, removal of compressible materials and replacement with compacted fill, and construction of large buttress cuts in segments to reduce the possibility of backcut failure.

Impact Significance Criteria

Earth resource impacts resulting from the proposed project could be considered significant if it causes any of the following impacts:

A. Changes in the geologic substructure or unstable earth conditions.

B. Exposures of people of property to geological hazards like landslides, mudslides, ground failure or similar hazards.

C. Substantial disruptions, displacements, compaction or overcovering of the soil.

D. Substantial increase in wide erosion of soils.

E. Changes in siltation, deposition or erosion that may modify the channel of a river or stream, or the bed of any bay, inlet or lake.

4.2.4 SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the proposed project, prior to the application of mitigation measures would result in significant impacts related to slope stability, landslides, mudslides, subsidence and erosion.

4.2.5 CUMULATIVE IMPACTS

Geotechnical impacts are not considered on a cumulative basis.

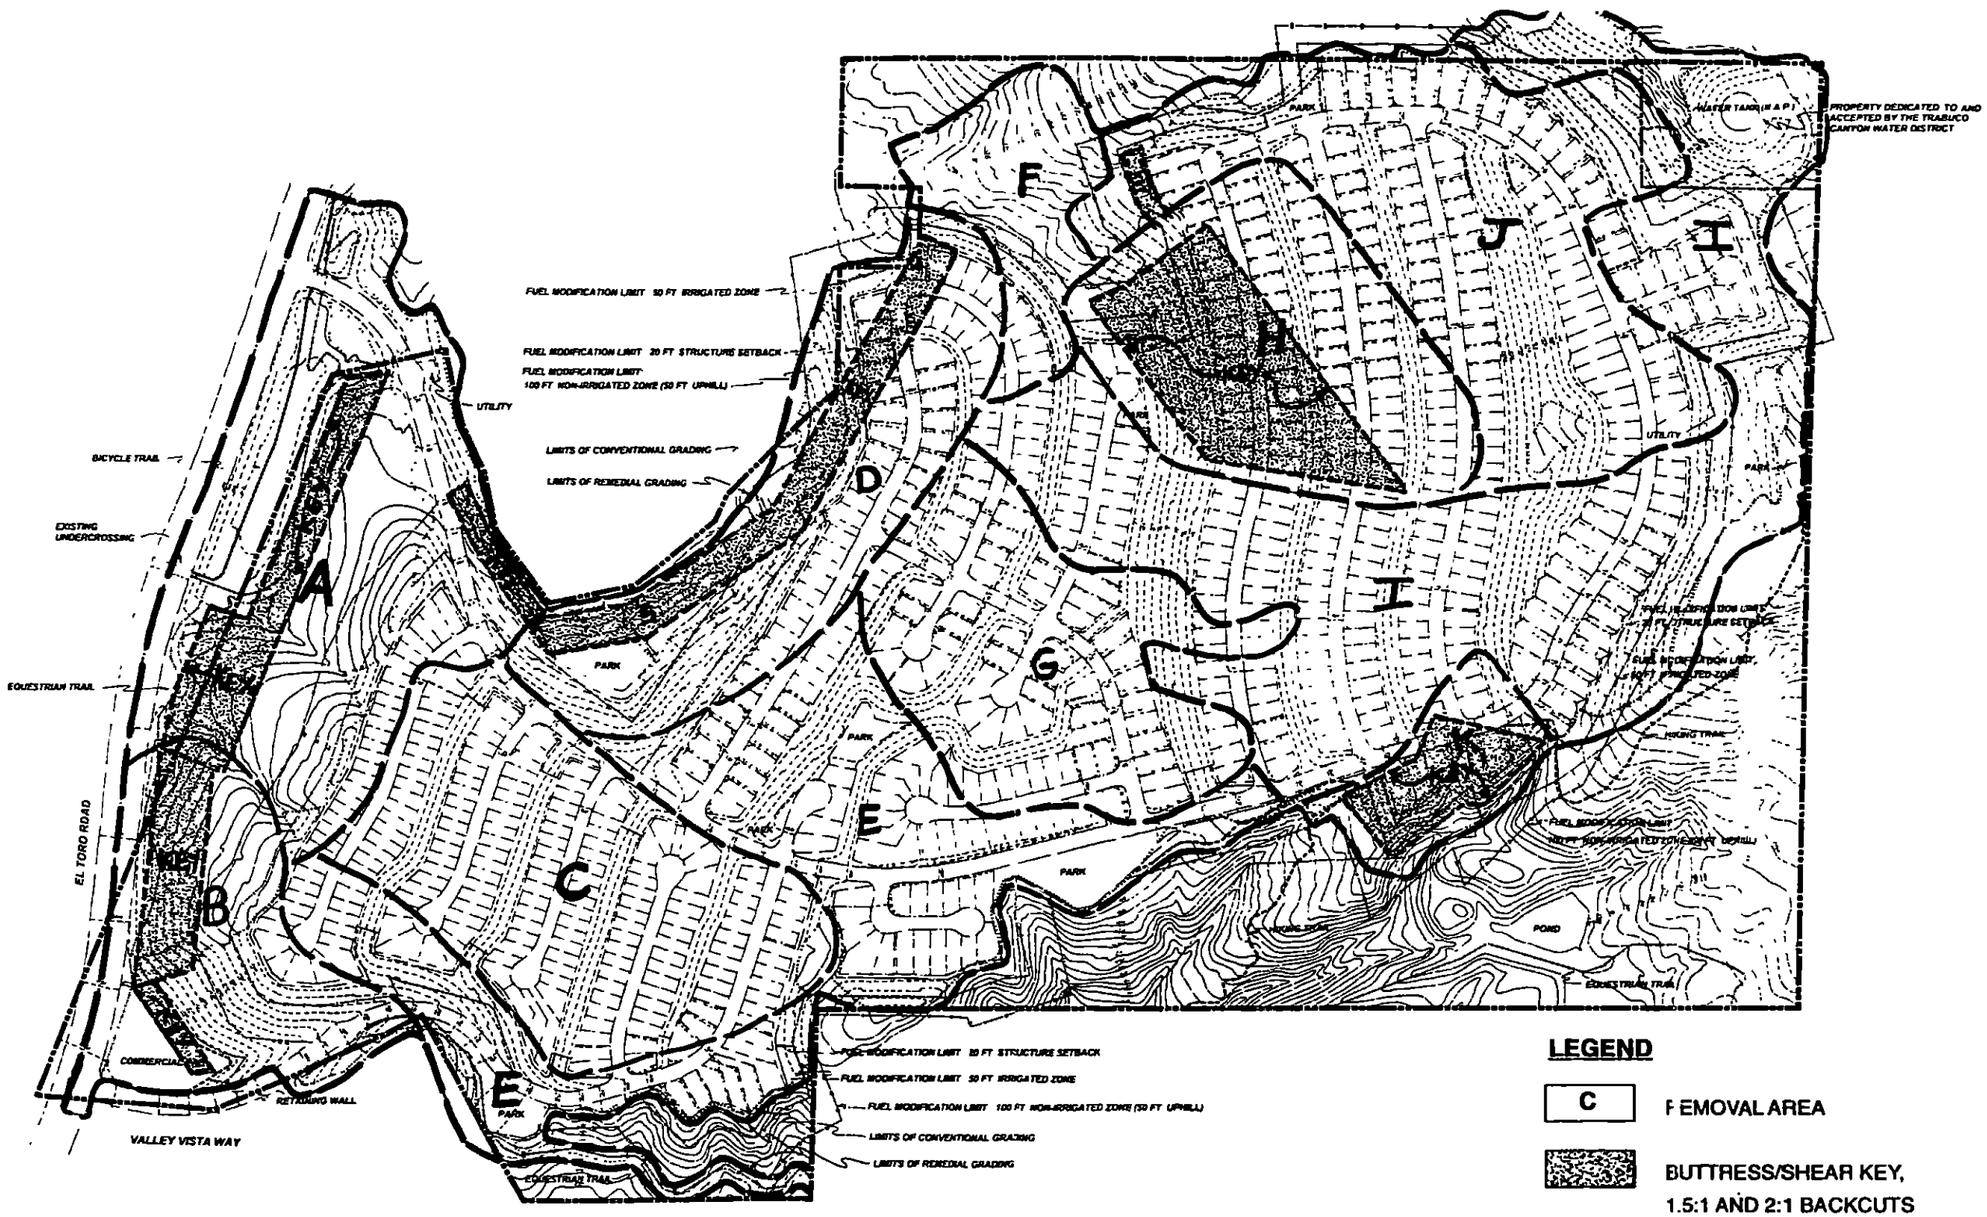
4.2.6 MITIGATION MEASURES

Project Design Features

PDF 2-1 A comprehensive remedial grading mitigation plan has been designed to stabilize the project site, in accordance with OCPDS requirements The plan is depicted in Exhibit 19, included in Appendix D and proposes measures including shear keys, buttresses, removals/recompaction to reduce hazards associated with landslides, erosion and subsidence.

Standard County Conditions and Mitigation Measures

SC 2-2 Prior to the issuance of a grading permit, the applicant shall submit a geotechnical report to the Manager, PDS/Subdivision and Grading Services Division for approval. The report shall include the information and be in a form as required by the Grading Manual.



SADDLEBACK MEADOWS - RECORDED TRACT MAP 10692
DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT 566

URBAN VISION

County of Orange P&DS

N

Geotechnical Hazard Mitigation Plan

EXHIBIT No. 19

SC 2-3 Prior to the issuance of any grading permits, the Manager, PDS/Subdivision and Grading Services Division, shall determine if the proposed grading complies with the grading illustrated in the plans approved by the decision-maker with regard to grading concepts, slope heights, slope ratios, and pad elevations and configuration. Significant deviations shall be reviewed by the decision-maker for a finding of substantial conformance. Failure to achieve such a finding will require processing a revised application per Orange County Zoning Code Section 7-9-139 and 7-9-150.

SC 2-4 Prior to the issuance of the first grading permit, for projects located immediately adjacent to or including portions of regional parks, significant open space corridors, or other environmentally sensitive areas, the project proponent shall provide evidence acceptable to the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Harbors Beaches & Parks Division, that graded areas will be compatible with natural land characteristics of the adjacent open space areas including techniques to enhance a smooth and gradual transition, urban edge treatment plans and incorporating view enhancement through architectural and design techniques.

SC 2-5 Prior to the issuance of any grading permit, offsite grading and/or drainage shall be conducted in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-6 Prior to the issuance of a grading permit, substantial compliance with the following shall be certified by a registered engineer in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division:

- Fill soils shall be placed in layers that are less than 8 inches thick and moisture-conditioned generally 1- to 2-percent above optimum moisture content. The existing diatomaceous soils should be moisture-conditioned to 125-percent of optimum moisture content.

- For preliminary earthwork computations, the following shrinkage/bulking factors are recommended for the onsite material (these do not include handling losses): Bedrock - 5% bulking; slopewash - 5% shrinkage; and Other Soils - 15% shrinkage. Grading plans shall include an area where finish grades can be raised or lowered to accommodate changes in actual material quantities.

- Dewatering shall be achieved using sumps and pumps located strategically within the excavated area. However, the excavation shall be carefully observed; if the conditions warrant, supplementary dewatering provisions shall be made. It is the responsibility of the contractor to provide an adequate dewatering system during construction.

Seismic

SC 2-7 Conformance with the Uniform Building Code and Orange County codes will insure that seismic considerations are incorporated into the structural designs. All recommendations of the geotechnical report shall be incorporated and utilized in the final construction plans for the parcels in a manner meeting the approval of the Manager, PDS/Building Permit Services Division. Larger buildings, structures with extraordinary architectural configurations, or those of tilt-up construction may require seismic analysis.

SC 2-8 The seismic exposure of the site shall be considered in the design of the proposed structures in a manner meeting the approval of the Manager, PDS/Building Permit Services Division.

SC 2-9 Geologic inspections shall be required during site grading for each parcel to confirm the absence of major faults in the local area in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-10 Prior to the issuance of any grading permits, if review of the grading plan for this property by the Manager, PDS/Subdivision and Grading Services Division, indicates significant deviation from the proposed grading illustrated on the approved tentative tract map, specifically with regard to slope heights, slope ratios, and pad elevations and configuration, the plan shall be reviewed by the Subdivision Committee for a finding of substantial conformance. Failure to achieve such a finding will require processing a revised tentative tract map; or, if a final tract/parcel map has been recorded, a new tentative tract/parcel map or a site development permit application per Orange County Zoning Code Section 7-9-139 and 7-9-150. Additionally, a new environmental assessment and determination is required.

SC 2-11 Prior to the issuance of any grading permit, if determined necessary by the Manager, PDS/Subdivision and Grading Services Division, a letter of consent, in a form approved by the Manager, PDS/Subdivision and Grading Services Division, suitable for recording, shall be obtained from the affected property owners for offsite grading and/or drainage. The owner/applicant shall record said letters of consent for offsite drainage and/or cross-lot drainage prior to recordation of the tract/parcel map or prior to the issuance of any grading permit, whichever comes first.

SC 2-12 Prior to the issuance of any preliminary grading permits, the subdivider shall request that the Vector Control District initiate the survey process of the tract/parcel map site to determine if vector control measures are necessary. If warranted, such measures shall be conducted by the developer in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-13 Prior to issuance of grading permits, a Water Quality Management Plan (WQMP) shall be submitted to and approved by the Manager, PDS/Subdivision and Grading

Services Division. The WQMP shall identify, at a minimum, the application and incorporation of those routine structural and non-structural BMPs outlined in the Countywide NPDES Drainage Area Management Plan (DAMP) Appendix G detailing implementation of BMPs not dependent on specific land uses, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 2-14 Prior to the issuance of any grading or building permits, whichever comes first, the applicant shall provide, in accordance with criteria supply by EMA, a "Hazardous Materials Assessment" and a "Disclosure Statement" covering the property (both fee and easement) which will be offered for dedication to the County of Orange, for review and approval by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Monitoring Programs Division.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

Grading

AM 2-15 Multiple cuts and fills (2.6 million cubic yards) to achieve planned elevations and profiles, and associated access roadways shall be required.

AM 2-16 Remedial grading (8.9 million cubic yards) to stabilize the proposed slopes by means of buttresses, shear keys, and stabilization fills shall be required. Back cut failure guidelines shall be provided to the Grading Services Division prior to issuance of grading permits.

AM 2-17 Removal (clean out) of all or major portions of the graben materials and softer alluvium and colluvium under most of the variable thickness fills shall be required.

AM 2-18 Installation of appropriate subdrain systems within natural drainage courses and within stability fills prior to fill placement shall be required.

AM 2-19 Adequate foundation and slab subgrade conditioning for the proposed development, including over excavation, capping and measures related to expansive soils shall be required.

AM 2-20 Achieving suitable surface gradients to preclude ponding anywhere onsite and to control water run-off via paved/closed drainage devices shall be required.

Compaction

AM 2-21 Wherever structural fills are to be placed, the upper 6 to 8 inches of the exposed

subgrade (after stripping and/or over excavation/clean-out) shall first be scarified and reworked. In general, the dry density of the in-situ (native) material shall be at least 85 percent of maximum. In the event that lower densities are determined by field testing to exist, the depth of over excavation will be determined onsite, given due consideration to the geology of the exposed material, as well as its relative location. It is at present expected that typical depths of over excavation will be on the order of 4 to 5 feet.

AM 2-22 Fill shall be placed in lifts of 6 to 8 inches (loose) in thickness. Rocks exceeding 4 inches in maximum dimension are best not incorporated within the upper fill zone (say 3 feet) where foundations and most utility systems are expected to be housed.

AM 2-23 In all fill areas where active gradients are steeper than 5:1 (horizontal:vertical), those surfaces shall be prepared to receive fill by excavating standard keyways and benches in a stair-step configuration.

AM 2-24 Any loosening of reworked or in-place (native material, consequent to weathering and/or passage of construction traffic, shall be made competent.

AM 2-25 Temporary fills, typically associated with access ramps built to accommodate grading equipment shall be subject to removal when their use is discontinued.

AM 2-26 The depths of excavation shall be subject to onsite monitoring by the Soil Engineer, normally during the actual removal operations. Any surface or subsurface obstructions, or questionable material encountered during grading, shall be brought immediately to the attention of the Soil Engineer, for his determination as to proper exposure, removal and/or processing as directed.

Material Selection

AM 2-27 After the site has been stripped of any debris, vegetation and organic soils, such exposed onsite shall be considered satisfactory for reuse in the construction of onsite fills, provided the organic content does not exceed 3% by volume. It is recommended that highly expansive soils not be placed within the upper 4 to 5 feet thick zone underlying final pad and street grades. More importantly, no such soil is to be placed (as backfill)within a horizontal distance equal to the wall height immediately behind retaining walls.

AM 2-28 Any objectionable material, as determined by the Soil Engineer, shall be subject to relocation in deeper fill areas or removal offsite.

AM 2-29 All borrow sites shall be approved by the Soil Engineer/Geologist prior to onsite delivery. This will permit the timely allocation of such available materials for use on the project site.

Compaction Requirements

AM 2-30 Reworking/compaction shall include water addition or drying-out as needed, to bring the soils close to their optimum moisture content. All such reworked soils, placed as structural fills, shall be densified to achieve at least 90 percent relative compaction with reference to the laboratory compaction standard. The optimum moisture content and maximum dry density, for each identified soil type, will be determined in the laboratory in accordance with ASTM Test Designation D1557.

Shrinkage/Subsidence

AM 2-31 For preliminary earthwork computations, an approximate (overall) shrinkage factor of 12 percent shall be required, for the existing site soils. The above value does not include allowance for stripping nor handling losses.

AM 2-32 Subsidence shall be assumed as 3/4 to 1-1/2 inches for grading design purposes.

Excavating Conditions

AM 2-33 Excavation of onsite soils shall be accomplished with standard heavy duty earthmoving or trenching equipment. Some hard cemented sandstone beds were encountered during the field exploration on portions of the site and some minor, isolated blasting may be required to remove these hard materials.

AM 2-34 Heavy seepage was encountered, as indicated on the Boring Logs, at multiple elevations. Consequently, considerable water can be expected within planned excavations, typically reaching maximum discharge within 2 to 5 days after exposure. Additional nuisance water (seepage) is foreseen in nearly all major cuts decreasing in volume with time, and being less at higher site elevations as well as in cuts made late in the year. All nuisance water shall be accommodated in accordance with County requirements.

Expansion Potential

AM 2-35 Onsite materials are considered to be moderately expansive, generally. Soils of high and low expansivity are expected to comprise less than 25% of the overall pad areas. The expansivity of the actual soils placed within structural areas shall be verified during grading, prior to construction.

Utility Trenching

AM 2-36 The typical walls of temporary construction trenches shall stand nearly vertical, with only minor sloughing, provided the total depth does not exceed 4 to 5 feet. Shoring of excavation walls and/of flattening of side slopes may be required, if greater depths are necessary.

AM 2-37 Trenches shall be located so as not to impair the bearing capacity nor settlement under planned foundations. As a guide, trenches shall be aligned perpendicular to foundations, and the Structural Engineer so informed to modify the foundation at the crossing, as needed. All other trenches shall observe a lateral off-set equal to their total depth.

AM 2-38 Existing soils shall be utilized for trench backfill, provided they are essentially free of organic materials and oversized materials (rock, gravel, etc. in excess of 1-inch maximum size, unless within an approved soil matrix). Alternately, select granular materials (sand equivalent of 30 or greater) may be imported as backfill. Compaction should be accomplished entirely by mechanical means, subject to onsite assessment during pipeline installation.

Surface Drainage

AM 2-39 Positive surface gradients shall be provided away from slope tops per approved grading plans and adjacent to the future buildings, so as to direct surface water run-off away from structural areas and toward suitable discharge facilities.

Sulphate Content

AM 2-40 The soils sulphate content shall be ascertained during the concluding stages of rough grading, and the type of cement to be used determined at that time.

Grading Control

AM 2-41 All grading and earthwork shall be subject to on-going testing and observation by the applicants geotechnical consultant, including engineers, engineering geologists and/or technicians.

Slabs-on-Grade

AM 2-42 Concrete slabs shall be founded on approved (reworked) in-place soils and/or on properly compacted fill. The subgrade shall be proof-rolled just prior to construction to provide a firm, unyielding surface, especially if the surface has been disturbed by the passage of time and/or exposure to construction traffic.

AM 2-43 Floor slabs shall be at least 4 inches thick. The Finished Floor Level should be at least 6 inches above highest adjacent exterior grade. Joints shall be provided.

AM 2-44 If flooring that would be affected by moisture is to be used, the slab shall be underlain by 2 inches of sand, with a 10-mil plastic sheet between the sand and the subgrade.

AM 2-45 Precautions in respect of expansive soils shall be taken.

Foundations

AM 2-46 The proposed structures shall be supported on conventional spread footings, supported into approved compacted fill and/or reworked native material.

Long Term Settlements

AM 2-47 The grading concept, as presently proposed, includes several areas where deep fill will result, exceeding 50 feet in depth. These soil masses may experience significant settlements, with time, of 4 to 6 inches or more. Such downward movements can be tolerated by most improvements, provided these occur at a reasonably uniform rate and rather evenly over a well distributed area. However, the degrees and rates of settlement shall be analyzed during the final design phase.

Phasing of Earthwork

AM 2-48 Unstable Ground
Initial stability evaluations have determined that several natural slopes subject to grading are inherently unstable. Removals, therefore, shall be planned and carried out with care in order to minimize deep-seated, in-construction failures. Typically, about 10 percent of back cuts for buttresses will fail during grading. Allowances for schedule and budget contingencies should be made.

AM 2-49 Required Clean-Out Work
Prior to improving the gross stability of hillsides, clean-out work will be necessary along their lowest (toe) elevations. Whereas such selective removals are essential prior to placement of additional fill, this process can trigger undesired slippage. Therefore, selective unloading of the slide mass shall be required before stabilization can effectively begin.

AM 2-50 Slide Unloading
Where existing slope faces are marginally safe in their present condition, the higher portions of each such slide shall require removals toward the top, prior to clean-out, and subsequent loading at the toe.

4.2.7 UNAVOIDABLE ADVERSE IMPACTS

Implementation of the proposed project, with the mitigation measures outlined in Section 4.2.6, would not result in any unavoidable adverse geotechnical impacts.

4.3 WATER/HYDROLOGY

The Hydrology Report has been prepared for the proposed project by Hunsaker and Associates and is included in its entirety in Appendix L of the Draft EIR.

4.3.1 EXISTING ENVIRONMENTAL SETTING

The project site is located within the boundaries of two primary watershed areas: 1) Aliso Creek and 2) Oso Creek. Approximately 75% of the site currently drains into Aliso Creek, with 25% draining to Oso Creek. Regional hydrology is shown in Exhibit 20.

Regional Hydrology

Aliso Creek originates in the Cleveland National Forest, extending for 19 miles to its outlet into the Pacific Ocean, at Aliso Beach. Aliso Creek's watershed encompasses 23,000 acres, and includes natural open space, urban development, regional parks and other recreational facilities. Aliso Creek is formally designated an "impaired" in terms of water quality by the State Water Quality Assessment.

Aliso Creek is located immediately west of the project site, east of El Toro Road adjacent to the northwest portion of the site, crossing under El Toro Road, and west of El Toro Road adjacent to the southwest portion of the site. Aliso Creek has a Q_{100} flow of 3135 cfs at the project's northern boundary.

Existing onsite drainage to Aliso Creek flows from the north and west portion of the property to the west property boundary in a generally westerly direction into three separate facilities which cross under El Toro Road: (a) in the north, these flows are conveyed southwest through a double 96-inch corrugated steel pipe facility (existing Q_{100} is 3,135); (b) in the south, near Valley Vista and El Toro Road, flows are concentrated into a 24-inch reinforced concrete pipe and then conveyed into a 30-inch reinforced concrete pipe; (c) in an area located between (a) and (b), additional offsite flows are collected into a 24-inch reinforced concrete pipe. Flows from each of these three facilities (a, b and c) outlet on the west side of El Toro Road into the natural drainage course of Aliso Creek. Aliso Creek flows southwest through a series of natural courses and man-made facilities eventually outletting into the Pacific Ocean.

The southerly 25% of the project site is located within, and drains into, the Oso Creek watershed. South of the project site, Oso Creek flows are concentrated into a concrete pipe system which increases in size from 42-inch to 54-inch. This system runs in a southwesterly direction through Tract 12724 (Hidden Ridge) beneath Yellow Pine Lane and Meadow Ridge Drive. Flows then outlet onto a concrete energy dissipater and thence back into the natural drainage course of Oso Creek which delivers its flow into the upper Oso Reservoir. Flows collected within the reservoir are then directed either over or through a spillway facility and continue southwest in Oso Creek (which alternates as a natural course or concrete lined channel) to south flowing facilities on the west side of the Golden State Freeway (Interstate 5). Eventually these flows drain into San Juan Creek which outlets into the Pacific Ocean at Doheney State Beach. A small area at the extreme eastern portion of the site drains into the Trabuco Creek watershed.

URBAN VISION

County of Orange P&DS

Scale: N/A

Source: N/A

Onsite Drainage

The majority of existing onsite drainage currently sheet flows to one of four (4) defined onsite drainage courses as shown in Exhibit 21. Existing onsite drainage is summarized in Table 9.

Table 9
EXISTING ONSITE DRAINAGE

Sub Area	Watershed	Q_{100} cfs
A	Aliso Creek	374.5
B	Aliso Creek	19.3
C	Aliso Creek	42.3
D	Oso Creek	103.5

Drainage Area A

The primary onsite drainage drains the northern half of the project site (Drainage Area A) in a generally east to west direction along the northern project boundary. This drainage has been highly eroded during previous winter storm events, and shows evidence of unstable banks. Drainage Area A has a total contributory Q_{100} of 374.5 cfs at the El Toro road 96-inch double pipe undercrossing.

Drainage Area B

Drainage Area B drains a 6.0 acre portion of the project site to a sump condition south of the primary drainage course. A Q_{100} of 19.3 cfs drains under El Toro Road in a 24-inch RCP, discharging to Aliso Creek, west of El Toro Road.

Drainage Area C

Drainage Area C drains the southwest portion of the site to the southwest corner of the site, where stormwater crosses under El Toro Road in a 24-inch RCP with a Q_{100} cfs stormflow volume of 42.3 cfs.

Drainage Area D

Drainage Area D drains the southeastern portion of the site to Oso Creek in a natural drainage course. Area D has an existing Q_{100} stormflow volume of 103.5 cfs.

N

Existing Hydrology

EXHIBIT No. 21

Livestock Ponds

Eight (8) ephemeral livestock watering ponds are located on the project site and were created by damming tributary drainages in the early 1920's. These ponds serve to retain storm flows until full, until they breach existing earthen dams and continue downstream.

Drainage Assessment Fees

A drainage assessment fee of $74,000 was paid to the County at the time Tract Map 10692 recorded in 1988, and covered the project's pro-rata share of regional drainage facilities.

4.3.2 EFFECTS FOUND TO BE INSIGNIFICANT

The following hydrology effects were found to be less than significant as determined by the Initial Study/Environmental Assessment contained in Appendix C of this EIR. These factors are not evaluated in this EIR.

- Implementation of the proposed project would not result in exposure of people or property to flood hazards.
- The project would not result in changes in the amount of surface water in a water body, changes in currents of the direction of water movement.
- The project would not result in the quantity of groundwater through direct additions or withdrawals, alteration of the rate of flow of groundwater or impacts to groundwater quality.

4.3.3 PROJECT IMPACTS

Implementation of the proposed project will result in the introduction of impervious surfaces (streets, driveways, residential units) and will result in a decrease in the area available for stormwater percolation and a subsequent increase in stormflow runoff. Implementation of the proposed project will result in substantial landform modification, redirecting site drainage throughout the site.

Post development drainage is proposed to be accommodated through a series of storm drains, catch basins and inlet/outlet structures designed to accommodate a 100 year storm event. The proposed storm drain facilities parallel to El Toro Road will join the existing dual 96-inch diameter CSP storm drain which currently crosses underneath El Toro Road. The proposed Orange County Flood Control District facility J01 storm drain plans were approved and signed by the County of Orange on November 16, 1988. The storm drain facilities consist of extending the dual 96-inch CSP storm drain to connect with an open channel riprap facility and a 14-foot by 12-foot reinforced concrete box culvert (RCB) that will run underneath the proposed entry road to Saddleback Meadows.

The on-site private storm drain improvement plans were approved and signed by the County of Orange on November 15, 1988. All of the proposed storm drain system is to be constructed of reinforced concrete pipe (RCP) ranging in size from 18 inches to 48 inches.

All hydraulic calculations and the related hydrology have been previously approved by the County of Orange. Minor updating of the hydrology might be needed in the future depending on input from the County during review of the 40-scale rough grading plans. Proposed drainage facilities are shown in Exhibit 22 and summarized in Table 10.

