1.0 INTRODUCTION

Addendum No. 2 to certified subsequent Environmental Impact Report (SEIR) 566 has been prepared to evaluate and document any potential changes in the environmental effects or baseline environmental conditions associated with the Saddleback Meadows project (PA 980103) since the preparation of SEIR Addendum No.1 in July 1998. The project evaluated by Addendum No. 2 is identical to the project evaluated in SEIR Addendum No. 1, consisting of 299 single family dwelling units on the 222.2 acre project site. California Environmental Quality Act (CEQA) documentation prepared for the project to date is summarized as follows:

EIR 561. Environmental Impact Report 561 was prepared in February 1996 for a 318 detached single family dwelling units on a 222.2 acre site.

SEIR 566. Subsequent Environmental Impact Report (SEIR) 566 for the Saddleback Meadows project was certified by the Orange County (County) Planning Commission on December 3, 1997, and affirmed by the County Board of Supervisors (Board) on January 27, 1998. The approved project was 705 manufactured homes.

Addendum 1. The First Addendum (Addendum No.1) to the certified SEIR (PA980103) was prepared in July 1998. The project evaluated by Addendum 1 was 299 detached single family dwelling units on 222.2 acres.

Addendum 2. This Second Addendum (Addendum No. 2) to SEIR 566 evaluates changes in the environmental conditions and potential effects associated with the currently proposed Saddleback Meadows project, which is 299 units The proposed project described in this Addendum 2 is the identical project (299 detached single-family dwelling units on a 222.2-acre site) as was described in Addendum 1. The Board must recertify SEIR 566 prior to adopting Addendum 2.

1.1 Legal History

In March 1998, after certification of SEIR 566 (including Addendum 1), a lawsuit (791309) was filed by the Vendanta Society of Southern California et al. in Orange County Superior Court. In January 1999, two additional lawsuits (804137 and 804139) were filed, and consolidated into one summary adjudication motion, which was granted by the trial court in April 1999. The judgement declared that the EIR had never been validly certified and directed the County of Orange (County) to set aside all approvals with regards to the 299-unit project. The County (applicant) appealed this judgement to the California Court of Appeal, Fourth Appellate District (G026580). On October 30, 2000, the Court of Appeal affirmed the trial court's judgement and confirmed the order to set aside certification of EIR 566, as well as all related County approvals, and directed the County to reconsider certification of EIR 566.

1.2 Board of Supervisors Actions

Based upon the October 30, 2000 court order, the Board met in closed session pursuant to Government Code Section 54956.9(A) and directed that all project approvals associated with the Board's prior actions of February 24, 1998, and December 8, 1998, be rescinded and vacated, as follows:

- Final Tentative Tract Map report regarding Tentative Tract Map 15784 and the CEQA documentation relating thereto, as adopted by the Subdivision Committee on October 21, 1998
- Ordinance 9817, enacting Zone Change ZC 98-3, adopted by the Board on December 8, 1998
- Resolution 98-466, approving the Addendum and Final SEIR (FSEIR) 566 to serve as the CEQA documentation for the 299-unit project, as adopted by the Board on December 8, 1998

- Resolution 98-467, denying the appeal and upholding the Planning Commission's approval of AP 98-2, as adopted by the Board on December 8, 1998
- Resolution 98-468, denying the appeal and upholding the Subdivision Committee's approval of Tentative Tract Map 15784, as adopted by the Board on December 8, 1998

1.3 Addendum No. 2 Organization

Addendum 2 is based on certified SEIR EIR 566, which was originally prepared to evaluate 705 manufactured homes (referred herein as the "approved project"), and re-evaluates the currently proposed 299-unit project that was evaluated in Addendum 1.

The 299-unit project was originally evaluated in Addendum No.1 and included strategically designed lotting, landform grading and landscaping to screen and filter the view of the proposed development area from surrounding land as compared to both the 318 unit proposal evaluated by EIR 561 and the 705 unit manufactured home project evaluated by SEIR 566. . Additional 299 unit project features included accomplished by shortening cul-de-sac street lengths and eliminating residential lots to allow space for landform berming and contour grading, designed to substantially reduce views of the development area from both Saint Michael's Abbey and the Ramakrishna Monastery. In comparison to the 705-unit previously approved project evaluated in certified SEIR 566, the currently proposed project has substantially reduced density and associated environmental effects.

Volume 1 of Addendum No.2 contains the environmental impact assessment evaluation of the proposed project, a comprehensive project chronology and updated technical studies for traffic and biological resources. Volume 2 contains the administrative record in support of the petitioner's motion for summary adjudication. Volume 3 includes the prior CEQA documents prepared for the project including EIR 561(including response to Comments, SEIR 566 (including response to comments) and SEIR 566 Addendum No.1.

1.4 CEQA Statutory Requirements

The California Environmental Quality Act (CEQA) Guidelines (CEQA Guidelines §15164.) authorize the use of an addendum for the purpose of determining whether a previously prepared EIR can be used for a project (CEQA Guidelines §15063(c)(7)). Section 15164(a) states:

> *The lead agency or responsible agency shall prepare an addendum to a previously certified EIR if some changes or addition are necessary, but none of the conditions described in Section 15162 calling for the preparation of a subsequent EIR have occurred.*

Section 21166 of the California Environmental Quality Act (CEQA, Pub. Res. Code §21000, et seq. and CEQA Guidelines §15162 set the standard to determine whether a new EIR should be prepared when a previous EIR has been prepared. Section 21166 states:

> *When an environmental impact report has been prepared for a project pursuant to this division, no subsequent or supplemental environmental impact report shall be required by the lead agency or by any responsible agency, unless one or more of the following events occurs:*
>
> *(a) Substantial changes are proposed in the project which will require major revisions of the environmental impact report.*
>
> *(b) Substantial changes occur with respect to the circumstances under which the project is being undertaken which will require major revisions in the environmental impact report.*

(c) New information, which was not know and could not have been known at the time the environmental impact report was certified as complete, becomes available.

Section 21166 is further explained in the CEQA Guidelines (§15162), in the following language:

(a) When an EIR has been certified or a negative declaration adopted for a project, no subsequent EIR shall be prepared for that project unless the lead agency determines, on the basis of substantial evidence in the light of the whole record, one or more of the following:

(1) Substantial changes are proposed in the project which will require major revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;

(2) Substantial changes occur with respect to the circumstances under which the project is undertaken, which will require major revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

(3) New information of substantial importance which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete or the negative declaration was adopted, shows any of the following:

(A) The project will have one or more significant effects not discussed in the previous EIR or negative declaration;

(B) Significant effects previously examined will be substantially more severe than shown in the previous EIR;

(C) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or

(C) Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

(b) If changes to a project or its circumstances occur or new information becomes available after adoption of a negative declaration, the lead agency shall prepare a subsequent EIR if required under subsection (a). Otherwise, the lead agency shall determine whether to prepare a subsequent negative declaration, an addendum, or no further documentation.

(c) Once a project has been approved, the lead agency's role in project approval is completed, unless further discretionary approval on that project is required. Information appearing after an approval does not require reopening of the approval. If after the project is approved, any of the conditions described in the subsection (a) occurs, a subsequent EIR or negative declaration shall only be prepared by the public agency which grants the next discretionary approval for the project, if any. In this situation no other responsible agency shall grant an approval for the project until the subsequent EIR has been certified or subsequent negative declaration adopted.

(d) A subsequent EIR or negative declaration shall be given the same notice and public review as required under Section 15087 or Section 15072. A subsequent EIR or negative declaration shall state where the previous document is available and can be reviewed.

The key to Sections 21166 and 15162 is to determine whether any circumstances have changed dramatically enough to justify repeating a substantial portion of the environmental documentation process. If conditions do not justify a new or supplemental EIR, but minor additional or technical changes (such as traffic updates) are appropriate to keep the document current and useful, an agency may prepare an addendum (CEQA Guidelines §15164).

1.5 Addendum No. 2 Findings

Based upon the foregoing information, preparation of a second addendum is the appropriate CEQA document to provide project-specific analysis and to provide clarification and minor changes to Final SEIR 566. This document is prepared under the authority of Section 15164 of the CEQA Guidelines for the following reasons:

- Only minor technical changes or additions are necessary to make the previously certified Final SEIR 566 adequate under CEQA.
- This Addendum No. 2 does not raise important new issues about the significant effects on the environment. There is no substantial evidence that the project, as mitigated by the measures required within the Final SEIR 566, would have a significant adverse effect on the environment (§15070).
- Final SEIR 566 was certified for the development of the previously proposed project in connection with earlier approvals. The certification of an EIR is recognition of the continuing utility of the document for subsequent development approval within the scope of the original approval. The Section 21166 test provides evidence under state law on the question of whether a new environmental document is necessary. This test is a tangible one, and does not challenge the age of a document, but only provides the criteria to test its continuing accuracy and utility.

2.0 PROJECT DESCRIPTION

The project description is the same as proposed and evaluated in Addendum 1 to SEIR 566. Project description details are hereby incorporated by reference (CEQA Guidelines Section 15150) from Addendum 1 and summarized in this section.

2.1. Location

The project site is situated on vacant land located on the eastern side of El Toro Road, approximately ½ mile south of the intersection of Santiago Canyon Road (El Toro Road) and Live Oak Canyon Road, in east-central unincorporated Orange County. Regional and vicinity maps are shown in Exhibits 1 and 2, respectively. The incorporated cities of Mission Viejo and Lake Forest lie approximately three miles to the south and southwest, and the Cleveland National Forest boundary is approximately ½ mile north of the project site. Aliso Creek is adjacent to the northwestern portion of the project site. In addition, a small strip of County-owned land is located between the project site and El Toro Road. See Exhibit 1 (Regional Location Map) and Exhibit 2 (Vicinity Map).

2.2. Background

A comprehensive chronology of the Saddleback Meadows project is included in its entirety in Appendix A of this document. The chronology details the CEQA and entitlement history of the project, beginning in 1978. The following cases are associated with the proposed project and will be considered by the Orange County Planning Commission and Board of Supervisors:

- Planning Application (PA) 980103
- Zone Change (ZC) 98-3
- Area Plan (AP) 98-2
- Tentative Tract Map 15784
- Vesting Tentative Tract Map 15230

In addition to these County of Orange Planning and Development Services cases, several regulatory permits are currently in process with state and federal resource agencies, Including:

- Army Corps of Engineers Section 404 Nationwide 26 Permit
- California Regional Water Quality Control Board Section 401 Certification
- California Department of Fish and Game 1603 Streambed Alteration Agreement

2.3. Project Description

The following project design features have been incorporated into the 299 detached single family unit project description, which is identical to the project description evaluated in SEIR 566 Addendum No. 1.

2.3.1 Project Design Features

Acreage, Lots, and Dwelling Units. The project proposes the construction of 299 single-family detached dwelling units (the proposed project) on 222.2 acres, as shown in Exhibit 3 (Illustrative Site Plan). This land plan is identical to the project discussed in the first Addendum (PA980103) (July 1998). The average lot size for this project is approximately 6,672 square feet (sf), with a minimum lot size of 5,000 sf. Total open space is approximately 71 percent (158.6 acres), which is approximately 30.47 acres more than the approved project.

Access and Fire Protection. Access to the project would be provided via a gate-guarded private street off El Toro Road, immediately south of the existing structure crossing under the Aliso Creek and Trail. An emergency-only access connects with Valley Vista Way. All habitable structures are proposed to be protected by automatic fire sprinkler systems.

Off-Site Water Tank. The project acreage does not include an adjacent off-site site for a water tank with a maximum capacity of 1.4 million gallons. The tank and an associated access road are proposed adjacent to the northeastern corner of the project site to provide water service to the proposed project. The site was previously dedicated to the Trabuco Canyon Water District when the existing Final Tract Map was recorded (Tract No. 10692). The water tank will be approximately 30-feet tall and 100 to 110 feet in diameter. It will be bermed, landscaped, and painted a color that compliments the surrounding setting.

Off-Site Acreage. A total of approximately 8 acres of off-site area would be affected as a result of project implementation to accommodate slope area, access roads, related remedial grading, the water tank, and County of Orange fuel modification requirements.

Traffic Circulation. On-site circulation is proposed with a system of private streets consisting of a primary spine street (56-foot right-of-way) and a series of cul-de-sacs (41-, 45-, and 52-foot rights-of-way). An encroachment easement is required from the County to accommodate the project access road where it traverses County-owned property along the western-most boundary of the site.

Rural Viewscape. The project has been designed to minimize impact on the existing landform. The homes have been located on the relatively level area in a broad crescent shape that flows along the southern and eastern sides of the site, while the steep terrain of the central canyon area has been left as open space. Development is kept off the eastern and northern major ridgelines bordering the property. A primary design consideration in establishing the rural character of Saddleback Meadows is presenting a landscape-enveloped community, when viewed both from the surrounding areas and from within the development. In response to this design intent and the interests of St. Michael's Abbey, the Ramakrishna Monastery, and the neighboring Hidden Ridge community, specific grading techniques, site planning, and landscape elements will be incorporated within the project. The intent of these features will be to enhance the view of Saddleback Meadows from the surrounding areas.

Design Features. Design features such as landform grading, resource enhancement, and recreation and open space components are summarized as follows:

- Landform grading along the northern side of the primary spine road, and the majority of the southern development edge, designed to screen off-site views of the development area

- A wildlife movement corridor system designed to accommodate primary wildlife movement through a 400-foot-wide east-west corridor (not counting 50-foot-wide buffer zones on either side of the corridor)
- Preservation of the southern ephemeral pond
- A ±90-acre extension of O'Neill Regional Park that may include a trailhead pocket park and ridgetop lookout park
- A hiking trail connecting the Aliso Creek Riding/Hiking Trail and the Live Oak Hiking Trail to the trail staging area and O'Neill Regional Park
- Relocation of residential lots so none is adjacent to the wildlife corridor or St. Michael's Abbey
- Preservation of the oak woodland associated with the east-west wildlife movement corridor
- Revegetation of the wildlife movement corridors with native plant materials
- Elimination of side yard slope retaining walls
- Elimination of a commercial use
- Approximately 68.6 acres of Restricted Scenic Preservation Easement (open space)

Grading. Implementation of the proposed project would require grading totaling approximately 8.6 million cubic yards.

Site Plan. The proposed project site plan is shown in Exhibit 3 (Illustrative Site Plan) and the proposed project land uses are summarized in Table 2-1 (Land Use Summary).

Table 2-1
LAND USE SUMMARY

On-Site	*Acres*	*Portion of Site*
Residential Lots	45.8	21%
Streets (private)	17.8	8%
Regional Park	90.0	41%
Restricted Scenic Preservation Easement	68.6	30%
Total	222.2	100%

2.3.2 General Plan and Zoning

Orange County General Plan

The project site is subject to policies contained in the following elements of the Orange County General Plan: Land Use, Circulation, Housing, Public Services and Facilities, Noise, and Recreation and Safety.

Land Use Element. The Land Use Element (adopted June 1982), designates the Saddleback Meadows project site as 1B (Suburban Residential, 0.5 to 18 dwelling units per acre [du/ac). The Community Profile, which is not a part of the General Plan, designates the site as 1.2 low-density residential (0.5 to 2.0 du/ac).

Housing Element. The Housing Element (adopted September 13, 1993) is a comprehensive statement of broad and specific policies to facilitate development of housing in the County. The project site is located in Regional Statistical Area (RSA) 43-C, for which the 1995 population was 190,700, the 2000 population

(projected in 1995) was 212,700 (2.3 percent growth), and the 1995 jobs-to-housing ratio was 3.80 (the highest in the County).

Affordable Housing. In 1979, the County adopted the Inclusionary Housing Program (IHP), which requires 25 percent of all new dwellings to be affordable category (i.e., cost 120 percent or less of the median annual income). In 1983, the IHP was replaced by the Housing Opportunities Program (HOP), which phased out mandatory requirements over a three-year period in favor of voluntary compliance with affordable housing objectives encouraged by County incentives and market forces. However, prior approvals of IHP-mandated affordable housing requirements were not rescinded and are still in effect.

A total of 26,907 mandatory affordable units have been required to date as part of General Plan amendments or zone changes. The vast majority of these (24,268) are found within planned communities, with the remainder scattered in conventionally zoned parcels.

The previously approved and recorded Final Tract Map 10692 was required in the IHP/HOP to provide 66 2/3 percent of total construction as affordable housing (mobile homes). Because this requirement was an original Condition of Approval, it still applies to the project.

Foothill-Trabuco Specific Plan

In December 1991, the County Board of Supervisors converted the then policy-level Foothill-Trabuco Feature Plan into the regulatory-zoning level Foothill-Trabuco Specific Plan. The Specific Plan sets forth goals, policies, land use district regulation, development guidelines, and implementation programs designed to preserve the area's rural character and to guide future development in Foothill-Trabuco area. To facilitate planning, three individual planning areas were created within the overall Specific Plan Area: the Upper Aliso Planning Area, the Trabuco Canyon Planning Area, and the Plano Trabuco Planning Area. The project site is located within the Upper Aliso Planning Area and is designated the "Bridlewood Residential District."

Exemption from Specific Plan. While the Foothill-Trabuco Specific Plan was adopted with the intent of guiding future land use within the Specific Plan area, its approval postdated that of tract Map 10692 by some 12 years. Accordingly, the current project, originally approved in 1979, is effectively exempt from the provisions of the Foothill-Trabuco Specific Plan.

The following passages are excerpted from the Land Use Regulations section of the Specific Plan:

> *As long as the site is developed in accordance with the existing Saddleback Meadows Planned Community zoning (Zone Change 84-3P) and Recorded Tract 10692, the project site shall be exempt from all of the Regulations and Guidelines included in this Specific Plan other than those provided for by this District.*
>
> *The Bridlewood Residential District is established to recognize the existing zoning and tract map approvals for the Bridlewood (Saddleback Meadows) property which permit the development of 705 manufactured homes on the site. While the board of Supervisors does not believe that these approvals are consistent with the Goals and Objectives of the Specific Plan, the property owner has recently declared bankruptcy. A legal stay precludes the board of Supervisors from taking any action related to the property that would affect its value. However, the provisions of this District require that the Specific Plan be amended to determine an appropriate density cap and District Regulations for the property in the event that it cannot be developed in a manner which is consistent with the approved zoning and tract map. (Foothill-Trabuco Specific Plan, p.III-20).*

Aliso Creek Corridor Specific Plan

The Aliso Creek Corridor Specific Plan (concept) (adopted in July 1978) outlines open space and recreational policies and programs for Aliso Creek and proximal surrounding area, from its headwaters in the Cleveland

National Forest to its outlet into the Pacific Ocean at Laguna Beach. The goals of the Aliso creek Corridor Specific Plan area as follows:

- The preservation of the natural character of the Aliso Creek Corridor from the forest to the sea, including the creek course and banks, irreplaceable resources and environmental features
- The utilization of the Aliso Creek Corridor as an organizer for various systems including, but not limited to, recreation, circulation, public service and development
- The provision of opportunities to provide for alternative means of transportation and recreation within the Aliso Creek Corridor utilizing bicycle, pedestrian, and equestrian trails, while minimizing conflicts with vehicular traffic along and across the corridor
- The utilization of the Aliso Creek Corridor as a regional recreation and open space amenity providing a variety of recreation opportunities
- Provision of a well-organized program designed to implement the Aliso Creek Corridor Specific Plan

Open Space/Recreation Requirement. The project site is partially located within the Aliso Creek Corridor Specific Plan, with the Specific Plan's boundary formed by the Aliso Creek watershed limits. The site is located within Subarea 33 of Planning Unit 5, and so is designated for open space and recreation land uses. In addition, the Concept Specific Plan shows a regional bike trail on-site.

Zoning

The entire project site is currently zoned "S"-Foothill-Trabuco Specific Plan with an "SR"-Sign Restriction overlay district. The Bridlewood/Saddleback Meadows Residential District was established within the Foothill-Trabuco Specific Plan, adopted December 1991, to recognize the existing zoning and tract map approvals for the Bridlewood/Saddleback Meadows property.

Required Zone Change. A zone change (ZC98-3) will be required to amend the Foothill-Trabuco Specific Plan ("Bridlewood Residential District") (Specific Plan Amendment), Page III-20 (Sections III.D.3.0 through 3.4). Although not a project-specific requirement, the County would be required to implement a General Plan Amendment to modify project-related affordable housing requirements no longer in effect. Once Zone Change 98-3 is adopted, the proposed project would be in substantial compliance with the Foothill-Trabuco Specific Plan.

2.4 Related Projects

Related projects are shown in Exhibit 4 (Related Projects) and listed in Table 2-2 (Related Projects). The additional related projects proposed within the County and surrounding jurisdictions since distribution of SEIR 566 and the Addendum 1 are asterisked on Table 2-2, and the cumulative impact analysis has been updated to reflect these related projects.

Table 2-2
RELATED PROJECTS

Project [b]	*Type of Development*	*Size*	*Status*
Saddle Creek/Saddle Crest*	Single-family residential	299 du	Pending
Live Oak Plaza	Commercial center	51,900 sf	Approved
Los Angeles Athletic Club*	Self-storage facility	77,095 sf	Approved
Mammoth Equities Office*	Office	49,000 sf	Approved
Painted Trails Residential	Single-family residential, private parks	578 du	Approved
Country Suites Hotel*	Hotel	118 rooms	Approved
Shea Properties*	Multifamily residential; apartments	230 apartments	Approved

Source: Development Resource Consultants, Draft Environmental Impact Report, County of Orange, No. 578, Saddle Creek & Saddle Crest Projects, December 2000.

** Not included in SEIR 566 or Addendum 1 (PA980103)*

du = dwelling units; sf = square feet

3.0 ENVIRONMENTAL SETTING

The natural environmental setting on the project site and in the surrounding vicinity of the project site has not substantially changed since Addendum 1 was prepared in 1998. All environmental setting descriptions in SEIR 566 and Addendum No. 1 remain valid. The environmental setting information contained in SEIR 566 and Addendum No. 1 is hereby incorporated by reference.

Additional Information. This Addendum No.2 contains additional updated information on traffic volumes and roadway improvements in the vicinity of the proposed project and additional information relative to the biological mitigation plan as a result of furthering discussions with the California Department of Fish and Game, the U.S Fish and Wildlife Service, and the U.S. Army Corps of Engineers.

4.0 ANALYSIS OF IMPACTS AND MITIGATION

The impact analysis in this Addendum No.2 discusses changes in impacts, as compared to the level of impact documented in Addendum No. 1. This section does not contain the full body of text from SEIR 566 or Addendum No. 1; however, those sections which are not duplicated herein are incorporated by reference. If no changes have occurred since Addendum 1, no further analysis is included herein or warranted.

Each of the following environmental factors has been re-evaluated to determine whether any additional project impacts or mitigation measures are required as a result of the implementation of the proposed project or changes in environmental conditions. A tabular summary is included for each environmental factor to document any change that may have occurred since Addendum 1 with respect to regional conditions, County conditions, impact thresholds, mitigation required, insignificant/significant impacts, and cumulative impacts. All mitigation measures contained in SEIR 566 and Addendum No.2 are hereby incorporated by reference.

4.1 Land Use and Planning

No Changes. As shown in Table 2-3 (Land Use and Planning), no changes in adverse project impacts on land use and/or planning have occurred since the completion of Addendum 1. No further impact analysis or additional mitigation measures are required.

Table 4-1
LAND USE AND PLANNING IMPACTS

Parameter	*Yes/No?*	*Status and Comments*
Changes in regional conditions?	Yes	Buildout of existing projects in the vicinity of Saddleback Meadows has continued to occur since completion of Addendum 1 to SEIR 566.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	No	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in significant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in cumulative impacts?	Yes	Additional related projects have been identified that could contribute to cumulative impacts, but no additional adverse impacts are anticipated.
New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	Addendum 1 to SEIR 566 remains valid.

4.2 Soils and Geology

No Changes. As shown in Table 2-4 (Soils and Geology), no changes with regard to project impacts on soils and geology have occurred since the completion of Addendum 1. No further impact analysis or additional mitigation measures are required.

Table 4-2
SOILS AND GEOLOGY IMPACTS

	Yes/No	*Status/Comment*
Changes in regional conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	No	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in significant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in cumulative impacts?	No	Addendum 1 to SEIR 566 remains valid.
New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	Addendum 1 to SEIR 566 remains valid.

4.3 Water and Hydrology

No Changes. As shown in Table 2-5 (Water and Hydrology), no changes with regard to project impacts on water and hydrology have occurred since the completion of Addendum 1. As indicated in Table 2-5 (Water and Hydrology), additional urban stormwater runoff requirements of the California Regional Water Quality Control Board (RWQCB) have been implemented and will be complied with as part of the RWQCB Section 401 certification requirements. No further impact analysis or additional mitigation measures are required.

Table 4-3
WATER AND HYDROLOGY IMPACTS

	Yes/No	*Status/Comment*
Changes in regional conditions?	No Yes	Additional urban stormwater runoff regulations have been adopted by the RWQCB, Los Angeles Region, which require on-site filtering on stormwater. The proposed project will comply with these state requirements.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	No	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in significant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in cumulative impacts?	No	Addendum 1 to SEIR 566 remains valid.
New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	All mitigation requirements will be designed into on-site open space areas.

4.4 Transportation and Circulation

A previous traffic study prepared by RKJK & Associates, Inc. on May 19, 1997 (based upon 1995 traffic counts) analyzed the impacts associated with the recorded tract map that included 705 manufactured housing units and 20,000 square feet of commercial retail use. According to the study, the recorded tract map (TR10692) would generate approximately 8,340 trip-ends per day.

The currently proposed project would include 299 single-family detached dwelling units and generate 3,588 trip-ends per day. This represents a decrease of 4,752 trip-ends per day over the previously recorded tract map (10692). A review of recent 24-hour traffic counts in the study area (including Santiago Canyon Road and El Toro Road) shows that actual volumes are generally less than those projected in the original traffic study for this time period. The reduction in traffic is likely due to the attraction of the Foothill Transportation Corridor (SR-241) which was not yet completed when the original traffic counts were taken in June of 1995.

For future Year 2020 traffic conditions, the forecast traffic volumes identified in the May 19, 1997 traffic study are consistent with two recently approved projects. These projects include Saddle Creek / Saddle Crest and Live Oak Plaza. The future Year 2020 traffic forecasts for both of these studies included the Saddleback Meadows project in their traffic analysis. In reviewing the mitigation measures proposed in these studies it can be concluded that the impacts of the currently proposed project (299 units) should be no greater than those for the initially proposed project (705 units). Therefore, no additional mitigation beyond those identified in the May 19, 1997 traffic study should be needed. It should be noted however, that any modification to the current mitigation will require a new traffic study.

Table 4-4
TRANSPORTATION AND CIRCULATION IMPACTS

	Yes/No	*Status/Comment*
Changes in regional conditions?	Yes	Addendum 1 to SEIR 566 remains valid.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	Yes	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in significant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in cumulative impacts?	Yes	Additional related projects have been identified that may generate additional incremental cumulative traffic.
New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	Traffic/circulation-related mitigation proposed in SEIR Addendum No.1 separately addresses cumulative traffic generation and mitigation.

4.5 Air Quality

No Changes. As shown in Table 2-7 (Air Quality), no changes with regard to project-related impacts on air quality have occurred since the completion of SEIR 566 Addendum 1. No further impact analysis or additional mitigation measures are required.

Table 4-5
AIR QUALITY IMPACTS

	Yes/No	*Status/Comment*
Changes in regional conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	No	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in significant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in cumulative impacts?	No	Addendum 1 to SEIR 566 remains valid.
New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	Addendum 1 to SEIR 566 remains valid.

4.6 Noise Analysis

No Changes. As shown in Table 2-8 (Noise), no changes with regard to project-related impacts on noise have occurred since the completion of SEIR 566 Addendum 1. No further impact analysis or additional mitigation measures are required.

Table 4-6
NOISE IMPACTS

	Yes/No	*Status/Comment*
Changes in regional conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	No	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in significant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in cumulative impacts?	No	Addendum 1 to SEIR 566 remains valid.
New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	Addendum 1 to SEIR 566 remains valid.

4.7 Biological Resources Analysis

No Changes. As shown in Table 2-9a (Biological Resources), no changes with regard to project-related impacts on biological resources have occurred since the completion of SEIR 566 Addendum 1. The biological resources mitigation program has been further refined since Addendum 1 has been prepared. The summary in Table 2-9b (Biological Mitigation Plan Summary) documents the current structure of the biological resources mitigation program. As outlined in Addendum No. 1 and SEIR 566, the biological mitigation plan will be implemented both on the project site and at offsite locations. The applicant is currently in the process of finalizing regulatory permits from the California Department of Fish and Game (CDFG), U.S. Fish and Wildlife Service (USFWS), and the Army Corps of Engineers (COE). No further impact analysis or additional mitigation measures are required.

Detailed biological mitigation plan features are described in detail in Appendix C, which includes the following documents:

- *Conceptual Mitigation and Monitoring Plan for CDFG Jurisdictional Areas*
- *Saddleback Meadows coastal California Gnatcatcher Surveys*
- *Viejo Conservation Bank Vernal Pool restoration/Creation Plan Outline*
- *Saddleback Meadows Riverside F airy Shrimp Mitigation Plan and Sampling Results*
- *U.S Army Corps of Engineers Wetland Mitigation Plan*

Table 4-7a
BIOLOGICAL RESOURCE IMPACTS

	Yes/No	*Status/Comment*
Changes in regional conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	No	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in significant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in cumulative impacts?	No	Addendum 1 to SEIR 566 remains valid.
New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	Mitigation measures have been further refined as a result of additional meetings and negotiations with CDFG, COE, and USFWS. See above discussion.

Table 4-7b
BIOLOGICAL MITIGATION PLAN SUMMARY

Habitat	Acreage Existing	Acreage Impacted	Acreage Mitigation	Mitigation Location and Comments
Venturan-Diegan Coastal Sage Scrub:				
Undisturbed	67.1	36.0	54.0	45.2 acres on-site
Disturbed	0	8.5	8.5	17.3 acres off-site (Edison property or Hidden Ranch Mitigation Bank)
Coast Live Oak Woodland	14.5	6.2 (181 trees)	18.6 (543 trees)	7.4 acres (200 trees) on-site; 11.2 acres (343 trees) off-site (Edison property or Hidden Ranch Mitigation Bank)
Ephemeral Ponds	0.48 (Ponds A, B,D,E,G)	0.40 (Ponds A, B,D,E,G)	1.28	1.20 acres excluding on-site preservation; 0.05 acres, Viejo Mitigation Bank
Mulefat Scrub	1.07	0.86 (includes 595 lf of drainages)	2.79	0.9 creation; 0.82 enhancement, Hidden Ranch
Vegetated Intermittent Non-Wetland Waters of the U.S.	3.16	0.17	2.31	O.17 excluding on-site preservation
Unvegetated Ephemeral Non-Wetland Waters of the U.S.	Included in 3.16	1.32	1.49	0.44 acres onsite; 1.05 acres off-site

4.8 Aesthetics

No Changes. As shown in Table 2-10 (Aesthetics), no changes with regard to project impacts on aesthetic resources have occurred since the completion of SEIR 566 Addendum 1. No further impact analysis or additional mitigation measures are required.

Table 4-8
AESTHETIC IMPACTS

	Yes/No	Status/Comment
Changes in regional conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	No	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.

New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	Addendum 1 to SEIR 566 remains valid.

4.9 Cultural and Scientific Resources

No Changes. As shown in Table 2-11 (Cultural and Scientific Resources), no changes with regard to project impacts on cultural and scientific resources have occurred since the completion of SEIR 566 Addendum 1. No further impact analysis or additional mitigation measures are required.

Table 4-9
CULTURAL AND SCIENTIFIC RESOURCE IMPACTS

	Yes/No	*Status/Comment*
Changes in regional conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	No	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in significant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in cumulative impacts?	No	Addendum 1 to SEIR 566 remains valid.
New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	Addendum 1 to SEIR 566 remains valid.

4.10 Recreation

No Changes. As shown in Table 2-12 (Recreation), no changes with regard to project impacts on recreation have occurred since the completion of the SEIR 566 Addendum 1. No further impact analysis or additional mitigation measures are required.

Table 4-10
RECREATION IMPACTS

	Yes/No	*Status/Comment*
Changes in regional conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	No	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in significant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in cumulative impacts?	No	Addendum 1 to SEIR 566 remains valid.
New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	Addendum 1 to SEIR 566 remains valid.

4.11 Hazards

No Changes. As shown on Table 2-13 (Hazards), no changes with regard to project impacts on hazards have occurred since the completion of SEIR 566 Addendum 1. No further impact analysis or additional mitigation measures are required.

Table 4-11
HAZARDS IMPACTS

	Yes/No	*Status/Comment*
Changes in regional conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	No	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in significant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in cumulative impacts?	No	Addendum 1 to SEIR 566 remains valid.
New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	Addendum 1 to SEIR 566 remains valid.

4.12 Public Services

No Changes (Noneducation). No changes with regard to project impacts on sheriff, fire, library, or solid waste services have occurred since the completion of SEIR 566 Addendum 1. No further impact analysis or additional mitigation measures are required for these services?.