Table 10
PROPOSED DRAINAGE FACILITY SUMMARY

Storm Drain	Size	Q_{25} cfs (Discharge	Q_{100} cfs (Discharge)	Outlet Location / Connector
A	27-48 inch	277	300	Aliso Creek
B	18-24 inch	68.2	--	Line "A"
E	30 inch	48.5	--	Line "A"
H	27 inch	41.2	--	Line "A"

Water Quality

Onsite surface and groundwater quality has not been evaluated from an analytical constituent standpoint due to: 1) its location at the headwaters of Aliso Creek and Oso Creek, 2) the undeveloped nature of the project site and upstream areas, and 3) the lack of pollutant generation sources. Ongoing livestock grazing activities have resulted in continued contamination of the onsite watering ponds with cattle manure. All organic material will be removed during grading operations.

Discharge of increased and concentrated runoff volumes into onsite natural drainage courses would result in increased erosion and associated sedimentation, primarily due to the unstable condition of drainage course banks.

Urban runoff associated with proposed onsite streets, driveways and manufactured slopes would be directly discharged into onsite drainage courses ultimately discharged to Aliso and Oso Creeks and the Pacific Ocean. Urban runoff constitutes would typically include oil, grease, cleaning products, herbicides, pesticides and fertilizers. Project urban runoff would be subject to an National Pollutant Discharge Elimination System (NPDES) Construction Stormwater Discharge Permit, issued by Regional Water Quality Control Board (RWQCB). In addition, the proposed project is subject to the County's NPDES requirements.

Project related post-development urban runoff would incrementally impact the ability of Aliso Creek to recover from its currently impaired designation.

N

Conceptual Drainage Plan

EXHIBIT No. 22

Impact Significance Criteria

An impact is considered significant if:

A. There will be substantial and adverse increased inundation, sedimentation and/or damage from water forces to the subject property or downstream areas; the project will adversely affect the collection and conveyance of runoff and sediment. The design hydrologic standard is the 100 year storm event with an 85 percent (85%) confidence level.[7]

B. Runoff from the completed project area would adversely impact the designated beneficial uses in the runoff receiving watershed, or would substantially impact Public Agency effects to improve any currently recognized conditions of water quality impairment.

4.3.4 SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the proposed project would increase onsite storm flows by 17-54% over existing Q_{100} levels. Discharge of urban runoff, discharge of post development runoff into onsite natural drainage courses would result in increased erosion and sedimentation. Urban runoff would be directly discharged into onsite natural drainage courses, resulting in impacts to downstream water quality in Aliso Creek and ultimately the Pacific Ocean.

4.3.5 CUMULATIVE IMPACTS

Implementation of the proposed project, in conjunction with related projects located within the watershed of both Aliso Creek and Oso Creek, would result in increased flows and increased urban runoff, ultimately discharging into the Pacific Ocean. Cumulative impacts to Oso Creek would also effect surface flows and water quality in San Juan Creek. These related projects are located within several jurisdictions, including the County of Orange, the Cities of Mission Viejo, Lake Forest, Aliso Viejo, Laguna Niguel, San Juan Capistrano, Dana Point and Laguna Beach, and Doheney State Park.

4.3.6 MITIGATION MEASURES

Project Design Features

PDF 3-1 A master drainage concept has been incorporated into the project design to mitigate hydrology impacts to existing OCPDS requirements and standards. The master drainage concept, shown in Exhibit 22, and contained in its entirety in Appendix L of this EIR, proposes a series of storm drains, catch basins, inlet/outlet structures, energy dissipators and slope drains to control project drainage.

---

[7] *These criteria represent refinements of CEQA Criteria that address flooding and runoff that have been utilized in other County of Orange EIRs.*

Standard County Conditions and Mitigation Measures

SC 3-2 Prior to the issuance of any grading permits the applicant shall, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division:

a. Prepare a drainage study determining the effect the proposed development and associated drainage patterns will have on existing drainage facilities.

b. Mitigate either by on-site retardation or by providing improvements appropriately to impacted existing drainage facilities.

SC 3-3 Prior to the issuance of any grading permits the applicant shall, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division:

a. Design and convey construction funds for surface drainage improvements; and

b. Design all necessary storm drain facilities extending to a satisfactory point of disposal for the proper control and disposal of storm runoff; and

c. Dedicate the associated easements to the County of Orange, if determined necessary.

SC 3-4 Prior to the issuance of any certificates of use and occupancy, said improvements shall be constructed in a manner meeting the approval of the Manager, PF&R/Construction Division.

SC 3-5 Prior to the issuance of any grading permit, and if determined necessary by the Manager, PDS/Subdivision and Grading Services Division, a letter of consent, in a form approved by the Manager, PDS/Subdivision and Grading Services Division, suitable for recording, shall be obtained from the upstream and/or downstream property owners permitting drainage diversions and/or unnatural concentrations.

SC 3-6 Prior to issuance of any building permits, the applicant shall participate in the applicable Master Plan of Drainage in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division, including payment of fees and the construction of the necessary facilities.

SC 3-7 Potential for the proposed project to impact the site's hydrology shall be reduced to a level of insignificance through engineering design and construction techniques incorporated into the project in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

Water Quality

SC 3-8 Prior to issuance of building permits, or grading permits, whichever come first, permit

applicant shall submit for approval of the Manager, PDS/Subdivision and Grading Services Division, a Water Quality Management Plan (WQMP) specifically identifying Best Management Practices (BMPs) that will be used onsite to control predictable pollutant runoff. This WQMP shall identify at a minimum the routine structural and non-structural measures specified in the Countywide NPDES Drainage Area Management Plan (DAMP) Appendix which details implementation of the BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, lessee, etc.); and, shall reference the location(s) of structural BMPs.

SC 3-9 Prior to the issuance of precise grading permits or building permits, whichever comes first, the applicant shall submit and obtain approval from the Manager, PDS/Subdivision and Grading Services Division, of a Water Quality Management Plan (WQMP) specifically identifying Best Management Practices (BMPs) that will be used on-site to control predictable pollutant runoff. This WQMP shall identify, at a minimum, the routine, structural and non-structural measures specified in the Countywide NPDES Drainage Area Management Plan (DAMP) Appendix which details implementation of BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association shall reference the location(s) of structural BMPs.

Flood Plain Elevation

SC 3-10 Prior to issuance of any grading permits, the applicant shall submit evidence to the Manager, PDS/Subdivision and Grading Services Division, that the applicant has obtained coverage under the NPDES statewide General Stormwater Permit from the State Water Resources Control Board.

Easements

SC 3-11 Prior to the issuance of any certificates of use and occupancy, the applicant shall not grant any easements over any property subject to a requirement of dedication or irrevocable offer to the County of Orange or the Orange County Flood Control District, unless such easements are expressly made subordinate to the easements to be offered for dedication to the County. Prior to granting any of said easements, the subdivider shall furnish a copy of the proposed easement to the Manager, PDS/Subdivision and Grading Services Division, for review and approval. Further, a copy of the approved easement shall be furnished to the Manager, PDS/Building Inspection Services Division, prior to the issuance of any certificate of use and occupancy.

4.3.7 UNAVOIDABLE ADVERSE IMPACTS

Implementation of the proposed project, in conjunction with the above outlined mitigation measures, would result in no unavoidable adverse impacts to surface or groundwater hydrology.

Implementation of identified Best Management Practices mitigation measures would reduce potential adverse water quality impacts to less than significant levels.

4.4 TRANSPORTATION/CIRCULATION

The traffic analysis entitled, "Saddleback Meadows (TT 10692) Growth Management/CMP Traffic Analysis (revised), Orange County, California", dated May 19, 1997, has been prepared for the proposed project by Robert Kahn, John Kain (RKJK) Associates, and is included in its entirety in Appendix F of this Draft EIR.

4.4.1 EXISTING ENVIRONMENTAL SETTING

Site Access

Access to the project site is currently provided from El Toro Road, and Valley Vista Way, located within the Hidden Ridge/Hidden Hills Community. The regional circulation system is shown in Exhibit 23.

Regional Transportation Facilities

The Orange County Master Plan of Arterial Highways shows the location and extent of arterial highways that are needed to adequately serve the ultimate development depicted by the Land Use Element of the General Plan and serves to coordinate future arterial highways between local jurisdictions. Exhibit 25 illustrates the typical Orange County cross-sections and design capacity values for various roadway classifications.

Existing roadways in the project area include the Foothill Transportation Corridor (SR-241), Santiago Canyon Road, El Toro Road, Marguerite Parkway, Portola Parkway, Santa Margarita Parkway, Live Oak Canyon Road, Ridgeline Road, Saddleback Ranch Road and Glenn Ranch Road. The Orange County Master Plan of arterial highways is shown in Exhibit 24.

Foothill Transportation Corridor (SR-241) has recently been extended southerly to Antonio Parkway. This corridor, in conjunction with Portola Parkway and Irvine Boulevard, now provides a connection from the communities of Coto de Caza and Santa Margarita to the City of Tustin. SR-241 is a limited access toll road facility, with on-ramps/off-ramps located near the project at Portola Parkway and Los Alisos Boulevard. Once completed, SR-241 will traverse inland Orange County from San Clemente at the south to its intersection with the Eastern Transportation Corridor on the north, in the City of Tustin.

Santiago Canyon Road is classified as a Primary (four-land divided) Arterial highway on the Orange County Master Plan of Arterial Highways (MPAH). It is currently two lanes in the vicinity of the site. Santiago Canyon Road currently accommodates approximately 10,000 to 14,000 average daily trips (ADT) in the project area.

El Toro Road is classified as a Major Arterial highway south of Live Oak Canyon Road on the

Orange County MPAH. It is partially constructed to its Master Plan classification near Santa Margarita Parkway and has yet to be improved (two lanes) in the vicinity of the project site. El Toro Road currently accommodates approximately 13,000 to 23,000 ADT in the project area.

Marguerite Parkway is classified as a Primary (four-lane divided) Arterial highway south of El Toro Road on the Orange County MPAH. Marguerite Parkway in the project area has been fully constructed and currently carries approximately 12,000 ADT in the project area.

Portola Parkway is classified as a Major (six-lane divided) Arterial highway north of El Toro Road to Alton Parkway on the Orange County MPAH. It is fully improved and currently accommodates approximately 20,000 to 22,000 ADT in the project area.

Santa Margarita Parkway is classified as a Major (six-lane Divided) Arterial highway on the Orange County MPAH. It has been fully improved to its Master Plan of Arterial Highways classification in the project area. Traffic volumes on Santa Margarita Parkway are approximately 26,000 ADT in the project area.

Live Oak Canyon Road is currently two lanes east of El Toro Road. It currently carries approximately 5,000 ADT in the project area.

Ridgeline Road is currently two lanes west of El Toro Road. It currently carries approximately 1,000 to 2,000 ADT in the project area.

Saddleback Ranch Road is currently two to four lanes in the project area. It currently carries approximately 3,000 ADT.

Glenn Ranch Road has recently been completed to provide a direct connection between El Toro Road south of the project site and Portola Parkway north of the Foothill Transportation Corridor (SR-241). Glenn Ranch Road is classified as a Primary (four-lane divided) Arterial highway on the Orange county MPAH. It is fully constructed and currently carries approximately 5,000 ADT in the project area.

N

Traffic Volumes and Conditions

Existing average daily traffic volumes on arterial highways throughout the project area are shown in Exhibit 26. ADT volumes are based upon the traffic data collected by the County of Orange and counts made by the traffic engineer in June, 1995. Existing ADT and Level of Service (LOS) information for project area roadways is contained in Table 11.

Table 11
EXISTING INTERSECTION ICU and LOS

Intersection	PEAK HOUR ICU		PEAK HOUR LOS	
	AM	PM	AM	PM
Santiago Canyon Road (NS) at:				
• Modjeska Canyon Road (EW)	0.82	0.57	D	A
• Ridgeline Road (EW)	0.78	0.55	C	A
El Toro Road (NS) at:				
• Live Oak Canyon Road (EW)	0.74	0.45	C	A
• Ridgeline Road (EW)	0.62	0.53	B	A
• Valley Vista Way (EW)	0.58	0.45	A	A
• Glenn Ranch Road (EW)	0.54	0.56	A	A
Saddleback Ranch Road (NS) at:				
• Glenn Ranch Road (EW)	0.29	0.33	A	A
Marguerite Parkway (NS) at:				
• El Toro Road (EW)	0.32	0.43	A	A
Portola Parkway (NS) at:				
• Glenn Ranch Road (EW)	0.54	0.45	A	A
• Foothill Transportation Corridor (EW)	0.40	0.55	A	A
• El Toro Road (EW)	0.40	0.49	A	A

As shown, all project area intersections are operating at an acceptable level of service.

Traffic signals appear to presently be warranted at the following unsignalized intersections:

Santiago Canyon Road at:

- Ridgeline Road

El Toro Road at:

- Live Oak Canyon Road

The project site is presently located within four roadway fee programs, as summarized in Table 12.

Table 12
ROADWAY FEE PROGRAMS

Program	Cost
• Eastern/Foothill Transportation Corridor Road Fee Program	$ 3,594/du - residential $4.99/sf - commercial
• Santiago Canyon Road Major Thoroughfare and Bridge Fee Program and Safety Improvement Program	$ 510/du - residential $0.45/sf - commercial
• El Toro Road Fee Program	$ 1,026/du - residential $5,948/ac - commercial
• Foothill Circulation Phasing Program Including Special FTC Fees	$ 2,914/du - residential $2.62/sf - commercial
Total	**$ 8,044/du - residential** **$8.34/sf - commercial**

Bikeways

The Master Plan of Countywide Bikeways contained in the General Plan Transportation Element identifies El Toro Road and Live Oak Canyon Road as Class 1 trails. OCTA recently adopted a *Commuter Bikeways Strategic Plan* (CBSP) which identifies a network of proposed regional bikeways that link residential areas with activity centers and intermodal transfer points. The CBSP replaces the County's Master Plan of Countywide Bikeways as the countywide commuter bike plan.

The CBSP identifies El Toro Road as a Class I bikeway and Live Oak Canyon Road as a Class II bikeway. Funding for regional bikeways on the Strategic Plan is provided by the SB-821 Bicycle and Pedestrian Facilities Program which is administered by OCTA. Funds for regional bikeways are allocated on a competitive basis to bikeway projects that are on the Commuter Bikeways Strategic Plan.

Scenic Highway

Both El Toro Road and Live Oak Canyon Road are identified as scenic highways on the County Master Plan of Scenic Highways and in the Foothill-Trabuco Specific Plan.

Public Transit

Orange County Transportation Authority (OCTA) representatives have indicated that the proposed project site is not currently served by an existing bus route extending adjacent to the site on El Toro Road. Two bus routes are located in the project vicinity. Route #309, with the nearest bus stop located at the intersection of Santa Margarita Parkway and Marguerite Parkway (near Trabuco Hills Center) is approximately 2.25 miles southwest of the project site. Route #93, with the nearest bus stop located at the intersection of Santa Margarita Parkway and Los Alisos Boulevard (Portola Plaza) is located approximately 2.5 miles southwest of the subject site.

The nearest Park and Ride parking lot (Park and Ride lots are provided by the OCTA to facilitate ride sharing and car pooling) is located at Saddleback Valley Community Church near the intersection of El Toro Road and Portola Parkway, approximately 2.0 miles southwest of the project site.

4.4.2 EFFECTS FOUND TO BE INSIGNIFICANT

The following transportation/circulation effects were found to be less than significant as determined by the Initial Study/Environmental Assessment contained in Appendix C of this EIR. These factors are not evaluated in this EIR.

- The proposed project would not result in insufficient parking capacity onsite or offsite.
- The proposed project would not conflict with alternative transportation policies (e.g., bus turnouts or bicycle racks).

4.4.3 PROJECT IMPACTS

Project access will be off of El Toro Road; an emergency access only/gated access at Valley Vista Way will also be provided. The entry street will be designed as a Collector roadway with a curb-to-curb width of 58 feet at its intersection with El Toro Road. This provides for two 12-foot exiting lanes and two 12-foot entering lanes with a 10-foot median. The Collector cross-section should be maintained for approximately 160 feet where it could then be transitioned to a standard 40-foot wide curb-to-curb width Collector roadway. The entry street will be designed with a traffic signal and a southbound left-turn pocket and northbound right-turn lane.

Traffic Impact Modeling

The current modeling source for traffic projections in the study area is the Orange County Transportation Analysis Model (OCTAM), Version 2.5, South County Subarea (SCTM). The Year 2000 and 2020 daily forecasts were projected to include the project, therefore, Year 2000 and 2020 traffic conditions without the project involved subtracting project volumes from the SCTM model volumes.

The Year 2000 and 2020 peak hour forecasts were developed using the previously described daily forecasts, along with peak hour traffic count data collected at each analysis location. Future baseline ADT volumes are shown in Exhibit 37. The proposed project is projected to generate approximately 6,220 trip-ends per day with 345 vehicles per hour during the AM peak hour and 635 vehicles per hour during the PM peak hour.

Trip Distribution/Assignment

Trip distribution represents the directional orientation of traffic to and from the project site. Trip distribution is heavily influenced by the geographical location of the site, the proximity to the regional freeway system, existing/future residential development, other commercial and community facilities. The directional orientation of traffic was determined by evaluating existing and proposed land uses within the community and the Master Plan of Arterial Highways (MPAH).

Existing plus project intersection ICU/LOS is shown in Table 13.

Table 13
EXISTING PLUS PROJECT ICU/LOS

Intersection	PEAK HOUR ICU		PEAK HOUR LOS	
	AM	PM	AM	PM
Santiago Canyon Road (NS) at:				
• Modjeska Canyon Road (EW)	0.87	0.61	D	B
• Ridgeline Road (EW)	0.82	0.60	D	A
El Toro Road (NS) at:				
• Live Oak Canyon Road (EW)	0.78	0.49	C	A
• Ridgeline Road (EW)	0.68	0.62	B	B
• Project Entrance (EW)	0.62	0.57	B	A
• Valley Vista Way (EW)	0.64	0.59	B	A
• Glenn Ranch Road (EW)	0.57	0.69	A	B
Saddleback Ranch Road (NS) at:				
• Glenn Ranch Road (EW)	0.32	0.33	A	A
Marguerite Parkway (NS) at:				
• El Toro Road (EW)	0.34	0.49	A	A
Portola Parkway (NS) at:				
• Glenn Ranch Road (EW)	0.57	0.46	A	A
• Foothill Transportation Corridor (EW)	0.40	0.58	A	A
• El Toro Road (EW)	0.41	0.50	A	A

Trip distribution for this study has been based upon near-term conditions, based upon those highway facilities which are in place. The trip distribution patterns for the project are graphically depicted on Exhibit 30, 31. This assignment of traffic from the site to the adjoining roadway system has been based upon the site's trip generation, trip distribution and proposed arterial highway and local street systems. The Projected ADT volumes along El Toro Road in the vicinity of the site do not exceed 30,000 vehicles per day. The projected ADT's along El Toro Road between the Foothill Transportation Corridor (SR-241) and Live Oak Canyon Road are well within the Level of Service "C" volumes for a Primary (four-lane divided) Arterial highway facility.

As shown in Table 13. Intersections in the vicinity of the site are projected to continue to operate at Level of Service "D" or better during peak hours. A traffic signal is projected to be warranted at the intersection of El Toro Road/Project Entrance for existing plus project traffic conditions.

Year 2000 intersection ICU/LOS projections with and without the project and with and without improvements are shown in Table 15. As shown in Table 15, all intersections will operate at LOS D or better, except for the intersection of Portola Parkway at Foothill Transportation Corridor, which will operate at LOS E during morning peak hours for the with project/without improvements scenario. A traffic signal would be warranted at the intersection of Santiago Canyon Road at Modjeska Canyon Road for the Year 2000 without project traffic conditions.

Year 2020 intersection ICU/LOS projections with and without the project and with and without improvements are shown in Table 15a. As shown in Table 15a several intersections would operate at unacceptable levels of service in Year 2020 without improvements in place. With project improvements in place, all intersections would operate at acceptable levels of service. Improvements would include the ultimate widening of El Toro Road and Santiago Canyon Road to four through travel lanes (two in each direction)

Santiago Canyon Road Analysis

Pursuant to the County of Orange Growth Management Plan (GMP), segments of Santiago Canyon Road are required to function at a Level of Service "C" Capacity improvements along Santiago Canyon Road will be required in conjunction with future growth to achieve Level of Service "C". The Santiago Canyon Road Major Thoroughfare and Bridge Fee Program has been designed to provide up to $34 million in improvements to Santiago Canyon Road from Chapman Avenue to Live Oak Canyon Road. However, the March, 1994 Project Report for improvements to Santiago Canyon Road indicates that the total cost of improvements is approximately $52.3 million for a "limited project" scenario. To address the difference between the ultimate cost of $52.3 million and the fee program allocation of $34 million, the project must provide an additional contribution beyond the payment of normal fees based upon its traffic share. Santiago Canyon Road Project Share Analysis is shown in Table 14.

Table 14
SANTIAGO CANYON ROAD PROJECT SHARE ANALYSIS

Volume Component	Roadway Segment					
	Live Oak Cyn. Rd. to Ridgeline Rd.		Ridgeline Rd. to Modjeska Cyn. Rd.		North of Modjeska Cyn. Rd.	
	AM	PM	AM	PM	AM	PM
Existing Volume (two way)	1,478	1,276	1,640	1,441	1,650	1,375
Project Volume (two way)						
-Residential	95	117	85	117	95	117
-Commercial	8	32	6	24	4	16
Project Increases						
-Residential	6.4%	9.2%	5.8%	8.1%	5.8%	8.5%
-Commercial	0.5%	2.5%	0.4%	1.7%	0.2%	1.2%

Impact Significance Criteria

The impact evaluation in this analysis focuses on intersection capacity, and uses peak hour intersection capacity utilization (ICU) values to express level of service (LOS). For the year 2010 evaluation, the GMP requires an evaluation of intersections where the project impact is greater than one percent. Satisfactory intersection operation is expressed as LOS D or better (ICU values from 0.00 to 0.90). Therefore, a significant circulation impact would occur if the project caused any intersection to exceed LOS D.

4.4.4 SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Under existing plus project intersection ICU/LOS conditions, the surrounding circulation would continue to operate at acceptable levels of service.

Year 2000 intersection conditions, without mitigation measures, would exceed Level of Service "D" significance criteria at the following intersection:

- Santiago Canyon Road at Modjeska Canyon/ Ridgeline Road
- Portola Parkway at Foothill Transportation Corridor
- El Toro Road at Live Oak Canyon Road/Glenn Ranch Road
- Portola Parkway at Glenn Ranch Road

Year 2020 intersection conditions, without mitigation measures, would exceed Level of Service "D" significance criteria at the following intersections:

- Santiago Canyon Road at Modjeska Canyon Road
- Santiago Canyon Road at Ridgeline Road
- El Toro Road at Live Oak Canyon Road
- El Toro Road at Ridgeline Road
- El Toro Road at Project Entrance
- El Toro Road at Glenn Ranch Road
- El Toro Road at Valley Vista Way
- Saddleback Ranch Road at Glenn Ranch Road
- Marguerite Parkway at El Toro Road
- Portola Parkway at Glenn Ranch Road
- Portola Parkway at Foothill Transportation Corridor
- Portola Parkway at El Toro Road

4.4.5 CUMULATIVE IMPACTS

The OCTAM/SCTM Year 2000/2020 model accounts for all cumulative projects within the region which could affect future traffic conditions. Refer to Section 4.4.3 for a complete analysis of cumulative impacts.

4.4.6 MITIGATION MEASURES

Project Design Features

Primary project access will be off of El Toro Road with an emergency access at Valley Vista Way.

PDF 4-1 The onsite circulation system is proposed as shown in Exhibit 45 to accommodate project related traffic generation, including design of the entry street as a Collector roadway with a curb-to-curb width of 58 feet at its intersection with El Toro Road. This provides for two 12-foot exiting lanes and two 12-foot entering lanes with a 10-foot median. The entry's cross-section shall be maintained for approximately 160 feet where it could then be transitioned to a standard 40-foot wide curb-to-curb width Collector roadway. Secondary emergency only access will be provided via a gated connection to existing Valley Vista Way. Minimum fire access roadway width of 28 feet shall be required.

PDF 4-2 The entry street will be designed with a traffic signal and a southbound left-turn pocket and northbound right-turn lane. The applicant shall provide a cash deposit for the design and construction of the traffic signal.

PDF 4-3 All weather access to the proposed water tank shall be provided by the applicant. This access shall be designed with a minimum 28 foot width and a maximum grade of 10%.

Standard County Conditions and Mitigation Measures

SC 4-4 Prior to the issuance of any building permits, the applicant shall participate in design, construction, and/or financing of the cost of a traffic signal in the project vicinity in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 4-5 Prior to the issuance of building permits, the applicant shall pay fees for the Major Thoroughfare and Bridge Fee Programs listed below, in a manner meeting the approval of the Manager, PF&R/Programs Division.

a. Foothill Circulation Phasing Program

b. Prior to recordation of a final tract map, the subdivider shall enter into an agreement with the County of Orange for participation in a fee program (if adopted by the Board of Supervisors) for implementation of the Foothill/Eastern Transportation Corridor. Said agreement shall provide that:

1. The fee shall be $158.00 per trip end times the County standard trip end generation rate for the type of development proposed, times the number of units (footage) proposed, or the fee payable under the program, whichever is less.

2. Subdivider's obligation to pay fees would arise only after the County establishes the fee program, prior to issuance of building permits.

3. Subdivider's obligation to pay the fee would be extinguished if the fee program were not established within three (3) years of the date of issuance of the first building permit for subject development.

4. Subdivider shall furnish surety bond, letter of credit, money or such other security approved by the Director, PF&RD, to assure payment of the fees related to subject development.

5. This condition shall be void if a trial court of competent jurisdiction, in a final judgement, or an appellate court, if the matter is appealed, sets aside a

condition imposed by the County which was substantially the same as said condition.

c. El Toro Road

d. Santiago Canyon Road

SC 4-6 Building permit issuance shall be phased in accordance with the Foothill Circulation Phasing Plan (FCPP) Development Phasing Plan, and shall also be subject to any other Board of Supervisors approved growth management phasing plan pertaining to the timely provision of public services and facilities.

SC 4-7 Building permit issuance shall be phased in accordance with any Board of Supervisors approved Growth Management Phasing Plan pertaining to the timely provision of public services and facilities.

SC 4-8 Prior to the issuance of any grading permits, adequate sight distance shall be provided at all street intersections per Standard Plan 1117, in a manner meeting the approval of the Manager, PF&R/Programs Division. This includes any necessary revisions to the plan such as removing slopes or other encroachments from the limited use area.

SC 4-9 Prior to the issuance of any certificates of use and occupancy, the developer shall construct the approved internal circulation improvements in a manner meeting the approval of the Manager, PF&R/Construction Division. Further, a copy of the approved plans shall be furnished to the Manager, Building Inspection Services, prior to the issuance of any certificates of use and occupancy.

SC 4-10 When monuments exist which control the location of subdivisions, streets or highways, or provide survey control, the monuments shall be located and referenced prior to any street construction or relocation, and shall be reset after construction as required by Section 8771 of the Business and Professions Code, in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division.

SC 4-11 Prior to issuance of a building permit, the applicant shall pay a cash fair share contribution for the design and construction of improving Santiago Canyon Road from Live Oak Canyon Road to Jamboree Road, in a manner meeting the approval of the Manger, PF&R/Programs Division. In addition, the applicant shall participate in the Santiago Canyon Road Safety Improvement Program.

SC 4-12 Prior to issuance of a building permit, the applicant shall design and construct roadway improvements for El Toro Road including a deceleration lane and a left turn pocket into the project entrance based on a 60 mph minimum design speed in a manner meeting the approval of the Manager, PF&R/Programs Division.

SC 4-13 Prior to issuance of a building permit, the applicant shall provide a cash deposit for

the difference in cost of designing and constructing the roadway improvements proposed with the project as compared to the costs associated with the ultimate configuration of El Toro Road, as determined by PDS/Environmental & Project Planning Services Division, all in a manner meeting the approval of the Manager, PF&R/Programs Division.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations in a manner meeting the approval of the Manager, Transportation Planning.

AM 4-14 El Toro Road lane improvements needed at the Project Entrance to serve Year 2000 and 2020 conditions shall be completed in conjunction with development.

AM 4-15 Traffic signing/striping shall be implemented in conjunction with detailed construction plans for the project. Verification of adequate parking shall be analyzed for the project site in conjunction with approval of the site plan.

AM 4-16 The project shall participate in existing road fee programs, including the Foothill/Eastern Transportation Corridor Fee Programs, Foothill Circulation Phasing Program (FCPP), El Toro Road Fee Program and the Santiago Road Fee Program.

Both existing traffic patterns and SCTM traffic projections for Years 2000 and 2020 indicate the attraction of Glenn Ranch Road, Portola Parkway, and the Foothill Transportation Corridor (SR-241) for increased traffic volumes in the project study area. North of the Foothill Transportation Corridor, El Toro Road can accommodate projected traffic volumes with the proposed project on four travel lanes divided by a raised or striped median.

4.4.7 UNAVOIDABLE ADVERSE IMPACTS

Implementation of the proposed project, with the above outlined mitigation measures, would reduce all traffic/circulation impacts to less than significant. No unavoidable adverse impacts would occur.

4.5 AIR QUALITY

An Air Quality Impact Assessment has been prepared for the proposed project by Giroux & Associates; and is included in Appendix F.

4.5.1 EXISTING ENVIRONMENTAL SETTING

Meteorology/Climate

The project site's climate, as with all of Southern California, is dominated by the strength and position

of the semi-permanent high pressure center over the Pacific Ocean near Hawaii. It creates cool summers, mild winters, infrequent rainfall, it drives the cool daytime sea breeze, and it maintains comfortable humidities and ample sunshine. Unfortunately, the same atmospheric processes that create the desirable living climate combine to restrict the ability of the atmosphere to disperse the air pollution generated by the large population attracted in part by the comfortable climate. Portions of the Los Angeles Basin therefore experience some of the worst air quality in the nation for certain pollutants.

Temperatures in El Toro average 62°F annually. Daily and seasonal oscillations of temperature are small because of the moderating effects of the nearby oceanic heat reservoir. In contrast to the steady temperature regime, rainfall is highly variable, and confined almost exclusively to the "rainy" period from early November to mid-April. Rainfall in the project area averages around 12 inches annually with January typically the wettest month of the year.

Winds near the project site, based on long-term monitoring from nearby El Toro MCAS, display several characteristic regimes. During the day, especially in summer, winds are from the west at 7-9 miles per hour. At night, especially in winter, the land becomes cooler than the ocean and an offshore wind of 3-5 miles per hour develops. After sunrise, the wind direction rotates through the southeast and south at 5-7 miles per hour until the west wind again becomes dominant in the early afternoon. Such light winds lead to limited local ventilation and resulting in possibly elevated pollution levels near freeways, shopping centers and other traffic concentrations. The project site is, however, sufficiently separated from traffic stagnation conditions as to preclude the formation of any local pollution "hot spots." One other important wind regime occurs when a high pressure center forms over the western United States and creates strong, hot, dry, gusty, Santa Ana winds from the northeast and east across El Toro.

The net effect of the area wind pattern is that any locally generated air pollutant emissions will be carried from east to west at night, and then reverse from west to east by day. Although the daytime wind speeds are generally stronger and therefore better ventilate the project area, the offshore flow, once well-organized late in the evening and during the night, is also strong enough to minimize any significant localized air stagnation. The least ventilated period is typically during the morning and evening directional transition when winds become near calm until the new flow component becomes fully established.

In addition to winds that govern the horizontal rate and trajectory of any air pollutants, Southern California experiences several characteristic temperature inversions that control the vertical depth through which pollutants can be mixed.

Ambient Air Quality Standards (AAQS): In order to assess the air quality impact of any proposed new development such as Saddleback Meadows, that impact, together with baseline air quality levels, must be compared to the applicable ambient air quality standards. These standards are the levels of air quality considered adequate to protect the public health and welfare. They are designed to protect that segment of the public most susceptible to respiratory distress or infection, such as asthmatics, the elderly, the very young, people weak from other disease or illness, and persons engaged in heavy work or exercise, called "sensitive receptors". Healthy adults can tolerate periodic exposure to air

pollution levels well above these standards before adverse health effects are observed. Recent research has shown, however, that adverse health effects may occur from life-long chronic exposure to ozone concentrations that just meet the hourly standard. Barely meeting clean air standards may, therefore, not be enough to insure public health protection until some additional margin of safety is established to overcome chronic exposure health effects.

The Clean Air Act Amendments of 1970 established national AAQS with states retaining the option to adopt more stringent standards or to include other pollution species. Because California already had standards in existence before federal AAQS were established, and because of unique meteorological problems in California, there is considerable diversity between state and federal standards currently in effect in California as shown in Table 16.

Baseline Air Quality: The project site is located within the South Coast Air Basin, which is currently classified as non-attainment status. Existing and probable future levels of air quality in the project area can be best inferred from ambient air quality measurements conducted by the South Coast Air Quality Management District (AQMD) at its El Toro monitoring station. Monitoring at this station include both regional pollutants such as dust and smog, as well as primary vehicular pollution levels such as carbon monoxide. Table 17 summarizes the last seven years of published data from this monitoring station. Although the entire spectrum of air pollutants is not monitored at the El Toro station, the following conclusions can be drawn from this data:

a. Photochemical smog (ozone) levels continue to exceed standards by a wide margin. However, the frequency of first stage smog episodes has ranged from 0-2 per year with a noticeable trend toward fewer episodes within the last several years. First stage smog episodes have dropped by 90% in 1987-93 from 1981-86. 1990 was the first year without a first-stage smog alert (one hour $\geq$ 0.20 ppm) since ozone monitoring began at El Toro. 1992-94 was the first consecutive three-year period without a first-stage smog episode.

b. Annual maximum ozone levels rose in the early 1980's to close to the second stage alert level of 0.35 ppm for 1 hour, but they since dropped sharply to the sub-0.20 ppm level. For several years, El Toro had the worst smog of any station in Orange County. In the last several years, however, El Toro, and by inference all of the South County, had some of the lowest smog readings on record.

Table 16
AMBIENT AIR QUALITY STANDARDS

AIR POLLUTANT	STATE STANDARD CONCENTRATION/ AVERAGING TIME	FEDERAL PRIMARY STANDARD CONCENTRATION/ AVERAGING TIME	MOST RELEVANT EFFECTS
Ozone	0.09 ppm, 1-hr. avg. >	0.12 ppm, 1-hr avg.>	(a) Short-term exposures: (1) Pulmonary function decrements and localized lung edema in humans and animals (2) Risk to public health implied by alterations in pulmonary morphology and host defense in animals; (b) Long-term exposures: Risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals after long-term exposures and pulmonary function decrements in chronically exposed humans; (c) Vegetation damage; (d) Property damage
Carbon Monoxide	9.0 ppm, 8-hr avg > 20 ppm, 1-hr avg. >	9 ppm, 8-hr avg > 35 ppm, 1-hr avg.>	(a) Aggravation of angina pectoris and other aspects of coronary heart disease; (b) Decreased exercise tolerance in persons with peripheral vascular disease and lung disease, (c) Impairment of central nervous system functions; (d) Possible increased risk to fetuses
Nitrogen Dioxide	0.25 ppm, 1-hr avg. >	0 053 ppm, ann. avg >	(a) Potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups; (b) Risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes, (c) Contribution to atmospheric discoloration
Sulfur Dioxide	0 04 ppm, 24-hr avg.> 0.25 ppm, 1-hr. avg. >	0.03 ppm, ann. avg > 0.14 ppm, 24-hr avg.>	(a) Bronchoconstriction accompanied by symptoms which may include wheezing, shortness of breath and chest tightness, during exercise or physical activity in persons with asthma
Suspended Particulate Matter (PM_{10})	30 $\mu g/m^3$, ann. geometric mean > 50 $\mu g/m^3$, 24-hr average>	50 $\mu g/m^3$, annual arithmetic mean > 150$\mu g/m^3$, 24-hr avg >	(a) Excess deaths from short-term exposures and exacerbation of symptoms in sensitive patients with respiratory disease; (b) Excess seasonal declines in pulmonary function, especially in children
Sulfates	25 $\mu g/m^3$, 24-hr avg >=		(a) Decrease in ventilatory function, (b) Aggravation of asthmatic symptoms; (c) Aggravation of cardio-pulmonary disease; (d) Vegetation damage; (e) Degradation of visibility; (f) Property damage
Lead	1.5 $\mu g/m^3$, 30-day avg. >=	1.5 $\mu g/m^3$, calendar quarter>	(a) Increased body burden; (b) Impairment of blood formation and nerve conduction
Visibility-Reducing Particles	In sufficient amount to reduce the visual range to less than 10 miles at relative humidity less than 70 percent, 8-hour average (10am - 6pm)		Visibility impairment on days when relative humidity is less than 70 percent

Table 17
Air Quality Monitoring Summary - El Toro Monitoring Stations (1989-95)
(Number of Days Standards Were Exceeded, and Maximum Levels During Such Violations
Entries shown as ratios = samples exceeding standard/samples taken)

Pollutant/Standard	1989	1990	1991	1992	1993	1994	1995
Ozone:							
1-Hour > 0 09 ppm (a)	30	32	29	31	22	16	15
1-Hour > 0.12 ppm (b)	7	11	10	9	7	5	1
1-Hour ≥ 0.20 ppm ©	2	0	1	0	0	0	0
Max 1-Hour Conc. (ppm)	0.23	0.19	0.24	0.16	0.16	0.18	0.15

Source: South Coast Air Quality Management District, El Toro Monitoring Station, El Toro Road @ Jeronimo Road.

(a) = California ambient air quality standard
(b) = National ambient air quality standard
(c) = California first-stage smog episode alert level.

c. Measurements of carbon monoxide have shown relatively low baseline levels for a monitoring station located near two busy arterials (El Toro Road and Jeronimo Road). With lower traffic volumes and more complex terrain reducing stagnation potential, CO levels near Saddleback Meadows are probably even lower than the AQMD readings at the El Toro monitoring station.

d. Respirable dust (PM-10) levels periodically exceed the state standard, but the less stringent

federal PM-10 standard has never been violated since PM-10 measurements began at El Toro.

Air Quality Planning

The Federal Clean Air Act (1977 Amendments) stated that designated agencies in any area of the nation not meeting national clean air standards must prepare a plan that demonstrates the steps needed to bring the area into compliance with all national standards by December 31, 1987. In the South Coast Air Basin (SCAB), the agencies designated to develop regional air quality plans are the SCAQMD and the Southern California Association of Governments (SCAG). The two agencies adopted an Air Quality Management Plan (AQMP) in 1979 and revised it in 1982 to project attainment of the standards in 2000. However, the EPA was required to disapprove the 1982 AQMP because it had not shown attainment by 1987, as required by the 1977 Clean Air Act Amendments (1977 CAAA).

Under court order, another AQMP revision was adopted by SCAG and the SCAQMD in 1989. The 1989 AQMP projected attainment of all national standards by the year 2007. The 1989 AQMP was again not approved by the federal Environmental Protection Agency (EPA) for incorporation in the State Implementation Plan (SIP) because the 2007 deadline for compliance was inconsistent with the 1977 CAAA.

The 1989 AQMP relied in part on technology which had not yet been invented to meet its year 2007 target. It called for stricter controls on automobiles, paints and coatings, new industries, and transportation usage. The plan was divided into three tiers, with Tier I representing measures which were available for immediate implementation, Tier II consisting of measures that needed further development but were based on known technology, and Tier III representing emission reduction measures that were dependent on the development of new technology, including heavy reliance on clean fueled vehicles.

In 1988, the California Legislature enacted the California Clean Air Act (CCAA). The CCAA requires that regional emissions be reduced by 5 percent per year, averaged over 3 year periods, until attainment can be demonstrated. Each area that does not currently meet a national or state ambient air quality standard is to prepare a plan which demonstrates how the 5 percent reductions will be achieved.

In July 1991, the SCAQMD adopted a new AQMP which was prepared to meet the CCAA requirements. Although the 1991 AQMP deferred the attainment date to 2010, consistent with the 1990 federal Clean Air Act, it contained fewer Tier III measures, relying on the adoption of new motor vehicle controls by the California Air Resources Board (ARB) which will result in cars by 2003 which are 80 percent cleaner than those sold in 1990.

The 1990 Federal Clean Air Act requires that revised SIPs be prepared with a sliding schedule of attainment dates depending upon the severity of existing air quality. Southern California has the worst smog in the country, and therefore has the longest amount of time to achieve clean air (2010). The 1991 AQMP was modified in 1994 and submitted in November, 1994 as the SCAB portion of the California SIP. A court-ordered requirement for substitution of a more draconian Federal

Implementation Plan (FIP) was reversed by the U. S. Congress in 1995. The 1994 SIP submittal is therefore the currently operable air quality plan for the region.

A residential development project such as Saddleback Meadows relates to the air quality planning process through the growth forecasts that were used as inputs into the regional transportation model. If a proposed development is consistent with those growth forecasts, and if all available emissions reduction strategies are implemented as effectively as possible on a project-specific basis, then the air quality impact on a regional basis should be considered as less than significant. The AQMP also contains a number of land use and transportation control measures (TCMs). Many of these measures can not be implemented on any single development basis because they require an integration of all development and all transportation planning. The effectiveness of many TCMs is expected to increase over the next decade AQMP consistency on a single development basis is thus more a matter of facilitating or providing the infrastructure for TCM implementation than of actually specifically being solely responsible to carry out regionally comprehensive AQMP measures.

4.5.2 EFFECTS FOUND TO BE INSIGNIFICANT

The following air quality effects were found to be less than significant as determined by the Initial Study/Environmental Assessment contained in Appendix C of this EIR. These factors are not evaluated in this EIR.

- The project would not create objectionable odors.

4.5.3 PROJECT IMPACTS

The analysis methodology utilized procedures outlined in the SCAQMD 1993 "CEQA Air Quality Handbook" where appropriate. In areas where more site-specific information was available beyond the default values recommended in the handbook, they were used to supplement the SCAQMD-suggested input parameters.

Vehicular emissions were calculated using the SCAQMD "MAAQI" computer model. Microscale emissions impacts were calculated using one generic run of the CALINE4 computer model adjusted for site-specific traffic volumes, travel speeds and emission data for intersections near Saddleback Meadows potentially affected by project-related traffic.

Many air quality impacts from dispersed mobile sources, i.e., the dominant pollution generators in the basin, often occur hours later and miles away after photochemical processes have converted primary exhaust pollutants into secondary contaminants such as ozone. The incremental regional air quality impact of an individual source is generally immeasurably small.

Significance Impact Criteria

Criteria for determining the potential significance of new air quality impacts are based on Federal, state and local pollution standards/regulations. Impacts are considered potentially significant if project emissions meet any of the following criteria:

A. If the project is capable of an increase in daily emissions that exceeds the following SCAQMD recommended threshold criteria:

Table 18
SCAQMD RECOMMENDED SIGNIFICANCE THRESHOLD CRITERIA[8]

Pollutant	Operational Emissions	Construction Emissions
Reactive Organic Gases (ROG)	55 lbs/day	75 lbs/day
Carbon Monoxide (CO)	550 lbs/day	550 lbs/day
Suspended Particulates (PM_{10})	150 lbs/day	150 lbs/day
Nitrogen Oxides (NO_x)	55 lbs/day	100 lbs/day
Sulphur Oxides (SO_x)	150 lbs/day	150 lbs/day

B. If project emissions increase ambient carbon monoxide levels from below the NAAQS/CAAQS to above these standards.

C. If project emissions result in the accedence of any State, Federal or local ambient standards.

These thresholds do not take into account several important considerations, namely:

1. Emission levels from one large project may exceed thresholds while those from numerous smaller projects with identical emissions might not, even though the regional impact is the same.

2. Large developments have a greater opportunity to effectively implement TCMs because of a greater potential participant pool in trip/VMT diversion programs.

3. Project-related emissions and their regional impact may already have been incorporated into regional growth projections.

4. Emissions generated in or near El Toro have essentially the same regional air quality impact if they were released in a nearby community. If the anticipated demand for residential use is not met at Saddleback Meadows but in some other community, the no-project alternative will have basically the same regional air quality impact.

Additional indicators should be used as screening criteria to evaluate the need for further analysis with

---

[8] *The SCAQMD recommended significance thresholds listed above are found in the District's revised CEQA Air Quality Handbook, adopted in February, 1993*

respect to air quality. Whenever possible, the project should be evaluated in a quantitative analysis; otherwise a qualitative analysis is appropriate. The additional indicators are as follows:

- Project could interfere with the attainment of the federal or state ambient air quality standards by either violating or contributing to an existing or projected air quality violation;
- Project could result in population increases within the regional statistical area which would be in excess of that projected in the AQMP;
- Project could generate vehicle trips that cause a CO hot spot;
- Project might have the potential to create or be subjected to objectionable odors;
- Project could have hazardous materials on site and could result in an accidental release of air toxic emissions;
- Project could emit an air toxic contaminant regulated by District rules or that is on a federal or state air toxic list;
- Project could involve disposal of hazardous waste;
- Project could be occupied by sensitive receptors near a facility that emits air toxics or near CO hot spots;
- Project could emit carcinogenic air contaminants that could pose a cancer risk.

Project-Related Sources of Potential Impact

Intensification of land uses in Orange County potentially impacts ambient air quality on two scales of motion. As cars drive throughout Southern California, the small incremental contribution to the basin air pollution burden from any single vehicle is added to that from several million other vehicles. The impact from this project, even if it generates a significant number of new vehicle trips, is very small on a regional scale. Basin-wide air quality impacts are, therefore, addressed in terms of project compatibility with regional air quality plans. If any given project or plan has been properly incorporated into basin-wide growth projections which are the basis for regional air quality/transportation planning, then the basin-wide impact of any proposed development is presumed, by definition, to be less than significant.

Locally, changes in the location of any collection of automotive sources, or changes in the number of vehicles or travel speeds may impact the microscale air quality around any given development site. Traffic increases not only contribute air pollutants in direct proportion to their cumulative percentage of traffic volume growth, but they may slow all existing traffic to slower, more inefficient travel speeds. The development traffic/air quality impact is thus potentially compounded.

Temporary construction activity emissions will occur during project buildout. Such emissions include

on-site generation of dust and equipment exhaust, and off-site emissions from construction employee commuting and/or trucks delivering building materials. Because of their temporary nature, air quality impacts from construction have often been considered as individually less than significant. Also, construction activity emissions are difficult to quantify, since the exact type and amount of equipment that will be used or the acreage that may be disturbed on any given day in the future is not known with any reasonable certainty. The emphasis in environmental documents relative to construction activity emission impacts has therefore been to minimize the emissions as fully as possible through comprehensive mitigation even if the precise amount of emissions can not be precisely quantified.

Historical use of agricultural pesticides or herbicides on the project site may have left residues within the soil that may be lofted during site development. Such concern, however, are more common for cultivated fields where DDT or other chlorinated compounds were used than for open rangeland such as the project site.

Construction workers, and to some extent the public at large, could also be exposed to any spores, viruses or other materials in the soil released during site grading. Grading activities are not likely to create any unacceptable health impacts from biological organisms in that organisms such as Valley Fever are not endemic to the El Toro area. Thousands of acres of Orange County have been tilled for many years or graded for new development with minimal evidence of any health impacts from soil-borne pathogens.

Construction Activity Impacts

Dust is normally the primary concern during construction of new buildings and infrastructure. Because such emissions are not amenable to collection and discharge through a controlled source, they are called "fugitive emissions". Emission rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). Because of such variations, regulatory agencies use one universal factor based on the area disturbed assuming that all other input parameters into emission rate prediction fall into mid-range average values.

The PM-10 fraction of fugitive dust emissions are predicted to be around 55 pounds per day per acre disturbed in the absence of any dust control measures being applied.[9] Mandatory measures required by South Coast AQMD Rule 403 (Fugitive Dust) are generally assumed to reduce this rate by 50%. Average daily PM-10 emissions during site grading and other disturbance are stated in the SCAQMD Handbook to be 26.4 pounds/ acre. Enhanced dust control procedures such as continual soil wetting, use of supplemental binders, early paving, etc. can theoretically achieve a 90% PM-10 control efficiency, or around 5.3 pounds per day per acre.

With "normal" dust control procedures, daily PM-10 emissions during construction of any individual project would exceed the SCAQMD emissions significance threshold of 150 pounds per day if more than 5.7 acres (150 lb ÷ 26.4 lb/acre = 5.7 acres) were under simultaneous disturbance. With

---

9 *AQMD CEQA Handbook, Table 9-2*

assumed maximum achievable dust control, up to 28.4 acres (150 ÷ 5.7 = 28.4) could be under simultaneous disturbance.

The proposed project would be mass graded in one phase, with a total area of disturbance of 211 acres Project development would exceed the PM-10 emissions significance threshold if a very substantial fraction of the project area were under simultaneous construction. It is highly doubtful, however, that heavy equipment operations will cover more than 25 acres because it would take an armada of equipment moving furiously to cover that much ground on any given day. It is possible, however, that more than 5.7 acres may be under simultaneous disturbance as the significance threshold for standard dust abatement. Enhanced dust control procedures thus need to be implemented during construction. With an effective dust control program implemented during construction, PM-10 impacts can be maintained at a less-than-significant level.

In addition to the fine particulates that remain suspended in the air semi-indefinitely, soil disturbance during construction may release considerable amounts of larger particles that have short atmospheric residence times. These larger particulates are generally inert silicates that are readily filtered out in the upper respiratory tract. They therefore have no adverse health effects. They may, however, create a soiling nuisance as they settle out on parked cars, landscaping foliage or other horizontal surfaces. Clouds of such dust may also locally impair visibility. Soiling nuisance at St. Michael's Abbey during daytime on-shore flow or in Hidden Hills during nocturnal drainage winds is therefore a possible concern that further prompts the use of efficient dust control.

It is through these larger particulates that the public is aware of a dust problem in a construction area rather than through PM-10. Because such large particles are more readily lofted by turbulence during strong winds, extra dust control or cessation of soil disturbance activities is recommended when wind speeds exceed a heavy particulate lofting threshold of around 25 mph.

Construction also entails use of internal combustion engines to power on-road trucks and off-road mobile, semi-mobile and semi-stationary equipment. Such sources are mainly diesel-powered and are poorly regulated in terms of allowable emission levels. Off-road sources are sometimes not well maintained because there is no regulatory mechanism to enforce efficient combustion as there is for on-road sources. The SCAQMD has calculated the total area under construction that would cause the significance thresholds to be exceeded from construction-related equipment combustion emissions. For single family residences, the threshold is 1.3 million square feet of gross floor area (SCAQMD Handbook, Table 6-2). For 705 units even at 2,630 square feet per unit, total improved footage from simultaneous construction of the entire project will be less than the stated threshold. With the use of a comprehensive dust control program, construction activity air quality impacts in the project vicinity can be maintained at less than significant levels.

Construction activities are concentrated at the construction site, but they also spill over into the adjacent community. Spill-over may be physical spillage, or it may be from off-site congestion effects. Vehicles may track dirt off-site, lane closures may create congestion on public roadways and construction worker vehicles and supply trucks may compete with the general public for sometimes inadequate roadway capacity. Trucks may be left idling near off-site sensitive receptors while waiting to load or unload. Each of these small impacts nevertheless may be cumulatively significant when

spread over several years of project area buildout. As with the on-site impacts, a heightened level of impact mitigation will need to be utilized to maintain an overall tolerable level of impact from site activity construction. Housekeeping and construction activity management procedures are identified in the impact mitigation discussion relative to "spill-over" minimization.

Mobile Source Impacts

The bulk of the proposed project's impact will derive from the approximately 5,410 daily trips that will be generated at full site buildout. At a typical trip length of around 9 miles per trip, project implementation would add around 50,000 vehicle miles traveled (VMT) to the basin-wide mobile source emissions burden.

The emissions associated with project buildout can be readily calculated using the SCAQMD's MAAQI computer model. Emissions from project-related travel were calculated for a buildout year of 1997 as the earliest likely project completion year. The results of these calculations are summarized in Table 19. The computer output from the emissions model is contained in Appendix G of this document.

Table 19
PROJECT-RELATED OPERATIONAL EMISSIONS (POUNDS/DAY)*

Land Use	CO	ROG	NO_x	SO_x	PM-10
750 D.U. (Mfg. Housing	1311.8	107.7	149.0	10.3	15.2
20 KSF Commercial	397.3	34.0	43.1	3.2	5.1
Total	1709.1	141.7	192.1	13.5	20.3
SCAQMD	550.0	55.0	55.0	150.0	150.0
Proj. Share of Threshold	311%	258%	349%	9%	14%

Source: MAAQI Computer Model (output in Appendix)

* Assuming a 1998 buildout.

** Stationary source emissions are slightly over predicted because project size was artificially modified upward to force MAAQI model trip projections to match the project traffic study forecasts.

Mobile Source Emissions

As shown in Table 19, mobile source emissions for the three primary exhaust pollutants (ROG, CO and NO_x) exceed the SCAQMD significance threshold by a wide margin. This conclusion is generally consistent with the SCAQMD Handbook ... which, in Table 6-2, states that single family residential projects of 166 units or more may have a significant environmental impact. Although the SCAQMD Air Quality Handbook states strongly that such emission levels will have a significant impact on the environment, that finding is not necessarily binding. The SCAQMD is only an advisory agency on this project, such that the Lead Agency must evaluate whether there will actually be a measurable degradation of the regional air quality environment resulting from project implementation. While the proposed project would cause the suggested AQMD emissions threshold to be exceeded by a wide margin, several considerations may mitigate against considering the resulting air quality impact as individually significant as follows:

1 Similar emissions would result from development of the same project in an adjacent jurisdiction or elsewhere in Orange County.

2. The project is consistent with growth assumptions that were used for regional emissions forecasts in the AQMP. The AQMP forecasts regional attainment of the federal ozone standard by 2010 as long as the rate of predicted regional growth is not exceeded. The Saddleback Meadows project is only a minute part of predicted Orange County growth.

3. The transportation infrastructure is in place to efficiently service the site with good access to multiple transportation modes.

4. The project is located near the Foothill Transportation Corridor that provides good linkage between the Orange County concentrated employment centers and the project site.

The above considerations would allow for the Lead Agency to find that the air quality impact is individually less than significant despite the considerable emissions magnitude. If the emissions total alone were to be judged as sufficient evidence for a finding of significance, then the above considerations should be incorporated into a statement of overriding consideration.

Relative to a finding of (in)significance for the mobile source emissions, it should also be noted that the calculations do not take into account mandatory conversion of the basin travel fleet to methanol or a similar "clean" fuel. Clean fuel market penetration is mandated to be 25 percent by 1997 and then rise steadily into the early 21st Century. Zero emissions vehicle (ZEV) availability is also currently mandated under state law by the end of this decade with accelerated market penetration expected in the first decade of the next century. The assumption of 100 percent use of gasoline and diesel fuel in the analysis thus overstates project regional air quality impacts. However, independent of any reason to reduce the stated burden, traffic from all future growth will contribute significantly to the sub-regional and regional air pollution burden, and, therefore, creates a cumulatively significant air quality impact, regardless of project size. This is a function of growth and the dependence upon

the single occupant fossil-fueled vehicle as the primary means of transportation. All growth delays the ultimate attainment of regional clean air standards. This project, within a loose definition of "cumulative projects", would contribute to that impediment to clean air. Regardless of any finding of individual impact significance, the proposed Saddleback Meadows development should be identified as having a cumulatively significant air quality impact.

Because vehicular sources from all combined growth will contribute so substantially to regional emissions total, it correspondingly represents a significant opportunity to reduce that contribution. A reasonable reduction percentage through the implementation of an aggressive transportation system management (TSM) will achieve a measurable reduction when applied to such a large baseline emissions level. If the air quality impact from mobile source emissions is to be maintained at an acceptable level, a viable TSM program is an imperative strategy toward achieving that end.

Orange County has been extensively involved in trip/VMT reduction programs through the trip reduction ordinances (TRO) and various geographically focused transportation management programs. Several countywide programs that monitor city and county response to AQMP TCMs have shown that the county collectively has exceeded the 1994 trip reduction target of the 1991 AQMP when the county is allocated its fair share of the basin-wide reduction target. While progress toward reducing the dependence on the single occupant vehicle (SOV) is slow, continued progress toward higher average vehicle ridership (AVR) is to be expected during the Saddleback Meadows buildout time frame.

While regional mobile source emissions do not have a very direct impact on local El Toro air quality, the incremental addition of growth-related traffic over a wide area may change microscale air quality distributions. To determine whether future traffic changes will create an adverse air quality impact, a microscale air quality analysis was performed for the traffic analysis grid around the project site. A screening procedure based on the California line source roadway dispersion model CALINE4 was run for a number of traffic scenarios to evaluate any changes due to changes in patterns of growth anticipated as part of the Saddleback Meadows development.