No Changes (Education). As stated in Addendum 1, implementation of the proposed project would add 169 students to an already overcrowded Saddleback Valley Unified School District. Since completion of Addendum 1, additional projects have been proposed that may, with inclusion of the proposed Saddleback Meadows project, result in additional?? impacts on educational resources. Table 2-14 (Public Services [Education]) presents impacts with regard to only educational services.

Table 4-12
PUBLIC SERVICE (EDUCATION) IMPACTS

	Yes/No	*Status/Comment*
Changes in regional conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	No	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in significant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in cumulative impacts?	No	Addendum 1 to SEIR 566 remains valid.
New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	Addendum 1 to SEIR 566 remains valid.

4.13 Utilities and Service Systems

No Changes. As shown in Table 2-15 (Utilities and Service Systems), no changes with regard to project impacts on utilities and service systems have occurred since the completion of SEIR 566 Addendum 1. No further impact analysis or additional mitigation measures are required.

Water Supply. In addition, regarding water supply, the Saddleback property has been included as part of the Trabuco Canyon Water District's planning and facility development for many years. Further, as the Final Map that currently applies to the property reflects 705 units for the project site, this planning has exceeded the potential water use that would occur with implementation of the proposed project (299 units). No further analysis or additional mitigation is required.

Table 4-13
UTILITY AND SERVICE SYSTEM IMPACTS

	Yes/No	*Status/Comment*
Changes in regional conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in County conditions?	No	Addendum 1 to SEIR 566 remains valid.
Changes in impact threshold?	No	Addendum 1 to SEIR 566 remains valid.
Changes in mitigation required?	No	Addendum 1 to SEIR 566 remains valid.
Changes in insignificant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in significant impacts?	No	Addendum 1 to SEIR 566 remains valid.
Changes in cumulative impacts?	No	Addendum 1 to SEIR 566 remains valid.
New significant adverse impacts?	No	Addendum 1 to SEIR 566 remains valid.
Additional mitigation required?	No	Addendum 1 to SEIR 566 remains valid.

5.0 FINDINGS AND DETERMINATION

Less Impact. The impacts associated with implementation of the proposed project would be substantially less than those associated with the previously approved 705 unit manufactured home project evaluated in SEIR 566 and similar to those evaluated in Addendum 1 to SEIR 566 (299 detached single family units. Impacts on all environmental factors identified in Addendum 1 would be substantially similar to those evaluated in Addendum 2 to SEIR 566.

No Greater Significant Adverse Effect. No significant adverse effects would occur as a result of implementation of the proposed project beyond those identified in Addendum 1 to SEIR 566.

Transportation, Circulation, and Biological Resources. Updated information provided in this Addendum 2 on transportation and circulation and biological resources further expands upon data and mitigation programs contained in Addendum 1 to SEIR 566. Regional improvements (SR 241 – Foothill Transportation Corridor) to the circulation system in the vicinity of the proposed project would have substantially reduced traffic congestion at key intersections and substantially reduced the proposed projects level of impact to the regional circulation system.

Appendix A

PROJECT CHRONOLOGY

Appendix A

PROJECT CHRONOLOGY

Appendix A
SUMMARY LAND USE ENTITLEMENT PROCESSING CHRONOLOGY (1978 – 2001)

SADDLEBACK MEADOWS SEIR ADDENDUM 2

[Append A Master Summary Chronology (MB)]

August 1978

- ✓ The Board of Supervisors of Orange County (Board) approved General Plan Amendment 78-1. Final Environmental Impact Report (FEIR) #59 was prepared and certified in conjunction with plan amendment

March 1979

- ✓ The property owner submitted a Zone Change Application, Tentative Tract Map, and Initial Study requests for mobile home subdivision to Orange County.

December 1980

- ✓ The Board approved Tentative Tract Map 10692, calling for development of a 714-lot single-family mobile home/manufactured housing subdivision and a small commercial site.

June 1984

- ✓ The Board approved the Development Plan (2nd revised) for Saddleback Meadows. This plan called for the 705-lot mobile home/manufactured housing subdivision and 1.7 acres of neighborhood commercial use.

October 1984 through July 1986

- ✓ The Orange County Subdivision Committee approved a 589-day tolling of the deadline to record the Final Map for Tentative Tract 10692 in October 1984. This action extended the expiration date for recording the Final Map for Saddleback Meadows to July 1986.

July 1986 through November 1998

- ✓ Sewer Moratorium. The Final Map did not record on in July 1986 because on July 16, 1986, the Santa Ana Mountains County Water District imposed a sewer moratorium. This moratorium tolled the expiration deadline for the tentative map until the moratorium was lifted in November 1988.

December 1988

- ✓ Final Map No. 10692 was recorded, and associated improvement bonds and fees (in excess of $2,000,000) were paid.

1990 through 1993

- ✓ During this period the Saddleback Meadows property was involved in various thrift regulation, bankruptcy, and foreclosing proceedings.

December 1991

- ✓ The Board approved the Foothill/Trabuco Specific Plan, which incorporated for the Saddleback Meadows property the site plan and development standards of Final Map (10692)

April 1994

- ✓ California Quartet filed with Orange County (the County) a Grading Application GA940031 for a portion, approximately 98 acres, of the site.

August 1994

- ✓ The environmental Initial Study was completed for the Grading Application and County staff decided that an environmental impact report (EIR) was necessary.
- ✓ California Quartet filed a Letter of Appeal with the County, contesting the requirement for an EIR for the Grading Application.

January 1995

- ✓ After several postponements, two hearings were held before the Planning Commission regarding the appeal of the EIR requirement (on January 17, & 31, 1995).
- ✓ On January 31, California Quartet. Ltd. withdrew the appeal of the County's determination to require the preparation of an EIR and clarified its intent to pursue a project that is more environmentally sensitive than the approved (705-lot) Final Map. The Planning Commission directed the applicant to develop a more compatible project in response to public testimony, staff concerns, and the Planning Commissions' direction (a process that was to take approximately 120 days).

February-June 1995

- ✓ California Quartet initiated contacts with community residents and neighboring property owners and undertook an intensive data gathering and design process.
- ✓ On June 9, a meeting with staff of the U.S. Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG) was held at USFWS offices at Carlsbad to discuss environmental permitting.
- ✓ The initial design process continued from February through late June 1995. On June 30, California Quartet submitted a 318-lot proposal for informal review by County staff. The submittal was called a "Revised Site Development Plan for Saddleback Meadows."

July 1995

- ✓ California Quartet submitted a formal Planning Application to the County based on a revised project proposal for 318 lots. The Planning Application consisted of a zone change, Area Plan, and EIR 561.
- ✓ A Site Development Permit for geotechnical testing on the property was processed to permit continuation of geotechnical testing on the site after the County issued a stop-work notice1.

August -- December 1995

- ✓ County staff completed the Initial Study on August 11, and issued and a Notice of Preparation (NOP) of an EIR for the revised project.
- ✓ California Quartet conducted an additional work session with community residents on August 14, 1995.
- ✓ The County staff convened on August 24, 1995, a public meeting on the revised project in the form of a Public Scoping meeting in conjunction with the preparation of the Draft EIR.

---

[1] This exploratory work was performed to provide geological data for use in conjunction with the revised site development plan. The County determined that since this was a new application, the Saddleback Meadows project would have to abide by the geo-technical investigation requirements of the Foothill Trabuco Specific Plan. The Specific Plan requires a site development permit to allow geo-technical testing on any property contained within the boundaries of the Specific Plan area, although Final Map 10692 is exempt from the requirements of the Specific Plan.

- ✓ California Quartet arranged for and participated in meetings with representatives of the neighboring St. Michael's Abbey and other nearby property owners contacted all the neighboring homeowner's associations to arrange for meetings to review their potential concerns.
- ✓ In October 1995, California Quartet sent an informational mailer with detachable questionnaire to over 2,000 households in the area.
- ✓ California Quartet also contacted members of the Foothill/Trabuco Specific Plan Review Board.
- ✓ On October 15, California Quartet submitted the Application for Vesting Tentative Tract Map 15230 that was based on the revised site plan.
- ✓ On November 9, a work session was held at the Saddleback Meadows property. Attendees included representatives of the U.S. Army Corps of (ACOE), the CDFG, the County (Harbors Beaches and Parks), California Quartet, and environmental consultants. The purpose of the session was to familiarize environmental permit agency staff with the site and to identify issues and concerns to be addressed in processing permits with ACOE, USFWS, and CDFG.
- ✓ County's planning staff met with staff from USFWS and CDFG on December 15, 1995, to discuss the proposed Saddleback Meadows project

February 1996

- ✓ County environmental review staff filed a Notice of Completion of the Draft Environmental Impact Report (DEIR) and begins the public circulation and comment period on February 5, 1996.
- ✓ The County's Director of Planning discussed DEIR 561 at the Foothill/Trabuco Review Board meeting of February 16, 1996.
- ✓ The DEIR was delivered to the ACOE, CDFG, and USFWS on February 13, 1996. On February 26, 1996 a meeting was held to present the Saddleback Meadows DEIR (#561) to representatives of the environmental permitting agencies. This session was held at the Carlsbad offices of the USFWS and attended by representatives of the USFWS, CDFG, and ACOE.

March 1996

- ✓ California Quartet discussed the discussed proposed project at Foothill/Trabuco Review Board meeting on March 8, 1996.
- ✓ On March 19, the first Planning Commission hearing on the revised project proposal was held. The purpose of this first hearing was to afford the public an opportunity to comment on the Draft EIR document prior to the close of the 45-day public comment period (March 25, 1996).
- ✓ A second Planning Commission public hearing was held on April 2, 1996, at which California Quartet provided a detailed briefing on the proposal for a revised project.
- ✓ Letters commenting on the DEIR were received from the CDFG and USFWS on March 25, 1996.

May 1996

- ✓ On May 5, the third Planning Commission hearing was postponed due to County staff concerns about the Resource Agencies (USFWS and CDFG) sudden and unexpected reversal of their position on the location and design of the wildlife corridor.
- ✓ On May 8, a work session was convened with County Environmental Management Agency (EMA) staff regarding alternative wildlife corridor alignments. General and specific discussion regarding suggestions for design modifications with the applicant explaining the economic and financial ramifications of the suggestions and how they would render the project infeasible from an economic and development objective standpoint. EIR Alternative 7 was reviewed with particular focus on the

size and width concerns of the wildlife corridor, which had appeared to be the primary source of the EMA's concerns regarding the proposed project.

- ✓ On May 17, a work session was convened. Representatives of the ACOE, CDFG, USFWS and County staff discussed wildlife corridor design issues and Alternative 7. The resource agencies, primarily the CDFG, asked for significant changes in the wildlife corridor location/alignment and its design. These comments conflicted with earlier comments from the agency.
- ✓ On May 20, the same environmental agency representatives who attended the May 17, 1996, work session participated in a tour of the Saddleback Meadows property. The purpose of this tour was to visualize in the field what was discussed at the May 17 session.
- ✓ On May 23, the first meeting was held with new counsel representing St. Michael's Abbey. This meeting served to re-establish dialogue with applicant. The Abbey had suddenly, and without explanation, terminated discussion in November of 1995.
- ✓ Based on comments from May 17 and May 20 sessions with representatives of environmental agencies, several additional alternative development plans were prepared and presented to County planning staff on May 24, 1996.
- ✓ A meeting with County staff was held on May 28 to discuss further refinements of the alternative development plans.

June 1996

- ✓ Prior to the June 5, 1996, Planning Commission public hearing (this was to be the third hearing), EMA staff recommended that the Planning Commission approve a project with a reduced lot yield of 299 lots (to become known as Alternative 8.)
- ✓ On June 5, the third Planning Commission public hearing was held. EMA staff recommend Alternative 8 with 299 Lots, California Quartet, Ltd. countered with a version of Alternative 8 with 318 lots fitting within the same development footprint as the 299-lot project. The Planning Commission continued the hearing to July 10, 1996.

July 1996

- ✓ In early July the County Tax Assessor's Office approved a payment plan for resolving the former owner's property tax delinquencies that dated back to 1991.
- ✓ On July 10, the fourth Planning Commission public hearing was held. After the staff recommended approval of a 299-lot project, the matter was continued to July 30, 1996.
- ✓ On July 30, the fifth Planning Commission public hearing was held and the Planning Commission was unable to reach agreement on the lot yield. The Commissioners voted four times on varying lot yields ranging from 318 lots to 260 lots. However, a majority of the commissioners were in agreement on the proposed development footprint as depicted by Staff-recommended-Alternative 8. The Commission voted to recommend that the Board certify the EIR for the project.

August through September 1996

- ✓ On August 2, California Quartet, Ltd., appealed the Planning Commission action of July 30 because the Commission's failure to reach agreement on the lot yield represented a *de facto* project denial.
- ✓ On September 10, California Quartet submitted a revised site plan (Alternative 9) that had a lot yield of 318 lots to County staff and requested that this alternative be considered by the Board as a plan that better addressed the concerns and issues raised by the public and the Planning Commissioners at the previous hearing.

October 1996

- ✓ The Saddleback Valley Unified School District Board approved a school facilities mitigation agreement for Saddleback Meadows (October 2, 1996).
- ✓ The Board held on October 22 a public hearing on the appeal of Planning Commission decision of July 30, 1996. Supervisor Silva recused himself from voting on the project and the Board denied the Appeal. The Supervisors then considered a motion to approve a project with a density cap of 100 lots (EIR Alternative 4). The motion did not carry and, at the request of Supervisor Stanton, the Board directed staff to report back to the Board on the process to initiate a reversion to acreage on the Saddleback Meadows property, (i.e., remove the existing Recorded Final Tract Map).

November 1996

- ✓ On November 5, the Board heard a County staff report concerning the reversion to acreage procedure. The motion to initiate the reversion to acreage did not carry. Supervisor Saltarelli requested staff to inquire about the potential acquisition of the Saddleback Meadows property for public purposes. The Board did not certify the EIR.
- ✓ On November 7 and 8, California Quartet attempted to resubmit the Grading Application based on Final Tract map. The County staff refused to accept any applications for submittal of anything relating to Saddleback Meadows. The County had determined that the previous Grading Application filed in April 1994 had expired in 1995; therefore, a new application would be necessary to continue processing the Grading Application.
- ✓ On November 8, California Quartet received a letter from Thomas Mathews, the County Planning Director, concerning Supervisor Saltarelli's desire to explore possible full or partial acquisition of the Saddleback Meadows property. In response, California Quartet's counsel transmitted to County Counsel a draft of a proposed Tolling Agreement to extend the deadline for filing a legal challenge to the Board decision of October 5, 1996.
- ✓ On November 15, California Quartet's counsel submitted to the County a Demand Letter concerning the processing of a Rough Grading Plan Application which the project civil engineer had attempted to submit on November 8 and 9, 1996, and also submitted a letter regarding Settlement Discussions concerning the sale of Saddleback Meadows property for public purposes laying out the ground rules for such negotiations.
- ✓ On November 18, 1996 California Quartet provided County staff with several sketch studies, which presented reduced development areas and lot yields as requested by County staff.
- ✓ On November 26, 1996 the Tolling Agreement was executed between California Quartet, Ltd. and the County. The Tolling agreement was effective on November 21, 1996 and was to expire 180 days from the effective date (May 20, 1997).
- ✓ On November 27, California Quartet received a letter from County staff regarding California Quartet's attempt to file a Grading Application for Tract 10692. The letter stated that the application was not accepted by the County was because of a misunderstanding by staff and invited California Quartet to resubmit the application.

December 1996

- ✓ On December 3, the County staff accepted the Grading Application for Tract 10692 (705 lots), which was assigned Grading Application Number GA960048.

- ✓ On December 24, 1996 the County staff circulated a NOP for a Draft Subsequent Environmental Impact Report related to Grading Application GA960048, Tract Map 10692. This started a 30-day comment period.

February 1997

- ✓ Because of concerns related to processing technicalities, the County staff recirculated the NOP.
- ✓ On February 7, a meeting requested by County staff was held to discuss potential full/partial acquisition possibilities with applicant and representatives from the community and neighbors. Attendees from the community included two members, representatives from the Foothill/Trabuco Review Board; St. Michaels Abbey; the Vedanta Society/Ramakrishna Monastery, and the Hidden Ridge community
- ✓ On February 21, California Quartet made an informational presentation before the Foothill/Trabuco Review Board.
- ✓ On February 28, the County held a followup session to the February 7 session with the same group of representatives from the community to receive their feedback from the previous meeting.

April 1997

- ✓ On April 7, the County's Director of Planning & Development Services sent a letter to the Board summarizing the alternatives proposed by the landowner but not acted on by the Board in October and the results of several meetings that had been held to explore acquisition of all or a portion of the property.[2]

May – September 1997

- ✓ The EIR for the Grading Application for the 705-lot project was prepared and circulated for public and governmental agency review and comment

October 1997

- ✓ On October 22, the first Planning Commission public hearing was held to review certification of Subsequent EIR 566 to allow the grading and development to implement the recorded (705-lot) Final Map. The hearing was continued to December 3, 1998.

November 1997

- ✓ The Board discussed amending the standard appeal procedures for SEIR 566 that would allow the SEIR to be directly to the Board following certification by the Planning Commission (November 25, 1997). No decision was reached and the hearing was continued to December 9, 1997.

December 1997

- ✓ On December 3, 1997, the Planning Commission voted to certify FSEIR 561. On December 9, the Board held a first reading of "An Ordinance of the County of Orange providing for appeal of certain Grading Permits". The item was continued to December 16, at which time the Board failed to approved the ordinance change.

---

[2] Community representatives maintained that a 100-unit project clustered adjacent to El Toro Road was the maximum development acceptable. However, California Quartet indicated that the 100-unit alternative was not economically feasible. In this letter, the Planning Director reported that his understanding was that the landowner would entertain any offer to purchase (for preservation of open space) all or a portion of the property, even though the property was not being marketed. The Planning Director indicated that County staff was unaware of any viable sources of funds, private or public, for this purpose and expressed the opinion that further exploration of public acquisition was not warranted.

- ✓ On December 17, 1997, the Chair of the Planning Commission sent a letter to members of the Board regarding the Commissions recent certification of SEIR 566 on Saddleback Meadows and recommending that the Board revisit an alternative zoning designation for Saddleback Meadows, suggesting Alternative 4 in SEIR 566 (299 lots).
- ✓ On December 18, 1997, the Vedanta Society of Southern California filed a notice of appeal regarding the Planning Commission's certification of FSEIR 566.

January 1998

- ✓ On January 27, the Board held a hearing to consider the appeal of the Planning Commission's certification of SEIR 566, as filed by the Vedanta Society of Southern California. The hearing was continued for a month

February 1998

- ✓ Dialogue between California Quartet and St. Michael's Abbey was re-established on February 9, when counsel representing the "Saddleback Land Conservancy" transmitted to California Quartet an offer to purchase a portion of Saddleback Meadows for approximately $5.2 million. This offer was made prior to the February 24 hearing by the Board of an appeal of the Planning Commission approval of the EIR for the Grading Application for Recorded Tract Map 10692 (for 705 lots for mobile home or manufactured housing.).
- ✓ California Quartet transmitted a response to the Conservancy offer to the Deputy County Counsel's office, stating why the partial acquisition offer was rejected.
- ✓ The offer for partial acquisition of Saddleback Meadows became a point of discussion at the February 24, 1998, hearing before the Board on the EIR appeal. The Board deadlocked 2-2 on the appeal question, thereby failing to reverse the Planning Commission certification of the EIR.
- ✓ At the conclusion of the February 24, 1998, SEIR appeal hearing; Supervisor Spitzer expressed his desire to bring about a settlement between parties in connection with the Abbey's offer to purchase a portion of the property in return for a significantly reduced development project. It was agreed among the Supervisors that Supervisor Spitzer would provide the Board with an update report within 45 days (by April 14, 1998).

March 1998

- ✓ The first settlement/negotiation meeting with all the parties, including the Vedanta Society and County staff, was held on March 6, 1998.
- ✓ Following the meeting of March 6, California Quartet analyzed the feasibility of various reduced density/development envelope concepts. St. Michael's Abbey reviewed these alternatives during the course of those negotiations in conjunction with a potential partial purchase of the remainder property.[3]
- ✓ On March 6, 1998, the Vedanta Society filed a lawsuit challenging the validity of the EIR for the Grading Application, arguing that a majority vote of the Board was required to reject the appeal of the December 3, 1997, certification of the EIR for the Grading Application.

[3] The analyses of each of these concepts included performing conceptual site planning design, development cost studies, view and premium analysis, and finally running preliminary financial proformas for each of these scenarios. During the course of these negotiations, California Quartet determined that a reduced development alternative in conjunction with a partial purchase of the remaining open space areas by the Abbey could be made financially feasible under certain circumstances. Major deal points were the maximum development density, the purchase price of the open space, defining the development area, use of the open space for environmental mitigation needs of the project, restrictions on the purchased land for open space uses only, indemnification and release of liability relating to the purchased open space, and a guarantee of support for the project by the opposing parties.

- ✓ At a second settlement meeting (on March 23) California Quartet discussed reduced alternatives that had been analyzed since the last meeting while County staff unveils the "Mathews Plan" prepared by County staff.

April 1998

- ✓ A third settlement meeting was held at which California Quartet presented a modified version of the staff alternative (a.k.a. the "Modified Mathews Plan," 130-150 units).
- ✓ On April 14, Supervisor Spitzer provided Board members with a status update on the Saddleback Meadows negotiations.
- ✓ A working session with County staff was held at the County offices on April 20, to review geotechnical questions and concerns related to Staff alternative and the modified staff ("Mathews Plan"). Representatives of St. Michael's Abbey, including geologists, participated in this discussion.
- ✓ A fourth settlement session was held (on April 23, 1998) at which representatives of St. Michael's Abbey and the Ramakrishna Monastery discussed their concerns with geotechnical stability issues.
- ✓ California Quartet arranged an additional work session involving the geotechnical consultants to discuss and address the concerns raised in this meeting. Counsel to the Abbey conveyed the Abbey's latest offer in tabular form, offering different amounts for various scenarios, and requested California Quartet to return with a counteroffer at the next settlement meeting.

May 1998

- ✓ On May 4, California Quartet convened a working session involving the respective geotechnical consultants to discuss and review concerns raised by representatives of the Abbey and the Monastery. Unfortunately, no consensus was reached.
- ✓ At a fifth settlement meeting, California Quartet presented a response to the partial acquisition offer in tabular form. At this session, representatives of the Abbey and Supervisor Spitzer appeared to agree to a partial acquisition in the amount of $5.2 million in conjunction with a development program to be defined that would be larger than the County staff's proposal for a reduced development alternative and the California Quartet's proposed modification to the staff proposal. The Abbey was to provide $4.2 million, and $1.0 million was to come from the County[4].
- ✓ On May 26, California Quartet representatives attended a meeting at which the counsel for St Michael's proposed acquisition of the entire property for $12.2 million, with $10.2 million to come from the Abbey and $2.0 million from the County.

June 1998

- ✓ Supervisor Spitzer presented status report on Saddleback Meadows settlement negotiations at the Board meeting of June 2. The Board directed County Counsel and staff to prepare for consideration by the Board a settlement agreement containing the following "conceptual" terms:

  1) $1.5 million in appropriated County funds (referred to as the "Strawberry Field Funds") to acquire an interest in the property with the understanding that these funds were to be used only in conjunction with $10.5 million from St. Michael's Abbey to purchase the entire property. Escrow was to close on or before October 29, 1998, with the understanding that, if the "Strawberry Field funds" turned out not to be available, the development option would not be

[4] However, counsel representing the Ramakrishna Monastery rejected the idea of a modification to the staff-proposed development program. After a caucus among Supervisor Spitzer and representatives of the Abbey and the Monastery, the meeting concluded with Verlyn Jensen and Supervisor Spitzer making a combined cash offer of $8.0 million ($7.0 million from the Abbey and $1.0 million from the County) for the entire property.

triggered until the Board had had an opportunity to explore alternative funding. The County's contribution of $1.5 million was to be reimbursed if the property was used for a purpose that derives financial benefit;

2) Tolling of all litigation by St. Michael's Abbey and/or California Quartet;;

3) Immediate beginning by County staff of processing an amendment to the General Plan, amendment to the Specific Plan, Zone Change, Area Plan, and Tentative Tract Map applications and any other required plan/application for the 299-lot development plan to be considered for approval if the acquisition was not completed by October 29, 1998, and;

4) Cessation by California Quartet of processing any permits related to the 705-unit manufactured home subdivision (Final Map 10692) until October 30, 1998.

✓ On June 12, California Quartet received from St. Michael's Abbey a letter of intent regarding purchase and sale of the Saddleback Meadows property.

✓ On June 15, California Quartet formally requested that the County cease processing the grading plan check application based on Recorded Tract Map 10692 (705 units), in accordance with the conceptual terms of the settlement agreement referenced in the Board motion of June 2, 1998.

✓ On June 22, California Quartet submitted to the County applications for the Area Plan and Zone Change for the 299-lot "Contingency Plan" that would be adopted if St. Michael's Abbey failed to perform on acquiring the property.

✓ At the Board meeting held on June 23, Supervisor Spitzer provided Board Members with a Saddleback Meadows Settlement negotiations update and reported that St. Michael's Abbey apparently had decided not to follow through on its offer to work with the County to acquire the Saddleback Meadows property.

July 1998

✓ On July 3, the Saddleback Meadows Land Conservancy, Norbertine Fathers (St. Michael's Abbey) and the Vedanta Society of Southern California (Ramakrishna Monastery) transmitted to California Quartet a "Summary of Settlement Terms" and a "Supplemental Term Sheet" proposing partial purchase of the property for $5.2 million.

✓ On July 17, California Quartet provided a detailed response to the partial acquisition offer of July 3, 1998.

✓ On July 27, California Quartet provided a detailed analysis of the impact of "ridgeline protection" criteria proposed by the Vedanta Society. California Quartet surveyed and staked the edge of the "Vedanta Ridgeline" with 10'-tall white polyvinyl chloride (PVC) poles so that its view of the ridgeline could be seen and studied relative to the viewpoint of the Ramakrishna Monastery.

August 1998

✓ A site tour was held on August 10, to allow representatives of the Vedanta Society (Ramakrishna Monastery) to view the ridgeline on the Saddleback Meadows property. The purpose of the site visit and meeting was to discuss the issue of the "Vedanta Ridgeline Protection" proposal that, when physically interpreted, severely impacted the development envelope for the partial development alternative's so as to make the project financially infeasible.

✓ On August 11, Supervisor Spitzer provided other Board members with a status report on the Saddleback Meadows settlement negotiations and invited Supervisor Wilson to participate in the negotiations with him. Supervisor Wilson accepted and the next status report was set for October 6,

1998. This was the same date that the Board members designated as the deadline for reaching a mutually satisfactory agreement on the matter.

- ✓ On August 11, the USFWS and CDFG wrote an unusual joint letter to the Board commenting on the 299-lot Contingency Plan and also indicating they (the two agencies) had been informed by interested parties that a new clustered development alternative proposal, along with the purchase of significant open space on the site, had been offered to the property owner.
- ✓ On August 25, the Planning Commission heard the Area Plan and Zone Change application along with the Addendum to SEIR 566. The Commission voted to continue the item to October 7, the day after the deadline for the settlement negotiations and the next Board status report on Saddleback Meadows.
- ✓ On August 27, the sixth settlement negotiation session was conducted with both Supervisors Spitzer and Wilson involved. The main issue of discussion was protection of the ridgeline. This issue was not resolved during this session. The next negotiation session was scheduled for September 15, 1998.
- ✓ On August 28, counsel to the Vedanta Society sent to California Quartet copies of the Vedanta Alternate Study, consisting of a site plan prepared by its consultant engineer and site planner. The study showed a plan for 120 lots.

September 1998

- ✓ A meeting was held at the offices of the counsel to the Vedanta Society on September 10, at which representatives of California Quartet offered an analysis of Vedanta Alternative Plan as received by California Quartet on September 1, 1998.
- ✓ California Quartet provided a cost and revenues comparison impact analysis of the Vedanta Alternative Plan (120-lots) as compared to the Modified Staff Alternative (127-lots) on September 14, 1998.
- ✓ The seventh Settlement Negotiation Meeting was held at the County Hall of Administration on September 22, with Supervisors Wilson and Spitzer in attendance. Discussion focused on California Quartet's analysis of the Vedanta Alternative Plan and the Vedanta ridgeline protection issue. California Quartet explained how the Vedanta ridgeline protection proposal rendered the reduced development alternative financially unfeasible, unless the purchase price was increased to offset the additional costs and lost revenues that would result from an alternative that honored the ridgeline provision. Attorney Ed Connor informed the participants in this session that his clients would accept the Modified Staff Alternative (127-lots) without the ridgeline provision along with a total purchase price of $5.2 million (which would include $1 million from the County) so long as the area outside the 44-acre development bubble was not disturbed in any way (including fuel modification), despite the fact that "environmental mitigation" would be necessary outside the 44-acre development to accommodate fuel modification, geotechnical mitigation, and natural resource management.
- ✓ Ed Connor, counsel to Vedanta Society, submitted a letter to the County's Planning Director on September 23, 1998. The letter objected to the County's continued processing of the Contingency 299-lot Plan and alleged the County's failure to comply with the procedural requirements of the Foothill/Trabuco Specific Plan by failing to forward California Quartet's Area Plan and Zone Change Application to the Foothill Trabuco Specific Plan Review Board for its review and recommendations prior to the Planning Commission's consideration of the application.

October 1998

- ✓ On October 4, California Quartet delivered to Supervisor Spitzer's office an executed copy of a revised Memorandum of Understanding (MOU) between California Quartet and the Saddleback Meadows Land Conservancy.
- ✓ On October 5, 1998, counsel for St. Michael's Abbey transmitted another version of the MOU reflecting the "deal" reached at the September 22, 1998, meeting held at the County offices.
- ✓ On October 5, Supervisor Spitzer sent a memorandum to the other Board members providing an update on the Saddleback Meadows settlement negotiations.
- ✓ Deputy County Counsel Ben de Mayo sent on October 6, 1998, a memorandum to Members of the Planning Commission concluding that the Commission could take action on the Saddleback Meadows Zone Change and Area Plan prior to the Foothill Trabuco Specific Plan Review Board completing a further review of the project.
- ✓ William D. Ross, counsel for California Quartet, wrote on October 6, 1998, to Mr. Connor and Mr. Winton responding to Mr. Winton's offer letter dated October 5, 1998.
- ✓ On October 7, the Planning Commission heard the Area Plan and Zone Change application along with the Addendum to EIR 566. The Commission voted to recommend that the Board certify EIR 566 and approve the Area Plan and Zone Change.
- ✓ A Saddleback Meadows negotiation meeting called by Supervisor Spitzer's office was convened on October 30, 1998. Supervisor Spitzer pressed Katherine Swiss on the question of whether there was a commitment to acquire a portion of the Saddleback Meadows property. There was a mutual agreement that California Quartet would prepare a Conceptual Remedial Grading Plan based on the 127-lot reduced alternative and present it to the group prior to the November 24 Board of Supervisor's hearing on Saddleback Meadows.
- ✓ Attorney Winton distributed on October 31, 1998, his Draft of the MOU document, reflecting extensive changes compared to document signed by Pike Oliver on October 5, 1998.

November 1998

- ✓ At the Board hearing of November 3, Katherine Swiss (representing the Saddleback Land Conservancy) and Pike Oliver (representing California Quartet) executed an MOU for partial acquisition and development of the Saddleback Meadows property. The County did not or could not sign the MOU because County Counsel advised the Board not to do so until the proposed action was properly noticed. The Board continued the hearing to November 24, at which time the appeals for both the Tentative Tract maps and the Area Plan would be heard in conjunction with consideration of the acquisition agreement (i.e., Purchase and Sales Agreement).
- ✓ Attorney Connor filed on November 5, 1998, an appeal of the County Subdivision Committee's approval of the Contingency 299-lot Tentative Tract Maps on behalf of the Vedanta Society and the Saddleback Meadows Land Conservancy.
- ✓ Attorney Ross distributed the proposed Purchase and Sale Agreement for the partial acquisition and development alternative to the involved parties on November 17, 1998. This version incorporated revisions to the draft provided by Attorney Winton on October 31, 1998. California Quartet delivered copies of the Conceptual Remedial Grading Plan to Attorney Connor, Supervisor Spitzer, and County Planning Director Tom Mathews.

- ✓ A negotiation session was held at Supervisor Spitzer's office on November 18, 1998, to review and discuss the Conceptual Remedial Grading Plan and Winton/Connor's comments regarding the draft Purchase and Sales Agreement sent by Mr. Ross on November 17, 1998.
- ✓ The Board held a public hearing on November 24, 1998. The hearing dealt with the status of negotiations and appeal of the 299-lot Contingency Plan and related entitlement documents. Testimony was received and the public hearing closed, with final action continued to December 8, 1998.
- ✓ Attorney Ross sent a letter on November 25, 1998, on behalf of California Quartet to Attorney Winton responding to Mr. Winton's document entitled "Purchase Agreement for Real Property and Escrow Instructions for the Purchase of Saddleback Meadows (Spitzer-Wilson 44-acre Compromise)," dated November 23, consisting of 29 pages delivered November 24, 1998, by the Office of Supervisor Spitzer at approximately 5:30 p.m. in the hearing room of the Board prior to the hearing for the Contingency Plan for 299 units on the Saddleback Meadows property.

December 1998

- ✓ Attorney Ross sent a letter on December 1, 1998, on behalf of California Quartet to Attorney Winton regarding the preparation of the proposed Conservation Easement. Mr. Ross also explained to Mr. Winton that California Quartet had circulated a proposed Land Purchase Agreement reflecting the business terms set forth in an MOU dated November 3, 1998, between the Saddleback Meadows Land Conservancy, the County, and California Quartet. Instead of receiving Mr. Winton's responsive comments or a redlined version of the document with proposed changes, Mr. Ross's office received on November 24 a partial copy of a completely new draft agreement. Further, Mr. Ross pointed out how this agreement imposed an unrealistic and unattainable deadline.
- ✓ Attorney Ross sent a December 7, 199,8 letter to the Board responding to Attorney Connor's arguments supporting their appeals of the Planning Commission's action on the Area Plan and the Subdivision Committee's action approving the tentative tract maps.
- ✓ The Board considered the matter of Saddleback Meadows on December 8, 1998, and denied the Vedanta Society's appeals (on a 2-2 vote) upholding the Planning Commission and Subdivision Committee's approvals of the Area Plan and Tract Maps, respectively. The Board certified SEIR #566 and approved the appropriate Findings and Statement of Overriding Conditions. The Board also adopted the resolutions and ordinances approving the Zone Change for the 299-lot Contingency plan.
- ✓ The County Department of Planning and Development Services filed a Notice of Determination on the FSEIR, starting the 30-day statute of limitations for filing a legal challenge under the California Environmental Quality Act (CEQA) (December 9, 1998).
- ✓ California Quartet became aware of an e-mail message that was addressed to all Board Members of the Sea and Sage Chapter of the Audubon Society, inviting them to join in a lawsuit soon to be filed by St. Michael's Abbey, the Endangered Habitats League, and the Rural Canyons Conservation Fund (December 31, 1998).

January 1999

- ✓ A Petition for Writ of Mandate and Complaint for Declaratory Relief Verification was filed with the Orange County Superior Court (Superior Court) by the Endangered Habitats League on January 8, 1999.
- ✓ A Petition for Writ of Mandate and Complaint for Declaratory Relief was filed by the Norbertine Fathers on January 8, 1999.

- ✓ A site visit with representatives of the ACOE and a project biologist was held on January 13, 1999.
- ✓ Attorney Connor filed a Notice of Related Cases in Vedanta, Norbertine and Endangered Habitats Actions on January 21, 1999.
- ✓ Joint Status Conference Statement of all parties was filed with the Superior Court on January 22, 1999.

February 1999

- ✓ The Answer of Real Party-in-Interest was filed with the Superior Court by California Quartet in the Norbertine Action on February 16, 1999. Also, a Summons on Cross Complaint; Verified Cross-Complaint of Real Parties-In-Interest for Breach of Contract, Unfair Business Practices, Intentional Interference with Economic Relationship and Declaratory Relief was filed in the Norbertine Action.

March 1999

- ✓ A Stipulation and Order addressing the briefing schedule and the hearing date for the Motion for Summary Adjudication was executed by the parties to litigation and filed with the Superior Court on March 3.
- ✓ An amended Petition and Complaint was filed in Superior Court by counsel for the Endangered Habitats League on March 9.
- ✓ The Norbertines substituted counsel (replacing Ed Connor with Mary Hudson) on March 18.

April 1999

- ✓ The Superior Court consolidated the Vedanta, Norbertine and Endangered Habitat lawsuits by Minute Order on April 8, 1999. Also, the County agreed to provide the Petitioners with notice prior to the issuance of grading permits for the Saddleback Meadows property.
- ✓ Vedanta filed on April 23 a motion to dismiss all cross-claims by Real Parties in connection with the Norbertine action.

May 1999

- ✓ A Memorandum of Points and Authorities was filed by counsel for the Norbertines in support of their motion to dismiss the Cross Compliant filed by Real Parties on May 6, 1999, and Real Parties (California Quartet) filed an opposition to this motion on May 7, 1999.
- ✓ Vedanta filed their reply in support of their motion to strike California Quartet's cross complaint on May 12.
- ✓ California Quartet filed its opposition to Vedanta's motion to strike the cross complaint on May 27.

June 1999

- ✓ The Norbertines and Saddleback Meadows Land Conservancy filed their reply to the California Quartet cross complaint on June 2.
- ✓ California Quartet filed applications with the ACOE (Nationwide 404 Permit), State Water Quality Control Board (401 Permit), and CDFG (1603 Permit) on June 14.
- ✓ Judge Thomas of the Superior Court entered his judgement denying the California Quartet cross complaint.

July 1999

- ✓ The parties failed to reach agreement on a briefing schedule and the scope of the administrative record.

- ✓ A site visit with the ACOE and biologists employed by California Quartet was conducted on July 8.
- ✓ California Quartet waived the 30-day clock at request of the CDFG on July 15.
- ✓ The Regional Water Quality Control Board e-mailed a request for additional information on July 27.

August 1999

- ✓ The ACOE issued a request for additional information on August 3.
- ✓ Vedanta filed an amended complaint and request for declaratory relief with the Superior Court on August 9, and moved for summary judgment on the 2-2-vote issue on August 10.

September 1999

- ✓ California Quartet provided additional information to the ACOE on September 3.
- ✓ California Quartet filed its opposition to the Vedanta motion on the 2-2-vote issue on September 10.
- ✓ California Quartet provided a response to a request for information from the Regional Water Quality Control Board on September 29.
- ✓ Vedanta filed its reply to California Quartet's opposition to the motion on the 2-2-vote issue on September 27, 1999.

October 1999

- ✓ Vedanta filed a statement with the Superior Court concerning its motion for a summary adjudication of the 2-2-vote issue on October 15.
- ✓ The ACOE issued a verbal request for additional information on October 15.
- ✓ California Quartet provided additional information to the ACOE on October 22.
- ✓ A settlement agreement and release of all claims on the cross complaint was executed on October 15.

December 1999

- ✓ Superior Court Judge Thomas ruled that the 2-2 vote (on February 24, 1998) by the Board on the Vedanta appeal (of the December 7, 1997, Planning Commission certification of the Supplemental **(Subsequent??)** EIR for the Grading Application for the 705-lot project) had the effect of granting the Vedanta appeal.
- ✓ Vedanta filed a proposed order granting its motion for summary adjudication on the 2-2-vote issue.
- ✓ A meeting was held between the ACOE and consultant team and a site visit with the ACOE and project biologists was held on December 15.
- ✓ California Quartet filed on December 17 a draft Biological Assessment at the request of the ACOE as a prelude to the Section 7 consultation process.
- ✓ The County and California Quartet filed on December 29 their objection to the Vedanta draft of the court order.
- ✓ The Superior Court entered on December 30 its order on the 2-2-vote issue.

January 2000

- ✓ California Quartet filed a writ petition with the Fourth District Court of Appeal on the 2-2-vote issue on January 3.

- ✓ Vedanta filed on January 5 a motion to remove its remaining claims based on the rationale that the Superior Court ruling on the 2-2 vote issue has made them moot. On January 13, 2000, a site visit was conducted with the ACOE and the ACOE requested additional information
- ✓ Vedanta and the other colitigants filed an opposition to the California Quartet writ petition to the Fourth District Court of Appeal on January 18.
- ✓ California Quartet provided additional information to the ACOE on January 21.
- ✓ California Quartet filed opposition to the Vedanta motion for summary adjudication on January 25.
- ✓ The ACOE indicated on January 31 that it intended to deem the California Quartet application incomplete and require that a new application be filed.

February 2000

- ✓ On February 10, The CDFG informed California Quartet that the Section 1603 Streambed Alteration Permit application had been reassigned to new staff person, and that no review has been conducted since the application was filed.
- ✓ A meeting was held on February 15 between representatives of California Quartet and staff at the Los Angeles District Office of the ACOE at which the ACOE agreed to continue to process the Section 404 application if requested information could be submitted timely.
- ✓ The Regional Water Quality Control Board informed California Quartet on February 22 that the file has been reassigned to new staff person and that California Quartet's previous response could not be located.
- ✓ Judge Thomas of the Superior Court granted on February 23 the Vedanta motion for summary adjudication and dismissal of the remaining causes of action in the consolidated cases (Vedanta, Norbertine, Audubon, and Endangered Habitats.)[5]
- ✓ On February 29, California Quartet submitted to the ACOE an updated jurisdictional delineation report.

May 2000

- ✓ On May 10, consultants for California Quartet led a site visit of Saddleback Meadows and a potential off-site mitigation opportunity (Southern California Edison's Viejo property) that was attended by representatives of the ACOE, USFWS, CDFG, and State Regional Water Quality Control Board.

June 2000

- ✓ In June, California Quartet submitted to the ACOE and CDFG conceptual plans for biological mitigation at two off-site locations, Hidden Ranch and Southern California Edison's Viejo property.

September 2000

- ✓ On September 5, the ACOE submitted a request for a formal Section 7 consultation to the USFWS.

October 2000

- ✓ On October 10, consultants of California Quartet led a meeting attended by representatives from the ACOE, USFWS, CDFG, and State Regional Water Quality Control Board.
- ✓ On October 18, California Quartet's biologist gave a tour of the Saddleback Meadows property to the USFWS.

[5] The County and California Quartet (as Real Party In-Interest) had filed in January 2000 an appeal with the Fourth District Court of Appeal, thereby automatically staying implementation of Judge Thomas' order until the appellate court disposes of the appeal.

- ✓ On October 24, the USFWS acknowledged the ACOE's request and expected to provide a biological opinion by no later than January 22, 2000. The ACOE suggests that it is ready to issue a Nationwide Permit pending receipt of the USFWS's biological opinion.
- ✓ On October 30, the Fourth District Court of Appeal issued a 19-page decision upholding the Superior Court decision on the 2-2 vote issue, concluding that a majority vote of the Board is required to reject the appeal of the certification of the EIR for the Grading Application for the Final Map for Saddleback Meadows (the 705-lot project.)

November 2000

- ✓ On November 17, consultants of California Quartet met with the USFWS. The meeting was also attended by representatives of the ACOE and the CDFG. The CDFG announced that its project manager would soon be leaving. The USFWS requested that dry sampling for Riverside fairy shrimp cysts be conducted at the two breached ponds.

December 2000

- ✓ On December 7, California Quartet's biologists gave the CDFG a tour of the site with a focus on wildlife corridors.
- ✓ On December 20, additional biological information was submitted to the USFWS. Included are results of dry sampling, which found some cysts, but at very low density.

January 2001

- ✓ On January 3, 2001, the Fourth District Court of Appeal issued a remittatur, formally returning *Vedanta Society v. County of Orange* to the Superior Court.
- ✓ In December, the ACOE announced that its project manager responsible for the 404 Permit Application for the Saddleback Meadows project would be leaving. On January 10, 2000, a transition meeting was held between California Quartet's consultants and the ACOE staff.

EXECUTIVE SUMMARY

This Conceptual Mitigation and Monitoring Plan (Plan) provides project information, a conceptual mitigation plan, and a monitoring program for mitigation of impacted California Department of Fish and Game (CDFG) jurisdictional areas on the Saddleback Meadows property, located northeast of the City of Mission Viejo in Orange County. The impacts mitigated in this plan are based on delineations conducted in 1998 and 1999 by Chambers Group, Inc. and in 1995 by Sweetwater Environmental Biologists, Inc.

The 222-acre Saddleback Meadows project site contains approximately 8.24 acres, including 0.34 acre of ephemeral ponds, 4.32 acres of wetland vegetation and 3.58 acres of streambeds, subject to CDFG jurisdiction under Section 1600 et seq. of the California State Code. The proposed project would impact approximately 4.09 acres of CDFG jurisdictional areas, including 0.28 acre of ephemeral ponds, 2.37 acres of wetland vegetation, and 1.44 acres of streambeds. This plan has been developed with five specific objectives:

1) **On-site Wetland Preservation** - Within open space on site, maximize the protection, to the extent practicable, of existing jurisdictional areas (i.e., ephemeral ponds and drainages, along with surrounding wetland vegetation);

2) **On-site Wetland Creation** - Maximize on-site creation of ephemeral ponds and wetlands;

3) **On-site Streambed Creation** - Stream courses will be reconstructed in their original location as part of the remedial grading (this will occur within areas of remedial grading that are outside of the conventional grading limits);

4) **Off-site Wetland Creation, Enhancement, and Preservation** – Preserve, create, and enhance as much wetland vegetation in suitable off-site areas as is hydrologically feasible; and

5) **Off-site Streambed Preservation** – Mitigate remaining impacts to streambeds through acquisition of streambeds at an off-site location.

On site, mitigation for the loss of 0.28 acre of ephemeral ponds will be mitigated at a 3:1 ratio, or a total of 0.84 acre. A total of 1.01 acres of ephemeral ponds will be created. An additional 0.18 acre of vernal pools will be preserved, created, and/or enhanced on the Viejo Mitigation Bank site. The excess ephemeral pond mitigation totaling 0.35 acre (0.17 acre ephemeral pond and 0.18 acre of vernal pool) would be used to mitigate impacts to wetland vegetation. Impacts to 2.37 acres of wetland vegetation (1.54 acres of mule fat scrub, 0.73 acre of oak woodland, and 0.10 acre of sycamore woodland) will be mitigated at a 3:1 ratio with the on-site creation of an additional 2.78 acres of wetlands, the off-site creation of 2.25 acres of riparian habitat, the off-site preservation and enhancement of 1.73 acres of riparian habitat, and the aforementioned credit from the creation, preservation, and enhancement of vernal pools.

Creation of ponds and streambeds and the surrounding wetland vegetation on site requires the excavation, grading, and contouring in disturbed upland areas or areas disturbed by remedial grading to form basins or streambeds, and revegetating the margin of these areas with riparian cuttings, plantings and seeds of native understory species. The depth and shape of the constructed basins will be based on the contours of the existing ponds. In addition, soils from the bottom of the existing ponds will be collected prior to impacts and the collected soils will be used to innoculate the created ponds. Additional mitigation measures include the installation of fencing to deter vandalism and other disturbance of the mitigation site. Creation and enhancement of riparian and oak woodland habitat off site is proposed on the Hidden Ranch property and will focus on areas previously disturbed by years of cattle grazing.

Impacts to 1.44 acres of CDFG-jurisdictional streambeds will be mitigated for on site by the creation of streambeds within areas proposed for remedial grading previously supporting streambeds (0.44 acre), and off site by purchase of 1.0 acre of existing streambeds at either the Viejo or Hidden Ranch Mitigation Banks. Impacts will be mitigated at a 1:1 ratio for a total of 1.44 acres.

The Plan provides information on the construction, maintenance, and monitoring of the on-site mitigation area as well as a description of the project goals and final success criteria. The on- and off-site mitigation areas will be monitored for five years or until project specific success criteria outlined in this Plan are achieved.

I. INTRODUCTION

This Conceptual Mitigation and Monitoring Plan (Plan) provides project information, a conceptual mitigation plan, and a monitoring program for impacted California Department of Fish and Game (CDFG) jurisdictional areas on the Saddleback Meadows property, located northeast of the City of Mission Viejo in Orange County. Mitigation for these impacts is required under section 1600 et seq. of the California State Code. Impacts were determined based on site delineations conducted in 1998 and 1999 by Chambers Group, Inc. and in 1995 by Sweetwater Environmental Biologists, Inc. (SEB). Mitigation for impacts occurring to other sensitive habitats, plants, and wildlife present on the Saddleback Meadows property will be covered in separate documents.

The development of this Plan included the evaluation of several on-site alternatives, including:

1) Using flatter portions of the property with good hydrology for on-site drainage mitigation.

   This proposed alternative gives higher priority to using the flat portions of the site for the creation of ephemeral ponds.

2) Using uplands adjacent to existing drainages for on-site drainage mitigation.

   These uplands are occupied by southern sycamore woodland and coastal live oak woodland habitat. This proposed alternative gives higher priority to preserving these existing vegetation communities.

3) Reworking existing drainages in order to create new, larger drainages.

   The drainages not impacted by the project footprint are of the "higher quality" on-site drainages. In addition, due to the steep terrain, the opportunity to achieve a "net gain" would be minimal. This alternative would not provide measurable benefits for the level of disturbance it would require.

II. PROJECT DESCRIPTION

A. PROJECT LOCATION

Saddleback Meadows is a 222-acre site located in an unincorporated area of southeastern Orange County approximately 16 miles inland from the Pacific Ocean within the foothills of the Santa Ana Mountains (Figure 1). The parcel is situated on the northeastern side of Santiago Canyon Road, approximately 1,000 feet south of its intersection with Live Oak Canyon Road (S-19) in the Foothill-Trabuco area (Figure 2). The site is located on the U.S. Geological Survey Santiago Peak and El Toro 7.5 minute quadrangles.

An active creek (Aliso Creek) runs north and south along the western boundary of the site. Residential communities are located to the south and west, pasture land is located to the east, and Saint Michael's Abbey is located to the north. The property is actively used for horse and cattle grazing. The intensive grazing combined with the presence of highly erodable soils on site has, over the years, resulted in extensive habitat degradation in both upland and wetland habitats. Significant erosion has also occurred within the drainages on the site. The project site is mostly undeveloped except for a small corral in the central portion of the western half of the site, remnants of houses, and a few unmaintained roads.

B. PROJECT SUMMARY

The proposed project entails the development of 299 single-family residential lots, roads, and recreational trails on approximately 63 acres of the property. An additional 102 acres will be impacted by remedial grading. The development is concentrated in the north and south sections of the property, avoiding a steep ravine and its associated oak woodlands near the center of the property. The remedial grading areas will be recontoured to preconstruction elevations, revegetated and preserved as open space. A total of approximately 159 of the property's 222 acres will be dedicated in permanent open space, including 90 acres dedicated to the County of Orange as an extension of O'Neill Regional Park. Manufactured slopes extending outside of the fuel modification zones will be revegetated with native vegetation and dedicated as open space. The current project configuration has been designed to avoid as much of the wetlands on site as possible, and to provide for an east-west wildlife corridor through the property to off-site open space areas located to the east and west. This east-west corridor is a critical component of the County's Natural Community Conservation Program (NCCP).

C. EXISTING JURISDICTIONAL AREAS

Several delineations have been conducted of the Saddleback Meadows property to identify areas subject to CDFG jurisdiction (Figure 3). SEB biologists conducted a jurisdictional delineation of the site in August 1995, and Chambers Group biologists delineated the project site in April and May 1998, and March, August, and October 1999. The delineations covered riparian plant communities and ponds within the project boundaries. In addition, all drainages on the site were inspected for evidence of periodic surface flows. Additional information on the site delineations is available in the Jurisdictional Delineation of the Saddleback Meadows Property in Orange County (Chambers Group 2000).

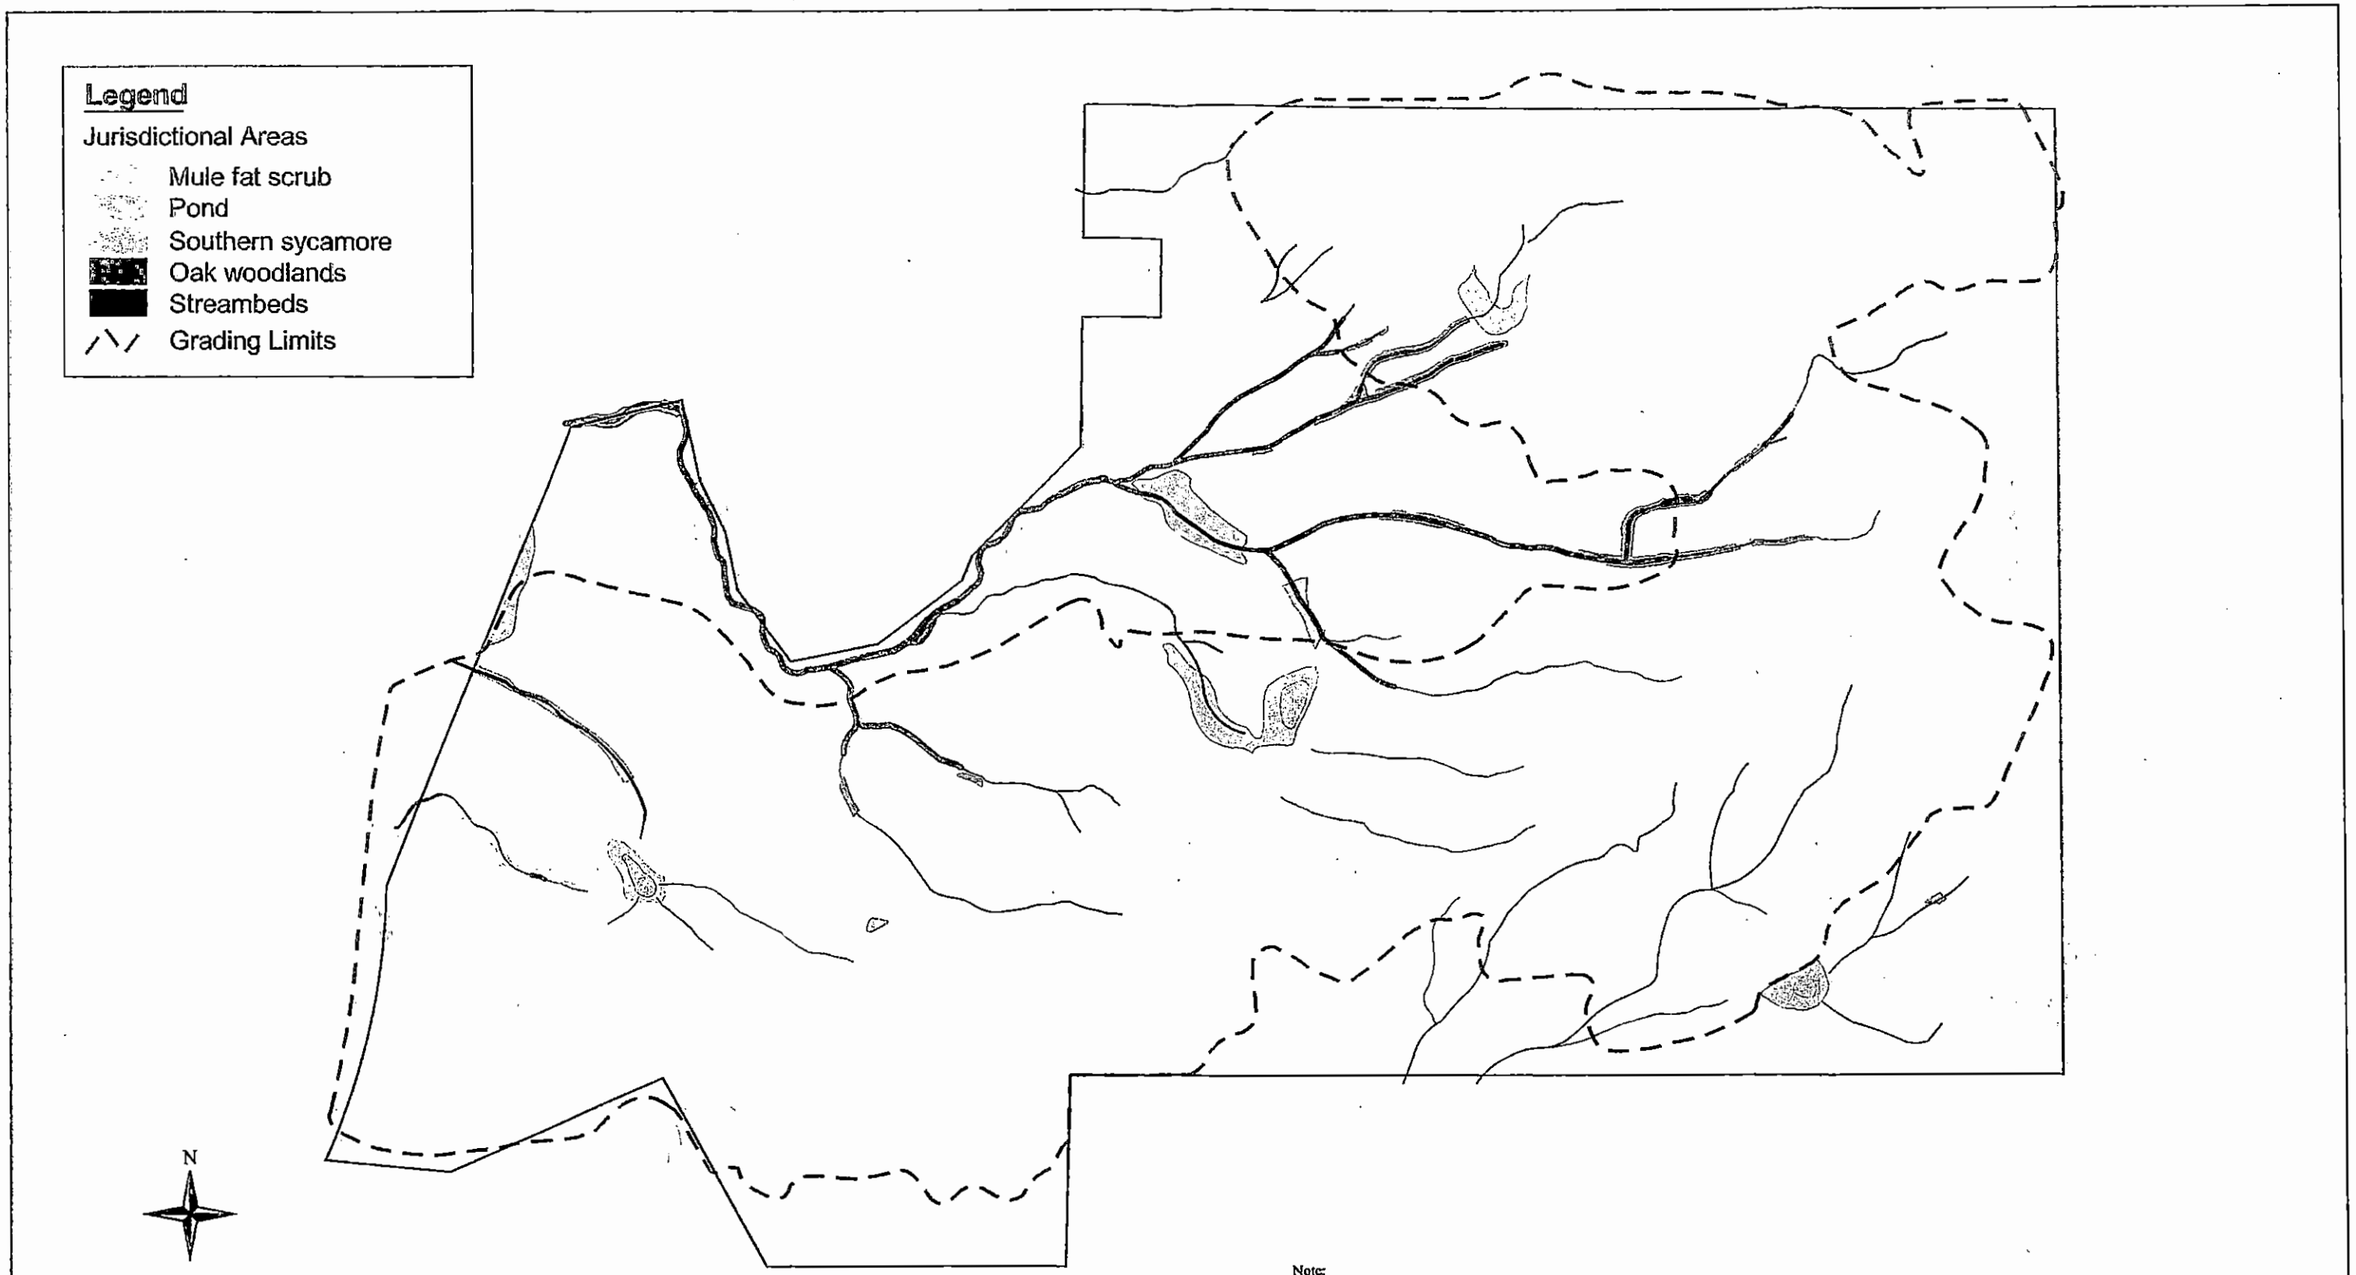
CDFG Jurisdictional Areas

A total of 8.24 acres on the site was determined to fall under CDFG jurisdiction (Figure 3; Table 1). CDFG jurisdiction is comprised of seven ephemeral ponds ringed by mule fat scrub, and patches of oak woodland, sycamore woodland, and mule fat scrub.

Table 1
IMPACTS TO CDFG JURISDICTIONAL AREAS

HABITAT	EXISTING (acres)	IMPACTS (acres)		
		Project Footprint	On-Site Mitigation Area	TOTAL
Ephemeral Ponds	0.34	0.28	–	0.28
Mule Fat Scrub	2.76	1.54	–	1.54
Oak Woodland	1.25	0.73	–	0.73
Sycamore Woodland	0.31	0.10	–	0.10
Streambed	3.58	1.34	0.10	1.44
TOTAL	8.24	3.99	0.10	4.09

Ephemeral Ponds – The site contains a total of nine stock ponds, two of which have breached and no longer retain water. The ponds are not natural, but rather man-made stock ponds created for cattle and other farming and ranching activities that have been present at the site for years. Four of the ponds, which are impoundments in otherwise natural drainages, are considered CDFG jurisdictional. The ponds



Source: Chambers Group Inc. February, 2000

Note:
This map is based on site conditions as observed at the time of our field investigations. The information presented herein was developed by visual inspection and/or aerial photograph interpretation. Note that both site conditions and applicable regulatory requirements may change.

Job No: CQL-02 Date: 8/24/00

CDFG Jurisdictional Areas

SADDLEBACK MEADOWS

Figure 3

are heavily degraded by cattle. For purposes of this analysis, it was assumed that the pond surface area extended to the maximum pond size based on the upper elevational limit of the dam that creates the pond. The ponds themselves are devoid of vegetation. Approximately 0.34 acre of ephemeral pond (calculated based on the sizes of the ponded basins) occurs on site.

Mule Fat Scrub - The mule fat scrub communities on site are, for the most part, associated with the ephemeral ponds and are essentially riparian "islands" within the surrounding upland communities. Mule fat (*Baccharis salicifolia*), in conjunction with arroyo willow (*Salix lasiolepis*) and red willow (*Salix laevigata*), also occurs along drainages on the site. Approximately 1.46 acres of mule fat scrub occurs along the edges of the ephemeral ponds; approximately 1.3 acres of mule fat scrub occur along two of the on-site drainages.

Oak Woodland– Approximately 1.25 acres of oak woodland, in association with mule fat, which extend beyond the banks of the drainage in the center of the property are considered CDFG jurisdictional.

Sycamore Woodland – Approximately 0.31 acres of CDFG-jurisdictional sycamore woodland occurs on the upper bench of Aliso Creek on site.

Streambeds – Approximately 3.58 acres of CDFG jurisdictional streambeds, which do not contain jurisdictional vegetation, occur on site.

D. JURISDICTIONAL AREAS TO BE IMPACTED

Implementation of the proposed project will impact a total of 4.09 acres of CDFG jurisdictional areas, including 0.28 acre of ephemeral ponds, 1.54 acres of mule fat scrub, 0.73 acre of oak woodland, 0.10 acre of sycamore woodland, and 1.44 acres of streambed (Table 1).

III. GOALS OF MITIGATION

The development of this Plan involved an iterative process that first focused on on-site preservation. Remaining on-site impact mitigation then focused on use of the flatter portions of the open space for creation of ephemeral ponds, with the surrounding area used for wetland creation. Other areas of on-site open space were also assessed for their potential for use as additional mitigation areas, including existing drainages. Widening existing drainages on site would result in greater impacts to wetland and upland habitats and were, therefore, not selected.

Remaining mitigation requirements are being met off site at two locations: the Viejo Mitigation Bank and the Hidden Ranch Mitigation Bank. The focus of mitigation on the Viejo site was the preservation, enhancement and creation of vernal pools, and the potential preservation of streambed and mule fat scrub. Mitigation on Hidden Ranch includes preservation, enhancement and creation of mule fat scrub, southern willow scrub, and sycamore/oak woodland. On site, two distinct areas were identified for mitigation: the area within the existing ranch compound that has been the most heavily disturbed and an area along the creek immediately upstream of the ranch compound that has been disturbed by long-term cattle grazing.

The Mitigation Plan has been developed with five specific objectives:

1) **On-site Wetland Preservation** – Within open space on site, maximize the protection, to the extent practicable, of existing ephemeral ponds and drainages, along with surrounding wetland vegetation;

2) **On-site Wetland Creation** - Maximize on-site creation of ephemeral ponds and wetlands;

3) **On-site Streambed Creation** - Stream courses will be reconstructed in their original location as part of the remedial grading (This will occur within areas of remedial grading that are outside of the conventional grading limits);

4) **Off-site Wetland Creation, Enhancement, and Preservation** – Preserve, create, and enhance as much wetland vegetation along the fringe of existing ephemeral basins and drainages as is hydrologically feasible; and

5) **Off-site Streambed Preservation** – Mitigate remaining impacts to streambeds through acquisition of streambeds at an off-site location.