The model combines the results of the traffic analysis with very restrictive dispersion conditions in order to generate a worst-case impact assessment. Carbon monoxide (CO) was used as an indicator of any "hot spot" potential because CO, unlike regional pollutants such as ozone, is directly related to source activity immediately adjacent to the receptor (a primary, unreacted pollutant impact). Calculations were made for an hourly exposure in the immediate vicinity of 10 roadway intersections where baseline traffic volumes were calculated in the traffic analysis.

The results of the microscale impact analysis are summarized in Table 20. The values in Table 20 must be added to any non-local background CO distribution. If one assumes that the maximum level measured near the El Toro and Jeronimo Roads intersection is the regional background, and that the worst-case, one-hour level of 6 ppm observed in 1995 occurs at the exact same hour as any worst-case project impact, then it would take a local contribution of 14 ppm to threaten the one-hour California CO standard of 20 ppm. Microscale hourly CO levels, both without and with the proposed project are forecast to be below the 14 ppm threshold. Combined CO concentrations will thus remain below the California 1-hour CO standard of 20 ppm, and far below the federal standard of 35 ppm.

Source: Screening Procedure based upon CALINE4 Model; Caltrans Air Quality Technical Analysis Notes (AQTAN), 1988.

Project-related CO contributions are seen in Table 20 to range from 0.0 to 1.9 ppm. The only increase exceeding 1 ppm occurs at El Toro Road and Ridgeline, where a change in level of service increases queuing times for all vehicles. The average increase at all intersections is 0.2 ppm compared to the most stringent standard of 20 ppm (1.0 percent average change). There are not now, nor will there be with the project, any microscale air pollution "hot spots" at any project area intersections.

Increased area-wide traffic and associated congestion is offset by continued improvements in vehicular CO emissions per average vehicle. Future (2020) CO levels with the proposed project and with anticipated intersection improvements are generally less than in 1997. At no intersection are 2020 "with project" levels greater than in 1997 by no more than 1.0 ppm. SCAQMD Rule 1303 identifies a CO increment of less than 5 percent of the hourly standard of 20 ppm, i.e., 1.0 ppm, to

be a de minimis increment requiring no further impact analysis. The findings of the microscale impact assessment are therefore that CO levels under theoretical worst-case conditions do not exceed clean air standards and the Saddleback meadows traffic will add an insignificant amount to the total CO exposure. Microscale impacts are less than significant.

4.5.4 SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the proposed project prior to the application of mitigation measures would result in significant impacts to short term dust (PM-10) generation, and operational emissions. Potentially significant impacts were identified during construction from dust (PM-10) generated by surface disturbance and from construction equipment operations. Operational emissions will be in excess of thresholds of significance for regionally significant pollutants as identified by the South Coast AQMD. As a minimum, vehicular emissions from project-related traffic should be identified as having a cumulatively significant air quality impact.

4.5.5 CUMULATIVE IMPACTS

Cumulative impacts are evaluated in Section 4.5.3 of this document. Regardless of any finding of individual impact significance, the proposed project would have an unavoidable adverse cumulative impact on air quality.

4.5.6 MITIGATION MEASURES

A number of mitigations, as related to the project, are already incorporated into rules, regulations or ordinances. They are included in the following list of mitigation measures in that compliance mitigates a potentially adverse impact. They are not discretionary measures, however, which a developer can implement or the County of Orange can additionally require since compliance is already assumed in the impact analysis.

Project Design Features

No air quality PDF's have been proposed.

Standard Conditions and Mitigation Measures

SC 5-1 Grading and excavation shall be halted during periods of high winds meeting the approval of the Manager, PDS/Subdivision and Grading Services Division. According to AQP Measure F-4, high winds are defined as 25 mph or greater. This level occurs only under unusually extreme conditions, such as Santa Ana wind conditions. Notations in the above format, included with other notations on the front sheet of grading plans, will be considered as adequate evidence of compliance with this condition.

SC 5-2 Prior to issuance of grading permits, the project applicant shall demonstrate measures to ensure compliance with SCAQMD Rule 403, and shall identify the dust

suppression measures, such as regular watering, which shall be implemented to reduce emissions during construction and grading in a manner meeting the approval of the Manager, PDS/Subdivision and Grading Services Division. This will help reduce the short-term impacts from particles which could result in nuisances that are prohibited by Rule 403.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provision of existing codes and regulations:

AM 5-3 As previously noted, no credit was taken for mobile source emissions reductions either from technology improvements (reformulated gasoline, alternative fuels and/or electric cars), nor from transportation behavior modification in response to programs such as South Coast AQMD Reg. XV or by the trip reduction programs. These programs will mitigate the identified significant growth-related cumulative air quality impact to some extent. Because the projected effectiveness of such programs and because the time frame for technology development is uncertain, the degree of possible mitigation can not be quantified with certainty. Similarly, the buildout date for Saddleback Meadows will depend on economic forces that can not be predicted. The following discussion structures the recommended mitigation as comprehensively as possible, but quantification of mitigation effectiveness is speculative at currently known levels of detail.

AM 5-4 Contractors will comply with SCAQMD Rule 403.

AM 5-5 Contractors will utilize measures to prevent dirt from being tracked, washed, blown or otherwise conveyed onto paved roadways, and will wash or sweep the construction access points at El Toro Road on a routine basis on a frequency specified by the County of Orange as well as whenever dirt is visible more than 50 feet from the access point independent of the routine clean-up schedule.

AM 5-6 Trucks hauling dirt on public roads to and from the site will be covered or will maintain a six inch differential between the maximum height of any hauled material and the top of the haul trailer. Haul truck drivers will water the load prior to leaving the site to prevent soil loss during transport.

AM 5-7 Construction management procedures required by the County of Orange and other jurisdictions shall be implemented. Contractor personnel responsible for supervision and the appropriate actions to be taken for the following measures shall be identified:

- Cessation of activities during a Stage-2 smog episode. Call 1-800-242-4022 for the daily forecast.

- Truck routes and schedules for receipt of materials shall be coordinated with County of Orange staff.

- Where feasible, on-road vehicles and off-road equipment shall be turned off and subsequently restarted if the anticipated duration of idling is expected to exceed five (5) minutes.

AM 5-8 Graded surfaces used for off-road parking, materials lay-down or awaiting future construction shall be stabilized for dust control as needed. Frequently accessed unpaved areas shall be paved as early as possible to minimize dirt trackout to public rights of way.

AM 5-9 Equipment will be maintained in proper tune to prevent visible soot from reducing light transmission through the exhaust stack exit by more than 20 percent for more than three (3) minutes per hour and use low-sulfur fuel as required by SCAQMD regulation.

Flag persons and appropriate traffic control devices will be used as needed to minimize construction activity interference with off-site traffic.

AM 5-11 Implementation of the above measures is expected to maintain construction activity air quality impacts at less than significant levels.

Operational Activities:

- Traffic flow at the project access will be maintained at acceptable levels of service through mitigation measures identified in the project traffic study.

- 220v electric power for future use to charge electric-powered vehicles will be made available in homeowner garages.

AM 5-12 Emissions calculations and the corresponding ambient air quality impact assessment for project-related construction and Saddleback Meadows operations presumed compliance with SCAQMD rules regarding dust control. The potential for additional emissions reduction beyond the mandatory requirements of existing rules and regulations was evaluated based on Appendix 11 of the SCAQMD Air Quality Handbook which quantifies reduction potential of a variety of project construction and operation emissions control measures.

Dust emissions can be controlled from their 50 percent control assumed for Rule 403 compliance by an additional 50-80 percent of the uncontrolled fraction. The net effective dust control level is therefore 75-90 percent.

Unless the entire project site is under simultaneous massive grading, attaining the optimum level of dust control will maintain dust impacts at less than significant levels.

Operational emissions reduction from mobile sources of 5 percent of their non-TCM implementation level can not reduce the substantial emission level to less than the SCAQMD advisory level significance thresholds. A number of secondary considerations were identified, however, that would either allow for a finding of an individually less than significant air quality impact.

4.5.7 UNAVOIDABLE ADVERSE IMPACTS

Implementation of the proposed project, in conjunction with the above outlined mitigation measures, would result in unavoidable adverse impacts to cumulative operational emissions.

4.6 NOISE

A Noise Impact Analysis has been conducted for the proposed project by Giroux & Associates, and is included in Appendix H of the DEIR.

4.6.1 EXISTING ENVIRONMENTAL SETTING

Sound is mechanical energy transmitted by pressure waves in a compressible medium such as air. Noise is generally described as unwanted sound. Sound is technically described in terms of the loudness (amplitude) of the sound and frequency (pitch) of the sound. The standard unit of measurement of the loudness of sound is the decibel (dB). Since the human ear is not equally sensitive to sound at all frequencies, a special frequency dependent rating scale has been devised to relate noise to human sensitivity. The A-weighted decibel scale (dBA) performs this compensation by discriminating against frequencies in a manner approximating the sensitivity of the human ear.

Several rating scales have been developed for the analysis of adverse effects of community noise on human beings. Based on these effects, the observation has been made that the potential for a noise to impact people is dependent on the total acoustical energy content of the noise. Upon this premise, a number of noise scales have been developed including the Equivalent Noise Level (LEQ) and the Community Noise Equivalent Level (CNEL).

LEQ is the sound level corresponding to a steady state sound level containing the same total energy as a time varying signal over a given sample period. LEQ is the "energy" average noise level. CNEL is similar to LEQ but is based on a 24 hour period, and applies a time-weighting factor that places greater significance on noise events occurring during the evening and night hours (when sleep disturbance is a concern). "Time-weighted" refers to the fact that noise occurring during certain sensitive time periods is penalized for occurring at these times. The evening period (7 p.m. to 10 p.m.) penalizes noises by 5 dB, while nighttime (10 p.m to 7 a.m.) noises are penalized by 10 dB. The CNEL scale is specified by the County of Orange for community noise analysis.

An interior CNEL of 45 dB(A) has been required by the State noise insulation standards (Title 24 of the California Code of Regulations) for all multiple family dwelling units and hotel/motel rooms since 1974. In 1988, the State Building Standards Commission expanded that standard to include all habitable rooms, including single family or low density residential uses. All development in close

proximity to automotive traffic, rail or industrial noise sources with baseline levels exceeding 60 dB CNEL must undergo an analysis to verify that the 45 dB interior standard is attainable.

Exterior to interior noise attenuation is typically 20 dB for all windows closed. A 65 dB CNEL exterior noise exposure thus generally allows the 45 dB CNEL interior standard to be met as long as windows can normally be closed to shut out the noise. A level of 65 dB is also the threshold where noise begins to intrude significantly into normal activities such as having a conversation. Although people may express annoyance if traffic noise levels in usable exterior space such as yards, patios, porches, etc. are below 65 dB, the percentage of "highly annoyed" people increases dramatically when noise exceeds 65 dB.

Noise/land use compatibility standards for various classes of land uses are generally expressed in the Noise Element of the General Plan to insure that noise exposure is considered in any development decisions. Local noise suitability criteria are based on state model guidelines shown in Exhibit 47.

Exhibit 47 contains four classes of acceptability and has a number of overlapping compatibility noise levels within several criteria. In order to reduce the potential ambiguity of various conditional acceptabilities, Orange County developed a more clear-cut matrix of acceptable noise levels shown in Table 21 and explained in Table 26.

Noise standards for residential projects are shown in Table 25:

Table 21
ORANGE COUNTY RESIDENTIAL NOISE STANDARDS

Exterior Level	Requirement
<60 dB CNEL	None
60-65 dB CNEL	Indoor Level <45 dB CNEL
>65 dB CNEL	Outdoor Level Mitigated to <65 dB CNEL Indoor Level <45 dB CNEL

Baseline Noise Levels

Existing noise levels on the project site are normally low except in close proximity to El Toro Road. Periods of quiet are interspersed with occasionally noisy periods of aircraft overflights. The project site also is near a flight corridor for military helicopter training operations in Santiago, Black Star and other interior canyons.

The project site is located near one of the primary landing/takeoff routes from El Toro MCAS. Aircraft above the site, however, are sufficiently high such that the noise exposure is only marginally degraded. Exhibit 48 shows that the site is traversed by the 60 dB CNEL contour, shown in the

Orange County Noise Element. The 60 dB contour just touches a small area in the southwestern corner of the project site. Almost all of the project site is outside the 60 dB CNEL contour. However, County policy relative to aircraft noise exposure is to use the highest exposure anywhere on the property as the noise reference level. At the property line adjacent to Valley Vista Way in an area of proposed open space, the maximum El Toro MCAS noise exposure is 62 dB CNEL. To be consistent with County policy, this level was thus used as an impact evaluation/mitigation criterion with the understanding that its use is over productive to varying degrees across the project site.

Aircraft fleet conversion since the element was adopted have slightly reduced the project site noise exposure. The project site is shown as being traversed by the 60 dB CNEL contour near the southwest corner of the property in the County Noise Element. Its current actual exposure is around 2 dB less with the 60 dB CNEL contour just off the project site. However, small differences (2 dB) are generally indistinguishable. Aircraft noise will thus be a project constraint as long as aviation operations continue at El Toro. Depending upon future site re-use, aircraft noise may or may not be an important issue.

Because aircraft noise contours are constructed based upon average annual operations, and because the contours represent extended periods of quiet with isolated noise peaks, CNEL is not necessarily the best indicator of noise nuisance potential. Individual fly-over events may thus be intrusive even if the CNEL is below levels considered unacceptable for noise-sensitive uses. Mitigation for single event intrusion has therefore been incorporated For this project in addition to complying with the uniforms building code adopted by the State of California and the practices of the Orange County Environmental Management Agency.

In order to characterize existing project site noise levels, a brief noise measurement program was undertaken on August 28, 1995. Noise levels were measured for 30-minute periods near El Toro Road, and again near the caretaker's trailer by the cattle corral. The observed levels (in dB) were as follows:

Table 22
EXISTING ONSITE NOISE LEVELS

Parameter	50' to El Toro Rd.	Cattle Corral [a]	Cattle Corral [b]
LEQ	67.8	62.4	48.0
Lmax	86.5	86.5	—
Lmin	38.0	39.0	—
L10	71.0	55.5	—
L50	59.5	46.0	—
L90	43.5	42.5	—

[a] - with helicopter overflights

[b] - without helicopter activity

The dramatic effect of just a few single loud noise events skewing the average is seen in the difference between periods of helicopter traffic versus flight-free periods. Without the helicopters, the site interior has a semi-rural noise character. With the flight activity, the average noise level, as expressed by LEQ, is only around 5 dB less than directly adjacent to El Toro Road. As noted above, average noise exposure alone is therefore not a completely sufficient criterion for evaluating possible impacts of the ambient acoustic environment on development plans for the project.

4.6.2 EFFECTS FOUND TO BE INSIGNIFICANT

The following noise effects were found to be less than significant as determined by the Initial Study/Environmental Assessment contained in Appendix C of this EIR. These factors are not evaluated in this EIR.

- None of the effects listed in the Initial Study are insignificant.

10 *Explanation and Definitions:*

1. *Allowed if interior and exterior community noise levels can be mitigated.*
2. *Allowed if interior levels can be mitigated.*
3. *New residential uses are prohibited in areas within the 65-decibel contour from any airport or air station; allowed in other areas if interior and exterior community noise levels can be mitigated. The prohibition against new residential development excludes limited "infill" development within an established neighborhood.*

Standards Required for Compatibility of Land Use and Noise

a. *Interior Standard. CNEL of less than 45-decibels (habitable rooms only)*
b. *Exterior Standard: CNEL of less than 65-decibels in outdoor living areas*
c. *Interior Standard: LEQ(h) = 45 to 65 decibels interior noise level, depending on interior use*

Typical Use	*LEQ(h)*
• *Private Office, Church Sanctuary, College, Preschool, Schools (Grade K-12), Board Room, Conference Room, etc.*	*45*
• *General Office, Reception, Clerical, etc.*	*50*
• *Schools (Grades K-12)*	*52*
• *Bank Lobby, Retail Store, Restaurant, Typing Pool, etc.*	*55*
• *Manufacturing, Kitchen, Warehousing, etc.*	*65*

d. *Exterior Standard: LEQ(h) of less than 65 decibels in outdoor living areas.*
e. *Interior Standard: As approved by the Board of Supervisors for sound events of short duration such as aircraft fly-overs or individual passing railroad trains.*

N

4.6.3 PROJECT IMPACTS

Three noise concerns are typically identified with land use intensification such as that proposed for the project area. Construction activities, especially heavy equipment, will create short-term noise increases near the project site. Upon completion, project-related traffic will cause an incremental increase in area-wide noise levels throughout the El Toro area. Since, however, the number of trips generated by this small housing project is limited, the impact of ambient noise on the project site, rather than project traffic noise impacts on the rest of the community, is the important noise environment concern.

Construction Noise Impacts

Temporary construction noise impacts will vary markedly because the noise strength of construction equipment ranges widely as a function of the equipment used and its activity level. Short-term construction noise impacts tend to occur in discrete phases dominated initially by site clearing and grading, then by foundation construction, and finally for finish construction. The earth-moving (grading) activities are anticipated to be the noisiest sources during construction with equipment noise ranging from 75 to 90 dB(A) at 50 feet from the source.

Spherically radiating point sources of noise emissions are atmospherically attenuated by a factor of 6 dB per doubling of distance. The quieter construction noise sources will, therefore, drop below 60 dB by about 300 feet from the source while the loudest sources might still be detectable above the local background beyond 1,000' from the construction area. With hilly topography in the project vicinity, the terrain shielding effects will limit the "noise envelope" around each construction site to considerably less than its theoretical maximum.

Construction noise sources are not strictly relatable to a noise standard because they occur only during selected times and the source strength varies sharply with time. The penalty associated with noise disturbance during quiet hours and the nuisance factor accompanying such disturbance usually leads to time limits on grading activities imposed as conditions on grading permits. The weekday (including Saturday) hours from 7 a.m. to 8 p.m. are the times allowed in the Orange County Noise Ordinance for construction or grading. Division 6 (Sec. 4-6-1, et seq.) of the County Code also contains standard requirements related to the distance separation between construction activities and any occupied dwellings. EMA's "Standard Condition for Approval" N10 requires:

1. All powered equipment operating within 1,000 feet of a dwelling must have a properly operating and maintained muffler.

2. Stockpiling and staging activities must be located as far as practicable from dwellings.

Construction activities in areas of noise-sensitive biotic habitats such as coastal sage scrub containing gnatcatchers may affect bird behavior. Little actual evidence of noise effects on gnatcatchers has been documented, but many wildlife management agencies believe such effects exist. In San Diego County, a standard of 60 dB Leq (one hour average) derived from studies on least Bells Vireo has been applied to gnatcatchers. Use of this standard ignores the fact that a large number of successful breeding pairs have been found directly under the take-off end of major airport runways or next to freeways where peak hourly noise levels reach almost 80 dB. Many San Diego County grading projects have nevertheless been conditioned to avoid the breeding season for possibly noise-sensitive birds, or to erect temporary berms or other buffers to reduce avian noise exposure if seasonal avoidance is not practical.

Development-Related Vehicular Noise Impacts

Long term noise concerns from the increased urbanization of the project area center primarily on mobile source emissions surrounding the project site. These concerns were addressed using the California specific vehicle noise curves (CALVENO) in the federal highway noise prediction model (FHWA-RD-77-108) in a computerized version of the model developed by Caltrans. The model calculates the Leq noise level for a particular reference set of input conditions, and then makes a series of adjustments for site-specific traffic volumes, distances, speeds, or noise barriers.

Project-related traffic may incrementally contribute to the noise exposure of off-site receiver locations. Of the 3780 daily project-generated trips, 75% will travel southwestward on El Toro Road, while the other 25% will turn right at El Toro Road to travel inland. At each subsequent turning opportunity, fractions of each traffic stream will split into different directions and thus dilute any off-site project traffic noise impact. The CNEL at 100 feet from area roadways for various scenarios is shown in Table 24.

As shown in Table 24, Valley Vista Way and Glenn Ranch Road would experience noise increases exceeding 2 dB noise level increases of 1 dB or greater are considered distinguishable. However, as shown in the Table 25, the 65 dB CNEL contour will remain within 50 feet of the roadway centerline when project traffic noise is superimposed upon existing noise levels. This offsets any degree of noise impact occurring on these roadways. It should also be noted that in areas of concentrated traffic, such as at the project area, the high noise levels already experienced will substantially mask most project noise contribution. The project is too limited in scope to create a discernible change in offsite traffic noise levels. Noise impact on the ambient acoustic environment is judged to be less than significant.

Source: FHWA-RD-77-108 (Calveno mod.)

The roadway that could affect project onsite noise exposure is El Toro Road. At the maximally exposed lot at around 400 feet from El Toro Road, the traffic noise level will be 63.5 dB CNEL at area buildout. Inclusion of a 60 dB CNEL aircraft contribution increases the noise exposure to 65.0 dB CNEL at the nearest property line This just meets the County exterior noise standards and requires no extensive noise mitigation. This calculation assumes a semi-infinite line of sight to El Toro Road. Terrain irregularities will reduce the actual noise exposure to well below the worst-case maximum. There, is, therefore, no required exterior noise mitigation because of adequate setback from El Toro Road.

Mitigation in the form of exterior to interior noise attenuation will be required to meet the 45 dB CNEL interior standard for all units within the development since a 62 dB CNEL aircraft noise contour will cover the site as long as El Toro MCAS operations occur. Meeting the interior standard requires the option to close the window. Such ability, in turn, requires that there is supplemental mechanical ventilation to replace the natural draft eliminated by such closure. For new homes in inland valleys of Orange County, air conditioning is normally a standard feature meeting this requirement.

Noise reduction of 20 dB is normally attainable with closed windows, which will reduce any aircraft-related CNEL from 62 to 42 dB. As previously noted, however, CNEL is not the best predictor of noise annoyance due to single event phenomena such as individual overflights. Measured peak noise levels from helicopter operations were 86.5 dB in the center of the project site. A comparable level would likely occur from El Toro jet aircraft operations. A 20 dB attenuation would create a 65+ dB single event level that may be annoying to occupants even with windows closed. Most new developments within the fringes of the El Toro noise impact envelope thus have been built with acoustically enhanced windows.

Use of windows rated with a sound transmission class (STC) of 25 or better is recommended to reduce noise annoyance potential from single events. Such windows reduce single event noise, reduce vibration response (rattle) to aircraft noise often found in single-pane windows and are more energy efficient.

Residential activities may affect adjacent noise-sensitive land uses such as contemplative religious facilities. These facilities are, however, already exposed to single event aircraft noise that is much louder than a distant barking dog, lawnmower or auto horn associated with project residential use. The combination of irregular terrain, distance buffering and normally quiet residential activities are not expected to create a significant noise impact on any adjacent abbey or monastery uses.

Impact Significance Criteria

According to CEQA guidelines, a significant noise impact is one that substantially increases the ambient noise levels for adjoining or nearby sensitive receptors. For purposes of community noise assessment, changes in noise levels of three dB or greater are typically identified as significant, while changes of less than one dB are not discernable. In the one dB to three dB range, residents sensitive to noise may perceive a slight change.

Transportation related noise standards have been established for noise sensitive land use areas (e.g., residences, schools, hospitals, churches, etc.) in the Orange County Noise Element. These standards are 65 dB CNEL for exterior noise sensitive areas and 45 dB CNEL for interior areas.

Thus, a noise impact will be considered potentially significant if the project results in a noise level increase of greater than three dB, and if that increase, or a lesser increase, causes the County noise standard of 65 dB CNEL to be exceeded.

A significant noise impact would occur if residential units are located within the MCAS El Toro 65 dB CNEL contour or higher.

4.6.4 SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the proposed project would result in short-term construction related impacts to adjacent land uses including: 1) St. Michael's Abbey; 2) Ramakrishna Monastery; 3) Hidden Hills planned community.

No onsite or offsite significant noise impacts would occur since 1) onsite residential lots would not be affected by 65 CNEL plus noise levels, 2) offsite roadway CNEL levels would not increase by more than 2 dB at 100 feet from the roadway centerline, and 3) the project site is outside of the MCAS 65 dB CNEL contour.

4.6.5 CUMULATIVE IMPACTS

Cumulative noise impacts are evaluated in Section 4.6.3 of the EIR.

4.6.6 MITIGATION MEASURES

Project Design Features

No PDF mitigation measures are proposed.

Standard County Conditions and Mitigation Measures

SC 6-1 All residential lots and dwellings shall be sound attenuated against present and projected noise which shall be the sum of all noise impacting the project so as not to exceed a composite interior standard of 45 dBA CNEL all habitable rooms and a source specific exterior standard of 65 DBA CNEL in outdoor living areas. Evidence prepared by a County-certified acoustical consultant, that these standards will be satisfied in a manner consistent with Zoning Code Section 7-9-137.5, shall be submitted as follows:

a. Prior to the issuance of grading permits, as determined by the Manager, PDS/ Building Permit Services Division, the applicant shall submit an acoustical analysis report to the Manager, PDS/Building Permits Services Division, for approval. The report shall describe in detail the exterior noise environment and preliminary mitigation measures. Acoustical design features to achieve interior noise standards may be included in the report, in which case it may also satisfy "B" below.

b. Prior to the issuance of any building permits for residential construction, the applicant shall submit an acoustical analysis report describing the acoustical design features of the structures required to satisfy the exterior and interior noise standards to the Manager, PDS/Building Permits Services Division, for approval along with satisfactory evidenced which indicates that the sound attenuation measures specified in the approved acoustical report have been incorporated into the design of the project.

c. Prior to the issuance of any building permits, the applicant shall show all freestanding acoustical barriers on the project's plot plan illustrating height, location and construction in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 6-2 Prior to the issuance of grading permits, as determined by the Manager, PDS/Building Permits Services Division, an acoustical analysis report shall be submitted to the Manager, PDS/Building Permits Services Division, for approval. The report shall describe in detail the exterior noise environment and preliminary mitigation measures. Acoustical design features to achieve interior noise standards may be included in the report in which case it may also satisfy SC 6-3 below.

SC 6-3 Prior to the issuance of any building permits for residential construction, an acoustical analysis report describing the acoustical design features of the structures required to satisfy the exterior and interior noise standards shall be submitted for review and approval to the Manager, PDS/Building Permits Services Division, along with satisfactory evidence which indicates that the sound attenuation measures specified in the approved acoustical report have been incorporated into the design of the project.

SC 6-4 Prior to the issuance of any building permits, all freestanding acoustical barriers must be shown on the project's plot plan illustrating height, location and construction in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 6-5 Prior to the issuance of any certificates of use and occupancy, the developer shall produce evidence acceptable to the Manager, PDS/Building Inspection Services Division, that information stating this property is subject to the overflight, sight, and sound of aircraft operating from (El Toro Marine Corps Air Station) has been provided to the Department of Real Estate of the State of California for inclusion into the Final Subdivision Public Report.

SC 6-6 Prior to the issuance of any certificates of use and occupancy, the applicant shall post aircraft noise impact notification signs in all sales offices associated with new residential development located within an aircraft 63 dB CNEL contour. The number and location of said signs shall be as approved by the Manager, PDS/Building Permits Services Division.

SC 6-7 Prior to the issuance of any building permit, an aviation easement over this property shall be offered for dedication to the County of Orange in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

SC 6-8 Prior to the sale, lease or rental of any structure or portion thereof, the applicant/owner shall provide to each prospective purchaser, lessee, or tenant a notice and statement of acknowledgment that the property is subject to overflight, sight, and sound of aircraft operating from (El Toro Marine Corps Air Station). The form and method of distribution of said notice and statement of acknowledgment shall be as approved by the Manager, PDS/Building Permits Services Division.

A. Prior to the issuance of any grading permits, the proponent shall produce evidence acceptable to the Manager, Building Permit, that:

(1) all construction vehicles or equipment, fixed or mobile, operated within 1000 feet of a dwelling shall be equipped with properly operating and maintained mufflers.
(2) All operations shall comply with Orange County "Codified Ordinance Division 6 (Noise Control); and
(3) Stockpiling and/or vehicle staging areas shall be located as far as practicable from dwellings.

B. Notations in the above format, appropriately numbered and included with other notations on the front sheet of grading plans, will be considered as adequate evidence of compliance with this requirement.

SC 6-9 Prior to issuance of any grading permits, the project proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division that excavation, grading and other construction-related activities shall be restricted to daytime hours as promulgated in the County's Codified Ordinance Division 6 (Noise Control).

SC 6-10 Prior to issuance of any grading permits, the project proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division that all construction equipment, stationary or mobile, shall be equipped with properly operating and maintained mufflers.

SC 6-11 Prior to the issuance of any grading permits, the project proponent shall produce evidence acceptable to the Manager, PDS/Building Permits Services Division, that:

a) All construction vehicles or equipment, fixed or mobile, operated within 1,000-feet of a dwelling shall be equipped with properly operating and

maintained mufflers.

b) All operations shall comply with Orange County Codified Ordinance Division 6 (Noise Control).

c) Stockpiling and/or vehicle staging areas shall be located as far as practicable from dwellings.

Notations in the above format, appropriately identified and included with other notations on the front sheet of grading plans, will be considered as adequate evidence of compliance with this condition.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations, in manner meeting approval of the Manager, PDS/Building Permits Services Division.

AM 6-12 Prior to the issuance of building permits, all operative windows exceeding 6 sq.ft. of glazing shall be rated SR=25 or greater.

4.6.7 UNAVOIDABLE ADVERSE IMPACTS

Implementation of the proposed project in conjunction with proposed mitigation measures would not result in any unavoidable adverse short term, operational or aircraft overflight impacts.

4.7 BIOLOGICAL RESOURCES

This section is based on the most recent biological assessments conducted for the project site by Sweetwater Environmental Biologists (SEB) in March, 1997 and December, 1995 and other previous studies conducted by SEB in August, 1995 and 1994 and Pacific Southwest Biological Services (PSBS) in 1989, 1993 and 1994. These studies can be found in their entirety in Appendix I of Draft EIR No. 561. In addition, an Oak Tree Inventory is included in Appendix K of this EIR and a Pond Mitigation Plan in Appendix K of Draft EIR No. 561.

4.7.1 EXISTING ENVIRONMENTAL SETTING

Prior to evaluating the onsite biological resources, a literature search was conducted to determine sensitive species which may potentially occur onsite. This included an evaluation of information from the Natural Diversity Data Base (NDDB) maintained by the California Department of Fish and Game (CDFG) and review of previous biological reports completed for the project site (PSBS 1993;1994).

A total of eight previous surveys for wildlife were completed by PSBS, including surveys for the coastal California gnatcatcher, including two general wildlife surveys in 1989, a general wildlife survey (which included a gnatcatcher survey) and two gnatcatcher surveys in 1993, and three gnatcatcher surveys in 1994. The 1993 and 1994 surveys for gnatcatchers satisfied U.S. Fish and Wildlife Service (USFWS) protocol for presence/absence surveys for the preparation of DEIR 561, and the overall wildlife data appear adequate for assessing the general presence and distribution of the various groups of vertebrates on the project site. Current (May 1997) USFWS survey protocol for determining the presence/absence of gnatcatchers requires seven in-season or nine out-of-season field surveys, conducted at one week intervals. These surveys have not been completed for the currently proposed project, and as required by the USFWS, the onsite coastal sage scrub habitat must be considered occupied by the coastal California gnatcatchers until proven otherwise The PSBS surveys had limitations in coverage, most of which were identified in their 1994 report when they stated that for detection of certain species (i.e., nocturnal, underground-living, or seasonal species) certain focused surveys would be required. Taped vocalizations of the coastal California gnatcatcher were played in all of the coastal sage scrub habitats onsite. Field investigators spent more than one hour per 25 acres of habitat during the surveys. This is consistent with the Natural Community Conservation Program (NCCP) Scientific Review Panel Guidelines (SRP 1992) for gnatcatcher presence/absence surveys.

A site visit to assess the potential onsite wildlife movement corridors was made on October 12, 1994. This survey was conducted on foot, with the majority of the time spent in areas with native vegetation. On June 1994, PSBS documented the presence of Riverside fairy shrimp and the potential for additional fairy shrimp in all onsite ponds. In April 1996, a survey for the western spadefoot toad was conducted in all the onsite ponds by SEB.

Vegetation mapping and sensitive plan surveys were conducted in June and July 1995. Vegetation was mapped using an aerial photograph and then transferred to the same scale topographic map. Botanical survey emphasis was placed on those species that have the potential to occur the habitats onsite.

A wetland delineation was completed for the project site in August 1995 in accordance with the 1987 U.S. Army Corps of Engineers (ACOE) Wetlands Delineation Manual (Environmental Laboratory 1987).

Vegetation Communities

Five types of native vegetation occur on the project site: Venturan-Diegan transitional coastal sage scrub, coast live oak woodland, southern sycamore riparian woodland, mulefat scrub, and southern mixed chaparral (onsite vegetation is shown in Exhibit 50). Portions of the venturan-diegan coastal sage scrub are disturbed. Annual grassland, agricultural land, and ephemeral ponds also occur on the site. The ephemeral ponds onsite are not vernal pools, but rather are holding ponds for watering cattle which graze on the site.

Table 26
ONSITE VEGETATION

Vegetation Community	Acreage
Venturan-Diegan Transitional Coastal Sage Scrub	64.8
Disturbed Venturan-Diegan Transitional Coastal Sage Scrub	2.3
Coast Live Oak Woodland	14.5
Southern Sycamore Riparian Woodland	0.5
Mulefat Scrub	2.9
Southern Mixed Chaparral	5.4
Annual Grassland	125.3
Agriculture	4.6
Ephemeral Ponds	0.8
Disturbed	1.1
Total	**222.2**

A total of 110 plant species, 73 (66 percent) of which are native, were observed during surveys. The presence of 39 non-native plant species on the project site reiterates the disturbed nature of most of the site. A common plant species in much of the site is the cardoon, an artichoke-like plant that grows in areas where soils, especially clay soils, have been highly disturbed and compacted. This aggressive plant species often dominates areas that have been heavily grazed. The undisturbed native vegetation communities onsite support a typical diversity of plant species common to central, cismontance Orange County.

Venturan-Diegan Transition Coastal Sage Scrub

Coastal sage scrub is a general habitat found in coastal areas of California from the San Francisco Bay Area to the Mexican border. The coastal sage scrub community is composed of low stature, drought-deciduous shrubs.

Four floristic associations are recognized within coastal sage scrub plant formation and these occur in distinct geographical areas along the California coast with the Diegan association occupying an area from Orange County to northwestern coastal Baja California, Mexico (O'Leary 1990). The Venturan association occupies an area from San Luis Obispo County to Orange County. Venturan-Diegan transitional coastal sage scrub is found throughout Orange County and is a transitional scrub community between two floristic associations of coastal sage scrub, Venturan and Diegan. Approximately 67.1 acres of this plant community occur onsite, 2.3 acres of which is currently disturbed.

N

Vegetation Communities / Sensitive Resources

EXHIBIT No. 50

Typical plants found within the onsite coastal sage scrub community include California sage brush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), laurel sumac (*Malosma laurina*), black sage (*Salvia mellifera*), and coastal prickly-pear (*Opuntia littoralis*). Disturbed portions of coastal sage scrub (2.3 acres) have a higher component of annual grasses and noticeably less shrub cover than undisturbed coastal sage scrub areas. Much of the coastal sage scrub onsite is unconnected and subject to continued degradation because of the cattle grazing.

Coastal sage scrub is the primary habitat of concern associated with the development of the Natural Communities Conservation Planning Program, currently being prepared.

Coast Live Oak Woodland

Coast live oak woodlands occur in the outer portion of the central California coastal mountain ranges and extend south into Baja California, Mexico occurring between 500 and 4,500 feet in elevation. In Orange County, this community is found mainly along the foothills of moderate, north-facing slopes and shaded ravines. The structure of this woodland typically consists of a canopy which reaches a height of 12 to 70 feet, incompletely closed, with an understory herbaceous layer approaching 80 percent cover. Approximately 14 5 acres of coast live oak woodland occur onsite, restricted to the central and northeastern quadrant of the site. A total of 298 coast live oak (*Quercus agrifolia*) and two scrub oak (*Quercus dumosa*) trees with calipers greater than 8-inches, are located onsite. Specific characteristics of each tree are evaluated in the Oak Tree Inventory contained in Appendix K of this EIR.

On the project site, the coast live oak woodland has a fairly open canopy and is dominated by coast live oak (*Quercus agrifolia*). Areas within small drainages or swales (central portion of the site) have the most dense canopy. The understory is, for the most part, dominated by annual grassland and has been heavily grazed, making the woodland of an overall moderate quality.

Southern Sycamore Riparian Woodland

Southern sycamore riparian woodland is composed of tall, open, broad-leaved, winter-deciduous trees that require water near the soil surface. Western sycamore (*Platanus racemosa*) is the dominant species forming an open, medium height woodland. Associated understory species include mulefat (*Baccharis salicifolia*), Mexican elderberry (*Sambucus mexicana*), and poison oak (*Toxicodendron diversilobum*). This habitat occurs along very rocky streambeds subject to seasonally high-intensity flooding (Holland 1986) and occurs along large intermittent streams in Orange County. An estimated 0.5 acres of this habitat occur onsite, along Aliso Creek near El Toro Road on the western boundary of the site.

Mulefat Scrub

Mulefat scrub is a depauperate, tall, herbaceous, riparian scrub community that often occurs along intermittent stream channels but is also found around ponds or other wet areas. This early seral community thrives in areas that are subject to flooding and other disturbances; the absence of which could lead to a riparian woodland or forest (Holland 1986). On the Saddleback Meadows site, mulefat scrub occurs around the ephemeral pond habitat and in areas where there is not enough water to support riparian tree species. Approximately 2.9 acres of mulefat scrub occur onsite.

Southern Mixed Chaparral

Southern mixed chaparral is composed of broad-leaved sclerophyllous shrubs that grow to about 6 to 10 feet tall and form dense often nearly impenetrable stands. The plants of this association are typically deep-rooted. Some of the dominant species of this community include lemonadeberry (*Rhus integrifolia*), toyon (*Heteromoles arbutifolia*), chamise (*Adenostoma fasciulatum*), and mission manzanita (*Xylococcus bicolor*). Southern mixed chaparral occurs on canyon slopes in the extreme northeast and southeast quadrants of the site. Approximately 5.4 acres of southern mixed chaparral occur onsite.

Annual Grassland

Annual grassland is a dense to sparse cover of mostly non-native grasses, often associated with numerous species of showy-flowered, native, annual forbs. This association occurs on gradual slopes with deep, fine-textured soils. Characteristic species include cardoon (*Cynara cardunculus*), oats (*Avena* sp.), red brome (*Bromus madritensis* ssp. *rubens*), ripgut (*B. diandrus*) and mustard (*Brassica* spp.). Most of the biomass within non-native grassland originated from the Mediterranean region, an area with a long history of agriculture and a climate similar to California. In conjunction with agriculture and grazing in California, many of these plants were imported. Approximately 125.3 acres of annual grassland occur throughout the site. Annual grassland is in every quadrant of the site, but the most dense coverage is on the less steeply sloped portions of the western half of the site.

Agriculture

Approximately 4.6 acres onsite consists of olive trees planted for agricultural purposes. These trees are found in the central portion on the site.

Ephemeral Ponds

All of the ephemeral ponds were artificially created a number of years ago to provide water for cattle. Some earthen dams are partially breached causing the ponds to shrink in size. Others are deteriorating and could soon breach. Winter storms have also taken their toll. Existing use of the ponds by cattle severely impact vegetation and water quality. The ponds were found to support Riverside fairy shrimp (*Streptocephalus wootoni*) a federally listed endangered species. Eight ponds, totaling 0.8 acre in size, occur on the site.

None of the plant species observed in the ephemeral ponds are primarily or typically found in vernal pools in southern California. Several species observed onsite can occur in vernal pools but typically occur elsewhere. These species include salt-grass (*Distichlis spicata*) and curly dock (*Rumex xrispus*). Salt-Grass is a species typically found in salt marshes, and moist, alkaline areas. Curly dock is a species typically found in disturbed places. The typical habitats of the plant species observed in or near the ponds include fresh or salt water marsh, riparian, moist places, and disturbed areas. Furthermore, spring surveys conducted in 1995 did not detect any vernal pool species on the site.

Based on the absence of vernal pool indicator species and the presence of species typically found in other wetland or disturbed habitats, the vegetation of the ephemeral ponds is considered atypical of vernal pools. This finding is consistent with observing vernal pool species which may occur in standing water and the drying pool beds.

The physical setting of these ponds also differs from most other southern California vernal pools (Zedler 1987). Vernal pools typically occur on relatively flat mesas, situated in low lying areas between mounds. This contrasts sharply with the lay of the land at Saddleback Meadows where few areas of the property are flat. Furthermore, the ponds do not occur in the few flat areas that do exist. They occur primarily in drainages which have been dammed. The disturbance associated with their formation and ongoing disturbance from cattle grazing are probably responsible for the low species diversity and high percentage of weed species. Based on vegetation, species composition, and physical setting, it is reasonable to conclude that the onsite ponds are not vernal pools.

Disturbed

A portion of the site is considered disturbed, which includes roads and other paved areas.

Animals

A total of 63 animal species were observed during the surveys. The animal species observed represent a somewhat lower diversity than is usually observed in the western foothill region of the Santa Ana Mountains, probably due to the disturbed nature of the site and the presence of cattle and man.

Invertebrates

Both the native and non-native plant communities onsite probably play host to a wide variety of invertebrate species, especially insects. Invertebrates are important features of an ecosystem because of their role in food chains and as decomposers. Specific surveys for invertebrates focused on the presence of Riverside fairy shrimp, which was known to occur onsite. Hundreds of additional invertebrates are expected to use the site.

Amphibians

No amphibians were observed during the surveys of the site. At least two species, the black-bellied salamander (*Batrachoseps nigriventris*) and California slender salamander (*Batrachoseps attenuatus*), are expected to occur. The disturbed conditions that exist throughout most of the site have likely restricted these species to the steeper slopes where vegetative coverage is most dense.

Reptiles

Four reptiles--the western fence lizard (*Sceloporus occidentalis*), coastal whiptail (*Cnemidophorus tigris multiscutatus*), orangethroat whiptail (*Cnemidophorus hyperythrus beldingi*), and side-blotched lizard (*Uta stanisburiana*) were observed onsite. Although the site has many disturbed areas, much reptile habitat still occurs throughout the site. Additional lizards and snakes would be expected, especially in the undisturbed portions of coastal sage scrub on the steeper slopes.

Birds

Bird species were most abundant and conspicuous during the surveys and undoubtedly exhibit the highest vertebrate diversity. Most of the birds were observed within the coastal sage scrub, southern mixed chaparral, and coast live oak woodland habitats onsite. A few of the resident birds which were most abundant onsite include California quail (*Calipepla californica*), Anna's hummingbird (*Calypte anna*), mourning dove (*Zenaida macroura*), California towhee (*Pipilo crissalis*), house finch

(*Carpodacus mexicanus*), and lesser goldfinch (*Carduelis psaltria*). Other bird species were observed foraging on the site but probably reside elsewhere including cliff swallow (*Hirundo pyrrhonota*), northern rough-winged swallows (*Stelgidopteryx serripennis*), red-tailed hawks (*Buteo jamaicensis*), and American kestrels (*Falco sparverius*). The barn owl (*Tyto alba*) was observed nesting in the coast live oak woodlands possibly as recently as 1989.

Mammals

Eight mammals were detected onsite including the California ground squirrel (*Spermophilus beecheyi*), desert cottontail (*Sylvilagus audubonii*), woodrat (*Neotoma* spp.), coyote (*Canis latrans*), bobcat (*Lynx rufus*), gray fox (*Urocyon cineroargenteus*), mule deer (*Odocoileus hemionus*), and domestic cattle. Several rodents and additional medium-sized mammals are expected to use the site as well. Some expected species include the Virginia opossum (*Didelphus virginiana*), striped skunk (*Mephitis mephitis*), and deer mouse (*Peromyscus maniculatus*). Many of the species which may occur were not observed during the diurnal surveys because they are nocturnal.

Natural Communities Conservation Planning (NCCP) Program

The NCCP program's goal is to permanently safeguard dozens of California's native plants and animals, and the land and water on which they depend, in reserves and open spaces, while also accommodating needed economic activity. The protected areas in Southern California are being designed pursuant to long-term conservation plans created under the program. They will provide both long-term protection for habitat and increased certainty in the land-use planning process for holders of private property within the range of the program.

The coastal sage scrub habitat, the first area in which the NCCP program has been implemented, is home to the California gnatcatcher and approximately 90 other potentially threatened or endangered species. This much-fragmented habitat is scattered over more than 6,000 square miles and encompasses large parts of Orange, San Diego, and Riverside counties, and smaller portions of Los Angeles and San Bernardino counties. Fifty-nine local government jurisdictions, scores of landowners from across these counties, other private interests, federal wildlife authorities, and the environmental community are actively participating in the program.

As conceived, the NCCP program differs fundamentally from the California and federal Endangered Species Acts (ESA). These laws are designed to identify and protect individual species whose numbers have declined in number significantly. By contrast, the primary objective of the NCCP program is to conserve natural communities before their constituent species have declined to the point

that protection under the ESAs is necessary and to accommodate compatible land use. The State seeks to anticipate and prevent the controversies and conflicts in Southern California caused when species are listed by focusing on the long-term stability of wildlife and plant communities and by making the stakeholders in these issues voluntary and fully cooperative partners in the planning process.

In Orange County, two conservation planning study areas comprise a total of approximately 340,000 acres and involve over a dozen cities and five major landowners. The southern subregional NCCP Plan (within which this project is located) is in the planning process. The central subregional plan has been approved and is operational. The two plans envision two reserves totaling 39,000-40,000 acres each and covering several habitat types and as many as 25 species. Both of these subregions have large areas of undeveloped coastal sage scrub habitat.

NCCP Program Goals

The NCCP program builds on, supplements, and improves conventional administration of the existing species protection laws. Whereas the ESA represent efforts at "critical care," NCCP is a preventative approach to conservation.

The NCCP program is designed to:

- Safeguard prime habitat for wildlife while allowing for compatible development. This is achieved when localities, landowners, and others work cooperatively to develop an NCCP that covers an entire region or area. Once approved, an NCCP will provide both guidance and certainty regarding habitat preservation and land use for many decades.

- Protect and preserve the rich biological diversity of an entire habitat.

- Enable compatible economic growth to proceed both during and after habitat planning.

- Conserve wildlife habitat within approved NCCP areas in an amount and configuration that will provide for listed species, minimize or preclude the need to list additional species under the State and federal laws, or eliminate any additional restrictions if additional species are listed later.

- Facilitate recovery efforts by encouraging conservation for multiple species, not merely separate habitat conservation plans for individual listed species under the federal ESA, and

eliminate the need for separate recovery plans.

- Create certainty regarding biological issues for private landowners as they seek changes in land use for their property in exchange for adherence to long-term conservation commitments.

- Maximize local control in habitat conservation and encourage local governments to fully integrate conservation planning and impacts to biological resources into decision-making on land-use issues and mitigation requirements.

- Encourage sufficient funding at all levels of government for habitat conservation and multi-species planning.

- Reduce state, federal and local redundancy in wildlife management pursuant to the State and federal ESA and the NCCP Act.

- Incorporate into law and State wildlife management the advances in conservation biology, landscape ecology, and biogeography that have been made in recent years.

The southern subregion is summarized as follows:

Southern NCCP

Total acreage in planning process:	131,000 acres
Coastal sage scrub acreage:	26,500 acres
Estimated css that will go into preserves:	18,000 acres
Habitat acres in planning areas:	95,000 acres
Habitat acres in proposed preserves:	40,000 acres
Jurisdictions included: County, 3 utilities and 3 private landowners	
Habitats covered:	12
Number of species covered:	25

It is anticipated that the 131,000-acre plan will include 65% of the coastal sage scrub and approximately 75% of the areas in which gnatcatcher and cactus wren sightings have occurred in the subregion. The plan will cover approximately 25 species. Local participants are focusing their efforts to identify external preserve linkages and corridors where proposed development is anticipated. The subregion will incorporate public lands of the Cleveland National Forest.

The Natural Communities Conservation Planning Program (NCCP) was initiated by the State of California under the special Section 4(d) Rule of the federal Endangered Species Act (ESA). This pilot program focuses on conserving coastal sage scrub in order to avoid the need for future federal and state listing of coastal sage scrub dependent species. The coastal California gnatcatcher (*Polioptila californica californica*) is presently listed as threatened under the federal ESA, although not found onsite, while several additional species inhabiting coastal sage scrub are candidates for federal listing.

Orange County's Southern Subregional NCCP is currently in preparation and is expected to be completed in late 1997 or early 1998. Six possible design alternatives for the southern subregional preserve are currently under consideration. The central subregional NCCP has been approved. The project site occupies a linkage area between the Central and Southern NCCP Subregional preserves, where a wildlife corridor is needed. Projects surrounding the site received approval prior to the NCCP process, reducing the flexibility of open space strategy in the area. The proposed southern subregional NCCP planning area is shown in Exhibit 51.

Wildlife Movement

Orange County is developing its NCCP preserve system for maintaining a viable coastal ecosystem. Open space configuration in the vicinity of the project site is a key planning element for an effective wildlife corridor between the planned Central and Southern Regional NCCP preserve areas. However, the project site, because of the topography, the disturbed nature of the site, and existing open space and development patterns in the project vicinity, would not serve to entirely fulfill wildlife corridor needs in the area. Existing FTSP designated corridors are shown in Exhibit 52.

N

Sensitive Resources

The following is a description of sensitive biological resources found on the project site. These resources represent different levels of constraints for the project's implementation.

Habitats

Venturan-Diegan Transitional Coastal Sage Scrub

Coastal sage scrub is considered a sensitive habitat because it supports a number of state and federally listed endangered, threatened, and rare vascular plants as well as several reptile, bird, and mammal species that are federally listed or are candidate species for federal listing. Loss estimates for coastal sage scrub habitat in California range from 36 to 85 percent, but since these estimates were made in 1979 to 1981, additional losses have since occurred (O'Leary 1990). The primary cause for the loss of coastal sage scrub within California has been habitat conversion to agriculture and urban development.

The California NCCP has established an Evaluation Logic Flow Chart for determining the potential value for long-term conservation of coastal sage scrub. According to this flowchart, the coastal sage scrub on the project site is considered to have intermediate value for long-term conservation because it is not the densest coastal sage scrub in the subregion, but is close to a higher value district (O'Neill, Whiting Ranch Regional parks and Cleveland National Forest). The fragmented nature of much of the coastal sage scrub onsite makes it low quality. The highest quality coastal sage scrub occurs on the steep slopes that connect with O'Neill Regional Park in the southeast quadrant of the site. This area supports the highest native plant component and the highest diversity of animal species.

Coast Live Oak Woodland

Coast live oak (*Quercus agrifolia*) woodland and individual oaks are protected by the tenets of CEQA because of their scarcity, wildlife values, and ability to provide watershed protection. The major factors contributing to the decline of oak woodlands in southern California include livestock grazing, recreational use, and urban and rural development. The coast live oak woodland onsite is of moderate quality because of the extensive grazing which has eliminated the natural understory.

A total of 298 coast live oak trees and two large scrub oaks (*Quercus dumosa*) are located on the project site. Specific characteristics of each tree are categorized in the Biological Resources Assessment in Appendix H of this EIR.

Southern Sycamore Riparian Woodland

Southern sycamore riparian woodland is considered sensitive because it is a riparian habitat. Riparian habitats serve as movement corridors, water sources, shelter/shaded areas, and the unique microclimate supports a variety of wildlife at all taxonomic levels. Many bird, fish, and amphibian species are completely restricted to riparian habitats and are dependent on them for breeding. Amphibians, reptiles, birds, and mammals also move back and forth across riparian habitats into adjacent upland or wetland habitats. Riparian systems are intimately linked with adjacent upland areas, and many species that are restricted to riparian habitats for breeding use upland areas surrounding riparian habitats for foraging. In addition, several insect and plant species are restricted to riparian habitats.

Ephemeral Ponds

Although this community by itself is not considered sensitive, it is recognized as sensitive in this case because it supports the Riverside fairy shrimp, a federal endangered species.

Wetlands and Waters of the United States

Wetlands and Waters of the United States are regulated by the State of California and the U.S. Army Corps of Engineers. Onsite, Waters of the United States occur in ephemeral pond habitat and intermittent streams that cross several areas of the site. Wetland habitat is associated with southern sycamore riparian woodland and mulefat scrub. Jurisdictional Wetlands and Waters of the United States are shown in Exhibit 53.

Sensitive Plants

Two sensitive plants, Catalina mariposa lily (*Calochortus catalinae*) and intermediate mariposa lily (*Calochortus weedii* var. *intermedius*), were detected onsite.

Catalina mariposa lily

Listing: USFWS: None; CDFG: None; CNPS: List 4, 1-2-3

Distribution: This species is distributed in all coastal counties from Santa Cruz County to San Diego, except Monterey County.

Habitat(s): The Catalina mariposa lily grows on heavy soils, usually in open grassland or scrubland.

Conservation Status: This lily is uncommon throughout its range. The main threat is development. The Catalina mariposa lily blooms from February through May (Skinner and Pavlik 1994).

Status Onsite: Eight stands were detected onsite (435 individuals), six of which (428 individuals) were in coastal sage scrub along the southern boundary of the site. The two additional stands (seven individuals) were in coastal sage scrub patches in the northeastern quadrant of the site.

Intermediate mariposa lily

Listing: USFWS: Category 2; CDFG: None; CNPS: List 1B, 2-2-3

Distribution: This mariposa lily has only been recorded from Los Angeles, Orange, and Riverside counties.

Habitat(s): Dry, rocky slopes are the habitat of this species.

Conservation Status: The main threats are development, fuel modification, and road construction. The intermediate mariposa lily blooms from May through July (Skinner and Pavlik 1994).

Status Onsite: Three stand were detected onsite, totaling 18 individuals. Two stands are in the southwest quadrant of the site, while the remaining stand is in the southeast quadrant.

Since the surveys had adequate coverage to detect potentially occurring sensitive plant species, no additional plant species are expected to occur onsite. The plants which were determined originally to have a potential to occur onsite included Palmer's grappling-hook (*Harpogonella palmeri*), many-stemmed dudleya (*Dudleya multicaulus*), and prostrate spineflower (*Chorizanthe procumbens*).

EXHIBIT No. 53

Sensitive Animals

Eight sensitive animals were observed during the most recent (1993/1994) site surveys. Riverside fairy shrimp, western spadefoot toad, coastal whiptail, orangethroat whiptail, Cooper's hawk (*Accipiter cooperii*), coastal cactus wren (*Campylorhynchus brunneicapillus*), loggerhead shrike (*Lanius ludovicianus*) and southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*). No coastal California gnatcatchers were observed onsite during the 1993/1994 surveys. Current 1997 surveys for the coastal California gnatchatcher have not been conducted to USFWS protocol, and as such, onsite coastal sage scrub habitat must be considered occupied by gnatcatchers until proven otherwise.

Riverside fairy shrimp

Listing: USFWS Endangered

Distribution: Extremely limited distribution in Riverside, Orange, and San Diego counties; and northern Baja California, Mexico. In Riverside County, known only from five vernal pools, in San Diego County, known only from two vernal pool complexes.

Habitat(s): Vernal and ephemeral pool habitats that are relatively deep and have low values for alkalinity and chloride presence. The Riverside fairy shrimp is considered a warm water species of fairy shrimp, and it hatches at water temperatures of 15 to 17°C.

Status Onsite: Six of the ponds and two recently dried ponds (their dams have been breached) have evidence of Riverside fairy shrimp. These locations represent a significant expansion of the shrimp's typical habitat range.

Western Spadefoot toad

Status: USFWS Regionally sensitive

Distribution: California Central Valley and San Francisco Bay area south along the coast to northwestern Baja California, Mexico.

Habitat: Mesa tops, valleys, low hills, floodplains, and washes. Southern California habitats include coastal sage scrub, chaparral, and grassland. Important habitat components include temporary pools (which form during winter and spring rains) for breeding and friable soils for burrowing.

Status Onsite: During focused surveys, western spadefoot tadpoles were observed in two of the ephemeral ponds onsite.

Coastal whiptail

Status: USFWS Regionally sensitive

Distribution: Ventura County south, in cismontane California, to south-central Baja California, Mexico.

Habitat(s): Open Venturan-Diegan transitional coastal sage scrub, grasslands, chaparral, and woodlands. Frequently found along the edges of dirt roads traversing habitat. Important habitat components include open, sunny areas for basking, plant litter, and an abundance of invertebrate prey, particularly termites.
Status Onsite: One was observed.

Orangethroat whiptail
Status: USFWS Regionally sensitive; CDFG CSC
Distribution: Southern Orange County and southern San Bernardino County (Colton), south to the cape of Baja California, Mexico.
Habitat: Venturan-Diegan transitional coastal sage scrub, chaparral, edges of riparian woodlands, and washes. Also found in weedy, disturbed areas adjacent to these habitats. Important habitat requirements include a mosaic of open, sunny areas and shade for thermoregulation, and an abundant invertebrate prey base, particularly termites.
Status Onsite: Two individuals were observed on a slope in the southeast quadrant of the site, adjacent to O'Neill Regional park.

Cooper's Hawk
Status: Nesting; CDFG CSC
Distribution: Throughout the continental United States excluding Alaska, parts of Montana, and parts of the Dakotas. Winters south to Mexico and Honduras.
Habitat: In San Diego County tends to inhabit lowland riparian areas and oak woodlands in proximity to suitable foraging areas such as scrublands or fields.
Status Onsite: One individual was observed hunting in grassland on the northern half of the site.