The intent of this wetland mitigation is to create and enhance riparian, ephemeral pond, and vernal pool habitats on and off site to ensure no net loss of habitat values. The Plan also provides criteria and recommendations for the protection, enhancement, maintenance, and management of the natural resources located within the mitigation areas.

A. TYPE(S) OF HABITAT TO BE PRESERVED, ENHANCED, OR CREATED

Both on-site and off-site habitat preservation, enhancement, and creation are proposed and are outlined below. Table 2 summarizes the acreage totals for the mitigation program.

1. On-site Preservation

On site, approximately 159 acres of habitat located outside of the fuel modification zone will be preserved as open space, including 90 acres dedicated to the County as an extension of O'Neill Regional Park. This open space will include the preservation of 4.25 acres of the site's 8.24 acres of CDFG jurisdictional areas, and is comprised of 0.06 acre of ephemeral pond, 1.95 acres of wetland habitats, and 2.24 acres of streambeds. Several measures will be taken to minimize impacts related to construction and protect the biological values of this open space. Impacts to remaining open space will be minimized through project scheduling and construction monitoring and the (pre-construction) installation of high visibility orange fencing and silt fencing at the construction limits (where applicable). A delayed start date for the construction will allow for the salvage/collection of native materials such as mule fat cuttings from the development site. Mitigation will be initiated prior to project construction to minimize the temporal loss of wetland habitat functions and values.

The preserved areas will be protected in perpetuity as part of the dedicated open space for the project. These areas will be permanently fenced along the development edge to preserve their functions and values. Signs will be posted labeling the areas as sensitive habitat. These measures are intended to decrease potential impacts from humans and domestic animals. Any future measures required to protect the functions and values of the two remaining ponds will be undertaken as part of the regular open space maintenance.

2. On-site Pond Creation

Mitigation for the loss of ephemeral ponds will include the creation of approximately 1.01 acre of ephemeral ponds on site, a greater than 3:1 mitigation ratio. The on-site mitigation will occur in areas currently containing disturbed upland habitat, including annual grassland, and in a small area of non-jurisdictional mule fat scrub.[1] Mitigation in excess of a 3:1 ratio will be used towards the mitigation requirement for mule fat scrub (Figure 4).

[1] Mule fat scrub will be impacted by the expansion of one pond.

Table 2
IMPACTS AND MITIGATION FOR CDFG JURISDICTIONAL AREAS

HABITAT	IMPACTS (acres)	MITIGATION (acres)[1]										
		Ratio	Requirement	On Site		Viejo Mitigation Bank			Hidden Ranch			Total
				E	C	P	E	C	P	E	C	
Ephemeral Ponds	0.28	3:1	0.84	--	1.01	0.02[2]	0.04[2]	0.12[2]	--	--	--	1.19[3]
Mule Fat Scrub	1.54[4]	3:1	4.62	--	0.78	--	--	--	--	1.73[5]	1.24	3.75
Oak Woodland	0.73	3:1	2.19	--	1.70	--	--	--	--	--	1.01	2.71[6]
Sycamore Woodland	0.10	3:1	0.30	--	0.30	--	--	--	--	--	--	0.30
Streambed	1.44	1:1	1.44	--	0.44	1.00[7]	--	--	0.00[7]	--	--	1.44
TOTAL	**4.09**		**9.39**	--	**4.23**	**1.02[7]**	**0.04**	**0.12**	**0.00[7]**	**1.73**	**2.25**	**9.39**

1 P = habitat preservation, E = habitat enhancement, C = habitat creation.
2 Mitigation acreages are preliminary estimates.
3 Excess of 0.84 acre used to mitigate mule fat scrub.
4 Impacts occur to approximately 1.16 acre of mule fat scrub around the ephemeral ponds and 0.38 acre along two drainages.
5 Mitigation includes both preservation and enhancement.
6 Excess of 2.19 acres used to mitigate mule fat scrub.
7 Mitigation for 1.0 acre of streambed will occur through preservation of waters/wetlands on the Viejo and/or Hidden Ranch sites.

3. On-site Habitat Creation

Mitigation for the loss of jurisdictional habitats on the site will consist of 2.78 acres of habitat creation. Specifically, habitat creation on site would include 0.78 acre of mule fat scrub, 1.70 acres of oak woodland and 0.30 acre of sycamore woodland. This on-site mitigation will occur in areas currently containing disturbed upland habitat, including annual grassland and non-jurisdictional mule fat scrub.

4. On-site Streambed Creation

Mitigation for loss of CDFG-jurisdictional streambeds will be mitigated on site within areas of remedial grading that are outside of the conventional grading limits. In these areas, stream courses will be reconstructed in their original location as part of the remedial grading. This will result in approximately 0.44 acre of streambed mitigation.

5. Off-site Vernal Pool Enhancement, Creation, and Preservation

Preservation (0.02 acre), enhancement (0.04 acre), and creation (0.12 acre) of vernal pools (Table 2) is proposed off site within the Viejo Mitigation Bank (Figures 5 and 6). The focus of this portion of the mitigation will be to provide long-term preservation of existing vernal pools and their watersheds on the Viejo site, as well as provide for enhancement and expansion of some of the existing pools, and the creation of new pools where appropriate. At least one of the pools supports the federally listed as endangered Riverside fairy shrimp (*Streptocephalus woottoni*). Some of the created pools may be created deep enough to support this species. A final determination shall be made through the federal Section 7 Consultation process with the U.S. Fish and Wildlife Service (USFWS).

6. Off-site Wetland Enhancement, Creation, and Preservation

Additional mitigation requirements for impacts to wetlands will be met by the off-site creation of 1.24 acres of mule fat scrub, 1.01 acres of oak woodland, and the off-site preservation and enhancement of 1.73 acres of degraded mule fat scrub/riparian habitat within the Hidden Ranch Mitigation Bank (Figure 7). The remaining mitigation requirements for wetland impacts will be met through mitigation of ephemeral ponds in excess of a 3:1 ratio by the creation, enhancement, and preservation of vernal pools in the Viejo Mitigation Bank.

In the main drainage channel, the existing creek crossing will be expanded with additional pipes to allow a wider area of inundation upstream and downstream (Figure 8). Areas of the creek downstream of the existing crossing (Area 1) will be widened to the same grade as the existing channel. These areas will be considered U.S. Army Corps of Engineers (ACOE)/CDFG creation areas. The existing creek channel both downstream and upstream of the crossing (Area 2) will be enhanced and graded to within one foot of the existing creek channel to the east for use as a CDFG creation area. Another area (Area 3) will be graded down and restored along the smaller drainage to the east of the primary drainage. The area upstream of the crossing (Area 4) will be graded down to provide for ACOE and CDFG creation. Additional areas to the north of the compound (Area 5 and to the east), where the existing channel is of better quality but the channel has been degraded by cattle grazing, will also be used for ACOE and CDFG creation.

The existing channels will be enhanced by weeding and planting of mule fat and a limited number of willows. The areas in the ranch compound will need to be planted at similar densities to areas proposed for creation given the highly disturbed nature of the channel. CDFG creation areas will be planted based on Table 3 below. Temporary irrigation will be used for all but the existing stream channel areas.

Figure 8

Table 3 CALIFORNIA DEPARTMENT OF FISH AND GAME RESTORATION AREAS	
SPECIES	PLANTS PER ACRE
Mule fat (*Baccharis salicifolia*)	200
Mexican elderberry (*Sambucus mexicana*)	20
Western sycamore (*Platanus racemosa*)	40
Coast live oak (*Quercus agrifolia*)	20
California rose (*Rosa californica*)	50

It is anticipated that this restoration effort will be successful because the areas proposed for creation/enhancement occur within or adjacent to the existing channel, and the width of the proposed creation/enhancement areas is no wider than the existing vegetation within the channel upstream or downstream where cattle grazing has been eliminated.

7. Off-site Streambed Preservation

Remaining mitigation requirements for streambeds (1.00 acre) will be provided through acquisition of 1.00 acre of streambeds at either the Viejo or Hidden Ranch Mitigation Bank.

A summary of existing conditions, impacts, and mitigation for CDFG jurisdictional areas is provided in Table 3.

B. TIME FRAME

The wetland monitoring program for Saddleback Meadows will take place over a five-year period, after installation of the creation areas is complete. The success criteria described below for this project must be met by the end of this period (Section IV of this document).

IV. FINAL SUCCESS CRITERIA

This section provides standards to determine the successful completion of the habitat creation outlined above. Attainment of these standards indicates that the mitigation area is progressing toward the target functions and values specified for this Plan. The methods to be used to measure these success criteria are described is section VIII A of this document. If at any time functions in these areas do not appear to be meeting the performance standards set forth in this Plan, California Quartet will be responsible for taking timely remedial actions (as determined by the restoration specialists) to ensure compliance with the performance standards.

TARGET JURISDICTIONAL ACREAGE TO BE CREATED/ENHANCED

Implementation of this Plan will result in the creation of 1.01 acres of ephemeral ponds, 2.78 acres of wetland habitats and 0.44 acre of streambed on the project site. A total of 0.18 acre of ephemeral ponds will be preserved, created, and enhanced off-site. Additionally, 2.25 acres of wetland habitat will be created off-site, and 1.73 acres of existing off-site riparian habitat will be preserved and enhanced to improve its wetland function and value. Also, 1.00 acre of off-site streambed will be acquired.

V. PROPOSED MITIGATION SITE

A. LOCATION AND SIZE OF MITIGATION AREA

1. On-site Habitat Creation

The wetland creation area will be located on site in areas that are deemed suitable based on soils (i.e., soil texture, and structure), topography, location within the same watershed, and potential for wildlife use. Suitable on-site creation areas are limited; therefore, the creation of the ephemeral ponds is planned for these areas. Streambeds will be recreated within remedial grading areas previously supporting these channels.

Figure 4 shows the locations of the ponds, wetlands, and streambeds proposed to be created. The ponds will be modeled after those currently existing on the project site. The impoundment will be situated to collect surface flows from the surrounding native habitat to ensure that a self-sustaining, ephemeral pond is created. The sites selected for the proposed ponds are located within the same watershed as the present impoundments and in the open space preserve areas of the project.

2. Off-site Wetland and Ephemeral Pond Creation, Enhancement, and Preservation; and Streambed Preservation

Off-site creation, enhancement, and preservation areas will be located in the Viejo and Hidden Ranch Mitigation Banks within the County of Orange. The final location of wetland enhancement and preservation areas will be determined in consultation with the County of Orange and the CDFG.

B. OWNERSHIP STATUS

The project applicant California Quartet owns the proposed on-site mitigation area. Off-site mitigation areas are owned by Southern California Edison.

C. EXISTING HABITAT VALUES OF MITIGATION AREA

The pond and wetland mitigation areas currently do not have wetland habitat values. They consist primarily of disturbed upland habitats that have been degraded by many years of grazing. The streambed habitat values vary for the streambeds being impacted and restored within the remedial grading areas. A majority of these areas are unvegetated streambeds that have been degraded by the ongoing cattle grazing; a limited area supports vegetated streambeds.

D. PRESENT AND PROPOSED USES OF MITIGATION AREA

Currently, the on-site mitigation areas are undeveloped. All of the on-site mitigation areas are proposed for open space preservation.

E. PRESENT AND PROPOSED USES OF ALL ADJACENT AREAS

On site, areas immediately adjacent to the created wetlands will be preserved as open space, wherever possible. The remainder of the site will be developed into a residential complex.

VI. IMPLEMENTATION PLAN

A. RATIONALE FOR EXPECTING IMPLEMENTATION SUCCESS

Ephemeral ponds have been successfully restored or created at various locations in California. A recent review of vernal pool rehabilitation and creation projects in San Diego County determined that most of the pools created adjacent to existing habitat successfully sustained populations of *Pogogyne abramsii*, an obligate vernal pool plant, over a period of 5 to 10 years (Black and Zedler 1998). A review of the Del Sol Reserve vernal pool project in Santa Barbara County also demonstrated that pools created and restored in 1986 are self-sustaining and support native vernal pool plant species (Ferren et al. 1998). Surveys conducted in 1996 found that the density and composition of macroinvertebrate populations, including several species of fairy shrimp, in vernal pools constructed in Folsom, California in 1994 were similar to that of adjacent reference pools (Rogers 1998). Generally, created pools inoculated with propagules taken from adjacent or nearby vernal pool complexes were more successful in sustaining populations of vernal pool species. The ponds on the project site will be designed using the methods of past successful projects as guidelines.

Measures outlined in guidelines described by the USFWS (De Weese 1998) will be incorporated into the construction, maintenance, and monitoring of the created ponds to ensure their successful creation. These measures include:

- The mitigation site will be located in an area that currently supports ephemeral ponds and has appropriate soil types (same series). An adequate buffer (>100') will be created between the pond habitat and the preserve boundary.
- Excavation of side slopes and pond bottoms will mimic that of the existing ponds to duplicate hydrologic depth, surface area, and inundation periods.
- Two existing on-site ponds will be preserved and managed for use as reference ponds.
- Hydrology staff gauges will be installed within the constructed and preserved ponds to facilitate monitoring of inundation periods. The hydrology will be monitored weekly during the wet season.
- Riverside fairy shrimp and other invertebrate populations will be monitored in the created and reference ponds once a month while the ponds hold water.
- Water quality, including temperature, turbidity, and conductivity, will be monitored in the created and reference ponds.
- Regular maintenance inspections will be performed to monitor for uncontrolled human disturbance, trash, and unexpected conditions (erosion, water run-off pollution, etc.).

Overall, success of the Plan is expected based on the following rationale:

- Plant material (seeds, container plants and cuttings) to be used for the revegetation effort will be derived from on-site material, which is anticipated to be adapted to the site conditions. Cuttings collected from the development site will also preserve the genetic integrity of the willow, mule fat, oak and sycamore populations.
- The mitigation site is located within a system that supports coastal sage scrub, coast live oak woodlands, and riparian habitat. The existence of these habitats provides support for the conclusion that the wetlands can be sustained.

- Exotic species to be removed within the site will reduce competition with existing native species and plantings associated with the revegetation project and enhance the site's ecological value.
- Removal of cattle is also expected to reduce the level of disturbance to the site.
- The revegetation site will be planted with cuttings and container plants at a relatively high density and seeded with a native herbaceous seed mix, which would impede the recolonization of invasive non-native plant species.

B. RESPONSIBLE PARTIES

1. Project Proponent

California Quartet
c/o TPG Management
ATTN: Pike Oliver
777 Campus Commons Road, Suite 200
Sacramento, California 95825

The project proponent and owner will be responsible for financing pre-grading plan hydrological testing, installation, maintenance, and monitoring of the habitat creation. In order to ensure the success of mitigation, the project proponent will enter into a five-year, secured agreement with the CDFG to cover the projected cost to install, monitor, and report on the mitigation. This agreement should be in the form of a 120 percent bond. The bond should be structured so that portions of the bond may be released as interim milestones are met (subject to negotiation between the proponent and the CDFG).

2. Landscape Architect

A licensed landscape architect will be selected for this project. The landscape architect shall prepare the construction drawings to accompany this Plan. The construction drawings shall be reviewed and approved by the restoration specialist.

3. Restoration Specialist

Monitoring of mitigation site preparation and installation, as well as maintenance/technical monitoring after site installation shall be the responsibility of a biologist, landscape architect, horticulturist, or other person knowledgeable in native habitat restoration. After each visit, the restoration specialist shall provide the project proponent and installation/maintenance contractor with a written checklist of maintenance items in need of attention, if any. All requests for work that are in addition to a contractor's scope of work shall first be approved by the project proponent. The restoration specialist shall educate the installation and maintenance contractors with regard to mitigation goals and requirements and will be responsible for tracking and preparing all required reports for submittal to the CDFG.

4. Landscape Contractor

The landscape contractor must be educated as to the installation and maintenance of native plants. This contractor shall be responsible for completion of grading, pre-planting weed control, irrigation system installation, planting, seeding, and final as-built plans.

Once the restoration specialist has verified the completion of the previous list of items, a 120-day installation maintenance period will begin. The landscape contractor shall be required to maintain the entire mitigation area at least once a month during this period. The landscape contractor shall meet the

restoration specialist at the site, when requested, and shall perform all maintenance items in need of attention in a timely manner. Maintenance tasks include, but are not limited to, dead plant replacement, reseeding, irrigation system repair, and weed control. At the end of the installation maintenance period, the restoration specialist will certify completion of the installation contract, provided all installation and maintenance tasks have been completed. The project proponent may change contractors at its discretion.

After the installation contract is certified as complete, site maintenance will be conducted by the landscape contractor for the five-year monitoring period. The contractor is responsible for actual implementation of this Plan's specifications and shall maintain the entire mitigation area according to a specified schedule. Maintenance tasks include, but are not limited to, dead plant replacement, reseeding, irrigation system repair, and weed control. The landscape contractor shall meet the restoration specialist at the site, when requested, and shall perform all maintenance items in need of attention in a timely manner. The project proponent may change contractors at its discretion. The landscape contractor will coordinate closely with the restoration specialist to ensure that the specifications of the mitigation plan are properly implemented.

C. SCHEDULE

Grading is to be completed no later than December 31, 2000. Planting and then seeding shall occur between November 15 and February 15 to take advantage of winter rains. Since irrigation will be provided for the container stock, planting (but not seeding) could occur into spring, but extreme care would need to be taken not to trample the previously spread seed mix.

If for any reason the plant materials (seeds and container plants) are undeliverable or rejected by the restoration specialist, planting will be completed as soon as desirable materials are available and the planting season is appropriate. The preliminary schedule guidelines for mitigation activities are outlined in Table 4.

Table 4
PRELIMINARY SCHEDULE GUIDELINES FOR MITIGATION ACTIVITIES

Mitigation Site Contracts Schedule
• Contract with Restoration Specialist
• Contract for plant materials
• Contract with earthmovers, schedule pond grading
• Restoration specialist and construction contractors attend pre-construction meeting(s)
• Contract with landscape contractor
• Contract with landscape architect (if Restoration Specialist determines irrigation a necessity)
Mitigation Site Preparation (September through November)
• Surveyor identifies restoration areas (verified by Restoration Specialist)
• Grade grasslands and create pond/wetland contours (Restoration Specialist present during grading activities)
• Pretreat site for weeds, if necessary
• Remove non-organic debris and vegetation material under guidance of Restoration Specialist
• Transfer inoculum from impact area ponds to replacement ponds
Planting (November through February)
• Schedule plant materials delivery date and planting crew
• Verify planting scheme for landscape contractor
• Collect/salvage suitable plant material from development site
• Cuttings and container plants installed

Table 4 (cont.)
Planting (November through February) (cont.)
• Seed application
• Coordinate replacement plantings
• Install replacement plantings (monitored by Restoration Specialist)
• Install plant fencing (if herbivory is a problem)
Maintenance and Monitoring
• See guidelines outlined in Sections VII and VIII of this report
Documentation
• Revegetation specialist submits annual reports to the CDFG by January 1 each year following implementation

D. SITE PREPARATION

1. Wetlands and Open Space Remaining On Site

Recommendations are presented to protect biological and aesthetic values of the natural habitats within the project site that are not directly affected by the proposed project. Impacts will be minimized through project scheduling and construction monitoring. A delayed start date for the construction will allow for the salvage/collection of native materials from the development site such as mule fat cuttings. Ponds to be retained in open space will be protected from construction disturbance through construction fencing and silt fencing or other erosion protection devices around the construction limits to prevent the flow of sediment into the ponds. Mitigation will be started before project construction to minimize the temporal loss of wetland habitat function. Specific measures to protect sensitive resources are discussed below.

2. Pond Creation Areas

Fencing – Orange plastic snow fencing (or other similar device) will be used to define limits of grading. Where possible, fencing will be located no closer than 15 feet from the dripline of all trees identified for protection.

Grading – A grading plan will be developed for the new ponds based on their position in the watershed, and the contours of the existing ponds. The new ponds will mimic as closely as possible the depths and areas of the existing ponds. A study of the hydrogeomorphology and dynamics of the existing ponds is currently in process. The yearlong study will provide the detailed information needed to create the exact specifications for the proposed ponds. Variables included in the study are topography and bank contours of the existing ponds, periods of inundation over time, watershed, and water quality analyses. Soils at the proposed sites will also be tested for permeability characteristics. Rough grading contours will be deep enough to allow for the application of a surface soil layer removed from the existing ponds.

Erosion Control – Only non-vegetative erosion control measures may be used in areas with native vegetation. Such erosion control measures may include sandbags, soil binders, waterbars, trenches, or dissipators. These measures preclude the introduction of non-native weedy species into the seed bank of areas with native vegetation. Drainage and sedimentation control devices will be routinely cleaned, maintained, and repaired prior to and during the rainy season. All repairs to these systems will be immediately executed to minimize erosion problems.

Debris – Garbage and debris will be removed from all areas of the mitigation site. Dead or downed wood will not be removed except as required for safety reasons, flood control or fuel modification because they provide important microhabitats for small vertebrates and invertebrates.

Transplanting Inoculum– After finish grading of the relocation ponds, the upper 24 inches of soils from existing ponds will be collected and spread over the bottom of the relocation ponds in two layers. The top layer shall be 1" deeper than the cracks in the soil and the second layer will be the remaining depth to 24". It is essential that the top soil layer salvaged is placed on the surface of the created basins. Initial grading of the mitigation site must include over excavation to allow for placement of the salvaged soil. Relocation ponds must also support a sufficient prey base population. If ponds do not support sufficient algal populations they will be inoculated with resources from the original ponds.

Vegetation Replacement – If any vegetation is removed, it will be replaced through seeding, container plantings, or both.

3. Wetland Enhancement Area

Regular weeding of the preserved habitat at Hidden Ranch shall be conducted according to the Post Installation Schedule presented in Table 7.

E. PLANTING PLAN MATERIALS AND METHODS

The planting palette for mule fat scrub (Table 5a), oak woodland (Table 5b), and sycamore woodland (Table 5c) shall be based on the species composition of corresponding extant habitat. Plants selected for the wetland areas are based mainly on those species currently found around the perimeter of the existing ponds and streambeds. The pond basins are not currently vegetated; therefore, no vegetation will be placed in the basins of the created ponds.

Table 5a
MULE FAT SCRUB PLANT SPECIES PALETTE

COMMON NAME	SCIENTIFIC NAME	PLANTING OR APPLICATION RATE/ACRE	GROUPING SIZE

Yerba mansa	*Anemopsis californica*	12 lbs/acre	--
Western ragweed	*Ambrosia psilostachya*	6 lbs/acre	--
Nettle	*Urtica holosericea*	8 lbs/acre	--

[1] 5 gallon container stock
[2] 1 gallon container stock
[3] Pounds of pure live seed per acre

To ensure preservation of regional genotypes, cuttings will be collected from mule fat and willows in the existing ponds and drainages for the development of container stock. Optimally, vegetation will be collected during the fall months, when the weather is cooler and the vegetation is generally in a dormant or slow growth phase. After collection of seed and plant materials, planting will begin during the fall to take advantage of the rainy season.

Container stock will be as 1-gallon plants at elevations of approximately 4 to 12 feet above groundwater, and in natural groupings. In addition, the restoration specialist shall approve the final layout of all plant materials in the field prior to planting to ensure their correct ecological positioning (e.g., plants are not installed in rows).

All container stock shall be planted in a hole at least twice the diameter of the container and twice the depth. Backfill shall not be amended. The top of the root ball shall be set one inch above finish grade. A mulched zone shall then be established around each container plant, extending for at least 18 inches from the base of the plant. The mulch shall be two to four inches thick and must not come in contact with the collar of the plant. No fertilizers shall be applied.

Seeding will be done by hand, hydroseeding, or imprinting depending on the size of the area, slope, and surface topography. Mychorrizal inoculum will be applied with the seed mix.

Contract Growing and Plant Material Sources - Arrangements shall be made as soon as possible in advance of the expected planting date, either by the project proponent or the landscape contractor, to acquire container plant materials and seed required for habitat creation. An additional 10 percent of the total number of container plants and seed mix shall be procured in case replanting or reseeding is necessary. A copy of the plant material contract shall be submitted to the restoration specialist as verification of acquisition. Contract growing and seed collection shall be conducted by an experienced native plant nursery or seed company such as, but not limited to, Tree of Life Nursery, San Juan Capistrano, California; Mockingbird Nursery, Riverside, California; and/or S&S Seeds, Carpinteria, California.

It is preferred that the source of all plant material used at the site be from the drainages on site or as close to the site as possible. If necessary, the restoration specialist shall help the grower locate acceptable local sources for plant materials.

Substitutions - No species shall be substituted without approval from the restoration specialist. If the project proponent or installation contractor is unable to obtain the proper species (and sizes) specified by the time of planting, commencement of the 120-day installation maintenance period shall be delayed until all plants specified are in the ground. Substitution of plant material at the time of planting depends solely upon the discretion of the restoration specialist in consultation with the landscape architect. Any substitutions that are approved shall be documented by the installation contractor in the final set of as-built plans.

Plant Material Inspection - All plant materials shall be inspected by the restoration specialist and approved as healthy, disease free, and of proper size prior to planting. Overgrown, root-bound container stock will be rejected.

Container Plant Guarantees - All plants determined to be dead or terminally diseased shall be replaced by the installation contractor as soon as possible but no more than 90 days after installation. Plant replacement by the landscape contractor shall be completed as soon as possible but no more than 90 days following written direction by the restoration specialist. Unless substitutions are approved by the restoration specialist, the replacement plants shall be of the same species and at least the same size as

originally planted. All replacement plants shall be inspected by the restoration specialist and approved as healthy, disease free, and of proper size prior to planting.

Seed Guarantees - The installation contractor shall guarantee a 50 percent germination coverage rate for all seeded areas (based on visual assessment by the restoration specialist) at the end of the 120-day installation maintenance period. If there are particular bare areas, reseeding shall take place in those areas at the direction of the restoration specialist. The restoration specialist shall determine the timing and method for reseeding.

F. IRRIGATION PLAN

An irrigation system will be installed where necessary. The mule fat scrub will receive water from seasonal precipitation and should not need one. The oak and sycamore woodlands will require irrigation for plant establishment. Supplemental hand watering shall be applied if necessary to prevent the mortality of seedlings. Care will be taken to avoid water entering into the pond basins to avoid triggering of fairy shrimp hatching at an inappropriate time of year. Supplemental irrigation is only expected to be used for the first three years, or less, of the five-year monitoring period. During the final two years, the restoration specialist shall determine whether or not irrigation is necessary.

G. AS-BUILT CONDITIONS

At the end of the installation phase of the project, the installation contractor shall prepare as-built plans of the mitigation area. The as-built plans will document the conditions of the site as they exist at the completion of the installation. These plans will include an as-built topographic map and show areas of grading, planting, and seeding. The restoration specialist will review these plans for conformance with this Plan's technical design criteria, CDFG permit conditions, and project objectives. Any differences found between the original design and the as-built conditions will be fully assessed and documented by the restoration specialist through field maps, photographs, and descriptive text. It is expected that modifications of the original plan will have occurred due to post-mapping changes in project design as well as unforeseen changes resulting from site conditions. Any changes in the plan shall be justified to and accepted in writing by the restoration specialist and the California Quartet before the as-built conditions are approved.

A report of the "As-Built Conditions" shall be submitted by the restoration specialist to the CDFG within six weeks of completion of site preparation and planting. If grading, planting and erosion control measures are not completed within six weeks of each other, separate reports for each activity will be submitted.

VII. MAINTENANCE DURING MONITORING PERIOD

A. MAINTENANCE ACTIVITIES

1. General Maintenance

All contractors shall be informed of the specific mitigation goals and maintenance requirements of this project. Maintenance efforts will focus on ensuring that the created ponds retain water consistent with the conditions of the existing ponds.

Only construction equipment necessary to accomplish the mitigation installation shall be allowed on the mitigation site, and each piece of construction equipment shall be removed from the site as soon as its task is complete. No vehicular fluids shall be added or changed on site. Once plant installation and

seeding has begun, no vehicles shall be allowed on the mitigation site. Workers' personal vehicles shall be parked outside the mitigation area. The mitigation site shall be kept free of garbage.

No power tools shall be operated on the mitigation site from March 15 through July 15. Only activities that can be performed with non-power tools shall be allowed during this period. This time period coincides with the breeding season of many sensitive riparian bird species.

Damage to plants on the mitigation site as a result of unusual weather or vandalism shall be repaired as directed by the restoration specialist. Such repairs shall be paid for by the project proponent. Any damage caused by a contractor's inadequate maintenance, as determined by the restoration specialist, shall be repaired by the contractor at its expense.

2. Fencing

California Quartet will be responsible for the maintenance of the perimeter fence. Additional, protective measures such as tree tubes and placement of cages or screens around individual plants will be used in areas subject to trampling, herbivory, or other threats as determined by the restoration specialist. All protective devices shall be maintained through completion of the monitoring period or until removal is authorized by the restoration specialist.

3. Weed Control

Weed control shall be conducted monthly by the installation contractor and per the schedule outlined in this document for the maintenance contractor, or as necessary, to minimize competition that could prevent the establishment and growth of native species. Weeds shall be removed for a minimum of 4 years or until plantings are well established to prevent detrimental competition of invasive species with the mitigation plantings for water, nutrients, light, and space. Maintenance personnel shall be trained to distinguish weed species from desirable native vegetation. All weeds shall be removed mechanically. No herbicides shall be applied in the wetlands adjacent to the ponds.

A mulched area 18 inches from the base of each container plant shall be maintained to minimize competition from weeds, except within basins. This mulch will be maintained during the establishment period (120 days following certification of the installation contract), or until plants reach 2 to 3 feet in height. Table 6 lists examples of weeds that need to be controlled at the mitigation site.

4. Disease and Pests

Damage-causing insects, high levels of herbivory, and diseases shall be monitored by the installation and maintenance contractors during their maintenance periods. Generally speaking, a high threshold of tolerance will be permitted before chemical/lethal control measures are considered. All specific recommendations will only be made by a licensed pest control adviser as required by law. All applicable federal and state laws and regulations will be closely followed. The CDFG and restoration specialist will be consulted on any pest control matters.

5. Pruning

No pruning shall be done unless directed by the restoration specialist.

Table 6 WEED SPECIES LIST*	
SCIENTIFIC NAME	COMMON NAME
Arundo donax	giant reed
Brassica nigra	black mustard
Carpobrotus edulis	hottentot fig
Cortaderia selloana	pampas grass
Cynara cardunculus	artichoke thistle
Cynodon dactylon	Bermuda grass
Eucalyptus spp.	eucalyptus species
Foeniculum vulgare	sweet fennel
Myoporum laetum	myoporum
Rincinus communis	castor bean
Schinus terebenthifolius	Brazilian pepper tree
Silybum marianum	milk thistle
Tamarix spp.	tamarisk species
Washingtonia robusta	Mexican fan palm
Xanthium strumarium	cocklebur

*This species lists some common wetland weed species. Other weed species may occur at this mitigation site.

6. Trash Removal

Following rain events, trash and debris may enter the creek from storm drains. Trash shall be removed during regular maintenance events by the installation and maintenance contractors during their respective maintenance periods.

B. RESPONSIBLE PARTIES

The project proponent (California Quartet) will be responsible for financing the maintenance program. The landscape contractor will conduct maintenance efforts and will submit regular maintenance reports to the project proponent.

The project proponent may choose to legally transfer the property in fee title (subject to agency approval) to a public or private entity specializing in long-term management of open space. If such a transfer occurs, this entity would become the responsible party for implementing the maintenance program.

C. SCHEDULE

During the 120-day installation maintenance period, the installation contractor shall be required to maintain the entire mitigation area at least twice a month. Once the 120-day installation maintenance period is over, the area will be maintained by the maintenance contractor according to the schedule in Table 7. Specific items evaluated during maintenance events will include the presence of weeds, trash, vandalism, irrigation function and scheduling, and plant material condition.

Table 7 MAINTENANCE SCHEDULE	
PHASE	**SCHEDULE**
120-day Installation Maintenance Period	Bi-weekly
Post-Installation Maintenance Period	
February-May	Bi-weekly
June-January	Monthly

The restoration specialist shall begin monitoring during the grading/site preparation and installation phases and shall then continue monitoring through the post-installation phase according to the schedule outlined in Table 8. The restoration specialist shall file a written monitoring report with the project proponent and landscape contractor after completing each inspection. Each of these reports shall identify maintenance concerns including, but not limited to, plant mortality, vandalism, and weed-related issues, and shall provide recommendations to the maintenance contractor regarding any changes to the maintenance program. These monitoring reports will be included as part of the annual report to the CDFG.

Table 8 MAINTENANCE MONITORING SCHEDULE FOR THE RESTORATION SPECIALIST	
PHASE	**SCHEDULE OF INSPECTIONS**
Grading/Site Preparation	2 times per week
Installation	Daily
Post Installation	
Year 1	Monthly
Year 2	February, March, April, May, June, September, December
Years 3-5 (or until performance standards have been met)	Quarterly

VIII. MONITORING PLAN

A. PERFORMANCE CRITERIA

Performance criteria are specific standards by which to evaluate the progress and success of the mitigation during the five-year monitoring period. The standards are based on a reference site. Three categories of interim success criteria shall be analyzed: species diversity, cover by weeds, and cover by native species. The annual milestones for these parameters are presented in Table 9.