Coastal cactus wren
Status: USFWS Regionally sensitive/CDFG CSC
Distribution: This coastal cactus wren's range extends from Southern Orange County (San Juan Creek) south through San Diego County into northwestern Baja California, Mexico.
Habitat: This wren of the coastal slope is restricted to clumps of prickly-pear (*Opuntia littoralis and O. oricola*) or cholla (*O. prolifera*) growing in coastal sage scrub or along washes. Because of this restriction to cactus patches, the coastal cactus wren naturally occurred in small isolated populations scattered throughout the coastal lowlands.
Status Onsite: A total of 10 individuals was observed in the southern half of the project site, with most (seven) occurring on the slopes contiguous habitat in O'Neill Regional Park.

Loggerhead shrike

Status: CDFG CSC

Distribution: Widespread, but declining, throughout North America. Winters south to Central America.

Habitat: Open habitats including grasslands, scrublands, and ruderal areas with adequate perching locations.

Status Onsite: Observed in 1989 but not mapped.

Southern California rufous-crowned sparrow

Status: USFWS Regionally sensitive; CDFG CSC

Distribution: This coastal species occurs from Ventura County across to Los Angeles county and southeast through Orange, Riverside and San Diego counties to northwestern Baja California, Mexico.

Habitat: Mainly inhabit Venturan-Diegan transitional coastal sage scrub where it occurs in rocky hillsides and canyons, but they also may be found in open sage scrub/grassy areas of successional growth (e.g., after a fire, etc.).

Status Onsite: Ten individuals were observed on the southern half of the site, mostly (seven) on the slopes of habitat contiguous with O'Neill Regional Park. Two additional individuals occur just offsite near the southern half of the site and in the northeast corner.

coastal California gnatcatcher

Status: USFWS threatened

Distribution: The coastal California gnatcatcher occurs throughout specified habitat types in Orange, San Diego, Western Riverside and coastal Los Angeles counties.

Habitat: Mainly coastal sage scrub, with limited slope characteristics.

Status Onsite: None observed onsite based on previous 1993/1994 surveys, although current 1997 presence/absence surveys have not been conducted per USFWS protocol. As such, onsite coastal sage scrub habitat must be considered occupied by coastal California gnatcatchers until proven otherwise.

Table 27

SENSITIVE ANIMAL SPECIES WITH THE POTENTIAL FOR OCCURRENCE ONSITE

Species	Status	Potential/Habitat
Invertebrates		
Quino checkerspot *Euphydryas editha quino*	USFWS FE	Low; Habitat highly variable, but primarily coastal sage scrub. Food plants (*Plantago* ssp.) present. Focused surveys are needed for detection but are not warranted. This species is extremely rare in Orange County.
Reptiles		
San Diego Horned lizard *Phrynosoma coronatum blainvilii*	USFWS Regionally sensitive CDFG; CSC	High; chaparral, coastal sage scrub, food source (harvester ants [*Pogonomyrmex* sp.]) not seen but probably present. Focused surveys may be needed for detection but are not warranted. Expected but not seen during surveys.
San Diego ringneck snake *Diadophus punctatus similis*	USFWS Regionally sensitive CDFG; CSC	Low to moderate; coastal sage scrub, chaparral, oak woodlands. Prefers moist habitats. Focused surveys needed for detection but are not warranted.
Coastal rosy boa *Lichanura trivirgata roseofusca*	USFWS Regionally sensitive	Low; rocky areas in coastal sage shrub, chaparral, and cactus scrub. Focused surveys needed for detection but are not warranted.

Table 27 (con't)
SENSITIVE ANIMAL SPECIES WITH THE POTENTIAL FOR OCCURRENCE ONSITE

Species	Status	Potential/Habitat
Birds Prairie falcon *Falco mexicanus*	CDFG CSC	Low; an uncommon visitor to grasslands and scrublands of Orange County.
Northern harrier *Ciscus cyaneus*	CDFG CSC	Moderate; habitat includes open areas, such as grasslands and adjacent habitats. Would have been observed if it consistently uses the site. Nevertheless, this rupture probably occurs in the site vicinity due to the amount of open habitat, especially to the southeast.
Burrowing owl *Speotyto cunicularia*	CDFG CSC	Low; often found in disturbed sites where ground squirrel burrows are present, but would have been observed if present.
Bell's sage sparrow *Amphispiza belli belli*	USFWS C2 CDFG CSC	Moderate; habitat is coastal sage scrub and chaparral. Not common and apparently absent from much of Orange County. Would likely have been detected if present.
Tricolor blackbird *Agelaius tricolor*	USFWS Regionally sensitive CDFG; CSC	Moderate potential as a winter visitor and as a migrant; mostly in grasslands and wetlands
coastal California gnatcatcher *Poplioptila californica*	USFWS threatened	Low potential based on previous onsite field surveys/coastal sage scrub.

Table 27(con't)
SENSITIVE ANIMAL SPECIES WITH THE POTENTIAL FOR OCCURRENCE ONSITE

Species	Status	Potential/Habitat
Mammals		
Pallid bat *Antrozous pallidus pacificus*	CDFG CSC	Moderate; habitat highly variable, could forage throughout the site, but roosting sites are likely elsewhere. Focused surveys needed for detection but not warranted.
Greater western mastiff bat *Eumops perotis californicus*	USFWS Regionally sensitive CDFG; CSC	Moderate; could forage in any habitat onsite, but roosting sites are likely elsewhere. Focused surveys needed for detection but not warranted.
Dulzura California pocket mouse *Chaetodipus californicus femoralis*	USFWS Regionally sensitive CDFG CSC	Low to moderate; dense chaparral, but occasionally other scrublands. Trapping necessary for detection but not warranted.
San Diego desert woodrat *Neotoma lepida intermedia*	USFWS Regionally sensitive CDFG; CSC	Moderate; woodrat sign was found, but it could have been dusky-footed woodrat. Habitat is coastal sage scrub and other xeric habitats. Trapping necessary for detection but not warranted.

Several additional animal species may occur onsite. The majority of these species have a low to moderate potential for occurring onsite. None of the species warrant further surveys because they are of a generally low level of sensitivity and adequate mitigation can be accomplished by mitigating for their habitats.

4.7.2 EFFECTS FOUND TO BE INSIGNIFICANT

All of the effects on biological resource factors were determined to be potentially significant.

4.7.3 PROJECT IMPACTS

Vegetation communities

Implementation of the proposed project results in the direct removal of 191.4 acres (86 percent) of onsite and 19.8 acres of offsite vegetation as shown in Table 28. A total of 30.8 acres (14 percent) of undeveloped land will remain in open space.

Table 28
IMPACTED VEGETATION (ACRES) SUMMARY

Habitat	Existing	Onsite Impacts	Percent Impact (%)	Preserved Onsite	Percent Impact (%)	Offsite Impacts	Total
• Venturan-Diegan Transitional Coastal Sage Scrub (disturbed and undisturbed)	67.1	44.2	66	22.9	34	6.1	50.3
• Southern Mixed Chaparral	5.4	1.8	33	3.6	67	1.9	3.7
• Coast Live Oak Woodland (acreage/individuals)	14 5/298	14.0/284	97	0.5/14	3	0.6/5	14.6

• Ephemeral Pond	0.8	0.6	75	0.2	25	0	0.6
• Annual Grassland	125.3	121 8	97	3.5	3	4.8	126.0
• Agriculture	4.6	4.6	100	0.0	0		
• Disturbed	1 1	1.1	100	0.0	0	2.6	3.7
TOTAL	222 2	191 4	84	30.8	16	19.8	211.19

Venturan-Diegan Transition Coastal Sage Scrub/NCCP

A total of 50.3 acres of coastal sage scrub would be impacted by implementation of the proposed project. The Natural Communities Conservation Planning (NCCP) program Southern Subregions is currently in preparation and is anticipated to be completed in late 1997 or early 1998. The USFWS/CDFG have developed interim loss procedures for coastal sage scrub habitat, which may occur during preparation of the subregional NCCP. Under the requirements of the Interim Take 4(d) Rule and guidelines, up to 5% of the coastal sage scrub habitat may be impacted during preparation of the southern subregional NCCP. In addition, the following NCCP findings must be made prior to coastal sage scrub impacts:

1) The proposed habitat loss is consistent with the interim loss criteria in the Conservation Guidelines.

   a) The habitat loss does not cumulatively exceed the five percent guideline for loss of CSS within a subregion.
   b) The habitat loss will not preclude connectivity between areas of high habitat values.
   c) The habitat loss will not preclude or prevent the preparation of the subregional NCCP.
   d) The habitat loss has been minimized and mitigated to the maximum extent practicable, in accordance with the Interim Mitigation Criteria of the NCCP Process Guidelines.

2) The habitat loss will not appreciably reduce the likelihood of the survival and recovery of listed species in the wild.

3) The habitat loss is incidental to otherwise lawful activity.

Implementation of the proposed project would not result in the cumulative exceedance of the five percent loss of coastal sage scrub in the southern subregion. When added to the current total loss to date of 296 acres (authorized and pending), and 274 acres recorded from non-NCCP authorized projects, the maximum loss of 50.3 acres associated with this project would bring the total loss to 620 acres, which is about 2.4% of the 26,315 acres of coastal sage scrub in the Southern Subregional NCCP program area.[11]

---

[11] *Personal Communications - Gary Medieros, EMA, Environmental Planning 10/23/95.*
- Written Communication, Timothy Neely, Administrator, Planning & Zoning, 5-13-97.

Southern Mixed Chaparral

Approximately 1.8 acres (33 percent) of southern mixed chaparral would be directly impacted onsite by the project, and an additional 1.9 acres would be impacted offsite. These impacts are not considered to be significant because of the small amount of impact and the fact that southern mixed chaparral is not considered a sensitive habitat

Mulefat Scrub and Southern Sycamore Riparian Woodland

Mulefat scrub (3.8 acres) would be impacted where it is associated with three of the ephemeral ponds and in three intermittent streambeds, and southern sycamore riparian woodland (3.3 acres) would be impacted by remedial grading along the western boundary of the site. These impacts would be significant because of the two habitats' values as wildlife habitats and because of their function as wetlands or Waters of the United States. Impacts to these habitats would require permitting as discussed below.

Coast Live Oak Woodland

A total of 14.6 acres (97 percent) of coast live oak woodlands (312 individuals) would be impacted by the proposed project, while 0.5 acres (14 individuals) will be preserved. Impacts to oak woodlands are considered significant because of their wildlife values, their function in watershed protection and, in the case of the project site, their function as part of the planned NCCP regional wildlife corridor.

Ephemeral Ponds

0.6 acres of the existing ephemeral ponds would be impacted as a result of project implementation. The 0.6 acres of impact to ephemeral ponds is significant due to the presence of Riverside fairy shrimp. In addition, impacts to portions of this habitat would require permitting as discussed below because of its function as a Waters of the United States.

Agriculture and Annual Grassland

Approximately 4.6 acres (100 percent) of agriculture, 121.79 acres (97 percent) of annual grassland, and 1.1 acres of disturbed land (100 percent) will also be impacted. An additional 4.8 acres of annual grassland and 2.6 acres of disturbed land will be impacted offsite These impacts are not considered significant because the habitats are not sensitive.

Wetlands and Waters of the United States

Implementation of the proposed project would result in impacts to jurisdictional Wetlands/Waters of the United States, as regulated by the U.S. Army Corps of Engineers, summarized in Table 29.

Table 29
IMPACTED WETLANDS/WATERS OF THE UNITED STATES

Type of Habitat	Acres
Wetlands (0.84 ac Mulefat/0.81 ac Sycamore Woodland)	1.65
Non-Wetlands Waters of the U.S. (Intermittent Streams and Man-Made Stock Ponds)	1.78
Total	**3.43**

A Federal Clean Water Act section 404 individual permit issued by the U.S. Army Corps of Engineers would be necessary for direct impacts to 1.65 acres of wetlands (0.84 acre of mulefat scrub and 0.81 acre of southern sycamore riparian woodland) and 1.78 acres of Waters of the United States (intermittent streams and ephemeral ponds). As part of the permitting process, there may be required mitigation measures independent of the requirements of CEQA for impacts to wetlands. Only a portion of the mule fat scrub being impacted was delineated as a wetland (0.84 acres), although the total impact to this community is 3.8 acres. Only a portion of the southern sycamore riparian woodland being impacted was delineated as a wetland (0.81 acres), though the total impact to this community is 3.3 acres (0.5 acres onsite and 2.8 acres offsite). A Streambed Alteration Agreement with CDFG will also be required for the 8.1 acres of impacts to wetland habitats (southern sycamore riparian woodland, mule fat scrub, and ephemeral pond).

Sensitive Plants

Seven of the eight stands of Catalina mariposa lily, including approximately 314 (72 percent) of the estimated 435 individuals, would be eliminated by the proposed project. Approximately 121 individuals of the remaining stand would remain in open space. Impacts to this species are not considered to be significant due to its relatively low level of sensitivity, the relatively small population size onsite, and the relatively board distribution of this species throughout its range.

Two of the three stands of intermediate mariposa lily would be totally impacted by the proposed

project. Only one of the estimated 18 individuals (5 percent) would be directly impacted. Impacts to this species are considered to be adverse but not significant due to the small size of the total site population and, therefore, low regional significance of the onsite population.

Sensitive Animals

Riverside Fairy Shrimp

Impacts to all ponds where fairy shrimp were detected are significant because of the limited distribution of the species, and because it is federally-listed as endangered.

Western Spadefoot Toad

One of the two ponds where larvae were found will be impacted by the project. The impact to this species is not significant because of the species low level of sensitivity and because the population onsite is not of regional significance due to its small size.

Orangethroat Whiptail, Coastal Whiptail, Coastal Cactus Wren, and Southern California Rufous-Crowned Sparrow

The orangethroat whiptail and coastal whiptail prefer the open coastal sage scrub and southern mixed chaparral areas of the site. Two orangethroat whiptails and one coastal whiptail were observed, although many more are expected. Approximately 54.0 acres of combined coastal sage scrub and chaparral would be directly impacted (including offsite impacts), leaving 26.5 acres in open space. Ten coastal cactus wrens and twelve southern California rufous-crowned sparrows are distributed throughout the coastal sage scrub onsite and just offsite. Approximately 50.3 acres of potential nesting and foraging habitat (coastal sage scrub) would be impacted on and offsite, including at least portions of areas occupied by all twelve pairs of sparrows and at least six pairs of coastal cactus wrens. Impacts to these four species combined are considered significant but mitigable.

Cooper's Hawk

No direct impacts to known Cooper's hawk nesting habitat are anticipated, because no nests were observed during the surveys. Impacts to foraging habitat onsite are considered adverse but not significant since it is unlikely that any active nests would be disturbed. Should Cooper's hawks breed on the site, the loss of foraging habitat could affect, at most, a portion of one territory of

one pair of Cooper's hawks, and this impact would not be considered significant.

Loggerhead shrikes were observed onsite, but it is unknown how many or whether they were breeding onsite. Assuming that they still use the site, the project impacts will still not be significant because of the low sensitivity of this species.

Coastal California Gnatcatcher

Previous field surveys (1993/1994) have determined that onsite coastal sage scrub habitat is not occupied by coastal California gnatcatchers, although current 1997 gnatcatcher surveys have not been completed to USFWS presence/absence protocol. As such, onsite coastal sage scrub habitats must be considered occupied by coastal California gnatcatcher until proven otherwise.

Raptor Foraging Habitat

Impacts to all habitats onsite would total 206.2 acres, while offsite impacts would total 7.0 acres. These impacts would generally add to the loss of raptor foraging areas in the region. However, because of the disturbed nature of most of the present habitat and the restoration of oak woodland and project slopes, sufficient habitat would remain so that these impacts are not considered significant.

Potentially Occurring Species

A list of potentially occurring mammals and additional species is shown in Table 27. Additional focused surveys (that is, small mammal trapping) would be required to determine the status of potentially occurring sensitive mammal species onsite. Given the low sensitivity of the potentially occurring species, their distribution throughout other parts of Orange County, and the low amount of anticipated impacts to their respective habitats, these impacts are considered to be adverse but not significant.

Wildlife Movement

Implementation of the proposed project would directly impact wildlife movement through the project site, as it does not contain any design features which seek to facilitate wildlife movement. It can not be assumed that wildlife would be able to move through the project site as currently designed. The project, as currently proposed, may hinder or preclude the preparation of the southern subregional preserve, due to restricted wildlife movement.

Impact Significance Criteria

The impact significance criteria listed below, are based on a combination of the following: the Natural Community Conservation Planning (NCCP) information from the County of Orange, including acreages of habitat types proposed to be included in the Southern Subregion reserves; significance criteria, adopted regulations and stated policies of the California Department of Fish and Game, California Resources Agency, U.S. Army Corps of Engineers, and the U.S. Department of the Interior Fish and Wildlife Service.

The criteria listed below have been developed with the knowledge of the habitat resources on the project site. They have been focused to address the project site, including the context of this site within the NCCP Southern Subregion.

The project will have a potentially significant effect if it results in one of the following:

- For the federally listed coastal California gnatcatcher, other NCCP "target and identified species," coastal sage scrub (CSS) habitat, and wildlife movement corridors, the project would impair the ability of the Lead Agency (the County of Orange) to prepare an effective subregional NCCP consistent with the requirements of the Special 4(d) Rule for the coastal California gnatcatcher, FESA Section 10, and the NCCP Planning guidelines.

  The California Resources Agency and Department of Fish and Game have stated their intent to declare that significant impacts for individual projects addressed by a NCCP should be evaluated and determined based on the above standard (consistency with the subregional NCCP). Once a subregional NCCP has been approved by State and Federal agencies, a project whose CSS impacts have been addressed by the approved NCCP should be considered to be mitigated to below a level of significant effect.

- For other species of limited distribution in a subregion, or otherwise of high sensitivity; a) loss of habitat such that the potential benefits of any current or expected process to maintain viable levels of the species, through study, listing or a proposal to list the species would be diminished by a loss of the habitat at this time; b) the loss would be a non-recoverable loss during a time when the species and its habitat are undergoing a rapid decline; or c) loss of a consequential portion of a known population in the subregion.

- Project implementation results in notable net loss of a biotic community that is subject to local, State and/or Federal regulations (e.g., riparian communities) or that is otherwise of

very limited occurrence in the subregion (e.g., oak woodland and native grassland).

- Project implementation results in the direct impairment of wildlife movement on a local or regional scale.

4.7.4 SIGNIFICANT IMPACTS OF PROJECT PRIOR TO MITIGATION

Implementation of the proposed project, prior to application of outlined mitigation measures, would result in significant impacts to the following resources:

Sensitive Vegetation

Project implementation would result in the direct impact to : 1) 50.3 acres of Venturan-Diegan transitional coastal sage scrub; 2) 14.6 acres of coast live oak woodland; 3) 5.0 acres of southern sycamore riparian woodland; 4) 3.8 acres if mulefat scrub; and 5) 0.6 acres of ephemeral pond.

Sensitive Animals

Implementation of the proposed project would result in direct impacts to the Riverside fairy shrimp, a Federal endangered species. In addition, impacts to the orange-throated whiptail, western spadefoot toad, coastal whiptail, coastal cactus wren, and Southern California rufous-crowned sparrow, cooper's hawk, and loggerhead shrike will also result. Based on the absence of a current (1997) coastal California gnatcather survey conducted to USFWS presence/absence survey protocol requirements, impacts to coastal California gnatcatchers must be considered significant until proven otherwise by future surveys.

Wildlife Movement

Implementation of the proposed project would conflict with existing wildlife movement corridors, as depicted in the Foothill-Trabuco Specific Plan, Exhibit 52 and is identified in Section 4.7.1 of this EIR.

4.7.5 CUMULATIVE IMPACTS

Contributions to Cumulatively Significant Impacts

Considered alone, many impacts associated with implementation of a single project may not meet the

criteria of significance, either because project implementation impacts a relatively small area or because the resources impacted are only moderately sensitive; many candidates for federal listing fall under this category. However, when considered in the context of past and ongoing development of the region, a single project's impacts can be seen as a contribution to cumulatively significant effects.

In light of the fact that the Southern Subregional NCCP preserve has not been finalized, cumulative impacts to coastal sage scrub habitat are considered significant.

- Implementation of the proposed project in conjunction with other projects would result in cumulative impacts to oak woodland and sycamore riparian habitat.

- Implementation of the proposed project would contribute to cumulatively significant impacts to wildlife movement in the vicinity of the proposed project.

- Implementation of the proposed project would contribute significant impacts to the coastal California gnatcatcher, until such time as future field surveys, conducted to 1997 USFWS presence/absence protocol, demonstrates that onsite coastal sage scrub habitat is not occupied by California gnatcatchers.

- Implementation of the proposed project would contribute to cumulatively significant impacts to Riverside fairy shrimp.

- Implementation of the proposed project would contribute to cumulatively significant impacts to coast live oak and southern sycamore/riparian woodland.

- Implementation of the proposed project would contribute to cumulatively significant impacts the completion of the NCCP Southern Subregional reserve.

4.7.6 MITIGATION MEASURES

Conceptual Mitigation Program

As outlined in Section 2.8, mitigation measures which would result in, or require physical change to, the layout of the proposed project as shown on recorded tract map 10692, are not possible due to the inability to deviate from the final recorded tract map.

The following conceptual mitigation program has been developed based on input from the USFWS

and CDFG. During the public review process for EIR 561 and the N.O.P. comment period for EIR 566.

Impacts to Venturan-Diegan transitional coastal sage scrub habitat will require a mitigation ratio of 1.5:1 because although it is ranked as intermediate value habitat (under the NCCP), in its current condition much of the habitat being impacted is fragmented, is at least partially disturbed, and it may not support the coastal California gnatcatcher. According to the NCCP Evaluation Logic Flow Chart, the coastal sage scrub on the project site is considered intermediate value for long-term conservation because although it is not the most dense coastal sage scrub in the region, it is located next to a higher value district (O'Neill Regional Park). Impacts to mulefat scrub will be mitigated at 1:1 because of the poor quality of the existing habitat, and because it is surrounded by agriculture and annual grassland habitats. Southern sycamore riparian woodland will be mitigated at a ratio of 3:1 because of its high habitat quality. Oak woodland habitat will be mitigated at a ratio of 1:1, due to its moderate habitat values. Ephemeral pond habitat will also need to be replaced at a 2:1 ratio. Refer to Table 30 for a summary of the biological mitigation requirements.

Table 30
CONCEPTUAL BIOLOGICAL MITIGATION PLAN REQUIREMENTS

Habitat	Sensitive Habitat Impact Acreage	Mitigation Ratio	Mitigation Acreage
Venturan-Diegan Coastal Sage Scrub	50.3	1.5:1	75.5 Acres
Mulefat Scrub	3.8	1:1	3.8 Acres
Southern Sycamore Riparian Woodland	3.3	3:1	9.9 Acres
Oak Woodland	14.6	1:1	14.6 Acres
Ephemeral Pond	0.6	2:1	1.2 Acres
Total	**72.6**		**105.0 Acres**

The biological resource mitigation measure outlined above and summarized in Table 30, can not be implemented onsite and must be implemented offsite. Specific standard county conditions and mitigation measures have been developed to ensure that a comprehensive biological resources mitigation program is devised and approved by the County of Orange, in conjunction with USFWS and CDFG prior to the issuance of grading permits.

Project Design Features

No PDFs proposed.

Standard County Conditions and Mitigation Measures

SC 7-1 Pursuant to Section 711 4 of the Fish and Game Code, the applicant shall comply with the requirements of AB 3158, prior to the filing of the Notice of Determination for the project, in a manner meeting the approval of the Manager, PDS/Environmental and Project Planning Services Division.

SC 7-2 Prior to the issuance of any grading permits, the applicant shall obtain a Streambed Alteration Agreement covering the affected water courses and wetland areas within the proposed project area from the California Department of Fish and Game. A 1603 Streambed Application has been submitted to CDFG. All Streambed alteration activities shall be carried out in accord with the requirements of an approved Streambed Alteration Agreement.

SC 7-3 Prior to the issuance of any grading permits, the applicant shall obtain the necessary individual or nationwide permit (pursuant to Section 404 of the Federal Clean Water Act) covering all affected wetland areas from the U.S. Army Corps of Engineers, Los Angeles District. All wetland areas shall be subject to the specifications of the 404 permit as determined by the Corps of Engineers. A copy of the 404 permit shall be submitted with the first grading permit application for the proposed project to the Manager, PDS/Subdivision and Grading Services Division.

SC 7-4 Prior to the issuance of a grading permit, as required by participation in the Natural Community Conservation Planning/Coastal Sage Scrub (NCCP) agreement signed by the County on May 1, 1992, the project applicant shall provide an accounting summary, in acres or portions thereof, of coastal sage scrub scheduled to be impacted by removal through grading in a manner meeting the approval of the Administrator, Planning & Zoning. (See Section 4.7.3.)

SC 7-5 Prior to the issuance of a grading permit, the applicant shall provide proof that the appropriate Federal approvals required for impacts to Coastal Sage Scrub have been obtained from the U.S. Fish and Wildlife Service, in a manner meeting the approval of the Administrator, Planning & Zoning and Manager, PDS/Grading Services Division, in consultation with the Administrator, Planning & Zoning.

SC 7-6 Notwithstanding the tentative map, no grading shall occur within the Natural Community Conservation Plan (NCCP) enrolled area except as in a manner meeting the approval of the Administrator, Planning and Zoning.

SC 7-7 Prior to the issuance of any grading permit, approval of any activity that involves removal of any native vegetation from subject site including clearing, grubbing, mowing, discing, trenching, grading, fuel modification, or other related construction-related activities, the applicant shall obtain written proof from the U.S. Fish and Wildlife Service that said activity complies with the Federal Endangered Species Act. This evidence shall be submitted to the Manager, PDS/Subdivision and Grading Services Division, for review and approval, in consultation with the Administrator, Planning and Zoning.

SC 7-8 Prior to the issuance of grading permits the applicant shall submit a landscape and tree preservation plan to the Manager, PF&R/Harbors Beaches and Parks Division, for review and approval in accordance with the following guidelines:

A. To the maximum extent feasible, all existing native and exotic trees and other significant vegetation shall be preserved in conjunction with any development activity.

B. A tree preservation plan shall be prepared by a landscape architect for all development projects which identifies the location, size and species of all trees having a trunk diameter of 5 inches or greater (measured at four and one-half feet above ground level) and shrubs having a trunk or branch diameter of 3 inches or greater. The plan shall show which plants are proposed for removal and where transplanted and/or replacement plants will be located. Tree preservation plans shall be approved prior to issuance of grading permits, or where grading permits are not required, prior to issuance of building permits.

C. Trees removed in accordance with an approved tree preservation plan shall be replaced by a combination of transplanting to another location on the subject property and/or replacement by a combination of 1 and 15-gallon plants at a minimum ratio of 5:1. The following sliding scale shall also be used for trees to determine if more than the minimum number of replacement trees are required.

Tree Replacement Scale

Trunk Diameter (inches) of Tree Removed At 4½ Feet Above Ground Level	Total Number of Replacement
5 to 11	5 (1-15 gal / 4-1 gal)
12 to 17	7 (1-15 gal / 6-1 gal)
18 to 23	10 (2-15 gal / 8-1 gal)
24 to 35	12 (2-15 gal / 10-1 gal

Any oak exceeding 35 inches in diameter should be preserved, transplanted or replaced in accordance with the provisions outlined in Section E of the mitigation measure. In the event that all required replacement trees will not fit on the property, increase in container size will be considered in conjunction with reductions in replacement quality

D. Significant shrubs removed in accordance with an approved tree preservation plan should be replaced by a combination of transplanting to another location on the subject property and/or replacement by 5-gallon plants at a minimum ration of 3:1.

E. All other plants not specified in Guidelines C and D above that are removed in accordance with an approved tree preservation plan should be either transplanted to another location on the subject property or replaced by 15-gallon plants for trees and 5-gallon plants for shrubs at a minimum ration of 1:1. The two 35" + oak trees impacted by project implementation, will be mitigated by an enhanced replacement ratio (5-15 gal/10-1 gal) to the satisfaction of the Manager, PF&R/Harbors Beaches and Parks Division.

F. All transplanting of trees shall be performed by an experienced nursery or other landscape contractor, who shall care for the trees for at least six months after transplanting.

G. Prior to issuance of final certificates of use and occupancy, all transplanted or replacement trees and shrubs shall be installed in accordance with the tree preservation plan.

H. Oak trees shall not be subjected to increased runoff from irrigation systems, impermeable surfaces, storm drain discharge, etc.

I. Natural drainage courses and natural grades in proximity of, and providing seasonal irrigation to oak trees shall not be altered.

J. Grading, placement of fill, storage of building materials and heavy equipment, structural development, and hardscape (e.g., roads, sidewalks, patio slabs and pool decks) shall be prohibited within the drip line (outer edge of branches) of any tree. During grading and construction operations, all trees shall be temporarily fenced off with chain link fencing to protect such areas.

K. Use of pre-emergent weed killers shall be prohibited within 10 feet of the drip line of any individual tree and within any natural drainage course which seasonally irrigates trees.

L. Use of soil sterilizers shall be prohibited because they kill everything in the soil.

SC 7-9 Specify areas/lots to be dedicated or irrevocably offered to the County in fee or easement for landscape maintenance purposes, scenic or resource preservation purposes or resource replacement shall be landscaped, equipped for irrigation, and improved in accordance with an approved plan as stated below:

a) Preliminary Plan -An agreement shall be entered into and financial security posed guaranteeing landscape improvements and the maintenance thereof based on a preliminary landscape plan showing major plant material and uses, with a cost estimate for the landscape improvements. The preliminary plan and cost estimates shall be reviewed and approved by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PFR/Harbors Beaches and Parks Division. Said plan shall take into account the previously approved landscape plan for AP 95-7, the EMA Standard Plans for landscape areas, adopted plant palette guides, applicable scenic and Specific Plan requirements, Water Conservation Measures contained in Board Resolution 90-487 (Water Conservation Measures), and Board Resolution 90-1341 (Water Conservation Implementation Plan).

b) Detailed Plan - Prior to the issuance of any building permit(s), a detailed landscape plan shall be submitted to and approved by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PFR/Harbors Beaches and Parks Division. Detailed plans shall show the detailed irrigation and landscaping design.

c) Installation Certification - Prior to the issuance of final certificates of use and occupancy and the release of the financial security guaranteeing the landscape improvements, said improvements shall be installed and shall be certified by a licensed landscape architect or licensed landscape contractor, as required, as having been installed in accordance with the approved detailed plans. Said certification, including an irrigation management report for each landscape irrigation system, and any other required implementation report determined applicable, shall be furnished in writing to the Manager, PFR/Construction Division, and the Manager, PDS/Building Inspection Services Division, prior to the issuance of any certificates of use and occupancy.

SC 7-10 Prior to the issuance of precise grading permits, landscaping for privately maintained areas shall be designed in accordance with a plan. The plan shall be certified by a licensed landscape architect or a licensed landscape contractor, as required, as taking into account approved preliminary landscape plan (if any), EMA Standard Plans, area plan 95-7, scenic corridor and Specific Plan requirements, Grading and Excavation Code erosion control requirements, Subdivision Code, Zoning Code, and conditions of approval, Water Conservation Measures contained in Board Resolution 90-487 (Water Conservation Measures) and Board Resolution 90-1341 (Water Conservation Implementation Plan). Said plan shall be reviewed by the future homeowners association and be reviewed and approved by the Manager, PDS/Subdivision and Grading Services Division.

SC 7-11 Prior to the issuance of grading permits, the applicant shall provide additional evidence that the onsite coastal sage scrub habitat is not occupied by California gnatcatchers, in accordance with current USFWS protocol (7 in season/9 out of season pass surveys) to the satisfaction of the USFWS and the Administrator, Planning and Zoning. Should occupied coastal sage scrub habitat be identified onsite by the surveys consultation shall be initiated with the USFWS, and a coastal sage scrub/gnatcatcher mitigation plan shall be developed to the satisfaction of the USFWS and the Administrator, Planning and Zoning prior to the issuance of grading permits.

SC 7-12 Prior to the issuance of grading permits, the applicant shall provide appropriate measures to mitigate the project related impacts to onsite wildlife movement, to the satisfactin of the USFWS, CDFG and the Administrator, Planning and Zoning. Mitigation shall consider onsite as well as offsite mitigation options, and established fee programs.

SC 7-13 Prior to the issuance of grading permits, the applicant shall provide assurances to the satisfactin of the County NCCP coordinator and the Administrator, Planning and Zoning, that the proposed project will participate in the NCCP planning process and not preclude the finalization of the Southern Subregional reserve component of the NCCP.

SC 7-14 Prior to the issuance of grading permits, the applicant shall prepare a relocation and establishment mitigation plan, designed to mitigate impacts to Riverside fairy shrimp/pond habitat, wetlands, and southern sycamore woodland, to the satisfaction of the Administrator, Planning and Zoning, in consultation with USFWS and CDFG. Mitigation shall consider onsite as well as offsite mitigation options, as well as, established fee programs.

Additional Mitigation Recommendations

The following additional mitigation measures (AM) shall be implemented and enforced through the provisions of existing codes and regulations in a manner acceptable to the Manager, Environmental and Project Planning Services Division, in consultation with the Manager, PF&R/Harbors Beaches & Parks Division.

AM 7-15 The following recommendations are proposed to further minimize some of the proposed impacts.

- Where possible, bulbs of individual Catalina Mariposa Lily and Intermediate Mariposa Lily that are to be impacted shall be dug up and transplanted to a suitable habitat with similar soil, slope exposure, etc.

- Lighting within development projects adjacent to conserved habitat should be selectively placed, shielded, and directed away from that habitat. In

addition, lighting from homes abutting conserved habitat should be screened with vegetation, and large spotlight-type lighting that may affect conserved habitat should be prohibited. These lighting restrictions should be incorporated into the project's CC&Rs.

4.7.7 UNAVOIDABLE ADVERSE IMPACTS

Implementation of the proposed project, in conjunction with all of the identified mitigation measures, would reduce all impacts to less than significant, with the exception of the following:

- Project specific and cumulative impacts to coastal sage scrub, mulefat scrub, southern sycamore woodland, oak woodland and ephemeral ponds will remain significant and unavoidable. Once an Interim Loss Habitat Mitigation Plan has been approved, OCPDS will issue a letter determining that the impact to coastal sage scrub has been reduced to less than significant.

- Impacts to the Riverside fairy shrimp would remain unavoidable and adverse, until such time as the U.S. Fish and Wildlife Service completes a Section 7 (Endangered Species Act) consultation as part of the ACOE Section 404 process, resulting in a biological opinion, which indicates that the mitigation plan would not jeopardize the survival of the species.

- Impacts to wildlife movement would remain unavoidable and significant.

4.8 AESTHETICS

4.8.1 EXISTING ENVIRONMENTAL SETTING

The project site is located approximately ½ of a mile south/southeast of the intersection of El Toro and Live Oak Canyon Roads, in the foothills of the Santa Ana Mountains, within the boundaries Foothill/Trabuco Specific Plan area. The project site is located in the northwest portion of the Specific Plan area within the district designated as the Upper Aliso Planning Area. Specific Plan goals and regulations are intended to guide future development with the overriding purpose of preserving the area's rural character and abundant natural and scenic resources.

Containing approximately 222.23 acres, the irregularly shaped project site is surrounded by the following land uses: north - Saint Michael's Abbey and School and low density residential and ranch

land uses, east - widely spaced low density single family residential and a rural church, south - the Ramakrishna Monastery, O'Neill Regional Park, and the Hidden Ridge medium/high density residential tract, west - Aliso Creek, El Toro Road and the Portola Hills planned community. The Hidden Hills and Portola Hills developments are both located outside the Foothill/Trabuco Specific Plan area. Existing views of the project site from surrounding land uses are shown in Exhibits 56-58.

The project site consists of moderate to steep rolling hills ranging in elevation from approximately 1,000 to 1,550 feet above sea level. General elevation change occurs from a low point (1,015 feet) at the southwest corner of the site to the high point of (1,640 feet) near a proposed water tank located just northeast of the project boundary. A designated major ridgeline located near the eastern portion of the site and running in an essentially north - south direction, crosses the site near the northeast corner. Surrounding topography consists of a similar combination of steep to moderate hills and canyons with generally similar elevation ranges as the project site.

Due to the varied elevations of the project site and surrounding topography, the subject property will be visible from numerous locations in the vicinity. The site is presently undeveloped affording a view of natural rolling topography, grasslands and oak woodlands, which generally are considered to be scenic amenities. Ongoing cattle grazing activities have altered the biological resources onsite and resulted in an overgrazed visual condition for a majority of the site.

4.8.2 EFFECTS FOUND TO BE INSIGNIFICANT

The proposed project will be visible from existing development located south of the site in Mission Viejo (Altisima "Road"). Due to the distance of this location from the project site, aesthetic visual impact of site development is considered insignificant. Altisima is located over one mile south of the site at a slightly higher elevation and has a view of an intervening canyon located within O'Neill Regional Park and the southern ridgeline of the subject property. Nearly the entire proposed project and off site water tank will be visible from this location. Significant potential aesthetic impact will be mitigated however, by the distance of this location from the project site. Further, screening mitigation is also anticipated from the replanting of graded slopes with native vegetation and common area landscaping.

Live Oak Canyon Road is a designated scenic highway located approximately 1/4 mile north, northeast and east of the project site. Partial public view of the project will be possible from a small portion of this roadway near its intersection with the Harris Truck Trail northeast of the site; however, only a few homes are potentially visible from this location. Therefore, potential impact to the public's enjoyment of the aesthetic resources visible from this scenic highway is not anticipated

to be significant.

4.8.3 PROJECT IMPACTS

Substantial alteration of the existing onsite aesthetic visual resources will occur with the development of the proposed project. Viewshed impacts will be primarily due to substantial direct and remedial site grading and the subsequent construction of 705 manufactured single family residences on site. Grading volumes are estimated at approximately 11.5 millions of cubic yards (2.6 millions of cubic yards of conventional and 8.9 millions of cubic yards of remedial). Significant change to existing landforms, due to the substantial cut and fill required to create flat buildable pad areas from the steep rolling terrain on site, will generate permanent alteration to the natural topography and have an associated aesthetic impact to the site's viewshed. Visual impact is not limited to topographic alteration, but will also include loss of a portion of an oak woodlands, onsite ponds, and annual grasslands. Approximately 211.12 acres of the site (191.4 onsite and 19.8 offsite) will be altered or disturbed by project development. 14% of the site will remain in undisturbed open space.

In addition, site development will change the surrounding property's viewshed of the site from essentially undisturbed natural rolling rangeland and oak woodland to an urban/suburban environment. Though approximately 14% of the site will be retained in a natural open space, the predominant view will be of man-made slopes, roads, manufactured single family residences, and planted landscaping. This impact is permanent and unavoidable with site development.

The project proposes development of 705 manufactured residential units on minimum 2,630 square foot pads. This intensity and scale of development could be perceived as aesthetically objectionable by nearby residents.

Another potential impact of site development is glare from night lighting of project streets and residences. The site currently generates no night lighting. As a result, adjacent land use experience a more natural night sky and view of the site. Glare from night lighting may impact the ability to view stars and the visual aesthetic resource of a naturally lit environment.

Potential impacts to visual and aesthetic site resources have been evaluated from the following specific locations listed below. Exhibits 60 - 62 show computer generated post development views and cross-sections from the following locations:

Saint Michael's Abbey and School - Located northwest and adjacent to the project site. Views of the project site from the main abbey compound are generally screened by intervening buildings on the

abbey property, mature vegetation and topography (see Exhibit 61). Proposed residences would be located approximately 300 feet from existing Abbey facility. A significant portion of the proposed development will be visible however, from other parts of the abbey grounds including the pool, recreation field and Stations of the Cross knoll. Views of the project from these various locations on the abbey grounds are considered potentially significant. Glare from night lighting will directly impact this property due to its proximity and its lower elevation from the project site allowing street and residence lighting to shine directly down on the abbey property.

Ramakrishna Monastery - The Ramakrishna Monastery has occupied this location directly adjacent to the southeast portion of the project site since 1946. Normally the monastery is occupied by seven resident monks and an occasional small number of short term visitors. Due to the contemplative purposes for which this facility exists, potential visual impact of site development may be particularly intrusive to monastery residents. Existing on site vegetation near the main monastery buildings and revegetation and common area landscaping of the project's graded slopes may provide additional screening of the site from the monastery property. Nevertheless, it appears that complete site screening will not be possible due to the project site's higher elevation and its proximity to the monastery grounds. Therefore, even with extensive project site landscaping a significant number of residences will remain visible from the monastery, particularly the shrine trail surrounding the monastery property.

Night lighting glare may also have a significant aesthetic impact on monastery residents from both street and normal residence lighting. Resident monks have indicated that night lighting glare from recently constructed residential development in the vicinity has already negatively impacted the quality of life at their facility.

A church and two dwellings are located immediately north of the Ramakrishna Monastery, and would be impacted to the same degree as the outlying areas of the monastery.

O'Neill Regional Park - Residential elevations and man-made slopes located near the south project property line will be visible to the public from the Live Oak Trail within O'Neill Regional Park. The trail view points are located over ½ mile approximately 2,900 feet from the project boundary. Though project views will be far enough away so that elevation details are not apparent, the mere visual presence of a large number of homes from a wilderness hiking trail is considered a significant aesthetic impact.

Portola Hills - Portola Hills is a 2,200 unit planned community located directly west of the project site, across El Toro Road at a similar elevation. Views of the project site will be extensive as

indicated in the viewshed analysis, and will encompass the entire proposed project and off site water tank (see Exhibit 60). Due to Portola Hills' elevation, mitigation of potential visual impacts to a level of insignificance is not possible.

Portola Hills residents night views of the site are currently of a dark naturally lit area. Subsequent project buildout will change their view of natural open space to a view of an artificially lighted urban hillside development. As with all aesthetic impacts, some individuals may find this night lighting change to be a negative impact, while others may consider night lighting when viewed from a higher elevation to be aesthetically pleasing.

Hidden Hills - Hidden Hills is located directly adjacent to the southwest portion of the project site. Viewshed analysis indicates that residents of this tract will have significant uphill view of residences constructed along the southern boundary of the proposed project (see Exhibit 62). This visual impact is considered potentially significant because of the close proximity of the proposed project to existing residences built at a lower elevation. This proximity between the two tracts may generate a feeling to existing residents that Saddleback Meadow homes are looming over their Hidden Hills tract, creating a sense of crowding and associated loss of privacy.

El Toro Road - The proposed project will be visible to motorists on El Toro Road and to bicyclists, equestrians and hikers utilizing the regional trail located parallel to El Toro Road and Aliso Creek west of the project site.

Live Oak Canyon Road - A small portion of the upper portions of the project will be visible from the intersection of Live Oak Canyon Road and Harris Truck Trail. Views of the project site from Live Oak Canyon Road north of the site are partially screened by intervening topography.

Impact Significance Criteria

The determination of whether an aesthetic impact is significant or not is subjective, and there is no universally adopted standard or set of criteria for this issue. The impact significance criteria listed below are based on the CEQA Guidelines, Appendix G, and the Foothill Trabuco Specific Plan Development and Design Guidelines.

The project will have a potentially significant aesthetic impact if it results in one of the following:

- Degradation of, or significant interference with, the public's enjoyment of the site's existing visual resources (from designated public open space or public roads).
- Substantial alteration of the site's natural character, including extensive removal/changes or fill of slopes, canyons, rock outcroppings and/or vegetation.
- Impacts visual resources of "Major Ridgelines/Major Rock Outcroppings" as identified in the Foothill-Trabuco Specific Plan.
- Elimination of a unique geologic or physical landform feature.
- Areas where the elevation change along the length of a graded slope meets or exceeds 100 feet.
- Areas where the depth of cut or fill meets or exceeds 50 feet.
- Elimination or modification of a significant landform feature that is part of a larger, contiguous, unmodified offsite landform feature.

4.8.4 SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Implementation of the proposed project, prior to application of mitigation measures, would result in significant impacts to the following surrounding land uses:

- O'Neill Regional Park
- Ramakrishna Monastery
- St. Michael's Abbey

These significant impacts would be related to the following visible project features: 1) grading, including cut and fill slopes; 2) proposed residences 3) drainage improvements; 4) native vegetation removal; and 5) night lighting.

4.8.5 CUMULATIVE IMPACTS

The proposed Saddleback Meadows project would result in the encroachment of large scale residential development into rural and undeveloped areas. The project will contribute to the cumulative impacts to existing rural and natural open space, and to a continuing urbanization of foothill areas in South Orange County.

4.8.6 MITIGATION MEASURES

Project Design Features

PDF 8-1 All public utilities shall be situated underground.

PDF 8-2 Where feasible, drainage devices (terrace drains, benches, and intervening terraces) shall be bermed and placed in swales.

PDF 8-3 Concrete drainage swales and other similar drainage infrastructure shall be tinted with an appropriate earth tone to effectively conceal them from surrounding view.

PDF 8-4 The water tank shall be bermed, landscaped and painted to blend with the surrounding environment.

Standard County Conditions and Mitigation Measures

SC 8-5 Prior to the issuance of any building permits, an agreement shall be entered into and financial security posted guaranteeing landscape improvements and the maintenance thereof based upon a detailed landscape plan showing landscape design and irrigation with a cost estimate for the landscape improvements approved by the Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Harbors Beaches & Parks Division. Said plan shall take into account previously approved landscape plan(s), PF&RD Standard Plans for landscape areas, adopted plant palette guides, applicable scenic and specific plan requirements, water

conservation measures contained in Board Resolutions 90-487 (Water Conservation Measures), and 90-1341 (Water Conservation Implementation Plan).

SC 8-6 Prior to the issuance of preliminary grading permits, landscaping for privately maintained areas shall be designed in accordance with a plan certified by a licensed landscape architect or a licensed landscape contractor, as required, as taking into account approved preliminary landscape plan(s), PF&RD Standard Plans, area plan 95-7 scenic corridor and Specific Plan requirements, Grading and Excavation Code erosion control requirements, Subdivision Code, Zoning Code, and conditions of approval, Water Conservation Measures contained in Board Resolutions 90-487 (Water Conservation Measures) and 90-1341 (Water Conservation Implementation Plan). Said plan shall be reviewed and approved by Manager, PDS/Building Permits Services Division, Manager, PDS/Subdivision and Grading Services Division, in consultation with the Manager, PF&R/Harbors Beaches & Parks Division, and Manager, PDS/ Environmental and Projects Planning Services Division.

SC 8-7 Prior to the issuance of certificates of use and occupancy and release of financial security, applicant shall install the approved landscaping and irrigation system and shall have a licensed landscape architect or licensed landscape contractor, as applicable, certify that it was installed in accordance with the certified plan. Said certification, including an irrigation management report for each landscape irrigation system, and any other implementation report determined applicable, shall be furnished in writing to the Manager, Building Inspection Services, prior to the issuance of any certificates of use and occupancy.

SC 8-8 Prior to issuance of any building permit, the applicant shall demonstrate that all exterior lighting has been designed and located so that all direct rays are confined to the property in a manner meeting the approval of the Manager, PDS/Building Permits Services Division.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the

provisions of existing codes and regulations:

AM 8-9 Prior to issuance of any grading permit, the project proponent shall provide evidence to the Manager, PDS/Subdivision and Grading Services Division indicating that graded areas will be compatible with natural landform characteristics to the greatest extent possible. Criteria to achieve the desired effect shall include:

a) Recontouring the existing landforms to provide a smooth and gradual transition between graded slopes and existing grade while preserving the basic topographic character of the site.

b) Variation and combination of slopes 2:1, 3:1 and 4:1 to create a more natural character wherever possible within the graded areas.

c) Attempting to balance cut and fill within the overall project area to eliminate offsite and import/export related grading operations.

d) Obscuring slope drainage structures with a variety of plant materials.

e) Preservation of visual opportunities from hillsides by providing for panoramic views from selected locations (e.g., view corridors, sensitive landscape placement).

AM 8-10 Manufactured slopes shall be replanted with vegetation native to the site to blend the new topography with existing natural on site vegetation, immediately following precise grading operations.

AM 8-11 Fuel modification areas shall be planted with fire resistant vegetation.

AM 8-12 Use of the California Sycamore or other species similar to trees currently existing onsite shall be used in appropriate common area and street landscape locations where feasible.

AM 8-13 Common area landscaping and habitat transition zones shall utilize the FTSP recommended plant palette (Appendix H) when selecting plant material.

AM 8-14 Slope landscaping shall occur as soon as feasible after grading and be maintained by

the applicant until a homeowners association has been organized and assumes long term maintenance responsibility.

Light and Glare

AM 8-15 Prior to issuance of any certificate of use and/or occupancy, the potentially adverse impact of night lighting on surrounding land use shall be mitigated to the satisfaction of the Manager, PDS/Subdivision and Grading Services Division by the following measures:

a) Street lights shall only be installed at intersections and as required to insure public safety.

b) Low intensity halogen street lamps shall be used.

c) Street lights shall be shielded to direct the light beam downward and to avoid direct glare into open space areas and adjacent property.

4.8.7 UNAVOIDABLE ADVERSE IMPACTS

Construction of 705 manufactured single family residential units on site and water tank just off site, will permanently change the site viewshed from an open space visual amenity to a more typical view of a residential housing tract. Partial mitigation of this visual resource loss is provided by the revegetation of slopes with native and screening vegetation and the existing rolling topography which screens the project site from various locations surrounding the property. The mitigation measures listed above will further reduce the potential aesthetic impacts of project development, but will not eliminate the project's significant adverse effects. Substantial views of project construction and site alteration will remain from Saint Michael's Abbey, the Ramakrishna Monastery, O'Neill Regional Park, Portola Hills, Hidden Hills, and El Toro Road.

In addition, night lighting glare will remain a significant adverse impact even after incorporation of recommended mitigation measures The change from an unlit dark site to an urban night environment is anticipated to be perceived by existing surrounding land use as significant, permanent and unavoidable adverse impact.

4.9 CULTURAL/SCIENTIFIC RESOURCES

A comprehensive cultural/scientific resources investigation has been prepared for the project by RMW Paleo Associates. The technical report is found in Appendix I of this document, with report exhibits on file with OCPDS Services Division.

4.9.1 EXISTING ENVIRONMENTAL SETTING

Archaeology

The project area is inhabited by a Native American group ethnographically known as the Gabrielino. However, the generally accepted boundary with the Juaneno group to the south is Aliso Creek, flowing directly adjacent to the study area along its western margin (Bean and Smith 1978, Kroeber 1925). It is likely that the study area contains traces of both these cultures.

The names the Native American groups applied to themselves are largely unknown; we know them by names the Spanish coined as they moved into Native American territories. The name "Gabrielino" identifies those people who were under the control of the Spanish Mission San Gabriel, while the name "Juaneno" denotes those people who were under the administration of the Spanish at Mission San Juan Capistrano.

The Juaneno and Gabrielino language, as well as that of the Lusieno to the south, was derived from the Takic family, part of the Uto-Aztecan linguistic stock, which can be traced to the Great Basin area (Drive 1969). The timing and extent of the migrations and their impact on indigenous peoples is not well understood and any data related to it represents a valuable contribution to the understanding of local prehistory.

Prehistoric Era: The archaeological heritage of California is quite rich, probably more so than any other North American region north of Mexico. However, the archaeology of California is not well known. The native Californians were generally quite peaceful and did not often offer warlike resistance to European settlement. Consequently, they did not gain great notoriety during the settlement period. Also, the original Californians were first under the control of the Spanish and then the Mexican governments and only later, after much of their culture has been destroyed by disease and displacement, were they subsumed under the United States government. There was only a minor Native American presence remaining in California when it became a United States possession and massive development began. For this reason, very little interest in the natives and their prehistory was initially generated. It was many years later before the size, complexity, and extent of archaeological

deposits in the state became apparent.

Homo Sapiens has been present in the New World since perhaps 10,000 to 11,000 years B.C.E. There is limited evidence that humans were present long before this date, but this is largely inconclusive and has not been accepted by most archaeologists. The earlier sites are all controversial in that they lack definite dateable context and material. Such sites can be interpreted in various ways, particularly in relationship to their age. The few generally accepted remains indicate a very small, mobile population apparently dependant on hunting of large game animals as the primary subsistence strategy. Other sources were certainly exploited, but the bulk of the traces remaining today are related to game hunting. (Chartkoff and Chartkoff 1984, Moratto 1984.)

The surviving material culture of this period consists primarily of large, extremely well made projectile points and large but crude tools such as scrapers and choppers. Encampments were never permanent, based in part of the paucity of significant midden areas that would have degraded to undetectability given the great age, and were probably sited near a major kill. Occupation would have persisted only until the resources of that kill were exhausted. Such an economy, using only a small fraction of the available resources, would not have supported a large population; therefore, it is probable that the Paleo-Indians lived in groups no larger than extended families and that contact with other such groups was infrequent.

The Millingstone Horizon (or Encinitas Tradition, as defined by Wallace (1968)) people (ca. 5500-1500 B.C.E.) practiced a mixed hunting and gathering food procurement strategy. Game hunting still played an important role in the economy, but by this time the Native Americans has learned to exploit the hard seed resources of the coastal sage scrub and chaparral ecological communities. The rapid extinction of the large mammals that the Paleo-Indian had previously been exploiting necessitated this shift in resource exploitation. The principal implements used to process the seeds, manos and metates, appear in large numbers for the first time in this horizon, and are especially numerous near the end of this tradition. Other specialized tools were developed to process the increased resources utilized by Millingstone peoples. Settlement size seems to have increased and an annual round of seasonal migrations was likely practiced as movements coincided with ripening vegetal resources. Some formal burials are also evident.

The Intermediate Horizon, locally known as the Campbell Tradition (ca. 1500 B.C.E. to C.E. 1000), is characterized by a shift away from primarily vegetable food exploitation to a more maritime subsistence strategy. It is during this time that the mortar and pestle were introduced, enabling acorn processing to begin.

In the Late Prehistoric Horizon (or Shoshonean Tradition), groups began to center around trade routes and there was a greater utilization of food resources with more land and sea mammal hunting to complement collecting. The pattern of life in this Late Horizon was more complex. More classes of artifacts were being produced and they exhibited a more sophisticated degree of workmanship. The observation that the bow and arrow was now utilized to a greater extent is based on the recovery of a greater number of small, finely chipped projectile points. Other items include steatite containers, shell fishhooks, perforated stones, bone tools, personal ornaments, asphalt adhesive and elaborate mortuary customs. In addition, the population increased and larger villages evolved (Wallace 1955:223). It is during the Late Prehistoric that the emigrants from the Great Basin appeared in the Los Angeles and Orange County area. These peoples were very quick to adopt most of the local traits, because it is difficult to separate the archaeological assemblages of the emigrants from those of the indigenous peoples on the basis of artifact typology alone.

The first permanent settlement in Orange County came when San Juan Capistrano was selected as the site for a Mission in the spring of 1775. Mission San Gabriel, located in Los Angeles County, was established in 1771.

After 1810, mission population declined faster than it could be replenished. The Mexican Revolution, beginning in 1821, overthrew Spanish control and the new Mexican government had a very different outlook on mission activities. Secularization of the missions, planned under the Spanish was greatly accelerated by the Mexican government. Plans to provide land, training and living quarters for the Indians never developed and the mission lands were soon under the control of a relatively few influential Mexican families.

The project area was never a part of a Spanish or Mexican land grant. The foothill area was not good grazing terrain. Instead, the Santa Ana Mountain area was to be ungranted and for the use of all. The Rancho Canada de los Alisos (Canyon of the Sycamores) abuts a portion of the study area to the west (Morgan 1973).

The Mexican war ended on February 2, 1848, with the signing of the treaty of Guadalupe Hidalgo. The treaty established California as a United States possession.

Several archeological field studies of the Saddleback Meadows site have occurred in conjunction with previous projects, first in 1978 (Tadlock and Tadlock), 1982 (Breece and Pardon) and 1989 (Dillon). These studies indicate that the subject property contains a variety of prehistoric and historic archeological sites consisting mainly of ancient seasonal encampments and a historic ranch house and associated buildings circa 1920. The density of archaeological deposits at the subject property was

initially believed to be high due to the discovery of numerous artifacts during earlier site surveys. These previously discovered artifacts consisted primarily of grinding implements and chipped lithic tools which have already been removed and cataloged by earlier researchers. As part of the cultural resource analysis for the current project, the site was reexamined by RMW Paleo Associates in December, 1995, and then again in February and March of 1997. Existing archaeological sites located on the project site are summarized in Table 31.