Table 9 ANNUAL SUCCESS CRITERIA MILESTONES[1]					
CRITERIA	YEAR				
	1	2	3	4	5
Species Diversity	40	50	60	70	80
Cover by Weeds[2]	140	130	120	110	100
Cover by Native Species[2]	60	70	80	90	100

[1]Values are percentages as compared with the reference site.
[2]Percent total cover.

B. MONITORING METHODS

Annual monitoring will be performed by the restoration specialist or by a qualified biologist with appropriate experience in site monitoring and transect measurements. This monitoring will include qualitative observations of overall plant survival, vigor, and recruitment, the status of irrigation, trash, and weeds, and the presence of wildlife species. In addition, monitoring will include quantitative measurements of native and non-native plant growth. Using the same techniques, a designated reference site will also be sampled so that comparisons can be made between the functions and values of the mitigation site and previously existing habitat. The reference site shall be located on site.

Vegetation monitoring will be conducted for the restored habitats created along riparian corridors and the margins of the created ponds. Observations of plant health and vigor will be made and compared to observations of plant health and vigor of the preserved habitats. All species that occur within the habitat, along with percent cover of native shrubs and annuals and non-native species, shall be noted separately for each area. In addition to the observations and measurements described above, several permanent stations for photo-documentation shall be established in each habitat type and annual photographs taken.

1. Species Diversity

Species diversity usually increases with recruitment of new native species from the surrounding native habitats. The effect of recruitment on diversity should allow the mitigation to approach the level of species diversity at the reference site. After five years, the mitigation site should reach 80 percent of the species diversity of the reference site.

2. Cover by Weeds

Many weeds have become naturalized, and therefore, the weed cover should reflect (or be less than) what is present at the reference site. Although weeds are expected, they should not be allowed to get out of control on site. Weeds should be controlled during site maintenance.

3. Cover by Native Species

Cover by native vegetation should increase over time and ultimately approach that of the reference site. With sufficient site maintenance, proper irrigation, and natural rainfall, native vegetation cover should approach 100 percent of the reference site in five years.

C. ANNUAL REPORTS

Annual reports on the status of the project mitigation shall include an assessment of the site's status relative to yearly target criteria as well as overall site progress toward final success criteria. These reports will also include the following:

- a list of names, titles, and companies of all persons who prepared the content of the annual report and participated in monitoring activities for that year;
- a copy of the CDFG permit and any attachments including Special Conditions and subsequent Letters of Modification;
- an analysis of all qualitative and quantitative monitoring data;
- copies of all monitoring photographs; and
- maps identifying monitoring areas, transects, planting zones, and so forth as appropriate.

Remedial recommendations, if necessary, shall be made in the annual reports as well as a summary of whether or not the mitigation is meeting the success criteria for the appropriate year.

D. SCHEDULE

Monitoring and performance criteria will be tied to implementation. The first annual monitoring event will occur in June after the first full growing season. Annual technical monitoring reports shall be submitted to the CDFG by the end of August of each year to ensure that there is adequate time remaining in the dry season to implement any necessary contingency measures.

IX. COMPLETION OF MITIGATION

The project proponent shall notify the CDFG upon completion of the mitigation effort through the submittal of the final annual technical monitoring report. The final report shall include a jurisdictional delineation of the mitigation areas. This delineation must show that the goals of the mitigation (as described in section III of this document) have been met.

Performance standards may be waived by the CDFG in any area if monitoring indicates that good growth and functional habitats are otherwise achieved. If performance standards cannot be met because of adverse soil or other unmanageable site conditions, an alternative or auxiliary mitigation plan may be submitted to the CDFG for approval.

Saddleback Meadows Project

2000 Dry Season Fairy Shrimp Sampling Results

INTRODUCTION

This report presents the findings of dry season fairy shrimp sampling conducted in two locations on the Saddleback Meadows site. Saddleback Meadows is a 222-acre site located in an unincorporated area of southeastern Orange County approximately 16 miles inland from the Pacific Ocean within the foothills of the Santa Ana Mountains (Figure 1). The parcel is situated on the northeastern side of Santiago Canyon Road, approximately 1,000 feet south of its intersection with Live Oak Canyon Road (S-19) in the Foothill-Trabuco area (Figure 2). The site is located on the U.S. Geological Survey Santiago Peak and El Toro 7.5 minute quadrangles.

An active creek (Aliso Creek) runs north and south along the western boundary of the site. Residential communities are located to the south and west, pasture land is located to the east, and Saint Michael's Abbey is located to the north of the project site. The property is actively used for horse and cattle grazing. The intensive grazing combined with the presence of highly erodable soils on site has, over the years, resulted in extensive habitat degradation in both upland and wetland habitats. Significant erosion has also occurred within the drainages on site. The project site is mostly undeveloped except for a small corral in the central portion of the western half of the site, remnants of houses, and a few unmaintained roads.

At the request of the U.S. Fish and Wildlife Service (USFWS), dry sampling for fairy shrimp was conducted in two breached stock ponds (C and F). The site contains a total of nine stock ponds, two of which have breached and no longer retain water. The ponds are not natural, but rather man-made impoundments created for cattle and other farming and ranching activities that have been present at the site for years. While it is clear that the breached ponds no longer serve as fairy shrimp habitat, it is possible that they once supported fairy shrimp, and their cysts may be present in the remaining soils.

The San Diego fairy shrimp (*Branchinecta sandiegonensis*) is listed as a federally endangered species by the USFWS. It is found only in San Diego County. This species occurs in vernal pools and other ephemeral pools often located in patches of grassland and agriculture interspersed in Diegan coastal sage scrub and chaparral.

The Riverside fairy shrimp (*Streptocephalus woottoni*) is listed as a federally endangered species by the USFWS. Its range includes Riverside, Orange, and San Diego counties; and northern Baja California, Mexico. This species occurs in vernal pools and other ephemeral pools.

METHODS

The purpose of the survey was to determine the presence/absence of the federally listed San Diego fairy shrimp and Riverside fairy shrimp within breached ponds C and F (Figure 3). Soil collection was conducted on December 1, 2000 by HELIX biologist Greg Mason (Permit #778195) with permission from the USFWS (attached). Following the soil collection, the samples were brought to Dr. Charles Black (Permit #835549-1) for analysis. Greg Mason assisted Dr. Black in the soil analysis.

During soil collection, approximate depth, area and habitat condition were noted and recorded on USFWS Vernal Pool Data Sheets. The data sheets, in addition to a USFWS California Native Species Field Survey Form, are included with this document. Per the USFWS protocol, 10 soil samples were collected from each of the breached ponds. Each sample had a volume of approximately 100 ml for a total sample volume of approximately 1 L per breached pond. Locations of each sample location are shown on the USFWS data forms (attached).

Figure 3

The soil samples were prepared for examination in the laboratory by dissolving the soil in water and sequentially sieving the resulting solution through 500-, 300- and 150-µm pore size screens. The size of the screens ensured that fairy shrimp cysts would be separated from the soil and retained. The portion of each sample retained in the screens was dispersed in a brine solution to separate the organic material from the inorganic. The organic fraction was then examined under a microscope and fairy shrimp cysts were identified to genus.

RESULTS

Soil samples from basins C and F on site included fairy shrimp cysts of the genus *Streptocephalus*. A total of 1 cyst was found in breached pond C and 4 cysts in F. The *Streptocephalus* cysts identified are considered to be Riverside fairy shrimp because this species occurs in other basins on site and is also the only *Streptocephalus* species known to occur within the project vicinity.

USFWS PERMISSION TO SAMPLE

From: Christine_Moen@r1.fws.gov
To: "Greg Mason" GregM@helixepi.com
Date: 11/30/00 10:35AM
Subject: Re: Dry Sampling

Hi Greg,

I've discussed this case with Dave Zoutendyk, Doug Krofta, and Linda Belluomini. Our recommendation is to authorize you to go ahead and conduct the soil sampling, and give the samples to someone authorized to do the analysis (Richard Hill, Charles Black, etc.). This is an unusual case, and that's why we're deviating from the standard of not authorizing soil samples at this time. It's our understanding (per your previous information) that the ponds that are to be sampled are old impoundments that no longer pond. The potential "take" of individuals in this case is offset by the need to know if any cysts are present. Because of the current situation at the impoundments, even if cysts are present, the conditions don't exist that would allow them to complete their life cycle (no water ponding).

Please contact me if you have any other questions,

Christine

EXECUTIVE SUMMARY

This Conceptual Mitigation and Monitoring Plan provides project information, a conceptual mitigation plan, and a monitoring program for mitigation of impacted jurisdictional areas on the Saddleback Meadows property, located northeast of the City of Mission Viejo in Orange County. This Plan is based on site delineations conducted in 1998 and 1999 by Chambers Group, Inc. (Chambers Group) and 1995 by Sweetwater Environmental Biologists, Inc. (SEB). The form and content of this report is based on the U.S. Army Corps of Engineers (ACOE) Habitat Mitigation and Monitoring Proposal Guidelines (1993).

The 222-acre Saddleback Meadows project site contains approximately 1.66 acres of wetland communities and 3.63 acres of non-wetland Waters of the U.S. subject to ACOE jurisdiction under Section 404 of the federal Clean Water Act. One species listed as endangered by the U.S. Fish and Wildlife Service (USFWS), the Riverside fairy shrimp (*Streptocephalus woottoni*), has also been documented in the ephemeral ponds present on the site.

The proposed project would impact 1.26 acres of ACOE jurisdictional wetlands (0.40 acre of ephemeral ponds and 0.86 acre of mule fat scrub) and 1.49 acres of Waters of the U.S./streambed (drainages). In addition, the proposed project will also result in impacts to approximately 0.40 acre of federally endangered Riverside fairy shrimp habitat within the ephemeral pond basins.

The Mitigation Plan has been developed with five specific objectives:

1) **On-site Wetland Preservation** - Maximize the protection, to the extent practicable, of existing ephemeral ponds, their watersheds, and surrounding wetland vegetation within open space habitat on site;

2) **On-site Wetland Creation** - Maximize on-site creation of ephemeral ponds capable of supporting the Riverside fairy shrimp;

3) **On-site Non-wetland Waters of the U.S. Creation** - Stream courses will be reconstructed in their original location as part of the remedial grading. This will occur within areas of remedial grading that are outside of the conventional grading limits;

4) **Off-site Wetland Enhancement** - Create as much wetland vegetation along the fringe of these ephemeral basins as is hydrologically feasible. Any remaining mitigation requirements will be met through an off-site giant reed removal program.

5) **Off-site Non-wetland Waters of the U.S. Preservation** – Mitigate remaining impacts to non-wetland waters of the U.S. through acquisition of waters of the U.S. at an off-site location.

On site, mitigation for the loss of 0.4 acre of wetlands (ephemeral ponds) containing Riverside fairy shrimp will be mitigated at a 2.53:1 ratio to create a total of 1.01 acres. Impacts to 0.86 acre of remaining wetland habitat (mule fat scrub) will be mitigated at a 3:1 ratio with the creation of 0.78 acre of wetlands as mule fat scrub around the perimeter of the created ponds and the enhancement of 1.80 acres of riparian habitat. Enhancement will include purchasing credits in an Orange County sponsored program or other mitigation site acceptable to the Corps dedicated to the eradication of invasive non-indigenous species, mainly giant reed (*Arundo donax*) along an existing riparian corridor. Creation of ponds and the surrounding wetland vegetation requires the excavation, grading and contouring in disturbed upland areas or areas disturbed by remedial grading to form basins, and revegetating the margin of these areas with riparian cuttings, plantings and seeds of native understory species. The depth and shape of the constructed basins will be based on the contours of the existing ponds. In addition, soils from the bottom of the existing ponds will be collected prior to impacts and the collected soils, which include Riverside

fairy shrimp cysts, will be used to inoculate the created ponds. Additional mitigation measures include the installation of fencing to deter vandalism and other disturbance of the restoration site.

Impacts to 1.49 acres of Waters of the U.S. will be mitigated for on site by the creation of Waters of the U.S. within areas proposed for remedial grading previously supporting Waters of the U.S. (0.44 acre), and by off site by purchase of 1.05 acre of existing Waters of the U.S. Impacts will be mitigated at a 1:1 ratio for a total of 1.49 acres of mitigation.

This mitigation and monitoring plan provides information on the construction, maintenance, and monitoring of the on-site mitigation area as well as a description of the project goals and final success criteria. The on-site mitigation area will be monitored for five years, or until project specific success criteria outlined in this plan are achieved. Off-site mitigation credits purchased from Orange County will be implemented and monitored by the County of Orange. Alternatively, off-site restoration at an alternative mitigation site would be monitored for five years.

I. INTRODUCTION

This Conceptual Mitigation and Monitoring Plan provides project information, a conceptual mitigation plan, and a monitoring program for impacted ACOE jurisdictional areas and Riverside fairy shrimp habitat on the Saddleback Meadows property, located northeast of the City of Mission Viejo in Orange County. Mitigation for these impacts is required under the federal Clean Water Act and the federal Endangered Species Act. Impacts were determined based on site delineations conducted in 1998 and 1999 by Chambers Group, Inc. (Chambers Group) and 1995 by Sweetwater Environmental Biologists, Inc. (SEB). The form and content of this report is based on the U.S. Army Corps of Engineers' (ACOE) Habitat Mitigation and Monitoring Proposal Guidelines (1993). Mitigation for impacts occurring to California Department of Fish and Game jurisdictional areas, and other sensitive habitats, plants, and wildlife present on the Saddleback Meadows property will be covered in separate documents.

The development of this mitigation plan included the evaluation of several alternatives, including:

1) Using flatter portions of the property with good hydrology for on-site drainage mitigation.

   The proposed alternative gives higher priority to using the flat portions of the site for the creation of ephemeral ponds (Riverside fairy shrimp habitat).

2) Using uplands adjacent to existing drainages for on-site drainage mitigation.

   These uplands are occupied by southern sycamore woodland and coastal live oak woodland habitat. The proposed alternative gives higher priority to preserving these existing vegetation communities.

3) Reworking existing drainages in order to create new larger drainages.

   The drainages not impacted by the project footprint are the higher quality of the on-site drainages. In addition, due to the steep terrain, the opportunity to achieve a "net gain" would be minimal. The proposed alternative does not rework existing drainages as this action would not provide measurable benefits for the level of disturbance it would require.

II. PROJECT DESCRIPTION

A. PROJECT LOCATION

Saddleback Meadows is a 222-acre site located in an unincorporated area of southeastern Orange County approximately 16 miles inland from the Pacific Ocean within the foothills of the Santa Ana Mountains (Figure 1). The parcel is situated on the northeastern side of Santiago Canyon Road, approximately 1,000 feet south of its intersection with Live Oak Canyon Road (S-19) in the Foothill-Trabuco area (Figure 2). The site is located on the U.S. Geological Survey Santiago Peak and El Toro 7.5 minute quadrangles.

An active creek (Aliso Creek) runs north and south along the western boundary of the site. Residential communities are located to the south and west, pasture land is located to the east, and Saint Michael's Abbey is located to the north of the project site. The property is actively used for horse and cattle grazing. The intensive grazing combined with the presence of highly erodable soils on site has, over the years, resulted in extensive habitat degradation in both upland and wetland habitats. Significant erosion has also occurred within the drainages on site. The project site is mostly undeveloped except for a small corral in the central portion of the western half of the site, remnants of houses, and a few unmaintained roads.

Figure 2

HELIX

B. PROJECT SUMMARY

The proposed project entails the development of 299 single family residential lots, roads, and recreational trails on approximately 165 acres of the property. The development is concentrated in the north and south sections of the property, avoiding a steep ravine and associated oak woodlands near the center of the property. Approximately 159 of the properties 222 acres will be dedicated in permanent open space, including 90 acres dedicated to the County as an extension of O'Neill Regional Park. Manufactured slopes extending outside of the fuel modification zones will be revegetated with native vegetation. The current project configuration has been designed to avoid as much of the wetlands on site as possible, and to provide for an east-west wildlife corridor through the property to off-site open space areas located to the east and west. This east-west corridor is a critical component of the County of Orange's NCCP program.

D. EXISTING JURISDICTIONAL AREAS AND RIVERSIDE FAIRY SHRIMP HABITAT

Several delineations have been conducted of the Saddleback Meadows property to identify areas subject to ACOE jurisdiction. SEB biologists conducted a jurisdictional delineation of the site in August 1995, and Chambers Group biologists delineated the project site on April 24 and May 21, 1998, and March 5, 12, and 18, August 5, and October 19, 1999. The delineations covered riparian plant communities and ponds within the project boundaries. In addition, all ephemeral ponds and drainages on the site were inspected for the presence of wetlands and ordinary high water marks. Additional information on the site delineations is available in the Jurisdictional Delineation of the Saddleback Meadows Property in Orange County (Chambers Group 2000).

The ACOE delineation was reviewed and refined with Vicki White of the ACOE during four field visits (January 13, July 8, December 15, 1999 and January 13, 2000). Mark Durham of the ACOE also participated in the December 15, 1999 field visit.

ACOE Jurisdictional Areas

A total of 5.29 acres on the site were determined to fall under ACOE jurisdiction, including 1.66 acres that meet the ACOE criteria for wetlands and 3.63 acres of Waters of the U.S. (Table 1; Figure 3). Wetlands on site are comprised of seven ephemeral ponds ringed by mule fat scrub, and additional patches of mule fat scrub occurring along drainages on site. Waters of the U.S. occur within several ephemeral and two intermittent drainages.

Ephemeral Ponds – The site contains a total of nine stock ponds, two of which have breached and no longer retain water. All but one of the ephemeral ponds present on Saddleback Meadows are not natural ponds, but rather man-made stock ponds created for cattle and other farming and ranching activities that have been present at the site for years. One basin, Pond E, may be a natural pond. The ponds are heavily degraded by cattle. For purposes of this analysis, it was assumed that the pond surface area extended to the maximum pond size based on the upper elevational limit of the dam used to create the pond. The ponds themselves are devoid of vegetation. The depth of these artificial ponds has created habitat suitable for Riverside fairy shrimp, which were found in six of the remaining ponds and on the site in 1994

(Simovich 1994), and are presumed to exist in the seventh. Approximately 0.48 acre of ephemeral pond habitat (calculated based on the sizes of the ponded basins) occurs on site.

Table 1
IMPACTS TO ACOE JURISDICTIONAL AREAS ON SADDLEBACK MEADOWS

HABITAT	EXISTING (acres)	IMPACTS (acres)		
		Project Footprint	On-Site Mitigation Area	TOTAL
ACOE Wetlands				
Ephemeral Ponds (with Riverside fairy shrimp)	0.48	0.40	-	0.40
Mule Fat Scrub	1.18	0.86	-	0.86
SUBTOTAL:	**1.66**	**1.26**	**-**	**1.26**
ACOE Waters of the U.S.				
Drainages	3.63	1.39	0.10	1.49
TOTAL:	**5.29**	**2.65**	**0.10**	**2.75**

Mule Fat Scrub - The wetland mule fat scrub communities on the project site are, for the most part, associated with the ephemeral ponds and are essentially riparian "islands" within the surrounding upland communities. Some additional mule fat scrub occurs along a few of the drainages. In both areas this plant community primarily supports mule fat (*Baccharis salicifolia*). A total of 1.18 acres of mule fat scrub habitat occurs on site, including 1.07 acres around the ephemeral ponds and 0.11 acre along drainages on site. Additional non-jurisdictional mule fat scrub habitat occurs in upland portions of the site.

Drainages – There are two types of drainages on site: approximately 19,750 linear feet of ephemeral drainages, which only contain water during and immediately after rain events, and approximately 3,314 linear feet of intermittent drainages, which contain water well beyond rain events and contain substantial riparian vegetation. A total of approximately 3.63 acres of drainages occur on site.

Riverside Fairy Shrimp

The federally endangered Riverside fairy shrimp (*Streptocephalus woottoni)* occurs within the ephemeral ponds at the Saddleback Meadows site. The Riverside fairy shrimp is currently known only from five vernal pools in western Riverside County in the vicinity of Temecula and Rancho California (Eng et al. 1990); two locations in Orange County; 20 to 30 pools on Otay Mesa and at least one pool on Miramar in San Diego County; and one pool at an undisclosed location in northern Baja California, Mexico. In addition to vernal pools, Riverside fairy shrimp have been observed to occur in other habitats that provide adequate water depth for at least several weeks during the winter rainy season. These habitats include depressions created by tanks, basins created for collecting runoff from kelp drying operations, abandoned borrow pits, and other man-made depressions.

Fairy shrimp are ecologically dependent on seasonal water fluctuation and are typically found in ephemeral or vernal pools. The Riverside fairy shrimp is considered a warm water species; it hatches when water temperatures reach 15 to 17 degrees Celsius (Clyde Eriksen 1993 in MEC Analytical Systems, Inc. 1993). This warm water temperature dependency is the main factor in the temporal limitation of the species.

Larvae appear when water temperature ranges from 10 to 20 degrees Celsius (Hathaway et al. 1992), usually in late February or early March (Eng et al. 1990; Eriksen 1993 in MEC Analytical Systems, Inc. 1993). Riverside fairy shrimp require 28 days or more to reach maturity (Hathaway et al. 1992); therefore, this species usually occupies ponds that retain water later in the year. Adults live among loose, emergent vegetation (Eng et al. 1990) where they swim upside down to feed.

Studies on the life histories of other species of fairy shrimp provide the only information on the early development of these species.. Females lay up to 200 eggs which settle into the mud at the bottom of the ponds (Brown and Carpelan 1971). The eggs do not rest on the surface of the mud but settle into the top five to 10 millimeters of mud (when dry). The eggs remain viable for several years until the proper conditions for hatching are present.

Anthropogenic activities (urban and agricultural development, flood control, and off-highway vehicle use) that reduce the acreage of vernal pool complexes or alter the runoff patterns of the watersheds that feed pools have dramatically reduced population levels of all fairy shrimp species in southern California. The origin of the shrimp in the ephemeral ponds on site is unknown at this time but may be from relict populations, introductions from web-footed avian species, or transferred by cattle carrying mud bearing Riverside fairy shrimp eggs.

E. JURISDICTIONAL AREAS TO BE FILLED

Implementation of the proposed project will impact a total of 1.26 acres of jurisdictional wetlands, including 6 of the 8 ephemeral ponds and associated mule fat scrub, and additional mule fat scrub along drainages, and 1.39 acres of Waters of the U.S. within ephemeral and intermittent drainages on the site (Table 1).

F. FUNCTION AND VALUE OF JURISDICTIONAL AREAS TO BE IMPACTED

All but one of the ephemeral ponds present on Saddleback Meadows are man-made stock ponds created for cattle and other farming and ranching activities that have been present at the site for many years. All of the ponds have been heavily degraded by cattle and hold water at a depth and for a duration that prohibits the establishment of vegetation. On site, the ephemeral ponds serve as habitat for two sensitive species, the federally endangered Riverside fairy shrimp and the western spadefoot toad, a federal and state special concern species, respectively. In addition to these two species, the ponds serve to provide water to a variety of wildlife during the winter rainy season, when they fill with water; however, because of their small size and lack of vegetation, they are not likely to provide other habitat functions for wildlife. When the ponds are dry they contribute acreage to upland open space that may be used by many wildlife species in passing.

Wetland habitat, such as the mule fat scrub at the perimeter of the ephemeral ponds and a few drainages on site, is naturally limited and remaining acreage provides important island habitats for migrant birds and other wildlife species. Other important functions of wetland habitat include flood conveyance; flood storage; control of water quality and erosion; providing surface water and insects for fish, amphibians, and birds; spawning grounds for aquatic fauna; habitat for rare and endangered species; and corridors for wildlife movement.

Impacts to wetlands and Waters of the U.S. are regulated by the ACOE under Section 404 of the Clean Water Act.

III. GOALS OF MITIGATION

The development of the mitigation plan involved an iterative process that first focussed on on-site preservation. Remaining impact mitigation then focused on use of the flatter portions of the open space for creation of ephemeral ponds, with the surrounding area used for wetland creation. Other areas of on site open space were also assessed for their potential for use as additional mitigation areas including existing drainages. Widening existing drainages on site would result in greater impacts to wetland and upland habitats and were therefor not selected.

The Mitigation Plan has been developed with five specific objectives:

1. **On-site Wetland Preservation** - Maximize the protection, to the extent practicable, of existing ephemeral ponds, their watersheds, and surrounding wetland vegetation within open space habitat on site;

2. **On-site Wetland Creation** - Maximize on-site creation of ephemeral ponds capable of supporting the Riverside fairy shrimp;

3. **On-site Non-wetland Waters of the U.S. Creation** - Stream courses will be reconstructed in their original location as part of the remedial grading. This will occur within areas of remedial grading that are outside of the conventional grading limits;

4. **Off-site Wetland Enhancement** - Create as much wetland vegetation along the fringe of these ephemeral basins as is hydrologically feasible. Any remaining mitigation requirements will be met through an off-site giant reed removal program.

5. **Off-site Non-wetland Waters of the U.S. Preservation** – Mitigate remaining impacts to non-wetland waters of the U.S. through acquisition of waters of the U.S. at an off-site location.

The intent of this wetland mitigation is to create and enhance riparian habitats on site to ensure no net loss of habitat values. The plan also provides criteria and recommendations for the protection, enhancement, maintenance, and management of the natural resources located within the mitigation areas. Given the disturbed nature of the basins being impacted, the plan provides the potential for a net increase their value over the long-term.

A. TYPE(S) OF HABITAT TO BE PRESERVED, ENHANCED, OR CREATED

On-site Wetland Preservation

On site, approximately 159 acres of habitat located outside of the fuel modification zone will be preserved as open space, including 90 acres dedicated to the County as an extension of O'Neill Regional Park. This open space will include the preservation of 0.38 acre of ACOE jurisdictional wetlands (occurring as ephemeral ponds and mule fat scrub), and 2.14 acres of Waters of the U.S. (occurring as drainages). Several measures will be taken to minimize impacts related to construction and protect the biological values of this open space. Impacts to remaining open space will be minimized through project scheduling and construction monitoring and the installation (pre-construction) of high visibility orange fencing and silt fencing at the construction limits (where applicable). A delayed start date for the construction will allow for the salvage/collection of native materials such as mule fat cuttings and soils containing Riverside fairy shrimp cysts from the development site. Mitigation will be initiated prior to project construction to minimize the temporal loss of wetland habitat functions and values.

The project has been designed to preserve wetland habitat consisting of two ephemeral ponds totaling 0.08 acre, and an additional 0.30 acre of mule fat scrub around the perimeter of the ponds. Both ponds

will be protected in perpetuity as part of the dedicated open space for the project. Riverside fairy shrimp have been previously observed in both ponds and the ponds are expected to continue to serve as habitat for this species. Additional measures will be taken to protect the function of these ponds as Riverside fairy shrimp habitat. To this end, the ponds and their associated watershed, or at least a five-foot buffer zone (whichever is greater), will be permanently fenced along the development edge to preserve their functions and values. Watersheds of these pools will be enhanced by native upland habitat restoration. Signs will be posted labeling the areas as sensitive habitat. These measures are intended to decrease potential impacts from humans and domestic animals. In the past, two ephemeral ponds on the project site have been destroyed by erosion that has breached the man-made dams built to create them. Any future measures required to protect the functions and values of the two remaining ponds will be undertaken as part of the regular open space maintenance.

On-site Wetland Creation

Mitigation for the loss of ephemeral ponds and associated mule fat scrub habitat, will include the creation of new ephemeral ponds and together with some associated mule fat scrub habitat (Figure 4). On site, space available for pond creation is limited by the topography of the preserved land since the open space consists mainly of steep canyons. Given the topographical and hydrological constraints for creating self-sustaining ephemeral ponds, this mitigation plan provides for the creation of approximately 1.01 acre of ephemeral ponds and 0.78 acres of associated mule fat scrub habitat on site. This results in a 2.53:1 mitigation ratio for the ponds. The on-site mitigation will occur in areas currently containing disturbed upland habitat, including annual grassland, and a small patch of non-jurisdictional mule fat scrub.

On-site Non-wetland Waters of the U.S. Creation

Mitigation for loss of non-wetland waters of the U.S. will be mitigated on site within areas of remedial grading that are outside of the conventional grading limits. In these areas, stream courses will be reconstructed in their original location as part of the remedial grading. This will result in approximately 0.44 acre of non-vegetated Waters of the U.S. within constructed drainages.

Off-site Wetland Enhancement

The remaining mitigation requirements for impacts to wetlands (1.80 acres of mitigation) will be mitigated for off site by enhancing 1.80 acres of existing riparian habitat. Mitigation credits for this will be purchased from the County of Orange to contribute to their riparian corridor enhancement program. Alternatively, mitigation will occur at a site acceptable to the ACOE. The program includes the removal of giant reed (*Arundo donax*) and other invasive non-natives from existing native riparian habitat. If conducted along Aliso Creek, the enhancement will benefit the on site portion of the creek by removing non-native species upstream of the project site.

Off-site Non-wetland Waters of the U.S. Preservation

Remaining mitigation requirements for Waters of the U.S. (1.05 acre) will be provided through acquisition of 1.05 acre of Waters of the U.S. (including unvegetated Waters, vegetated Waters, or wetlands) at the Edison Viejo preserve or other site acceptable to the ACOE.

A summary of existing conditions, impacts, and mitigation for ACOE areas is summarized in Table 2.

B. FUNCTIONS AND VALUES OF HABITAT TO BE CREATED/ENHANCED

On-site Wetland Creation

The Mitigation and Monitoring Plan is designed to present a program that will enable the project site to sustain native vegetation and provide suitable habitat for the Riverside fairy shrimp. Once revegetation is

2 Impacts will occur to approximately 0.77 acre of mule fat scrub around the ephemeral ponds and 0.09 acre along two drainages.
3 Acquisition of existing Waters of the U.S.

implemented and becomes established, it will provide a site that will minimize erosion, be resistant to invasion by non-native plant species, and increase biotic interactions between micro- and macroorganisms, thus creating a nutrient system in which organic matter and nitrogen are cycled in a self-sustaining system.

On-site Waters of the U.S. Creation

Constructing Waters of the U.S. in areas proposed for remedial grading will restore and potentially enhance the function and value of these drainages. Removal of the cattle, grading the channels to a design to minimize erosion, and revegetating the channel and adjacent uplands with native species will enhance the functions and values.

Off-site Wetland Enhancement

The off-site mitigation area already serves many of the functions and values of wetland systems. The removal of invasive non-native species will allow native species cover to increase, thereby improving the quality of the habitat for native wildlife. In addition, the removal of giant reed will decrease chances of fire and flood within the riparian habitat, thereby decreasing chances for disturbances that could favor the re-establishment of non-native species.

C. TIME FRAME

The wetland mitigation and monitoring program for Saddleback Meadows will take place over a five-year period, after installation of the creation areas is complete. The success criteria described below for this project must be met by the end of this period (Section IV of this document).

D. ESTIMATED COSTS

The cost of the mitigation described in this document is expected to be approximately $150,000. This amount includes site preparation, installation, maintenance, and monitoring (including maintenance monitoring reports and annual technical reports) for the five-year period.

IV. FINAL SUCCESS CRITERIA

The following sections provide standards to determine the successful completion of the habitat creation outlined above. Attainment of these standards indicates that the mitigation area is progressing toward the target functions and values specified for this plan. The methods to be used to measure these success criteria are described is section VIII A of this document. If at any time functions in these areas do not appear to be meeting the performance standards set forth in the mitigation plan, California Quartet will be responsible for taking timely remedial actions (as determined by the Restoration specialists) to ensure compliance with the performance standards.

A. TARGET FUNCTIONS AND VALUES

The goal of the wetland creation is to progress toward the performance standards detailed below, including the ability of the project site to sustain native wetland vegetation, provide suitable habitat for the Riverside fairy shrimp, and provide habitat for other riparian habitat-dependent wildlife species.

Performance Standards for Created Wetlands

The performance standards for the created ephemeral ponds are based on their value to Riverside fairy shrimp. The creation of a hydrological regime that allows a self-sustaining population of Riverside fairy shrimp to exist will be the benchmark for determining the success of the created ponds.

Riparian habitat performance standards for created areas are based on the progress of these wetland areas toward targets developed from plant and animal species diversity and percent cover of vegetation wetland areas remaining on site. The goal of the mitigation plan is to establish habitat that will be used by resident riparian habitat species as well as by migratory birds. Observations of wildlife and plant species within the mitigation area and an on-site reference area shall be recorded during site visits.

Performance Standards for On-site Waters of the U.S. Creation

Creation of the drainages within the previous locations for these drainages will be the goal. No performance standards are proposed other than the constructed channels will provide a minimum of 0.44 acre of channel area; however, repairs during the five-year monitoring period may be required for these structures to maintain their function and minimize erosion.

Performance Standards for Off-site Wetland Enhancement

Payment of a fee to enhance 1.80 acres of riparian habitat will fulfill any obligation by the applicant, therefore, performance standards are not applicable to this area. If the County of Orange sites are not an option, success criteria would be developed in consultation with the ACOE.

B. TARGET HYDROLOGICAL REGIME

The ephemeral ponds require seasonal ponding of water to support Riverside fairy shrimp. A study of the hydrogeomorphology and dynamics of the existing ponds is currently in process. The yearlong study will provide the detailed information needed to create the exact specifications for the proposed ponds, including the target hydrological regime. Variables included in the study are topography and bank contours of the existing ponds, period(s) of inundation, watershed size , and water quality analyses. Soils at the proposed sites will also be tested for permeability characteristics.

C. TARGET JURISDICTIONAL ACREAGE TO BE CREATED / ENHANCED

Implementation of this mitigation plan will result in the creation of 1.01 acres of wetlands as ephemeral ponds ringed by 0.78 acres of jurisdictional wetlands as mule fat scrub on site. The 1.01 acres of ephemeral ponds will also serve as Riverside fairy shrimp habitat. Approximately 0.44 acre of Waters of the U.S. would be created on-site. In addition, 1.80 acres of existing off-site riparian habitat along Aliso Creek that has been degraded by giant reed will be enhanced to improve its wetland function and value.

V. PROPOSED MITIGATION SITE

A. LOCATION AND SIZE OF MITIGATION AREA

On-site Wetland Creation

The wetland creation area will be located on site in areas that are deemed suitable based on soils (i.e., soil texture and structure), topography, location within the same watershed, and potential for wildlife use. Suitable on site creation areas are limited, therefore, the most critical restoration, the creation of the

ephemeral ponds, is planned for these areas. Waters of the U.S. will be recreated within remedial grading areas previously supporting these channels.

Figure 4 shows the locations of the proposed ponds and associated riparian habitat, as well as the created Waters of the U.S. These ponds will be modeled after those currently existing on the Saddleback Meadows site. The impoundment will be situated to collect surface flows from the surrounding native habitat to ensure that a self-sustaining, ephemeral pond is created. The sites selected for the proposed ponds are located within the same watershed of the present impoundments, and in the open space preserve areas of the project.

Off-site Wetland Enhancement

The wetland enhancement area is located within Orange County. County owned riparian areas potentially available for enhancement include a portion of Aliso Creek located upstream of the project site, and portions of the Santa Ana River. The final location of wetland enhancement will be determined in consultation with the County of Orange and the ACOE.

B. OWNERSHIP STATUS

The project applicant California Quartet, owns the proposed mitigation area. The County of Orange owns the riparian enhancement area.

C. EXISTING FUNCTIONS AND VALUES OF MITIGATION AREA

The pond mitigation areas currently do not have wetland functions and values. They consist primarily as disturbed upland habitats that have been degraded by many years of grazing. The Waters of the U.S. functions and values vary for the Waters of the U.S. being impacted and restored within the remedial grading areas. A majority of these areas are unvegetated Waters of the U.S. that have been degraded by the ongoing cattle grazing. A limited area supports vegetated Waters of the U.S.

D. PRESENT AND PROPOSED USES OF MITIGATION AREA

Currently, the on-site mitigation areas are undeveloped. All of the on-site mitigation areas are proposed for open space preservation.

E. JURISDICTIONAL DELINEATION

The on site mitigation area was delineated in conjunction with the delineation for the project site. The areas currently proposed for mitigation are not ACOE jurisdictional areas; however, due to hydrological requirements for wetland creation, at least some of the created basins and mule fat scrub are for areas located adjacent to existing non-wetland Waters of the U.S.

F. PRESENT AND PROPOSED USES OF ALL ADJACENT AREAS

On site, areas immediately adjacent to the created wetlands will be preserved as open space, wherever possible. The remainder of the site will be developed into a residential complex.

G. ZONING

There is no plan to change the zoning of the mitigation area.

VI. IMPLEMENTATION PLAN

A. RATIONALE FOR EXPECTING IMPLEMENTATION SUCCESS

On-site Wetland Creation

Ephemeral ponds have been successfully restored or created at various locations in California. A recent review of vernal pool rehabilitation and creation projects in San Diego County determined that most of the pools created adjacent to existing habitat successfully sustained populations of *Pogogyne abramsii*, a vernal pool plant specialist, over a period of 5 to 10 years (Black and Zedler 1998). A review of the Del Sol Reserve vernal pool project in Santa Barbara County also demonstrated that pools created and restored in 1986, are self-sustaining and support native vernal pool plant species (Ferren et al. 1998). Surveys conducted in 1996 found that the density and composition of macroinvertebrate populations, including several species of fairy shrimp, in vernal pools constructed in Folsom, California in 1994 were similar to that of adjacent reference pools (Rogers 1998).

Riverside fairy shrimp also occur in a single vernal pool on the nearby Edison property. The contours of the Edison property pool had, in the past, been disturbed with heavy equipment that increased the depth of the pool (K. Gould, pers. com.). It is not known if the pool supported fairy shrimp prior to the disturbance.

Populations of other species of fairy shrimp have been successfully relocated to man-made ephemeral pools using inoculum taken from existing pools (T. Bomcamp, pers. com.), and it has been done successfully by the authors of this report. Thus, it is reasonable to expect that ponds created in similar topography and soils on the Saddleback Meadows site will successfully support this species. Generally, created pools inoculated with propagules taken from adjacent or nearby vernal pool complexes were more successful in sustaining populations of vernal pool species. The ponds at Saddleback Meadows will be designed using the methods of past successful projects as guidelines.

Measures outlined in guidelines described by the U.S. Fish and Wildlife Service (De Weese 1998) will be incorporated into the construction, maintenance, and monitoring of the created ponds to ensure their successful creation. These measures include:

- The mitigation site will be located in an area that currently supports ephemeral ponds and has appropriate soil types (same series). An adequate buffer (> 100') will be created between the pond habitat and the preserve boundary.
- Excavation of side slopes and pond bottoms will mimic that of the existing ponds to duplicate hydrologic depth, surface area, and inundation periods.
- Two existing on site ponds will be preserved and managed to maintain the populations of Riverside fairy shrimp and for use as reference ponds.
- Hydrology staff gauges will be installed within the constructed and preserved ponds to facilitate monitoring of inundation periods. The hydrology will be monitored weekly during the wet season.
- Riverside fairy shrimp and other invertebrate populations will be monitored in the created and reference ponds once a month while the ponds hold water.
- Water quality, including temperature, turbidity, and conductivity, will be monitored in the created and reference ponds.

- Regular maintenance inspections will be performed to monitor for uncontrolled human disturbance, trash, and unexpected conditions (erosion, water run-off pollution, etc.).

Overall, success of the mitigation implementation plan is expected based on the following rationale:

- Plant material (seeds, container plants and cuttings) to be used for the revegetation effort will be derived from on site material, which is anticipated to be adapted to the site conditions. Cuttings collected from the development site will also preserve the genetic integrity of the willow and mule fat populations.

- Populations of fairy shrimp have been successfully relocated to man-made ephemeral ponds using inoculum (soils) taken from existing ponds.

- The mitigation site is located within a system that supports coastal sage scrub, coast live oak woodlands, and riparian habitat. The existence of these habitats provide support for the conclusion that the wetlands can be sustained.

- Exotic species to be removed within the site will reduce competition with existing native species and plantings associated with the revegetation project and enhance the site's ecological value.

- Removal of cattle is also expected to reduce the level of disturbance to the site.

- The revegetation site will be planted with cuttings and container plants at a relatively high density and seeded with a native herbaceous seed mix which would impede the recolonization of invasive non-native plant species.

B. RESPONSIBLE PARTIES

1. Project Proponent

California Quartet
c/o TPG Management
ATTN: Pike Oliver
777 Campus Commons Road, Suite 200
Sacramento, CA 95825

The project proponent and owner will be responsible for financing pre-grading plan hydrological testing, installation, maintenance, and monitoring of the habitat creation. In order to ensure the success of mitigation, the project proponent will enter into a five-year, secured agreement with the ACOE to cover the projected cost to install, monitor, and report on the mitigation. This agreement should be in the form of a 120 percent bond. The bond should be structured so that portions of the bond may be released as interim milestones are met (subject to negotiation between the proponent and the ACOE).

2. Landscape Architect

An ACOE approved landscape architect will be selected for this project. The licensed landscape architect shall prepare the construction drawings to accompany this mitigation plan. The construction drawings shall be reviewed and approved by the restoration specialist.

3. Restoration Specialist

Monitoring of mitigation site preparation and installation, as well as maintenance/technical monitoring after site installation shall be the responsibility of a biologist, landscape architect, horticulturist, or other

person knowledgeable in native habitat creation/restoration. After each visit, the restoration specialist shall provide the project proponent and installation/maintenance contractor with a written checklist of maintenance items in need of attention, if any. All requests for work that are in addition to a contractor's scope of work, shall first be approved by the project proponent. The restoration specialist shall educate the installation and maintenance contractors with regard to mitigation goals and requirements and will be responsible for tracking and preparing all required reports for submittal to the respective agencies

4. Landscape Contractor

The landscape contractor must be educated as to the installation and maintenance of native plants. This contractor shall be responsible for completion of grading, pre-planting weed control, irrigation system installation, planting, seeding, and final as-built plans.

Once the restoration specialist has verified the completion of the previous list of items, a 120-day installation maintenance period will begin. The landscape contractor shall be required to maintain the entire mitigation area at least once a month during this period. The landscape contractor shall meet the restoration specialist at the site, when requested, and shall perform all maintenance items in need of attention in a timely manner. Maintenance tasks include, but are not limited to, dead plant replacement, reseeding, irrigation system repair, and weed control. At the end of the installation maintenance period, the restoration specialist will certify completion of the installation contract, provided all installation and maintenance tasks have been completed. The project proponent may change contractors at its discretion.

After the installation contract is certified as complete, site maintenance will be conducted by the landscape contractor for the five-year monitoring period. The contractor is responsible for actual implementation of the mitigation plan specifications and shall maintain the entire mitigation area according to a specified schedule. Maintenance tasks include, but are not limited to, dead plant replacement, reseeding, irrigation system repair, and weed control. The landscape contractor shall meet the restoration specialist at the site, when requested, and shall perform all maintenance items in need of attention in a timely manner. The project proponent may change contractors at its discretion. The landscape contractor will coordinate closely with the restoration specialist to ensure that the specifications of the mitigation plan are properly implemented.

C. SCHEDULE

Execution of the mitigation plan, including the relocation of Riverside fairy shrimp and implementation of the revegetation project, is to be completed no later than December 31, 2000. Vegetation may be installed between October 1 and March 31 to take advantage of the winter rainy season. Any schedule modifications will be granted upon approval in writing by the ACOE.

If for any reason the plant materials (seeds and container plants) are undeliverable or rejected by the restoration specialist, planting will be completed as soon as desirable materials are available and the planting season is appropriate. The preliminary schedule guidelines for mitigation activities is outlined in Table 3.

Planting and then seeding shall occur between November 15 and March 15 to take advantage of winter rains. Since irrigation will be provided for the container stock, planting (but not seeding) could occur into spring, but extreme care would need to be taken not to trample the previously spread seed mix.

Table 3 PRELIMINARY SCHEDULE GUIDELINES FOR MITIGATION ACTIVITIES
Mitigation Site Contracts Schedule
• Contract with Restoration Specialist
• Contract for plant materials
• Contract with earthmovers, schedule pond grading
• Restoration specialist and construction contractors attend pre-construction meeting(s)
• Contract with landscape contractor
• Contract with landscape architect (if Restoration Specialist determines irrigation a necessity)
Mitigation Site Preparation (September through November)
• Surveyor identifies restoration areas (verified by Restoration Specialist)
• Grade grasslands and create pond/wetland contours (Restoration Specialist present during grading activities)
• Pretreat site for weeds, if necessary
• Remove non-organic debris and vegetation material under guidance of Restoration Specialist
• Transfer inoculum from impact area ponds to replacement ponds
Planting (November through March)
• Schedule plant materials delivery date and planting crew
• Verify planting scheme for landscape contractor
• Collect/salvage suitable plant material from development site
• Cuttings and container plants installed
• Seed application
• Coordinate replacement plantings
• Install replacement plantings (monitored by Restoration Specialist)
• Install plant fencing (if herbivory is a problem)
Maintenance and Monitoring
• See guidelines outlined in Sections VII and VIII of this report
Documentation
• Revegetation specialist submits annual reports to the ACOE by January 1 each year following implementation

D. SITE PREPARATION

Wetlands and Open Space Remaining On Site

Recommendations are presented to protect biological and aesthetic values of the natural habitats within the project site that are not directly affected by the proposed project. Impacts will be minimized through project scheduling and construction monitoring. A delayed start date for the construction will allow for the salvage/collection of native materials from the development site such as mule fat cuttings and Riverside fairy shrimp. Mitigation will be started before project construction to minimize the temporal loss of wetlands habitat function. Specific measures to protect sensitive resources are discussed below.

Measures to protect Riverside fairy shrimp in ponds outside of the project footprint include:

- Construction fencing; and
- Silt fencing or other erosion protection devices around the construction limits to prevent the flow of sediment into the ponds.

Wetland Creation Area

Fencing – Orange plastic snow fencing (or other similar device) will be used to define limits of grading. Where possible, fencing will be located no closer than 15 feet from the dripline of all trees identified for protection.

Grading – A grading plan will be developed for the new ponds based on their position in the watershed, and the contours of the existing ponds. The new ponds will mimic as closely as possible the depths and areas of the existing ponds. A study of the hydrogeomorphology and dynamics of the existing ponds is currently in process. The yearlong study will provide the detailed information needed to create the exact specifications for the proposed ponds. Variables included in the study are topography and bank contours of the existing ponds, periods of inundation over time, watershed, and water quality analyses. Soils at the proposed sites will also be tested for permeability characteristics. Rough grading contours will be deep enough to allow for the application of a surface soil layer removed from the existing ponds.

Erosion Control – Only non-vegetative erosion control measures may be used in areas with native vegetation. Such erosion control measures may include sandbags, soil binders, waterbars, trenches, or dissipators. These measures preclude the introduction of non-native weedy species into the seed bank of areas with native vegetation. Drainage and sedimentation control devices will be routinely cleaned, maintained, and repaired prior to and during the rainy season. All repairs to these systems will be immediately executed to minimize erosion problems.

Debris – Garbage and debris will be removed from all areas of the mitigation site. Dead or downed wood will not be removed except as required for safety reasons, flood control or fuel modification because they provide important microhabitats for small vertebrates and invertebrates.

Transplanting Inoculum and Food Resources – After finish grading of the relocation ponds, the upper 24 inches of soils from existing ponds will be collected and spread over the bottom of the relocation ponds in two layers. The top layer shall be 1" deeper than the cracks in the soil and the second layer will be the remaining depth to 24". It is essential that the top soil layer salvaged is placed on the surface of the created basins. Initial grading of the mitigation site must include over excavation to allow for placement of the salvaged soil. Relocation ponds must also support a sufficient prey base population. If ponds do not support a sufficient algae population, they will be inoculated with resources from the original ponds.

Mitigation for the fairy shrimp consists of translocating the species to the newly created ponds. Soil that is salvaged from the existing stock ponds will be placed in the bottoms of the new ponds to translocate Riverside fairy shrimp eggs. Loose, emergent vegetation will be planted within the ponds for adult fairy shrimp to live among, although they currently exist without it.

Riverside fairy shrimp eggs should be salvaged by removing at least the top 10 millimeters of dry mud which should then be stored in a cool, dry place until the mitigation ponds are constructed. If the existing ponds are not entirely dry, then mud should be taken from the ring of dry mud surrounding the remaining water. The dry mud should be placed at the bottom of the newly created ponds, and it should not be inverted, mixed, or broken up.

Vegetation Replacement – If any vegetation is removed, it will be replaced through seeding, container plantings, or both.

Wetland Enhancement Area

Appropriate areas of habitat containing giant reed will be identified.

E. PLANTING PLAN

Planting Materials and Methods

The plants selected for the wetland areas are based mainly on those species currently found around the perimeter of the existing ponds. The pond basins are not currently vegetated, therefore, no vegetation will be placed into the basins of the created ponds. The wetland plant species palette is presented in Table 4.

Table 4
WETLAND PLANT SPECIES PALETTE

Common Name	Scientific Name	Occurrence	Minimum Density/ Acre	Distribution
Upper Canopy-Lower Benches				
Black willow	*Salix goodingii*	Subdominant	30	Scattered
Lower Canopy				
Mexican elderberry	*Sambucus mexicana*	Dominant	40	Scattered
Mule fat	*Baccharis salicifolia*	Dominant	250	Groups: 5-20
Herbaceous Layer (Seed Mix)				
Mugwort	*Artemisia douglasiana*	Dominant	5 lbs/acre	---
Meadow barley	*Hordeum brachyantherum*	Dominant	12 lbs/acre	---
Western ragweed	*Ambrosia psilostachya*	Subdominant	6 lbs/acre	---
Beardless wild rye	*Elymus triticoides*	Subdominant	8 lbs/acre	---
Spikerush	*Eleocharis macrostachya*	Subdominant	1 lb/acre	---
Toad rush	*Juncus bufonius*	Subdominant	1 lb/acre	---

To ensure successful recreation of the current conditions, cuttings will be collected from the existing ponds for utilization at the new sites. Optimally, vegetation will be collected during the cooler fall months; the weather is cooler and the vegetation is generally in a dormant or very slow growing phase. After collection of seed and plant materials, planting will begin during the fall to take advantage of the rainy season.

Species comprising the shrub understory and willow trees, will be installed as rooted cuttings, liners, and 1-gallon plants at elevations of approximately 4 to 12 feet above groundwater. The mule fat scrub area will provide cover and forage habitat in areas receiving surface flows. Rooted cuttings of mule fat and willows will be planted in natural groupings. An herbaceous understory of mugwort, meadow barley, western ragweed, and beardless wild rye will be hand seeded on the upper perimeter of the impoundment to control erosion and to provide cover and habitat for ground foraging animals.

All container stock shall be planted in a hole at least twice the diameter of the container and twice the depth. Backfill shall not be amended. The top of the root ball shall be set one inch above finish grade. A mulched zone shall then be established around each container plant, extending for at least 18 inches from the base of the plant. The mulch shall be two to four inches thick and must not come in contact with the collar of the plant.

No fertilizers shall be applied because of the presence of Riverside fairy shrimp in the ponds

Contract Growing and Plant Material Sources - Arrangements shall be made as soon as possible in advance of the expected planting date, either by the project proponent or the installation contractor, to acquire container plant materials and seed required for habitat creation. An additional 10 percent of the total number of container plants shall be grown to replace those that die. An additional 10 percent of the seed mix shall be procured in case reseeding is necessary. A copy of the plant material contract shall be submitted to the restoration specialist as verification of acquisition. Contract growing and seed collection shall be conducted by an experienced native plant nursery or seed company such as, but not limited to, Tree of Life Nursery, San Juan Capistrano, California; Mockingbird Nursery, Riverside, California; and/or S&S Seeds, Carpinteria, California.

It is preferred that the source of all plant material used at the site be from the drainage on site or as close to the site as possible. If necessary, the restoration specialist shall help the grower locate acceptable local sources for plant materials.

Substitutions - No species shall be substituted without approval from the restoration specialist. If the project proponent or installation contractor is unable to obtain the proper species (and sizes) specified by the time of planting, commencement of the 120-day installation maintenance period shall be delayed until all plants specified are in the ground. Substitution of plant material at the time of planting depends solely upon the discretion of the restoration specialist in consultation with the landscape architect. Any substitutions that are approved shall be documented by the installation contractor in the final set of as-built plans.

Plant Material Inspection - All plant materials shall be inspected by the restoration specialist and approved as healthy, disease free, and of proper size prior to planting. Overgrown, root-bound container stock will be rejected. In addition, the restoration specialist shall approve the final layout of all plant materials in the field prior to planting to ensure their correct ecological positioning (e.g., plants are not installed in rows).

Container Plant Guarantees - All plants determined to be dead or terminally diseased shall be replaced by the installation contractor as soon as possible but no more than 90 days after installation. Plant replacement by the maintenance contractor shall be completed as soon as possible but no more than 90 days following written direction by the restoration specialist. Unless substitutions are approved by the restoration specialist, the replacement plants shall be of the same species and at least the same size as originally planted. All replacement plants shall be inspected by the restoration specialist and approved as healthy, disease free, and of proper size prior to planting.

Seed Guarantees - The installation contractor shall guarantee a 50 percent germination coverage rate for all seeded areas (based on visual assessment by the restoration specialist) at the end of the 120-day installation maintenance period. If there are particular bare areas, reseeding shall take place in those areas at the direction of the restoration specialist. The restoration specialist shall determine the timing and method for reseeding.

F. IRRIGATION PLAN

No irrigation system will be installed as the wetland areas around the ephemeral ponds will receive water from seasonal precipitation. Supplemental hand watering shall be applied if necessary to prevent the mortality of seedlings. Care will be taken to avoid water entering into the pond basin to avoid triggering of fairy shrimp hatching at an inappropriate time of year. Supplemental irrigation is only expected to be used for the first three years, or less, of the five-year monitoring period. During the final two years, the restoration specialist shall determine whether or not irrigation is necessary.

G. AS-BUILT CONDITIONS

At the end of the installation phase of the project the installation contractor shall prepare as-built plans of the mitigation area. The as-built plans will document the conditions of the site as they exist at the completion of the installation. These plans will include an as-built topographic map and show areas of grading, planting, and seeding. The restoration specialist will review these plans for conformance with the mitigation plan's technical design criteria, ACOE permit conditions, and project objectives. Any differences found between the original design and the as-built conditions will be fully assessed and documented by the restoration specialist through field maps, photographs, and descriptive text. It is expected that modifications of the original plan will have occurred due to post-mapping changes in project design as well as unforeseen changes resulting from site conditions. Any changes in the plan shall be justified to and accepted in writing by the restoration specialist and the California Quartet before the as-built conditions are approved.

A report of the "As-Built Conditions" shall be submitted by the restoration specialist to the ACOE within 6 weeks of completion of site preparation and planting. If grading, planting and erosion control measures are not completed within six weeks of each other, separate reports for each activity will be submitted.

VII. MAINTENANCE DURING MONITORING PERIOD

A. MAINTENANCE ACTIVITIES

1. General Maintenance

All contractors shall be informed of the specific mitigation goals and maintenance requirements of this project. Maintenance efforts will focus on ensuring that the relocation ponds retain water consistent with the conditions of the existing ponds.

Only construction equipment necessary to accomplish the mitigation installation shall be allowed on the mitigation site, and each piece of construction equipment shall be removed from the site as soon as its task is complete. No vehicular fluids shall be added or changed on site. Once plant installation and seeding has begun, no vehicles shall be allowed on the mitigation site. Workers' personal vehicles shall be parked outside the mitigation area. The mitigation site shall be kept free of human garbage.

No power tools shall be operated on the mitigation site from March 15 through July 15. Only activities that can be performed with non-power tools shall be allowed during this period. This time period coincides with the breeding season of many sensitive riparian bird species.

Damage to plants on the mitigation site as a result of unusual weather or vandalism shall be repaired as directed by the restoration specialist. Such repairs shall be paid for by the project proponent. Any damage caused by a contractor's inadequate maintenance, as determined by the restoration specialist, shall be repaired by the contractor at its expense.

2. Fencing

California Quartet will be responsible for the maintenance of the perimeter fence. Additional, protective measures such as tree tubes and placement of cages or screens around individual plants will be used in areas subject to trampling, herbivory, or other threats as determined by the restoration specialist. All protective devices shall be maintained through completion of the monitoring period or until removal is authorized by the restoration specialist.

3. Weed Control

Weed control shall be conducted monthly by the installation contractor and per the schedule outlined in this document for the maintenance contractor, or as necessary, to minimize competition that could prevent the establishment and growth of native species. Weeds shall be removed for a minimum of 4 years or until plantings are well established to prevent detrimental competition of invasive species with the mitigation plantings for water, nutrients, light, and space. Maintenance personnel shall be trained to distinguish weed species from desirable native vegetation. All weeds shall be removed mechanically. No herbicides shall be applied in the wetlands adjacent to the ponds due to the presence of Riverside fairy shrimp.

A mulched area 18 inches from the base of each container plant shall be maintained to minimize competition from weeds, except within basins. This mulch will be maintained during the establishment period (120 days following certification of the installation contract), or until plants reach 2 to 3 feet in height. Table 5 lists examples of weeds that need to be controlled at the mitigation site.

Table 5
WEED SPECIES LIST FOR SADDLEBACK MEADOWS*

Scientific Name	Common Name
Arundo donax	giant reed
Brassica nigra	black mustard
Carpobrotus edulis	hottentot fig
Cortaderia selloana	pampas grass
Cynara cardunculus	artichoke thistle
Cynodon dactylon	Bermuda grass
Eucalyptus spp.	eucalyptus species
Foeniculum vulgare	sweet fennel
Myoporum laetum	myoporum
Rincinus communis	castor bean
Schinus terebenthifolius	Brazilian pepper tree
Silybum marianum	milk thistle
Tamarix spp.	tamarisk species
Washingtonia robusta	Mexican fan palm
Xanthium strumarium	cocklebur

* This species lists some common wetland weed species. Other weed species may occur at this mitigation site.

4. Disease and Other Pests

Damage causing insects, high levels of herbivory, and diseases shall be monitored by the installation and maintenance contractors during their maintenance periods. Generally speaking, a high threshold of tolerance will be permitted before chemical/lethal control measures are considered. All specific recommendations will only be made by a licensed pest control adviser as required by law. All applicable federal and state laws and regulations will be closely followed. The ACOE and restoration specialist will be consulted on any pest control matters.

5. Pruning

No pruning shall be done unless directed by the restoration specialist.

6. Trash Removal

Following rain events, trash and debris may enter the creek from storm drains. Trash shall be removed during regular maintenance events by the installation and maintenance contractors during their respective maintenance periods.

B. RESPONSIBLE PARTIES

The project proponent (California Quartet) will be responsible for financing the maintenance program. The landscape contractor will oversee maintenance efforts and will submit regular maintenance reports to the project proponent.

The project proponent may choose to legally transfer the property in fee title (subject to agency approval) to a public or private entity specializing in long-term management of open space. If such a transfer occurs, this entity would become the responsible party for implementing the maintenance program.

C. SCHEDULE

During the 120-day installation maintenance period, the installation contractor shall be required to maintain the entire mitigation area at least twice a month. Once the 120-day installation maintenance period is over, the area will be maintained by the maintenance contractor according to the schedule in Table 6. Specific items evaluated during maintenance events will include the presence of weeds, trash, vandalism, irrigation function and scheduling, and plant material condition.

Table 6
MAINTENANCE SCHEDULE

Phase	Schedule
120-day Installation Maintenance Period	Bi-weekly
Post Installation Maintenance Period	
February-May	Bi-weekly
June-January	Monthly

The restoration specialist shall begin monitoring during the grading/site preparation and installation phases and shall then continue monitoring through the post-installation phase according to the schedule outlined in Table 7. The restoration specialist shall file a written monitoring report with the project proponent and landscape contractor after completing each inspection. Each of these reports shall identify maintenance concerns including, but not limited to, plant mortality, vandalism, and weed-related issues, and shall provide recommendations to the maintenance contractor regarding any changes to the maintenance program. These monitoring reports will be included as part of the annual report to the ACOE.

Table 7 MAINTENANCE MONITORING SCHEDULE FOR THE RESTORATION SPECIALIST	
Phase	**Schedule of Inspections**
Grading/Site Preparation	2 times per week
Installation	Daily
Post Installation	
Year 1	Monthly
Year 2	
March-June	Monthly
July-February	Quarterly
Years 3-5 (or until performance	Quarterly
standards have been met)	

VIII. MONITORING PLAN

A. PERFORMANCE CRITERIA

Performance criteria are specific standards by which to evaluate the progress and success of the mitigation during the five year monitoring period. The standards are based on a reference site. Three categories of interim success criteria shall be analyzed: species diversity, cover by weeds, and cover by native species. The annual milestones for these parameters are presented in Table 8.

Table 8 ANNUAL SUCCESS CRITERIA MILESTONES FOR SADDLEBACK MEADOWS[1]					
	Year				
Criteria	**1**	**2**	**3**	**4**	**5**
Species Diversity	40	50	60	70	80
Cover by Weeds[2]	140	130	120	110	100
Cover by Native Species[2]	60	70	80	90	100
[1]Values are percentages as compared with the reference site [2]Percent total cover					

B. MONITORING METHODS

Annual monitoring will be performed by the restoration specialist or by a qualified biologist with appropriate experience in site monitoring and transect measurements. This monitoring will include qualitative observations of overall plant survival, vigor, and recruitment, the status of irrigation, trash, and weeds, and the presence of wildlife species. In addition, monitoring will include quantitative measurements of native and non-native plant growth. Using the same techniques a designated reference site will also be sampled so that comparisons can be made between the functions and values of the mitigation site and previously existing habitat. The reference site shall be located on site.

Vegetation monitoring will be conducted for the mule fat scrub habitat created along the margins of the created ponds. Observations of plant health and vigor will be made at each pond and compared to observations of plant health and vigor at the two remaining reference ponds. All species that occur within the habitat shall be noted separately for each pond. Percent cover of native shrubs and annuals and non-native species will be noted for each pond. In addition to the observations and measurements described above, several permanent stations for photo-documentation shall be established in each habitat type and annual photographs taken.

All pools will be tested for the presence of Riverside fairy shrimp at monthly intervals while the ponds hold water.

Species Diversity

Species diversity usually increases with recruitment of new native species from the surrounding native habitats. The effect of recruitment on diversity should allow the mitigation to approach the level of species diversity at the reference site. After five years, the mitigation site should reach 80 percent of the species diversity of the reference site.

Cover by Weeds

Many weeds have become naturalized, and therefore, the weed cover should reflect (or be less than) what is present at the reference site. Although weeds are expected, they should not be allowed to get out of control on site. Weeds should be controlled during site maintenance.

Cover by Native Species

Cover by native vegetation should increase over time and ultimately approach that of the reference site. With sufficient site maintenance, proper irrigation, and natural rainfall, native vegetation cover should approach 100 percent of the reference site in five years.

C. ANNUAL REPORTS

Annual reports on the status of the project mitigation shall include an assessment of the site's status relative to yearly target criteria as well as overall site progress toward final success criteria. These reports will also include the following:

- a list of names, titles, and companies of all persons who prepared the content of the annual report and participated in monitoring activities for that year;
- a copy of the Corps permit and any attachments including Special Conditions and subsequent Letters of Modification;
- an analysis of all qualitative and quantitative monitoring data;
- copies of all monitoring photographs; and
- maps identifying monitoring areas, transects, planting zones, and so forth as appropriate.

Remedial recommendations, if necessary, shall be made in the annual reports as well as a summary of whether or not the mitigation is meeting the success criteria for the appropriate year.

D. SCHEDULE

Monitoring and performance criteria will be tied to implementation. The first annual monitoring event will occur in June after the first full growing season. Annual technical monitoring reports shall be submitted to the ACOE by the end of January 1 of each year to ensure that there is adequate time remaining in the dry season to implement any necessary contingency measures.

IX. COMPLETION OF MITIGATION

A. NOTIFICATION OF COMPLETION

The project proponent shall notify the ACOE upon completion of the mitigation effort through the submittal of the final annual technical monitoring report. The final report shall include a jurisdictional delineation of the mitigation areas. This delineation must show that the goals of the mitigation (as described in section III of this document) have been met.

Performance standards may be waived by the ACOE in any area if monitoring indicates that good growth and functional habitats are otherwise achieved. If performance standards cannot be met because of adverse soil or other unmanageable site conditions, an alternative or auxiliary mitigation plan may be submitted to the ACOE for approval.

B. AGENCY CONFIRMATION

After receipt of the final annual technical monitoring report, the ACOE may inspect the mitigation site to confirm the completion of the mitigation and examine the jurisdictional delineation.

X. CONTINGENCY MEASURES

A. INITIATING PROCEDURES

If the ACOE determine upon receipt of any of the annual monitoring reports that the mitigation effort is not meeting success standards for the project, the ACOE shall notify the project proponent in writing that the mitigation effort may require augmentation for successful implementation. The project proponent shall have 30 days to respond to the ACOE correspondence, confirming their agreement that contingency measures will be required.

B. ALTERNATIVE LOCATIONS FOR CONTINGENCY MITIGATION

No alternative locations are proposed for this mitigation. If the success criteria are not being met on site, the ACOE and the project proponent will work towards a mutual solution.

C. FUNDING MECHANISM

The project proponent shall be responsible for all costs associated with any contingency measures.

D. RESPONSIBLE PARTIES

The project proponent shall be the responsible for any necessary contingency measures associated with this project.

Subject: Saddleback Meadows

Dear Vicki:

HELIX Environmental Planning, Inc. (HELIX) has refined potential restoration areas and methods for implementing U.S. Army Corps of Engineers (ACOE) and California Department of Fish and Game (CDFG) required wetland mitigation for the Saddleback Meadows project on the Hidden Ranch site (Figures 1 and 2). These refinements are based on our June 15, 2000 site visit to Hidden Ranch and presented as part of the overall mitigation program being implemented for the Saddleback Meadows project, including on-site conservation and restoration, off-site acquisition, enhancement and creation of wetlands at the Viejo Mitigation Bank and the mitigation outlined below on Hidden Ranch.