Table 31
EXISTING ONSITE ARCHEOLOGY SITES

TRINOMIAL	TYPE	COMMENTS	IMPORTANCE/ SIGNIFICANCE
CA-ORA-710	Prehistoric	Ground and chipped stone tools found over 100x50 m area by Dillon.	Important
CA-ORA-711	Prehistoric	Not relocated.	Important
CA-ORA-712	Prehistoric	Not relocated. Possibly destroyed.	Not Important
CA-ORA-713	Prehistoric	Tadlock & Breece - numerous ground and chipped stone artifacts, 100x100 m; Dillon - cupule in concretion.	Not yet determined
CA-ORA-714	Prehistoric	Two artifacts discovered by Dillon	Not important
CA-ORA-715	Prehistoric	Five artifacts discovered by Dillon. Chipped and groundstone.	Not important
CA-ORA-716	Prehistoric	One artifact discovered by Dillon.	Not important
CA-ORA-1255	Prehistoric	Five artifacts discovered by Dillon. 25x25 m site area.	Not important
CA-ORA-1256	Prehistoric	Two artifacts discovered by Dillon	Not important
CA-ORA-1257	Prehistoric	Bedrock feature and one mano discovered by Dillon.	Not important
CA-ORA-1435H	Historic	Historic ranch and associated structures.	Not yet determined
CA-ORG 1437	Prehistoric	(Maxon 1995) Groundstone, debitage & thermally modified rock.	Not yet determined

It should be noted that two sites, CA-ORG-710 and CA-ORG-711 have been determined to be important and warrant further investigation/ excavation. Evaluation is ongoing and will continue during project construction as monitored by a registered archeologist. If grading operations uncover

additional artifact material, the status of these sites may change and could require further recovery work.

Paleontology

The project site is underlaid by three separate rock units, the Sespe Formation, the undifferentiated Sespe and Vaqueros Formations and the Topanga Formation. The oldest unit in the study area is the late Eocene to early Miocene Sespe Formation deposited when a floodplain covered much of southern California approximately 30 million years ago. The Sespe Formation is found only in the northeast corner of the project site. This geologic unit has produced fossil at numerous locations, most notably in Simi Valley and locally in the Irvine Lake area, however, no fossils were observed in this formation on the subject property.

Overlying and interbedded with the Sespe Formation is the early Miocene age undifferentiated Sespe-Vaqueros Formation (34 to 17 million years ago) indicating a variety of deposition environments along the shifting margins of an ancient sea that once covered this region. Deposits in this unit range from floodplains to deep water off shore sediment. This formation underlies nearly the entire project site except for the northeast corner. Initial site examination has revealed the presence of several distinct fossil horizons of both invertebrate and vertebrates animal groups in this formation.

A small exposure of middle Miocene age Topanga Formation, deposition approximately 15 million years ago is located on the ridge bordering Oso Creek near the southern property boundary. These sandstone deposits which indicate ancient beach deposition, have produced hundreds of vertebrate fossils at several locations within the County, with one of the largest assemblages of middle Miocene age marine vertebrate concentrations found near Upper Oso Dam and also in Mission Viejo. Numerous on site boulders have revealed the fossilized remains of at least two types of whales and a pinniped. The abundance of fossilized remains exposed at these locations indicate that more significant material may be buried on site.

History

A ranch residence and associated out buildings, located near the center of the site within the oak woodlands preservation area, will be directly impacted by the proposed project. These ranch buildings are in an advanced state of decay and have been vandalized to a point where only the roof, chimney and framing of the ranch house remain. Another large out building nearby has collapsed, though a couple of small structures remain standing. Archival research of Orange County records indicates that the structure was not occupied by any person of historical note or by a person who has played

a role in the historic or cultural development of the region.

4.9.2 EFFECTS FOUND TO BE INSIGNIFICANT

The following cultural resources effects were found to be less than significant as determined by the Initial Study/Environmental Assessment contained in Appendix C of this EIR. These factors are not evaluated in this EIR.

- The project does not have the potential to cause a physical change which would affect unique cultural values.

Archaeology

Potential project impact on the following archeological sites is considered insignificant based on the currently known density and extent of the artifacts at these locations.

CA-ORA-712: Located on a prominent knob a short distance southeast of CA-ORA-710, this site was originally recorded to contain chipped lithics uncovered by bulldozing. Subsequent examination has revealed no additional material in this area and no significant impact is anticipated.

CA-ORA-714: The site is located on the ridge west of CA-ORA-713 and was originally reported as a probable quarry containing assayed stones. Subsequent inspection has uncovered no definite artifacts at this location. Since bedrock is near the surface at this area of the project site, extensive subsurface deposits are not anticipated and no further action required.

CA-ORA-716: This site is located off the subject property to the west and has been extensively damaged by previous grading. No monitoring or other action is required.

CA-ORA-1255: Previous site investigation recovered a half dozen artifacts at this location near one of the relatively recently man made vernal pools in the northeast portion of the subject property. No artifacts have been recovered during the current study and the site is not considered significant.

CA-ORA-1256: Original investigation of this site recovered two artifacts whose cultural significance is presently in question. No archeological evidence is otherwise indicated for this site and it will be recommended that this site be redesignated from an archeological site to an isolate.

CA-ORA-1257: Located on a spur in the west central portion of the property, the site originally

yielded a few small artifacts that are currently in doubt with regard to their cultural significance. It is anticipated that the site will not yield any significant artifact deposits.

Paleontology

The geologic formations underlying the project site have produced fossil finds at other locations and it is anticipated that this will hold true for the subject property. Grading associated with site development may impact paleontological resources by disturbing and destroying fossils before they can be recovered. This potential impact to scientific resources is potentially significant unless mitigated.

History

Ranch: The remaining portions of the ranch residence and out buildings will be directly impacted by development since they are not located within an area designated for open space. These structures are not considered to be historically or culturally significant and no impact is anticipated.

4.9.3 PROJECT IMPACTS

Archaeology

A number of the known archeological sites on the subject property were initially found to contain a high density of artifact deposits which for the most part have been removed by previous site researchers. Some of these sites may still contain significant deposits below ground. Without mitigation, potentially culturally significant sites may be destroyed by project development. The recommended course of action for these potentially significant sites is to collect the visible surface artifacts, disk the site to determine if there are significant artifact deposits below current grade, and then if warranted excavate up to 12 one meter by one meter excavation units to determine the extent and cultural significance of the site. Depending on the significance of the find, the site can either be preserved in place, artifacts collected and cataloged, or no further action taken if the site proves unimportant.

CA-ORA-710: The site is located on a relatively flat knoll or terrace, directly east of, adjacent to and 40 feet above Aliso Creek in the northwestern portion of the property. Boundaries of the site are approximately 165 x 245 feet.

The original recorders (Tadlock & Tadlock 1978) reported a wide range of artifacts over a rather

large area. Subsequent archaeologists were not able to locate artifacts to that extent. Dillon (SRS 1989) discovered a chalcedony core, a chert flake and a burned piece of C\chert shatter as well as three "truncated" manos, which he apparently collected and removed from the site during his reconnaissance investigation. Truncated manos are discussed by Van Horn and Murray (1984). These manos were recovered at CA-ORA-486, along Aliso Creek, just a short distance away from site CA-ORA-710. The specimens had been "truncated" or broken off at one end and the rough end pounded smooth. They have been associated with the processing of "cacomites": a Spanish term referring to varieties of edible roots, bulbs and corms (bulb-like stems) that are found in the site vicinity.

Work consisted of a surface examination and surface collection. This resulted in the recovery of 26 artifacts including 16 uni- and bifacial manos (one possibly truncated) and mano fragments composed of porphyry, granite and metavolcanics, and chipped stone implements including three choppers, two hammerstones, one core, and four pieces of debitage. Material types here include metavolcanics, quartzite and quartz. subsequently, a disker pulled by a small bulldozer was employed to turn up the soil to a depth of three to five inches, with the purpose of uncovering near surface artifacts. This method, after a second surface collection, resulted in the recovery of an additional 56 artifacts including 11 groundstone implements; eight manos composed of granite (4) and porphyry (4), and three metate fragments - two of granite and one quartzite. chipped stone implements included 12 cores of metavolcanics, chert and quartzite; two hammerstones; two choppers; three scrapers and 25 pieces of debitage made primarily of chert and metavolcanics.

Eight 1 x 1 meter units were next excavated to determine the spatial extent of the site and verify the existence of a subsurface deposit. Fifty-eight artifacts were recovered and two of the units produced in situ features.

The sites inhabitants were utilizing a range of material types to fashion tools: chert (31%), metavolcanics (23%), granite (15%), porphyry (11%), quartzite (9%), metasedimentary (7%) and smaller percentages of jasper, sandstone and quartz. Some of the chert may have been heat treated.

Based on the characteristics of the artifacts recovered during the course of the test excavation, it is likely that the site is of Millingstone age. The lack of evidence of the mortar and pestle being used at the site further bolsters this hypothesis. The mortar and pestle technology is associated with the later Intermediate period when exploitation of the acorn became widespread.

A large portion of the artifacts were recovered from the western portion of the site in Units 1 through 3. Units 1 and 2 produced the three in situ features; therefore, it is established that this portion of the

site's subsurface remains intact.

It is likely that a substantial subsurface deposit remains relatively undisturbed at the site; therefore, the site is deemed important and further data recovery is warranted during ground disturbing activities.

CA-ORA-711: The site is located on a low, flat ridge directly east of Aliso Creek and just north of a smaller tributary drainage. It measures approximately 170 x 170 feet. The original recorders (Tadlock & Tadlock 1978) reported a "sparse distribution of flakes, cores, and one chopper." Dillon (1989) was unable to relocate the site during his reconnaissance.

Work performed consisted of a surface examination and surface collection. This resulted in the recovery of 30 artifacts including 12 uni- and bifacial manos (one or two possibly truncated) of granite, sandstone, metavolcanics and porphyry. Chipped stone implements recovered include two cores, two hammerstones, one uniface, one biface, one scraper plane and 11 pieces of debitage composed of chert, porphyry, metavolcanics and quartzite. Subsequently surface collection during the course of excavation produced 16 additional artifacts including three manos, one metate, four cores, one hammerstone and seven pieces of debitage. Material types included chert, metavolcanics, granite, porphyry and quartzite.

As with CA-ORA-710, excavation at CA-ORA-711 was limited to a small fraction of the total site area. And similarly, a relatively wide range of tool and material types was recovered. This, again, indicates that a number of activities were probably performed on the site. Lithic tool production activities are evidenced by the recovery of 13 cores and a variety of waste flakes and other debitage, as well as associated hammerstones. The recovery of 39 manos and mano fragments and five metates and metate fragments is strong evidence that processing of the hard seed resources associated with the coastal sage scrub and chaparral communities was being accomplished. Scrapers and choppers were being utilized to process vegetable and wood fibers, as well as for working hides and bone.

CA-ORA-712: The site was described by Tadlock and Tadlock (1978) as being on a relatively flat hill overlooking CA-ORA-710 and 711 and Aliso Creek. It was described as a chipped lithic scatter, heavily damaged by bulldozing. Cultural material could not be relocated by subsequent researchers. The site is therefore not important, but the area should be monitored by a qualified archaeologist during mass grading operations.

CA-ORA-713: The site is located on a ridge between Oso and Aliso Creeks and on the ridge's north facing slopes as well as a relatively flat area at the slopes base. The area measures approximately 500

x 700 feet and could comprise two or more sites.

The original recorders of the site (Tadlock and Tadlock 1978) reported finding flakes, scrapers, cores, choppers and manos. Breece and Padon (1982) reported only three flakes Dillon (SRS 1989) found no "portable artifacts", but discussed a sandstone concretion boulder with a cupulae ground into its upper surface.

Work on the site during the current project consisted of a surface examination and surface collection. This resulted in the recovery of 14 artifacts including two metavolcanic cores, a quartzite flake, a piece of metavolcanic shatter, a granite chopper, eight uni- and bifacial, porphyry and granite manos and a granite basin metate fragment. The cupulae noted by Dillon (SRS 1989) was seen, but the current researchers have serious reservations regarding the cultural nature of the cupulae. Subsequently, a disker pulled by a small bulldozer was employed to turn up the soil to a depth of 3-5 inches to expose near surface artifacts. This method resulted in the recovery of an additional 14 artifacts including three scrapers of metavolcanics (2) and granite, two quartzite cores, three pieces of metavolcanic (2) and quartzite debitage and six manos, uni- and bifacilly ground, composed of granite (4) and porphyry.

Since artifacts were scattered over a large area, a number of unrelated encampments occupied over a period of time may be represented. It is therefore recommended that controlled grading under the guidance of a qualified archaeologist be accomplished before the commencement of mass grading. Should clusters of artifacts be discovered, additional units could be excavated in those specific areas.

CA-ORA-714: The site is located on a domed hill on the ridge between Oso and Aliso Creeks, west of CA-ORA-713 and just to the south of a steep cliff leading down to a large Oso tributary drainage. Tadlock and Tadlock (1978) called the site a probably quarry containing assayed stones and Dillon (SRS 1989) only reported two artifacts. The presence of bedrock near and at the site's surface eliminated the possibility of extensive subsurface deposits. Bleached cow bones litter the ridgeline indicating either a carcass dumping ground or a carnivore feeding area. The site measures some 200 x 90 feet.

Work undertaken at this site was essentially surface examination and surface collection. Twelve artifacts were recovered as a result of this procedure including three unmodified hammerstones of metavolcanics (2) and porphyry, two cores of quartz and chert, four choppers of porphyry (3) and metavolcanics and three uni- and bifacial manos of porphyry.

The site was probably a short term encampment, perhaps the result of a single occurrent and because of the presence of exposed bedrock, a subsurface deposit is not expected.

CA-ORA-715: The site is located on a relatively flat, rounded hill comprising the ridge above the headwaters of Oso Creek, overlooking Aliso Creek. The site measures approximately 180 x 210 feet. A bulldozer cut in the site area establishes that soils have considerable depth.

Work on the site consisted of a surface examination and a surface collection. Thirty two artifacts were recovered including 13 uni- and bifacially ground manos, four of them fragments, composed of porphyry (8), sandstone (2), metavolcanics, quartzite and granite, four choppers of quartzite, metavolcanics, porphyry, and quartz, two bidirectional metavolcanic cores, one metavolcanic anvil, one metavolcanic hammerstone and eleven pieces of debitage of metavolcanics (5), chert (4), jasper and quartzite.

Although few artifacts were recovered from the subsurface, the relatively large number of artifacts recovered during the surface collection indicates that prehistoric activity did take place at the site. The presence of groundstone implements suggests the processing of hard seed resources associated with the area's coastal sage scrub and chaparral. Choppers were used to process vegetable and wood fibers, as well as for working hides and bone. Lithic tool production and/or maintenance is evidenced by the recovery of cores, debitage and associated hammerstones. Material types represented at the site included metavolcanics 33%, porphyry 24%, chert 18%, quartzite 13%, and small percentages of sandstone, quartz, jasper and granite.

CA-ORA-716: The site is located on a high hilltop in the northeastern corner of the project area. Tadlock and Tadlock (1978) reported finding a negligible number of flakes on the westerly portion of the site and flakes, cores and a redeposited chopper on the central and eastern portion. Dillon (SRS 1989), then reports finding just one basalt core at the site area and comments that much of the surface of the site has been graded to and below the surface of bedrock.

Relative to the current project, the site, or what is left of it, lies off the property to the west; therefore, no further action is required.

CA-ORA-1255: The site lies on the lower drainage of a small knoll creating an upland pond and overlooking a steep-sided drainage. It is approximately 80 x 80 feet in size. Dillon (SRS 1989) described the site as lying approximately 50 meters southwest of the pond in a natural amphitheater formed by a series of low, rounded knolls. Artifacts recovered by Dillon include one sandstone

metate fragment, one core, two flakes and quartzite prismatic blade.

Previous work on the site consisted of a surface examination and surface collection. One metavolcanic flake was recovered by this method. Subsequently, two .50 x 1 meter units were excavated on the top of the knoll. Unit 1 was excavated to 20 cm, Unit 2 to 30 cm. The lone artifact recovered was a piece of metavolcanic shatter in the 10-20 cm level of Unit 2. The units were very shallow because a very light colored decomposing bedrock sand was encountered at those levels and the units were abandoned.

CA-ORA-1256: The site lies to the south and downslope from the southwest margin of CA-ORA-715, along a brushy fingerline ridge. Site dimensions are approximately 100 x 16 feet. Dillon (SRS 1989) first recorded the site and reported finding a large, crude, "early" appearing scraper plane and an and site core/scraper. Dillon's photographs leave some doubt as to the cultural nature of the objects.

CA-ORA-1257. The site lies to the west and downslope of a low knoll directly west of Aliso Creek, and north of a steep cliff. Dillon (SRS 1989) recorded the site and reported finding a unifacial granite mano and a sandstone bedrock feature containing two cupules or incipient bedrock mortars. He commented that the mano was not truncated like the other three found at CA-ORA-710, but may have been used in conjunction with the bedrock feature for grinding purposes: therefore he called it an incipient bedrock mortar.

During a prior visit to the site the small boulder containing the purported cupules was seen, and during the current project it was again located.

CA-ORA-1435H (Hausauer Ranch): The site is located at the bottom of a deep drainage in the center of the property. It is surrounded by dense foliage (oak, eucalyptus and pepper trees). The site is a ranch complex comprised of a residence, barn (collapsed), several out structures, a holding pond and a large olive grove numbering nearly 100 trees. The ranch buildings are in an advanced state of decay and have additionally been vandalized. The site complex measures approximately 900 x 330 feet.

CA-ORA-1437: This newly discovered site lies on a rounded knolltop at the northern edge of the property overlooking a small drainage leading south-westward into Aliso Creek. The site is approximately 450 feet northwest of CA-ORA-1255 and measures ca. 60 x 60 feet.

The site was discovered serendipitously as the reconnaissance crew was searching for CA-ORA-1255. Work performed on the site included a surface examination and the subsequent recording of all identified artifacts. Twenty-nine items were identified including mano fragments, metate fragments, cores and flakes. The items were not collected, precluding the possibility of further study (material types, measurements, weights) of the artifacts. Finally, an archaeological site record was prepared for the site.

Paleontology

The rock units underlying the project site have a history of fossil production dating from the 1930's and represent a significant scientific resource. The most abundant concentration of fossils appear to be located in the Topanga and undifferentiated Sespe Vaqueros Formations. Initial project site investigation has uncovered numerous fossil concentrations at various locations within the Sespe-Vaqueros Formation on the subject property. The Topanga Formation has yielded numerous occurrences of vertebrate fossils in boulders which have apparently eroded from higher elevation. One of these boulders contains a portion of a baleen whale skull and another contains what appears to be the skeleton of a large toothed whale. Based on the abundance of observed fossils currently exposed on site, it is anticipated that project grading and construction will unearth additional fossil concentrations which may be destroyed without adequate precaution to document, recover and preserve what is found.

History

The ranch house and out buildings are located in an area that will be directly impacted by the proposed project.

Impact Significance Criteria

If the project may cause damage to an important archaeological resource, the project may have a significant effect on the environment. For the purposes of CEQA, an "important archaeological resource" is one that:

- Is associated with an event or person of: 1) recognized significance in California or American History, or 2) recognized scientific importance in history.

- Can provide information which is both of demonstratable public interest and useful in

addressing scientifically consequential and reasonable or archaeological research questions.

- Has a special or particular quality such as oldest, best example, largest, or last surviving example of its kind.

- Is at least 100 years old and possesses substantial stratigraphic integrity.

- Involves important research questions that historical research has shown can be answered only with archaeological methods.

4.9.4 SIGNIFICANT IMPACTS OF THE PROJECT PRIOR TO MITIGATION

Archaeology

The project may have a significant impact on the following archaeological sites: CA-ORA-710, CA-ORA-713, CA-ORA-715 and CA-ORA-1435H unless adequate safeguards are taken to document and recover any artifacts found at these locations. All other archeological sites have been deemed not important/ significant.

Paleontology

Disturbance of potential paleontological resources may occur with project development without adequate mitigation.

History

Project implementation will directly impact CA-ORA-1435H, which may be considered significant.

4.9.5 CUMULATIVE IMPACTS

Archaeology

Cultural archeological resources are non-renewable in character. Once disturbed or destroyed, they can never be recovered. Cumulative impact to archeological and culture resources stems from their irreplaceable loss due to site development. The recommended mitigation measures will reduce the potential impact of site development, particularly to the known archeological sites on the subject

property. Complete mitigation of the potential effects of site development on cultural resources is not fully possible however, because other archeological sites often remain hidden until project grading activities uncover them.

Paleontology

Fossils recovered at other locations from the rock formations underlying the project site have contributed to the understanding of the regions geologic and evolutionary history. Fossils are unique and irreplaceable scientific resources which can be lost forever unless adequate mitigation measures are taken to ensure their recovery and preservation.

Historical

No significant impact is anticipated.

4.9.6 MITIGATION MEASURES

Standard County Conditions and Mitigation Measures

Archaeology

SC 9-1 Prior to the issuance of any grading permit, a County-certified archaeologist shall be retained by the applicant to complete a literature and records search for recorded sites and previous surveys. In addition, a field survey shall be conducted by a County-certified archaeologist unless the entire proposed project site has been documented as previously surveyed in a manner which meets the approval of the Manager, PF&R/Harbors Beaches and Parks Division. A report of the literature and records search and the field survey shall be submitted to and approved by the Manager, PF&R/Harbors Beaches and Parks Division. Mitigation measures may be required depending upon the recommendations of this report. This mitigation measure has been completed as part of the Draft EIR.

SC 9-2 Prior to issuance of any grading permit, a county-certified archaeologist shall be retained by the applicant to perform a subsurface test level investigation and surface collection as appropriate. The test level report evaluating the site shall include discussion of significance (depth, nature, conditions and extent of the resources), final

mitigation recommendations and cost estimates and shall be approved by the Manager, PF&R/Harbors Beaches and Parks Division. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis.

SC 9-3 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified archaeologist has been retained to conduct pregrade salvage excavation of the archaeological resources in the permit area. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis. A final report of the salvage operation shall submitted to and approved by the Manager, PF&R/Harbors Beaches and Parks Division, prior to any grading.

SC 9-4 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified archaeologist has been retained, shall be present at the pregrading conference, shall establish procedures for archaeological resource surveillance, and shall establish, in cooperation with the project developer, procedures for temporarily halting or redirecting work to permit the sampling, identification, and evaluation of the artifacts as appropriate. If the archaeological resources are found to be significant, the archaeological observer shall determine appropriate actions, in cooperation with the project developer, for exploration and/or salvage. The archaeologist shall submit a follow-up report to the Manager, PF&R/Harbors Beaches and Parks Division, which shall include the period of inspection, an analysis of any artifacts found and the present repository of the artifacts. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis. These actions, as well as final mitigation and disposition of the resources, shall be subject to the approval of the Manager, PF&R/Harbors Beaches and Parks Division.

Additional Mitigation Measures

The following additional mitigation measures (AM) shall be implemented and enforced through the provision of existing codes and regulations in a manner acceptable to the Manager, PF&R/Harbors Beaches and Parks Division Facilities.

AM 9-5 Prior to site grading the project site shall be examined by a qualified archeologist, all potential archeological sites identified, and surface collection and documentation of

artifacts be conducted.

AM 9-6 As indicated by the project archeologist, sites warranting further study shall be disced to ascertain the extent and significance of the deposit. If the project archeologist determines that a site is potentially of cultural worth, then additional excavation in a manner determined by the project archeologist shall occur prior to further grading or construction activities at these locations.

AM 9-7 During initial grading, the project site shall be monitored by a qualified archeologist who shall have the authority to order a temporary cessation of grading activities and take appropriate action to preserve any culturally significant materials if uncovered.

AM 9-8 If human remains of Native American origin are encountered during the project the County Coroner's Office and the Native American Heritage Commission shall be contacted for preservation and protection of the remains.

Paleontology

SC 9-9 Prior to the issuance of any grading permit, a County-certified paleontologist shall be retained by the applicant to complete a literature and records search for recorded sites and previous surveys. In addition, a field survey shall be conducted by a County-certified paleontologist unless the entire proposed project site has been documented as previously surveyed in a manner which meets the approval of the Manager, PF&R/Harbors Beaches and Parks Division. A report of the literature and records search and field survey shall be submitted to and approved by the Manager, PF&R/Harbors Beaches and Parks Division, Future mitigation shall depend upon the recommendations of the report. This mitigation measure has been completed.

SC 9-10 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified paleontologist has been retained by the applicant to conduct pregrade salvage and prepare a catalogue of the exposed resources. Excavated finds shall be offered to the County of Orange, or designee, on a first refusal basis. The paleontologist shall submit a follow-up report for approval by the Manager, PF&R/Harbors Beaches and Parks Division, for review and approval, which shall include methodology, an analysis of artifacts found, a catalogue of artifacts, and their

present repository. This mitigation measure has been completed.

SC 9-11 Prior to the issuance of any grading permit, the project applicant shall provide written evidence to the Manager, PDS/Subdivision and Grading Services Division, that a County-certified paleontologist has been retained to observe grading activities and salvage and catalogue fossils as necessary. The paleontologist shall be present at the pregrading conference, shall establish procedures for paleontological resource surveillance, and shall establish, in cooperation with the project developer, procedures for temporarily halting or redirecting work to permit sampling, identification, and evaluation of the fossils. If major paleontological resources are discovered, the paleontologist shall determine appropriate actions, in cooperation with the project developer, which ensure proper exploration and/or salvage Excavated finds shall be offered to the County of Orange, or its designee, on a first-refusal basis. The paleontologist shall submit a follow-up report for approval by the Manager, PF&R/Harbors Beaches and Parks Division, which shall include the period of inspection, a catalogue and analysis of the fossils found, and present repository of the fossils. These actions, as well as final mitigation and disposition of the resources, shall be subject to approval by the Manager, PF&R/Harbors Beaches and Parks Division.

Additional Mitigation Measures

AM 9-12 A qualified paleontologist shall be retained to perform periodic inspections of excavations and, if necessary, salvage exposed fossils. The frequency of inspections will depend on the rate of excavation, the materials being excavated, and the abundance of fossils. Initially, monitoring shall be on a full time basis in all excavations because of the high potential for the discovery of fossils in all the rock units present in the study area.

AM 9-13 The paleontologist shall be allowed to divert or direct grading in the area of an exposed fossil to facilitate evaluation and if necessary, salvage.

AM 9-14 To recover small fossils, it will be necessary to collect sediment samples from promising horizons discovered during grading monitoring for processing through fine mesh screens. Once the samples have been screened, they will be examined microscopically for small fossils.

AM 9-15 Fossils shall be prepared to the point of identification and catalogued before they are donated to their final repository.

AM 9-16 All fossils collected should be donated the County of Orange's designated repository.

AM 9-17 A report detailing the results of these efforts, listing the fossils collected, and naming the repository shall be submitted to the lead agency at the completion of the project.

Historical Resources

SC 9-18 Prior to issuance of a grading permit, project applicant shall provide written evidence to Manager, PF&R/Harbors Beaches and Parks Division that an historian has been retained by the applicant to implement final mitigation measures. A final report shall be submitted to and approved by the Manager, PF&R/Harbors Beaches & Parks Division prior to any alteration of the historical site area.

SC 9-19 Development adjacent to a place, structure, or object of historic significance shall be designed so that permitted uses and architectural design will protect the visual setting of the historic site. Such design shall be submitted to and approved by the Manager, PF&R/Harbors Beaches & Parks Division prior to any alteration of the historical site area.

4.9.7 UNAVOIDABLE ADVERSE IMPACTS

Archaeology

No significant adverse impact to archeological or cultural resources is anticipated with the proposed project with the incorporation of the recommended mitigation measures.

Paleontology

No significant adverse impact to paleontological resources is anticipated with the proposed project with the incorporation of the recommended mitigation measures.

History

No significant impact is anticipated.

4.10 RECREATION

4.10.1 EXISTING ENVIRONMENTAL SETTING

The project site has access to a number of regional recreational facilities located in the immediate vicinity. Most notable is O'Neill Regional Park located directly south and adjacent to the subject property. Whiting Ranch Wilderness Park is located approximately one mile to the west and the Cleveland National Forest southern boundary is located approximately ½ mile north of the project site. In addition, the project will have access to the Orange County Regional Riding and Hiking Trail System, with an on site connection provided to the Live Oak Canyon Trail (#21) and the Aliso Creek Regional Riding and Hiking Trail (#19), which parallels El Toro Road adjacent to the west project boundary.

O'Neill Regional Park

Encompassing over 2,000 acres of canyon bottom, shrub covered hills and oak and sycamore woodlands, O'Neill Regional Park is the closest recreational facility serving the subject property. The park is known for its native oak and sycamore trees and accompanying woodland habitat and has provided area residents and visitors with camping, day use picnic areas, playground facilities, and riding and hiking trails since its establishment in 1948. Classified as a Natural Regional Park in the Orange County General Plan Recreation Element, the park's primary purpose is to provide an area of limited physical improvement for the public's enjoyment of passive recreational activities, and the aesthetic beauty of the natural environment. The portion of O'Neill Regional Park adjacent to the project site is devoted to wilderness activities, including hiking. The Live Oak Trail is located in this part of the park, approximately 1,000 feet south of the project site.

Whiting Ranch Wilderness Park