METHODS

During the initial June 15th site visit with David Zoutendyk of the U.S. Fish and Wildlife Service, Leslie MacNair of the CDFG and yourself, areas were identified that would be potentially suitable for wetland and streambed restoration. The site was revisited on June 19th by Larry Sward and Barry Jones of HELIX to assess in more detail appropriate areas for preservation/enhancement and creation of ACOE and CDFG jurisdictional habitats. Areas within and immediately adjacent to the existing creek on site were deemed to be the most appropriate areas for ACOE and CDFG enhancement and creation areas, while areas further removed from the creek centerline were identified as CDFG mitigation areas only. Additional oak restoration areas were also identified for use in meeting County of Orange oak mitigation requirements for the project. Each area was flagged and photographed. Survey feathers were also used to mark permanently the proposed restoration areas. These areas were then surveyed in using a Global Positioning System (GPS), allowing for very accurate area calculations.

RESULTS

Two distinct areas were identified for mitigation: the area within the existing ranch compound that has been the most heavily disturbed and an area along the creek immediately upstream of the ranch compound that has been disturbed by long-term cattle grazing (Figure 3).

The ranch compound area has two drainages traversing it (Figure 4). The main drainage channel has been completed denuded of vegetation from the existing creek crossing downstream to the fenceline (Figure 5). Upstream of the crossing, some riparian vegetation does exist (Figure 6). A second channel enters the compound from the east and flows south into the main channel. Currently, this channel has limited riparian vegetation due to cattle grazing activities (Figure 7).

Figure 4 shows the areas proposed for preservation, enhancement and creation in the ranch compound. The existing barn, corral and associated equipment will be removed from the site, while the existing homes and pump house will remain. The existing crossing will be expanded with additional pipes to allow a wider area of inundation upstream and downstream. Areas of the creek downstream of the existing crossing (Area 1) will be widened to the same grade as the existing channel. These areas will be considered ACOE/CDFG creation areas. The existing creek channel both downstream and upstream of the crossing will be enhanced (Area 2) and graded to within one foot of the existing creek channel to the east for use as CDFG creation area; another area (Area 3) will be graded down and restored along the smaller drainage to east of the primary drainage. The area upstream of the crossing (Area 4) will be graded down to provide for ACOE and CDFG creation.

Figures 8 through 10 show the areas proposed for preservation, enhancement and creation to the north of the compound area. The existing channel is of better quality in this area but has still been degraded by cattle grazing. Area 5 will be used for ACOE and CDFG creation. Adjacent areas to the east will be used for oak woodland restoration for County of Orange mitigation needs.

The existing channels will be enhanced by weeding and planting of mule fat (*Baccharis salicifolia*) and a limited number of willows (*Salix* sp.). The areas in the ranch compound will need to be planted at similar densities to areas proposed for creation given the highly disturbed nature of the channel. ACOE creation areas will be planted based on Table 1 below; CDFG creation areas will be planted based on Table 2 below. We feel that this two-zone approach is best suited to the site. Temporary irrigation will be used for all but the existing stream channel areas.

Table 1

Coast live oak (*Quercus agrifolia*)	20
California rose (*Rosa californica*)	50

It is anticipated that this restoration effort will be successful because the areas proposed for creation/enhancement occur within or adjacent to the existing channel, and the width of the proposed creation/enhancement areas is no wider than the existing vegetation within the channel upstream or downstream where cattle grazing has been eliminated. Additionally, the hydrology of the creation areas will be consistent with the hydrology of the existing channel.

The proposed restoration will result in the enhancement of 1.1 acres of existing degraded stream channel, creation of 0.9 acre of ACOE/CDFG jurisdictional areas and 0.34 acre of CDFG only jurisdictional areas. Combined with the Saddleback Meadows on-site preservation, enhancement and creation as well as preservation and creation at the Viejo Mitigation Bank, a total of 0.78 acre of ACOE jurisdictional mule fat scrub will be created on site, 0.9 acre of mule fat scrub/riparian will be created at the Hidden Ranch site and 0.9 acre of existing degraded mule fat/riparian will be preserved and enhanced at the Hidden Ranch site. The remaining 1.05 acres of waters of the U.S. mitigation will be mitigated through preservation of waters/wetlands on the Viejo and/or Hidden Ranch sites.

The combination of on- and off-site measures will result in ACOE mitigation ratios of 3:1 for mule fat scrub (1.95:1 of creation and 1.05:1 enhancement for the 0.86 acre impacted) and 1:1 for waters of the U.S./streambed (1.05 acres impacted).

Similarly, a total of 0.78 acre of CDFG jurisdictional mule fat scrub will be created on site, 1.24 acres of mule fat scrub/riparian will be created at the Hidden Ranch site, and 1.1 acres of existing degraded mule fat/riparian will be preserved and enhanced at the Hidden Ranch site. An additional 1.01 acres of CDFG oak woodland will be restored on Hidden Ranch. The remaining 1.0 acre of streambed mitigation will be mitigated through preservation of waters/wetlands on the Viejo and/or Hidden Ranch sites. Combined, these measures will result in mitigation ratios of 3:1 for mule fat scrub and oak woodland impacts and 1:01 for waters of the U.S./streambed impacts.

The combination of on- and off-site measures will result in CDFG mitigation ratios of 3:1 for mule fat scrub (2:1 of creation and 1:1 preservation and enhancement for the 1.54 acres impacted) and 1:1 for waters of the U.S./streambed (1.01 acres impacted).

Please review the information provided and provide us with input as to whether this site and the methods proposed can provide the basis for formalizing this in greater detail in the mitigation plan. Please also let me know if you have any questions.

Sincerely,

Barry L. Jones
Senior Consulting Biologist

MEMORANDUM

date: October 6, 2000

to: Vicki White
U.S. Army Corps of Engineers

from: Barry Jones

subject: Saddleback Meadows coastal California gnatcatcher surveys

job number: CQL- 02

message: The following is a summary of surveys conducted for the coastal California gnatcatcher (*Polioptila californica californica*) on the Saddleback Meadows project. A summary was also provided on page 6 of the Biological Assessment prepared for the project.

Focused surveys for the coastal California gnatcatcher were conducted on April 15, May 22, 29, June 5, 16, and June 23, 1998 by Mari Schroeder, Christine Mukai, and Michelle Dohrn of Chambers Group. These biologists are listed on Chambers Group's Federal Fish and Wildlife Permit (PRT-781217) to conduct coastal California gnatcatcher surveys and these surveys were performed in accordance with USFWS guidelines (1997). Surveys were also conducted by Sweetwater Environmental Biologists, Inc. in 1993 and 1994, and by Pacific Southwest Biological Services in 1993.

No coastal California gnatcatchers were observed during the reconnaissance-level or focused field surveys. Additionally, Sweetwater Environmental Biologists, Inc. and HELIX Environmental Planning, Inc. have been on the site dozens of times conducting a variety of biological assessments with biologists permitted to conduct gnatcatcher surveys over the past six years. No gnatcatchers have been observed during any of the surveys noted above.
We strongly disagree with the assertion by Royce Riggan that the sage scrub on site is excellent quality habitat on site for the gnatcatcher. A majority of the sage scrub has been heavily impacted by cattle and cardoon (*Cynara cardunculus*), and would not support breeding gnatcatchers. Most of the remaining sage scrub is dominated by black sage and is on steep slopes. Gnatcatchers typically do not occur in these areas, or occur in very low numbers. Additionally, elevations on site range from approximately 1,000 1,600 feet, which is considered the upper elevational limits for the gnatcatcher. There are significant populations at lower elevations to the west. However, this species is not known from areas to the north, east and south of the project. It should also be noted that Mr. Riggin's observations occurred in late September when this species typically expands its use areas.

Based on the discussion above, it is our opinion that the site is not occupied by breeding gnatcatchers.

MEMORANDUM

date: October 6, 2000

to: Vicki White
U.S. Army Corps of Engineers

from: Barry Jones

subject: Saddleback Meadows minimization measures

job number: CQL- 02

message: Remedial grading for the project will be in close proximity to two of the existing ponds on site, Pond H and Pond I. Potential impacts from grading are being minimized by the following measures.

- A 25-foot buffer will be provided between the edge of pond H and remedial grading as shown in Figure 1. A 50-foot buffer will be provided between the edge of pond I and remedial grading as shown in Figure 2.
- All grading directly adjacent to the ponds will be done outside of the rainy season (May 15-November 15).
- Silt fencing and any other erosion control measures deemed necessary will be provided.
- Remedial grading areas will be revegetated with coastal sage scrub per the upland mitigation plan.

Combined, these measures will insure that both direct and indirect impacts to these basins will be minimized.

HELIX

Viejo Conservation Bank
Vernal Pool Restoration/Creation Plan Outline

Proposed vernal pool restoration on the Viejo site would involve restoration and expansion of existing low quality pools on site in addition to creation of new pools in suitable areas. The attached table presents a pool by pool list of the proposed restoration activities. A wetland delineation and vernal pool analysis of the site was conducted by Planning Consultants Research (PCR) in 1998. HELIX Environmental planning, Inc., (HELIX) revisited the site in 2000 to relocate the pools and identify potential restoration areas. A global positioning satellite (GPS) system with an accuracy of approximately four inches was used to survey in the limits of vernal pool watershed and potential restoration areas. The state of each pool was noted and restoration requirements were recorded. A map showing the proposed vernal pool locations, watershed area and flow lines is attached.

Restoration on site will include the following:

Topography/Hydrology

Restored/created pools will be contoured to replicate hydrologic conditions of existing vernal pool habitat in the project vicinity. Care will be taken to avoid altering the watershed of the preserved pools. Material removed during pool excavation will be used to construct the mima mounds on site forming pool boundaries. Restoration within the preserved pools will be limited to minor recontouring and incorporation in the overall vernal pool weeding program. Existing roads not needed to service on site powerlines, and disturbed upland areas will be re-graded to restore natural hydrologic conditions of the preserve area.

Grading

Grading of the proposed restoration areas will begin in late fall. The revegetation specialist will mark all areas to be graded. Preserved vernal pools and their immediate watersheds will also be marked as avoidance areas. An on-site meeting will be held with the installation contractor and the revegetation specialist to identify sensitive areas and devise a strategy for avoidance prior to initiation of restoration activities. Sensitive areas to be avoided will be clearly marked with stakes and flagging. A staging area will be established outside of the preserve area. Grading shall be implemented using small tracked dozers with ripping tines and slope boards and rubber-tired loaders. A sheep's foot shall be used for mound construction. All vehicles and construction equipment will be restricted to the staging areas when not required for restoration activities.

Road De-compaction

All dirt roads and trails within the preserve area will be ripped to a depth of 8 inches prior to seeding with California sagebrush species. Roads within 5 feet of a vernal pool will be ripped using hand tools in order to avoid unnecessary impacts. Road shoulders will be feathered back

to original grades where possible. Following road de-compaction, the seed mix will be applied at the beginning of the rainy season to maximize the potential for germination.

Fencing

Prior to and during construction a temporary fence will restrict access to the preserve area. A split rail fence will be installed along the roadway boundary to preclude vehicle access.

Soil/Inoculum

Restoration of the native vernal pool habitat on site requires the reintroduction of plants and animals in addition to the physical construction described above. Partly because vernal pools recur reliably in the same location year after year, many vernal pool species are adapted for a strategy of non-dispersal. As a result, the restoration of vernal pool habitat can be greatly accelerated by the active transport of propagules from donor sites into the restored pools. This will be accomplished through redistribution of topsoil containing vernal pool seed and propagules collected from pools to be restored.

Topsoil from existing pools to be restored will be salvaged and stored. Hand tools (i.e., shovels and trowels) will be used to remove the first two inches of soil from these pools. All collected soils will be placed in labeled bags or boxes and stored in a cool, dry place before re-introduction into the newly restored/created pools. Soil storage may be avoided if the project schedule allows soil collection and introduction to occur at the same time. Each of the restored/created pools will receive a share of the total collected pool material proportionate to its surface area. The collected soils will be spread out and raked into the bottoms of the restored pools. The preserved pools will not receive inoculum.

Off-site inoculum may be required to supplement the on-site salvaged soils. Potential sources of inoculum include other vernal pools in the project vicinity. Care will be taken to minimize the introduction of weed seeds into the restored vernal pools. Prior to the use of off-site inoculum, the restoration specialist will contact the appropriate resource agencies for approval.

Maintenance/Monitoring

A five-year maintenance program is proposed to ensure the successful establishment and persistence of the preserved and restored vernal pool habitat. The maintenance program will involve removal of trash, weed control, fence repair, and any remedial measures deemed necessary for the success of the restoration program (e.g., re-seeding, re-contouring).

Particular emphasis will be placed on pro-active weed control. All weeding within and immediately adjacent to the vernal pools will be by hand. Weeds in the upland areas will be removed by hand whenever possible. Focused herbicide application will also be used to control weeds in the upland area. No herbicide will be used within or adjacent to the restored and preserved vernal pools. Mechanical removal of weed species with a weed-eater or other such device in the upland areas may also be necessary. All exotic species in the vernal pool and upland areas will be targeted for removal. Weed species of major concern on site include, but

are not limited to, filaree, star thistle, Italian ryegrass, rabbitfoot grass, yard knotweed, fennel and curly dock. Hydrologic conditions will be modified if necessary to assure prolonged periods of inundation to help control exotic species. Pools that hold water longer generally have fewer invasive species.

Monitoring will be carried out under the direction of the restoration specialist to assess the progress of the restoration effort and determine any appropriate remedial measures. Quantitative success criteria presented above will be used to measure the success of the mitigation. Final and yearly success criteria are included to measure interim and ultimate habitat development. If the annual goals are not being met, corrective measures will be implemented. Corrective measures may include, but are not limited to importing new soil inoculum from an off-site source, recontouring of non-functioning pools and re-seeding with collected or commercially available seeds from the immediate area. Prior to conducting any remedial measures, the ACOE and USFWS will be notified.

As part of the monitoring program, annual reports prepared by HELIX will be submitted to the ACOE and USFWS evaluating the success of the mitigation effort to date, along with any recommendations for future work that may be deemed necessary. The annual monitoring report will include data collected throughout the year in addition to the annual monitoring visit.

MEMORANDUM

date: December 20, 2000

to: David Zoutendyk

organization: U.S. Fish and Wildlife Service

from: Barry Jones

subject: Additional information requested for Saddleback Meadows

job number: CQL-02

Based on our November 16, 2000 meeting with the U.S. Fish and Wildlife Service, California Department of Fish and Game, and the U.S. Army Corps of Engineers we are providing you with the following additional information on the Saddleback Meadows project:

- Survey results for the Riverside fairy shrimp in Ponds C and F.
- Memo recommending use of the soils from Ponds C and F in new pond creation.
- Map and table of watersheds of existing ponds and and table of watersheds of created ponds.
- Proposed phasing plan of Riverside fairy shrimp mitigation and project development.

Please let me know if you have any questions.

Proposed Phasing of Riverside Fairy Shrimp Mitigation and Project Development – Saddleback Meadows

Proposed Phasing

Timeframe	Pond Creation		Project Development			Net Pond Impact
	Ponds	Acreage Created	Residential Lots	Ponds Impacted	Acreage Impact	
Winter 2000/2001	1, 2, 7, 8[1]	0.61				+ 0.61 ac.[4]
Start: 2nd Qtr 2002			1 – 129	A, B	0.13	+ 0.48
Start: 2nd Qtr 2003			130 – 299	D, E, G[3]	0.27	+ 0.21
4th Qtr 2003	3, 4, 5, 6[2]	0.54				+ 0.75

[1]Ponds 1, 2, 7, 8 are independent of project remedial and mass grading. Pond 6 is also independent but it is very close to Pond 5 and is a small pond that early creation is not recommended.

[2]Ponds 3, 4, 5, 6 are located either immediately adjacent (50'+/-) or within the footprint of project remedial grading; therefore, construction of these ponds can not be initiated prior to substantial completion of the remedial and mass grading of Phase 2 of the project.

[3]The remedial and mass grading for Lots 1 through 129 will disturb neither the ponds nor the watershed of Ponds D, E, and G. There will be remedial grading within the watershed of Pond H.

[4]Ponds constructed prior to start of project represents a 1.5:1 ratio to total impact. Overall on-site mitigation ratio is 2.88:1

Proposed Ponds (as of November 6, 2000)

Pond	Acreage
1	0.16
2	0.15
3*	0.02
4	0.10
5	0.37

*Source: Jurisdiction Delineation, dated March 2000, Chambers Group.

**Ponds C and F were breached have been significantly impacted by sedimentation and base soil alternation. Cysts have been found although at a very low density. Since neither pond has the ability to impound water, neither pond is considered to be habitat.

HELIX environmental planning, inc.

MEMORANDUM

date: December 19, 2000

to: David Zoutendyk

organization: U.S. Fish and Wildlife Service

from: Barry Jones

subject: Saddleback Meadows fairy shrimp dry sampling results

job number: CQL-02

Dry sampling of Ponds C and F have confirmed the presence of Riverside fairy shrimp cysts in low densities (one cyst in Pond C and four cysts in Pond F). Neither basin is currently capable of retaining water, and hence no longer provides habitat capable of supporting Riverside fairy shrimp.

Although habitat for the fairy shrimp is no longer present, TPG Management is willing to collect soil (including fairy shrimp cysts) within these two basins for use as inoculum in basins proposed for creation on Saddleback meadows. This measure would offset impacts to cysts within the two basins, and would be incorporated into the overall mitigation for the Riverside fairy shrimp on the project.

Los Angeles, California 90053-2325

Subject: Saddleback Meadows

Dear Vicki:

HELIX Environmental Planning, Inc. (HELIX) has refined potential restoration areas and methods for implementing U.S. Army Corps of Engineers (ACOE) and California Department of Fish and Game (CDFG) required wetland mitigation for the Saddleback Meadows project on the Hidden Ranch site (Figures 1 and 2). These refinements are based on our June 15, 2000 site visit to Hidden Ranch and presented as part of the overall mitigation program being implemented for the Saddleback Meadows project, including on-site conservation and restoration, off-site acquisition, enhancement and creation of wetlands at the Viejo Mitigation Bank and the mitigation outlined below on Hidden Ranch.

METHODS

During the initial June 15th site visit with David Zoutendyk of the U.S. Fish and Wildlife Service, Leslie MacNair of the CDFG and yourself, areas were identified that would be potentially suitable for wetland and streambed restoration. The site was revisited on June 19th by Larry Sward and Barry Jones of HELIX to assess in more detail appropriate areas for preservation/enhancement and creation of ACOE and CDFG jurisdictional habitats. Areas within and immediately adjacent to the existing creek on site were deemed to be the most appropriate areas for ACOE and CDFG enhancement and creation areas, while areas further removed from the creek centerline were identified as CDFG mitigation areas only. Additional oak restoration areas were also identified for use in meeting County of Orange oak mitigation requirements for the project. Each area was flagged and photographed. Survey feathers were also used to mark permanently the proposed restoration areas. These areas were then surveyed in using a Global Positioning System (GPS), allowing for very accurate area calculations.

RESULTS

Two distinct areas were identified for mitigation: the area within the existing ranch compound that has been the most heavily disturbed and an area along the creek immediately upstream of the ranch compound that has been disturbed by long-term cattle grazing (Figure 3).

The ranch compound area has two drainages traversing it (Figure 4). The main drainage channel has been completed denuded of vegetation from the existing creek crossing downstream to the fenceline (Figure 5). Upstream of the crossing, some riparian vegetation does exist (Figure 6). A second channel enters the compound from the east and flows south into the main channel. Currently, this channel has limited riparian vegetation due to cattle grazing activities (Figure 7).

Figure 4 shows the areas proposed for preservation, enhancement and creation in the ranch compound. The existing barn, corral and associated equipment will be removed from the site, while the existing homes and pump house will remain. The existing crossing will be expanded with additional pipes to allow a wider area of inundation upstream and downstream. Areas of the creek downstream of the existing crossing (Area 1) will be widened to the same grade as the existing channel. These areas will be considered ACOE/CDFG creation areas. The existing creek channel both downstream and upstream of the crossing will be enhanced (Area 2) and graded to within one foot of the existing creek channel to the east for use as CDFG creation area; another area (Area 3) will be graded down and restored along the smaller drainage to east of the primary drainage. The area upstream of the crossing (Area 4) will be graded down to provide for ACOE and CDFG creation.

Figures 8 through 10 show the areas proposed for preservation, enhancement and creation to the north of the compound area. The existing channel is of better quality in this area but has still been degraded by cattle grazing. Area 5 will be used for ACOE and CDFG creation. Adjacent areas to the east will be used for oak woodland restoration for County of Orange mitigation needs.

The existing channels will be enhanced by weeding and planting of mule fat (*Baccharis salicifolia*) and a limited number of willows (*Salix* sp.). The areas in the ranch compound will need to be planted at similar densities to areas proposed for creation given the highly disturbed nature of the channel. ACOE creation areas will be planted based on Table 1 below; CDFG creation areas will be planted based on Table 2 below. We feel that this two-zone approach is best suited to the site. Temporary irrigation will be used for all but the existing stream channel areas.

Table 1
ARMY CORPS OF ENGINEERS
RETORATION AREAS

SPECIES	PLANTS PER ACRE
Mule fat (*Baccharis salicifolia*)	250
Arroyo willow (*Salix lasiolepis*)	20
Black willow (*Salix gooddingii*)	20

Table 2 CALIFORNIA DEPARTMENT OF FISH AND GAME RESTORATION AREAS	
SPECIES	PLANTS PER ACRE
Mule fat (*Baccharis salicifolia*)	200
Mexican elderberry (*Sambucus mexicana*)	20
Western sycamore (*Platanus racemosa*)	40
Coast live oak (*Quercus agrifolia*)	20
California rose (*Rosa californica*)	50

It is anticipated that this restoration effort will be successful because the areas proposed for creation/enhancement occur within or adjacent to the existing channel, and the width of the proposed creation/enhancement areas is no wider than the existing vegetation within the channel upstream or downstream where cattle grazing has been eliminated. Additionally, the hydrology of the creation areas will be consistent with the hydrology of the existing channel.

The proposed restoration will result in the enhancement of 1.1 acres of existing degraded stream channel, creation of 0.9 acre of ACOE/CDFG jurisdictional areas and 0.34 acre of CDFG only jurisdictional areas. Combined with the Saddleback Meadows on-site preservation, enhancement and creation as well as preservation and creation at the Viejo Mitigation Bank, a total of 0.78 acre of ACOE jurisdictional mule fat scrub will be created on site, 0.9 acre of mule fat scrub/riparian will be created at the Hidden Ranch site and 0.9 acre of existing degraded mule fat/riparian will be preserved and enhanced at the Hidden Ranch site. The remaining 1.05 acres of waters of the U.S. mitigation will be mitigated through preservation of waters/wetlands on the Viejo and/or Hidden Ranch sites.

The combination of on- and off-site measures will result in ACOE mitigation ratios of 3:1 for mule fat scrub (1.95:1 of creation and 1.05:1 enhancement for the 0.86 acre impacted) and 1:1 for waters of the U.S./streambed (1.05 acres impacted).

Similarly, a total of 0.78 acre of CDFG jurisdictional mule fat scrub will be created on site, 1.24 acres of mule fat scrub/riparian will be created at the Hidden Ranch site, and 1.1 acres of existing degraded mule fat/riparian will be preserved and enhanced at the Hidden Ranch site. An additional 1.01 acres of CDFG oak woodland will be restored on Hidden Ranch. The remaining 1.0 acre of streambed mitigation will be mitigated through preservation of waters/wetlands on the Viejo and/or Hidden Ranch sites. Combined, these measures will result in mitigation ratios of 3:1 for mule fat scrub and oak woodland impacts and 1:01 for waters of the U.S./streambed impacts.

The combination of on- and off-site measures will result in CDFG mitigation ratios of 3:1 for mule fat scrub (2:1 of creation and 1:1 preservation and enhancement for the 1.54 acres impacted) and 1:1 for waters of the U.S./streambed (1.01 acres impacted).

Please review the information provided and provide us with input as to whether this site and the methods proposed can provide the basis for formalizing this in greater detail in the mitigation plan. Please also let me know if you have any questions.

Sincerely,

Barry L. Jones
Senior Consulting Biologist

INTRODUCTION

1.0 INTRODUCTION

1.1 INTRODUCTION / SUMMARY

This Response to Comments document has been prepared in accordance with the California Environmental Quality Act (CEQA) as amended (Public Resources Code Section 21000 *et seq.*), and *CEQA Guidelines* (California Administrative Code Section 15000 *et seq.*). The Final EIR contains the following components:

- Final Revised Subsequent EIR including Response to Comments (June 2002) (SCH No. 1996121072)
- Incorporated revisions and minor additions into the Draft Revised Subsequent EIR based upon public and agency comments
- Draft Revised Subsequent Environmental Impact Report (April 2002) (SCH No. 1996121072)

The above outlined documents are incorporated by reference into the Final EIR and are available for review at the Orange County Planning and Development Services Department and the following Orange County Public Libraries:

Orange County Library - Rancho Santa Margarita Branch
30902 La Pramera
Rancho Santa Margarita, California 92688

Orange County Library – El Toro Branch
24672 Raymond Avenue
El Toro, California 92630

Orange County Library – Silverado Branch
281922 Silverado Canyon Road
Silverado, California 92676

Orange County Library – Mission Viejo Branch
25209 Marguerite Parkway
Mission Viejo, California 92691

California State University, Fullerton
Library Documents Section

UC Irvine
Main Library – Government Publications/Microforms Department

The above outlined CEQA documents are collectively referred to as the Final EIR. Environmental Findings have been prepared for the Final EIR in accordance with Section 15091 of the *CEQA Guidelines*, and are contained in a separate document.

The Draft EIR was distributed to various public agencies, citizen groups and interested individuals on April 26, 2002 for a period of 45 days (see Appendix A.1 for a distribution list). The comment period closed June 10, 2002. However, the comment review period was extended an additional two-weeks per requests from California Department of Fish and Game (CDFG) and U.S. Fish and Wildlife Service (USFWS) (see Appendix A.1). Thus, the comment review period closed on June 24, 2002. Orange County Planning and Development Services Department received a total of 27 letters from responsible agencies and special interest groups (see Appendix A.2). This Response to Comments document contains responses to comments received on the Draft Revised Subsequent EIR during the public review period.

Comments have been retyped, numbered in sequential order, and are followed by responses. Copies of all comment letters are included in Appendix A.2 of this document.

In accordance with Public Resources Code 21092.5 of the *CEQA Guidelines*, this Response to Comments document will be provided to commenting public agencies, organizations, and individuals for a minimum of ten days prior to certification of the EIR.

SECTION 2.0

CORRECTIONS AND ADDITIONS

2.0 CORRECTIONS AND ADDITIONS

This section contains revisions to information included in the Draft Revised Subsequent EIR based upon: (1) additional or revised information required to prepare a response to a specific comment, (2) updated information which has become out-of-date as a result of the passage of time, and/or (3) typographical errors.

1. Page 1-4, Section 1.4.2 "Draft Revised Subsequent EIR": Add the following text to the second paragraph: "*The Initial Study identifies "Hazards" as a potentially significant impact which may result from project implementation. However, issues surrounding "Hazards" involve fire hazards, emergency response plans, as identification of unavoidable and cumulative hazard impacts. These issues are discussed and analyzed under Section 4.12 Fire Protection and Section 4.13 Police Protection rather than a separate section exclusive to Hazards.*"

2. Page 2-16, Section 2.3.2 "Project Phasing": Change "*However, project grading would be completed in one phase and require approximately 13 months to complete.*" to read "*However, project grading would be completed in one phase and require approximately 15 months to complete.*"

3. Page 3-5, Table 3.1: The following table reflects current information and shall replace "Table 3.1 – Related Projects" as found in the Draft Revised Subsequent EIR:

Table 3.1
Related Projects

Project	Type of Development	Size	Status

10. Page 4.5-30, M 5-5 under Section 4.5.6 "Mitigation Measures": Add the following sentence: "*The fair share funding amount agreed to by the TCA must be submitted prior to the issuance of any building permits for the project.*"

11. Page 4.8-32, Section 4.8.6 "Mitigation Measures": Add new mitigation measure M 8-4:

"*M 8-4* *Prior to grading, all Plummer's mariposa lily bulbs shall be salvaged. The bulbs shall be stored at a qualified native plant nursery prior to transplanting them for on-site habitat enhancement. All transplanted bulbs shall be maintained, including weed control. Monitoring and reporting shall be conducted. A qualified biologist/botanist shall oversee all aspects of this mitigation plan including bulb collection and transplanting, per the recommendations of the project biologist. The Plummer's mariposa lily mitigation plan shall be reviewed and approved by the Planning and Development Services Department, prior to issuance of grading permits.*"

12. Page 4.10-14, second paragraph under "Project Impacts": Change "*Data recovery would occur prior to ground disturbing activities.*" to read "*Additional mitigation would need to be accomplished if development plans change and the site is to be disturbed.*"

13. Page 4.12-1, second paragraph under Section 4.12.1: Change "*61 fire stations*" to read "*59 fire stations.*

14. Page 4.12-1, third paragraph, second bullet under Section 4.12: Remove *"only available from a medic van"* from the sentence and add the following sentence to the end of the bullet. *"OCFA provides paramedic service both paramedic assessment and full paramedic services through a number of configurations in addition to the medic vans."*

15. Page 4.12-2, Table 4.12.1 - Fire Station Locations: The following table reflects current information and shall replace "Table 4.12.1 – Fire Station Locations" as found in the Draft Revised Subsequent EIR.

Table 4.12.1
Fire Station Locations

Station No.	Staffing and Equipment	Response Distance (miles)[a]	Response Time (maximum, minutes: seconds)[b]
Fire Station No. 42: 19150 Ridgeline Drive Trabuco Canyon, CA 92679, Portola Hills	Paramedic Assessment Unit/Brush Engine, 3 Firefighters	0.3	4
Fire Station No. 18: O'Neill Park, Trabuco Canyon Road, Trabuco Canyon, CA 92679	Paramedic Assessment Unit/Brush Engine, 3 Firefighters	4.2	8:40
Fire Station No. 16: 28891 Modjeska Canyon Road Modjeska Canyon, CA 92676	Paramedic Assessment Unit/Brush Engine, 3 Firefighters	3.5	9:30
Fire Station No. 45: 30131 Adventura, Rancho Santa Margarita, CA 92688	Paramedic Assessment Unit, Truck, 1 Battalion Chief, 8 Firefighters	5.3	10:30
Fire Station No. 54 19811 Pauling Avenue Lake Forest, CA 92610	Paramedic Assessment Unit Engine, 3 Firefighters	2.8	6:20
Fire Station No. 31 22426 Olympiad Road Mission Viejo, CA 92692	Paramedic Assessment Unit Engine (closest one to the project site), Basic Life Support Engine, 3 Firefighters	3.7	7:50

[a] *Response distance is an approximate.*
[b] *Response time is an approximate based upon an average of 35 mph and 90 seconds of call processing and turnout time with the exception of Fire Station 16 which incorporates a two minute time period added for the volunteer personnel to get to the fire station (Fire Station 16 does not have full time firefighters, only volunteer firefighters).*

Sources: Service Letter from Battalion Chief Michael S. Rohde, Advance Planning, OCFA, July 13, 2001; Telephone communication with Battalion Chief Michael S. Rohde, Advance Planning, OCFA, August 29, 2001; Letter from Gene F. Begnell, Battalion Chief, Strategic Services, OFCA, June 6, 2002.

16. Page 4.12-2, third paragraph: Change *"average response time of six minutes"* to read *"average response time of nine minutes."*

17. Page 4.12-2, fourth paragraph: Replace the last sentence *"At this location three firefighters are on duty staffing either a paramedic assessment unit or a brush engine."* to read *"At this location, 20 volunteer firefighters staff the engine when called upon to do so."*

18. Page 4.12-3, first paragraph, last sentence: Change "*eight firefighters*" to read "*seven firefighters.*"

19. Page 4.12-9, under Section 4.12.4 "Project Design Features and Standard County Conditions": Add new Standard County Condition SC 12-16:

    "*SC 12-16* *Secured Fire Protection Agreement: Prior to grading, the applicant shall enter into a Secured Fire Protection Agreement with the OCFA.*"

20. Page 4.12-5, Figure 4.12.1 – Fuel Modification Plan: Please refer to the revised Figure 4.12.1 – Fuel Modification Plan as found at the end of Section 2.0 of this Response to Comments document.

21. Page 4.12-4, under Section 4.12.3 "Cumulative Impact", second paragraph: Delete the second sentence and replace with: *"Additional staffing and/or equipment may be needed to meet this demand. This issue will be addressed within the Secured Fire Protection Agreement and as with the proposed project, the related projects would be individually subject to protection and safety measures to adequately mitigate fire protection."*

22. Page 4.16-6, under Section 4.16.6 "Mitigation Measures": Add new mitigation measure: M 16-2:

    "*M 16-2* *Prior to undertaking construction of the project, the applicant shall enter into an improvement agreement with TCWD to provide for the design, construction, installation, dedication and funding of all necessary master plan and in tract storage facilities or alternatively pay TCWD's in lieu water storage fees.*"

23. Page 5-37, Alternative 6 – 44/178 Alternative "Public Services – Fire Protection and Police Protection": Replace text after first sentence with the following: *"However, the layout of the "Development Area" under this alternative would not allow for secondary access for emergency vehicles and may require the acquisition of additional easements or other mitigation measures to ensure that adequate access to the project is provided. As with the proposed project, this alternative would require a fuel modification plan to minimize or retard the spread of dry brush and wildfire into the area.*

    Fire protection impacts would be greater with implementation of Alternative 6, compared to those associated with the proposed project."

24. Page 5-47, under Section 5.5 "Environmentally Superior Alternative": Replace last sentence "*Alternative 8, the reduced residential alternative would be the environmentally superior alternative among the non no project alternatives.*" To read "*Alternative 4, the Foothill Trabuco Specific Plan EIR 531 Staff alternative would be the environmentally superior alternative among the non-no project alternatives. Although Alternative 4 is environmentally superior, it would be economically infeasible to develop. Land acquisition, engineering, construction, and implementation of mitigation measures could not be amortized over 100 single-family units. These costs combined with mitigation costs, such as those associated with stabilizing the geotechnical hazards would exceed project revenues.*"

25. Page 5-48, Table 5.7: A revised Table 5.7 reflects current information and shall replace "Table 5.7 – Comparison of Proposed Project and Alternative Impacts" as found in the Draft Revised Subsequent EIR. The revised table is included at the end of Section 2.0 of this Response to Comments document.

Draft Revised Subsequent EIR 566

SECTION 3.0

RESPONSE TO WRITTEN COMMENTS

3.0 RESPONSE TO WRITTEN COMMENTS

3.1 INTRODUCTION

In order to comprehensively respond to all letters received on the Draft Revised Subsequent EIR and address each CEQA issue raised, a summary matrix has been developed which lists the commenter and the corresponding issues raised. The matrix contains the names of all commenters, and has been apportioned into 25 major comment categories, outlined as follows:

1. Land Use
2. Geophysical Resources
3. Hydrology
4. Water Quality
5. Transportation/Traffic
6. Air Quality
7. Noise
8. Biological Resources
9. Aesthetics/Visual
10. Cultural/Paleontological Resources
11. Recreation
12. Fire Protection
13. Police Protection
14. Schools
15. Libraries
16. Water Supply
17. Wastewater
18. Solid Waste
19. Electricity
20. Natural Gas
21. Procedural Issues
22. Mitigation Issues
23. Alternatives
24. Other Concerns/Issues
25. No Comment/No Response Required

All comment letters have been reviewed and placed into one or more of the above-outlined comment categories. Each original comment letter can be found in Appendix A.1 of this document. In total 27 comment letters were received during the comment period. Each comment letter has been retyped and divided into individual specific numbered comments. Each numbered comment is followed by a response.

All written comments are summarized in Table 3.1 and organized as follows:

- Draft EIR Public Agency Comment Letters (12 letters)
- Draft EIR Organization/Businesses Comment Letters (11 letters)
- Draft EIR Individual Comment Letters (4 letters)

Table 3.1
List of Commenters

Comment Section	Commenter	Comment Category
3.2	**Agency Comments**	
3.2.1	U.S. Fish and Wildlife Service / State of California, Department of Fish and Game	2, 3, 8, 23
3.2.2	State of California, Governor's Office of Planning and Research – State Clearinghouse	25

3.2 AGENCY COMMENT LETTERS

The following agencies commented on the Draft Revised Subsequent EIR:

- U.S. Fish and Wildlife Service/State of California, Department of Fish and Game
- State of California, Governor's Office of Planning and Research - State Clearinghouse
- State of California, Department of Transportation
- California State University, Los Angeles
- South Coast Air Quality Management District
- Southern California Association of Governments
- Transportation Corridor Agencies
- Orange County Fire Authority
- Trabuco Canyon Water District
- City of Lake Forest
- City of Mission Viejo
- City of Rancho Santa Margarita

3.2.1 U.S. Fish and Wildlife Service / California Department of Fish and Game

Karen A. Evans, June 26, 2002

William E. Tippets, June 26, 2002

USFWS/CDFG 1 – Comment

The U.S. Fish and Wildlife Service (Service) and the California Department of Fish and Game (Department), hereafter referred to as the Wildlife Agencies, have reviewed the Draft Revised Subsequent Environmental Impact Report (DEIR) for the construction of the Saddleback Meadows Project, in the County of Orange, California. The project proposed development of 299 single-family houses on a 229.2-acre site in the lower foothills of the Santa Ana Mountains in southern Orange County. The proposed project also includes two new paved access roads off of El Toro road and an adjacent offsite 1.4 million-gallon water reservoir. The Wildlife Agencies have commented on various development proposals and environmental documents for this project since 1994. As we have stated in our previous comments, the proposed project poses significant unmitigated impacts to future Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP) reserve design for the Southern Subregion of Orange County.

The Department is identified as a Trustee Agency pursuant to the California Environmental Quality Act (CEQA) section 15386 and is responsible for the conservation, protection, and management of the State's biological resources. The Department is also responsible, pursuant to the California Endangered Species Act, California Fish and Game code 2050 et seq., *for the protection of species listed by the State as endangered or threatened or identified as species of concern, and the habitats they require. The Department also manages the NCCP Program (California Fish and Game Code 2800* et seq.*), a regional conservation planning effort, that includes Southern Orange County.*

The Service's primary mission is to work "with others to conserve, protect, and enhance fish, wildlife, and plants and their habitats for the continuing benefit of the American People." The Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States. Specifically, we administer the Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 et seq.*), and work in accordance with the provisions of the Fish and Wildlife Coordination Act (48 Stat. 401 as amended, 16 U.S.C. 661* et seq.*). Section 7 of the Act requires Federal Agencies to consult with the Service should it be determined that their actions may affect federally listed threatened or endangered species. Take incidental to otherwise lawful activities can be permitted under the provisions of Section 7 (Federal consultations) or 10 (permits) of the Act.*

USFWS/CDFG 1 – Response

This comment presents an overview of the project and discusses the role of U.S. Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG). No response is required.

USFWS/CDFG 2 – Comment

As noted in the DEIR, the Service has completed formal consultation with the U.S. Army Corps of Engineers (Corps) and issued a biological opinion (FWS-OR-1023.8) on the Saddleback Meadows Project's effects on the federally endangered Riverside fairy shrimp (Streptocephalus woottoni, "fairy shrimp") and its designated critical habitat and designated critical habitat for the threatened coastal California gnatcatcher (Polioptila californica californica, "gnatcatcher"), in accordance with Section 7 of the Act. To clarify, however, our biological opinion evaluated the 283-unit alternative, not the proposed 299-unit alternative discussed in the DEIR. If the 299-unit Alternative is pursued, reinitiation of consultation with the Corps would be required. Although impacts to federally listed species and their designated critical habitat have been addressed in the cited biological opinion for the Saddleback Meadows project, evaluation of impacts to wildlife movement for non-listed species in relation to development of an NCCP/HCP is outside the purview of Section 7 of the Act.

USFWS/CDFG 2 – Response

Comment noted. Although the development footprint and related biological resources mitigation program associated with the 299 unit project presented in the Revised Draft Subsequent EIR is similar to the 283 plan evaluated by the USFWS and contained in the Biological Opinion, it is acknowledged that if the Section 7 is processed for the proposed 299-unit project, additional review and a revised opinion would be required.

USFWS/CDFG 3 – Comment

Relationship of the Project to Regional Conservation Planning Efforts

The NCCP Act was approved in 1991 and established a program to provide for regional protection and perpetuation of natural wildlife diversity while allowing compatible land use and appropriate development growth. The program provides an alternative to "single-species" conservation via the formulation of regional, natural community-based habitat protection programs. The first NCCP/HCP projects in California focused on providing adequate conservation and mitigation for impacts to coastal sage scrub vegetation, the preferred plant community of the gnatcatcher.

Following the Federal listing of the gnatcatcher in 1993, the Service adopted a Special Rule for the gnatcatcher pursuant to section 4(d) of the Act incorporating the conservation and process guidelines established by the State under the NCCP Act. The guidelines set forth procedures for the creation of regional and subregional conservation plans. In accordance with the guidelines, jurisdictions enrolled in the NCCP planning program can authorize a limited amount of interim loss of coastal sage scrub during the planning period subject to six interim habitat loss provisions[1]. However, the interim habitat loss provisions are only applicable until the adoption of a regional or subregional conservation plan. In summary, per the NCCP program, conservation planning within enrolled jurisdictions may be governed by an adopted regional or subregional conservation plan, or is subject to the interim habitat loss provisions of the Special 4(d) Rule.

As an enrolled jurisdiction in the NCCP program, the County of Orange (County) has both an adopted subregional conservation plan that applies to its Central and Coastal subregions (the Orange County Central-Coastal NCCP/HCP) and is participating in development of the Southern Subregion NCCP/HCP. The County has committed to work with the Wildlife Agencies to ensure that projects within its jurisdiction do not prevent connectivity between areas of high habitat values or preclude reserve design options for the Southern Subregion NCCP/HCP.

---

[1]The following mandatory findings must be met for a project to be approved pursuant to the interim habitat loss provisions of the Special 4(d) Rule: 1) The habitat loss does not cumulatively exceed the 5% guideline; 2) The habitat loss will not preclude connectivity between areas of high habitat values; 3) The habitat loss will not preclude or prevent the preparation of the subregional Natural Community Conservation Plan; 4) The habitat loss has been minimized and mitigated to the maximum extent practicable in accordance with the Conservation Guidelines; 5) The habitat loss will not appreciably reduce the likelihood of the survival recovery of listed species in the wild; and 6) The habitat loss is incidental to otherwise lawful activities.

USFWS/CDFG 3 – Response

The County has committed to work with the Wildlife Agencies to ensure that projects within its jurisdiction do not prevent connectivity between areas of high habitat values or preclude reserve design options for the Southern Subregion NCCP/HCP. Although the original Saddleback Meadows project was conceived and approved long before the inception of the NCCP, the project applicant nevertheless committed to work with the Wildlife Agencies during project redesign to minimize impacts to coastal sage scrub and provide for significant on-site preservation and off-site acquisition. As a result of the coastal sage scrub restoration efforts on-site, there will be no net loss of coastal sage scrub on-site, and the quality of the habitat would be enhanced over the long-term. Additionally, 14.8 acres of coastal sage scrub is proposed to be acquired off-site (see Table 4.8.3 of the Draft Revised Subsequent EIR).

USFWS/CDFG 4 – Comment

Reserve Design Inconsistency

Our primary concern with the proposed project is the significant impact it poses to the major lower elevation wildlife movement corridor/linkage along the Santa Ana Mountain foothills of southern Orange County. Saddleback Meadows, together with the adjacent Saddle Creek and Live Oak properties, represents the only remaining unobstructed low elevation wildlife corridor/linkage between the Central and Southern Subregions of the Orange County NCCP/HCP planning areas. To highlight its importance, Orange County's Central-Coastal NCCP/HCP identifies this area as a key corridor/linkage between the subregions. The proposed development on Saddleback Meadows along the eastern and northern portions of the site as shown in Alternative 2 (the No Project, "Existing Entitlement" Alternative), Alternative 3 (the F/TSP EIR 531 Staff Alternative A), Alternative 5 (the Cluster/Single-Family/Multi-Family Residential Alternative), or Alternative 8 (the Reduced Residential Alternative) of the DEIR could substantially eliminate this corridor/linkage and thereby, severely constrain movement of mule deer, coyote, mountain lion and other large mammals from O'Neill Regional Park in the Southern Subregion of the Central Subregion NCCP/HCP reserve. We raised similar concerns regarding the proposed development on

the Saddle creek property in our comments on the recently circulated DEIR- State Clearinghouse No. 199111120 (FWS-OR-1309.1).

Pursuant to the CEQA Guidelines (Section 15130), a revised DEIR should discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable and should review the impacts in light of past, present and future probably projects that could result in related impacts, including those outside of the control of the lead agency. However, this current, revised DEIR does not adequately address cumulative impacts to the low-elevation wildlife corridor/linkage through the Saddleback Meadows, Saddle Creek and Live Oak properties. Also, it appears that a comprehensive plan for maintaining a viable corridor/linkage through these properties has not been completed. For example, the Saddleback Meadows DEIR shows a northern wildlife corridor extending from Saddleback Meadows through the adjacent Saddle Creek property. However, the Saddle Creek DEIR does not show this corridor, which could be blocked by the residential development proposed in the DEIR. In addition, development on the Live Oak property could further limit wildlife movement between the subregions. Therefore, the Saddleback Meadows DEIR should evaluate cumulative impacts to wildlife movement in consideration of past development, the proposed development on the Saddle Creek and Live Oak properties and other probable developments, and demonstrate that the Saddleback Meadows project will not preclude the retention of a viable low-elevation wildlife corridor/linkage connecting the Central and Southern Subregions through all three properties. We wish to work with the County and property owners to develop a comprehensive plan to accomplish this vital component of the Southern Subregion NCCP/HCP.

analyzed

USFWS/CDFG 4 – Response

The Saddleback Meadows project site has not been identified as a major lower elevation corridor/linkage for the region in the Draft Revised Subsequent EIR. It is important to note that the NCCP/HCP planning documents also do not identify a major wildlife corridor on the Saddleback Meadows property, nor are any other properties in the vicinity identified. After distribution of the Draft Revised Subsequent EIR, a letter was received from Dennis Murphy, a Professor and Program Director at the University of Nevada, Reno, who was the chief architect ~~for~~ of the original guidelines for the NCCP (please see Appendix C of this Response to Comments document). According to Dr. Murphy, local wildlife would not be dependent on engineered habitat pathways within a suburban development, but instead on O'Neill Regional Park, Whiting Ranch Wilderness Park and Cleveland National Forest. Mule deer, mountain lion, and other large mammals are far more likely to use areas to the east and north of the site, even without project development. Further, mountain lions should hardly be encouraged into small natural spaces in already suburbanized Orange County. Nevertheless, at the request of the wildlife agencies during the project design process, the project retains an existing local corridor that allows for mammal movement through and around the property. This corridor was established after numerous consultations with the wildlife agencies.

The conceptual corridor shown through the proposed Saddle Creek/Saddle Crest project was intended to show potential wildlife movement in a generalized area where a local corridor could potentially be identified. With or without this local corridor, the regional wildlife movement will still move to the east and north of the project.

The cumulative analysis included in Section 4.8.3 of the Draft Revised Subsequent EIR does not require additional analysis regarding wildlife corridor/linkage through the adjacent properties.

USFWS/CDFG 5 – Comment

To address our concerns for Saddleback Meadows, the Wildlife Agencies recommend further consideration of Alternative 4 (F/TSP EIR 531 Staff Alternative B) of the DEIR as it would allow continued movement of wildlife through the area while still meeting the project's objective of "develop(ing) a single-family, rural community that balances residential development with protection of on-site sensitive resources and values of the surrounding community." Alternative 6 (the 44/178 Alternative) may be able to mitigate significant impacts to wildlife movement if remedial grading requirements can be limited within the corridor/linkage area.

USFWS/CDFG 5 – Response

Please see Section 3.3.2 (Connor 30 – Response) of this Response to Comments document regarding the feasibility of Alternatives 4 and 6.

USFWS/CDFG 6 – Comment

Geotechnical

According to the DEIR, the site is characterized by several unfavorable geothechnical conditions including unstable landslides and presence of ground water that could compromise the site's ability to support the project. Mitigation would include the construction of canyon subdrains and back drains to minimize or eliminate the effects of ground water. The Final EIR (FEIR) should discuss how these changes would affect groundwater availability and timing for use by riparian vegetation in upper Aliso Creek.

USFWS/CDFG 6 – Response

As discussed in Section 4.2.2 and Appendix C of the Draft Revised Subsequent EIR, the proposed remedial grading related subdrains have been proposed to prevent a buildup in groundwater pressure, which could potentially affect post grading on-site geotechnical conditions. Any groundwater intercepted by the proposed subdrains would ultimately discharge into Aliso Creek at the western edge of the project site, resulting in no net adverse effect to groundwater availability or timing for use by Aliso Creek vegetation.

USFWS/CDFG 7 – Comment

Hydrology/Beneficial Uses

The Santa Ana Regional Water Quality Control board has designated the existing biological beneficial uses of "warm freshwater habitat," "wildlife habitat," and "rare, threatened, or endangered species" for portions of Aliso Creek, including the reach downstream from the Saddleback Meadows project. The Wildlife Agencies are concerned about the onsite and downstream effects the project-related changes in the surface flows may have on these beneficial uses and on the habitats and biological resources supported by Aliso Creek. In addition to modifications in peak flows resulting from an increase in impervious surface, we are concerned about changes on the velocity, volume, duration, and frequency of dry-weather and non-peak wet-weather flows. Even small changes in the flow regime often effect changes in the stream community that, over time, can seriously damage stream habitats. Increases in flows from impervious surfaces associated with urbanization can result in: 1) stream bed scouring and habitat degradation; 2) shoreline erosion and stream bank widening; 3) loss of aquatic species; and 4) decreased baseflow (USEPA 1999). Downstream sections of Aliso Creek are known to be sediment-deficient and have already been adversely affected by scour, erosion and subsequent habitat degradation. The Wildlife Agencies recommend that every effort be made to integrate measures to ensure full protection of the beneficial uses and biological resources of Aliso Creek. The development design and construction operations should minimize the modifications of dry and wet-weather flows and integrate onsite best management practices (BMPs) that would attenuate the flows to reduce impacts on the stream morphology and habitats onsite and downstream. Examples of BMPs to consider include appropriately sized grassy swales and vegetated detention basins. Proper design of structural BMPs will require analyses of the sediment transport and hydrological regime of the headwaters of Aliso Creek. The project is located within Reach 1 of the Aliso Creek Watershed Management Feasibility Study, Orange County, California *prepared by the Corps. We recommend this study be consulted to determine possible effects of the project on the Aliso Creek watershed.*

USFWS/CDFG 7 – Response

The proposed project will comply with the requirements of Section 401 of the Clean Water Act (Water Quality Certification) as administered by the California Regional Water Quality Control Board (RWQCB). The concerns raised by the resource agencies regarding changes to surface flow and peak flow are addressed in Section 4.4 of the Draft Revised Subsequent EIR. The project design includes a drainage system which recreates existing flow regimes to the maximum extent practicable, in conjunction with stormwater management requirements. A comprehensive set of Best Management Practices (BMPs) have been proposed to minimize the effects of project-related urban runoff on Aliso Creek, including a riverine system of grassy swales and detention basins. All impacts to water quality and downstream surface flow impacts have been mitigated to less than significant levels.

USFWS/CDFG 8 – Comment

Significance Criteria for Biological Resources

The thresholds of significance for biological resources provided in section 4.8.2 of the DEIR do not appear to be consistent with the CEQA definition of rare, threatened, and endangered species (see CEQA Guidelines, § 15380). In addition, the Department recommends that the significance criteria in the body of the DEIR be revised to be consistent with CEQA Sections 15064.7 and 15065, and Appendix G of the CEQA Guidelines.

USFWS/CDFG 8 – Response

As stated in Section 15064.7 of the *CEQA Guidelines*, each public agency is encouraged to develop thresholds of significance. The significant thresholds included biological resources contained in the Draft Revised Subsequent EIR are derived from Public Resources Code Section 21001(c) and criteria established by the County and resource agencies. These thresholds, although not verbatim, include issues contained in Appendix G of the *CEQA Guidelines*, and adequately define potentially significant impacts.

USFWS/CDFG 9 – Comment

Annual Grasslands

The project proposes that mitigation requirements for cumulative impacts to raptor foraging habitat (consisting primarily of coastal sage scrub and grasslands) will be met in conjunction with the proposed coastal sage scrub mitigation. The Department recommends mitigation measures be incorporated specifically for impacts to annual grassland. These areas provide foraging areas for raptors and small mammals and proposed impacts to a total of 103.7 acres on-and offsite should be considered significant. Appendix I.1 of the DEIR indicated that raptor species including Cooper's hawk (Accipiter cooperii), a state species of special concern (CSC), sharp-shinned hawk (A. striatus, CSC), red tailed hawk (Buteo jamaicensis) red shouldered hawk (B. striatus), and American kestrel (Falco sparverius) were observed during the surveys of the project site, and other species including northern harrier (Circus cyaneus, CSC) and loggerhead shrike (Lanius ludovicianus, CSC) have at least a moderate potential of using the grasslands onsite for foraging. We therefore recommend that annual grassland mitigation at a 0.5:1 preservation-to-impact ratio in an offsite area with long-term conservation potential to be included in the FEIR.

USFWS/CDFG 9 – Response

As stated on page 4.8-11 of the Draft Revised Subsequent EIR, much of the annual grasslands on-site have been heavily disturbed by historic cattle ranching operations, and support significant amounts of cardoon (*Cynara cardunculus*), an artichoke-like plant that grows in areas where soils have been highly disturbed and compacted. This is an aggressive plant species that often dominates areas that have been heavily grazed. The raptor species noted as occurring on-site will benefit from the

sage scrub restoration effort, as well as from off-site preservation of sage scrub and off-site restoration of riparian and oak woodland habitat. As stated in Section 4.4.2 of the Draft Revised Subsequent EIR, impacts to annuals grasslands would not be significant and no additional mitigation is proposed.

USFWS/CDFG 10 – Comment

Intermediate Mariposa Lily

The DEIR states that impacts to intermediate mariposa lily (Calochortus weeddii var. intermedius) would not be significant. This species is listed by the California Native Plant Society as a "1B" plant (Plants rare threatened, or endangered In California and elsewhere). Species included on List 1B must be fully considered under CEQA. The Department recommends that the FEIR include mitigation for impacts to this species (for example, see Rancho Potrero Leadership Academy EIR, County of Orange, 2001).

USFWS/CDFG 10 – Response

Although impacts to this sensitive species were not assessed in the Draft Revised Subsequent EIR as being significant, due to the limited number of individuals impacted, an additional mitigation requirement has been added in response to this and other comments. The applicant has agreed to transplant potentially impacted bulbs of this species to appropriate open space areas on-site. Please see Section 2.0 of this Response to Comments document, which includes additional mitigation for the intermediate mariposa lily (new mitigation measure M 8-4).

USFWS/CDFG 11 – Comment

Cactus Wren

According to the DEIR, impacts to the cactus wren (Campylorhynchus brunneicapillus couesi) are not considered significant. As proposed in Appendix I.3 to the DEIR, the coastal sage scrub mitigation plan does not specifically include salvage or container stock planting of prickly-pear (Opuntia spp.) required for cactus wren nesting and foraging. By providing suitable replacement habitat, a potentially significant impact to cactus wren may be mitigated. To provide replacement habitat for cactus wren impacted by implementation of the project, we recommend that the coastal sage scrub palette is revised to include a substantial amount of prickly-pear. This may be achieved by salvage of existing plant material followed by direct replanting within the mitigation area or by collecting pads prior to impact and rooting them in containers. In addition, we recommend that reference sites are currently reporting cactus wren be chosen to provide an adequate baseline for comparison.

USFWS/CDFG 11 – Response

Comment noted. The salvage of prickly pear cactus will be incorporated into the final sage scrub restoration plan.

USFWS/CDFG 12 – Comment

Oak Woodland Mitigation Plan

Mitigation for oak woodland impacts is described on page 4.8-26 of the DEIR and we concur with the restoration approach in concept. However, unlike the coastal sage scrub mitigation plan, details of the oak woodland mitigation strategy are not adequately described in Appendix I.3 such that the impacts can be shown to be mitigated below a level of significance. For example, the proposed locations for oak woodland restoration should be depicted and described. In addition, container sizes, understory species, and maintenance activities specific to the oak woodland restoration should be detailed.

USFWS/CDFG 12 – Response

Figure 4.8.7 of the Draft Revised Subsequent EIR identifies the proposed oak woodland restoration areas on-site. SC 8-6 summarizes the size and number of container stock required for oak restoration (see Section 4.8.4 of the Draft Revised Subsequent EIR). Maintenance activities will be consistent with those proposed for sage scrub restoration (see PDF 8-1 of the Draft Revised Subsequent EIR).

USFWS/CDFG 13 – Comment

The Wildlife Agencies appreciate the opportunity to review and comment on the DEIR. If you have any questions please contact Mr. David Zoutendyk of the Service at (760) 431-9440 or Mr. Brad Henderson of the Department at (310) 214-9950.

USFWSCDFG 13 – Response

Comment noted.

3.2.2 State of California, Governor's Office of Planning and Research – State Clearinghouse

Tal Finney, May 9, 2002

Terry Roberts, June 11, 2002

State Clearinghouse 1 – Comment

This is to acknowledge that the State Clearinghouse has received your environmental document for state review. The review period assigned by the State Clearinghouse is:

Review Start Date: April 26, 2002

Review End Date: June 10, 2002

We have distributed your document to the following agencies and departments:

California highway Patrol
Caltrans, District 12
Department of Conservation
Department of Fish and Game, Region 5
Department of Forestry and Fire Protection
Department of Housing and Community Development
Department of Parks and Recreation
Department of Water Resources
Native American Heritage Commission
Office of Historic Preservation
Regional water Quality Control Board, Region 9
Resources Agency
State Lands Commission

The State Clearinghouse will provide a closing letter with any state agency comments to your attention on the date following the close of the review period.

Thank you for your participation in the State Clearinghouse review process.

State Clearinghouse 1 – Response

The comment has been received and noted. No response is required.

State Clearinghouse 2 – Comment

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on June 10, 2002, and the comments from the responding agency (ies) is (are) enclosed. If

this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the Project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please not that Section 21104(c) of the California Public Resources Code states that:

> *"A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."*

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 45-0613 if you have any questions regarding the environmental review process.

State Clearinghouse 2 – Response

The comment has been received and noted. No response is required.

3.2.3 State of California, Department of Transportation

Robert F. Joseph, May 28, 2002

Caltrans 1 – Comment

Thank you for the opportunity to review and comment on the Draft EIR dated April 2002 for Saddleback Meadows. The project is located on the eastern side of El Toro Road, one half mile from the Santiago Canyon/Live Oak Canyon Road junction.

The project consists of the development of 299 detached single family residences on 66.9 acres out of a total 222-acre site. The nearest State Routes are SR-241 and I-5.

Caltrans District 12 status is a reviewing agency on this project and has the following comments:

As indicated in the report, the proposed project will generate 3690 trips per day that mostly use El Toro Road. This report has not yet included west/south of El Toro beyond Santa Margarita Parkway towards I-5 interchange in the Traffic study section. We have concerns that this development will ultimately contribute to the cumulative impacts at El Toro Road/I-5.

Caltrans 1 – Response

By comparing the ICU values in Tables 2-2 and 4-1 of the traffic analysis (Appendix F of the Draft Revised Subsequent EIR), project-related changes at intersections can be determined. At the Portola Parkway/El Toro Road intersection, no change in the P.M. peak hour ICU occurs. During the A.M. peak hour, only a one percent change occurs. This condition defines the outer edge of measurable traffic impacts based upon County of Orange GMP criteria.

Caltrans 2 – Comment

We recommend that the project proponents work to coordinate their efforts with the City of Lake Forest and their project "The Arbor on El Toro Specific Plan" in terms of project phasing, filing a traffic management plan during construction, and avoiding impacts to El Toro Road and ultimately the I-5 during traffic peak periods.

Caltrans 2 – Response

As stated in Section 4.5.2 of the Draft Revised Subsequent EIR, impacts from construction activities would have short-term, but not significant impacts on vehicular traffic along streets adjacent to the project site during the grading and excavation phase. No significant impacts would occur to El Toro Road or Interstate 5 during these phases.

Caltrans 3 – Comment

Other than identifying the County Bikeway network, this project doesn't evaluate or stipulate the use of alternative modes of transportation, such as buses, to be incorporated into the development. Such alternatives would work to reduce future congestion in the region while at the same time help to improve the overall air quality.

Caltrans 3 – Response

As stated in Section 4.5.1 of the Draft Revised Subsequent EIR, the nearest bus route with a stop near the intersection of Glenn Ranch Road and Portola Parkway is located approximately 1.5 miles southwest of the project site. The traffic analysis included in the Draft Revised Subsequent EIR was prepared to evaluate the worst-case traffic impacts on the area circulation system. The use of alternative modes of transportation would reduce vehicle impacts. The Orange County Transportation Authority (OCTA) provides local transit service in the project area and is responsible for determining the need for additional transit facilities.

Caltrans 4 – Comment

The project proponents will insure that during construction all loads will be contained that may use state routes and that no net runoff increase will flow over, into or under State Right of Way.

Caltrans 5 – Response

As stated in Section 4.6.6 of the Draft Revised Subsequent EIR (mitigation measure 6-7), dirt hauled off-site shall be wet down or covered to ensure "spill-over" is minimized.

Caltrans 6 – Comment

Please continue to keep us informed of this project and other future developments, which could potentially impact our transportation facilities.

Caltrans 6 – Response

Comment noted.

3.2.4 California State University, Los Angeles

Patricia Martz, June 10, 2002

California State University, Los Angeles 1 – Comment

I have reviewed the cultural resources section of the DEIR and have the following comments:

The cultural resources section of the EIR does not accurately reflect the findings and recommendations provided in the cultural resources appendix. In some cases there are serious contradictions

California State University, Los Angeles 1 – Response

Although there may be some minor discrepancies between the Section 4.10 (cultural resources) of the Draft Revised Subsequent EIR and the findings and recommendations provided in Appendix J, due to summarizing all the information, the mitigation measures recommended in both documents are essentially equivalent. As in the Appendix J, CA-ORA-710 and CA-ORA-711 are the only two sites recommended eligible for listing on the National Register of Historic Places and/or the California Register of Historical Resources. CA-ORA-710 would remain undisturbed in dedicated open space and CA-ORA-711 would be subjected to data recovery excavation prior to disturbance.

California State University, Los Angeles 2 – Comment

The cultural resources appendix indicates that this project is subject to a Corps of Engineers 404 permit and therefore the cultural resources are subject to the provisions of Section 106 of the National Historic Preservation Act. The EIR does not indicate this and the treatment of the archaeological sites is not in compliance with the Act as amended in 1999.

California State University, Los Angeles 2 – Response

While Section 4.10 of the Draft Revised Subsequent EIR may not specifically indicate that a 404 permit was required and that the cultural resources portion of the project was subject to Section 106 of NHPA, it is not correct that the archaeological sites were not treated in compliance with the Act. The U.S. Army Corps of Engineers (USACE) claimed jurisdiction of seven of the sites on the Saddleback Meadows property (CA-ORA-710, -711, -713, -715, -1255, -1256, and CA-ORA-1435H). In accordance with stipulations in Section 106, test excavations at these (and the remainder) of the sites on the property, and subsequent consultation with the USACE, Native American groups, and the State Historic Preservation Officer (SHPO) established that only two of the sites (CA-ORA-710 and CA-ORA-711) were eligible for listing on the National Register. Consultation continued with a treatment plan being developed and circulated to guide mitigation of the adverse effects of the project via regional background research and data recovery excavation of CA-ORA-711.

California State University, Los Angeles 3 – Comment

The investigations to determine the significance/importance of the archaeological sites are inadequate. The excavation of three 1 x 1 meter units in CA-ORA-713 is not sufficient to determine the depth, nature, condition and extent of a site of this size. Since the site appears to be dispersed over a large area, remote sensing and/or geomorphological studies should be conducted to locate areas of the site that contain buried cultural deposits and features. The discovery of buried cultural deposits and features or human burials should not be done by bulldozer.

California State University, Los Angeles 3 – Response

The commenter is incorrect that the archaeological investigations are inadequate. Every site on the property underwent a test excavation program of a sufficient number of units to characterize the subsurface. As for CA-ORA-713, a surface collection, discing followed by a second surface collection and the excavation of three 1x1 meter units was undertaken at the site. Because these methods produced small numbers of artifacts relative to the size of the area studied and the subsurface investigation produced no artifactual material, the site was deemed not eligible for listing, because it is unlikely to yield important information. The USACE and SHPO agreed with this finding. Since minimal numbers of artifacts were scattered over a large area, it is possible that CA-ORA-713 actually represents a series of small, unrelated camps.

California State University, Los Angeles 4 – Comment

Likewise the determination that CA-ORA-715 is based on the excavation of four 1 X 1 meter units. This is not sufficient to determine the depth, nature, condition, and extent of this site and to determine that it is not "significant/important."

California State University, Los Angeles 4 – Response

The test excavation was sufficient to characterize the site. The excavation of four 1x1 meter units to a depth of 30 centimeters produced only four flakes. It appears that the site is confined to the surface. All the exposed surface artifacts were collected, and there are unlikely to be any additional significant resources within the site area. The USACE and SHPO agreed and the site was determined to be not significant.

California State University, Los Angeles 5 – Comment

Pg. 4.10-12 of the EIR states that a final test excavation of site CA-ORA-1437 was undertaken in November 2001, but does not indicate the methods used or the results. There is no information to support the determination that the site is not "significant/important."

California State University, Los Angeles 5 – Response

While the EIR indeed does not include the CA-ORA-1437 test excavation document, the site was tested near the end of 2001 and found to be not significant. The report on the excavation (including methods and results) is nearing completion. It will subsequently be filed with the South Central Coastal Information Center, California State University, Fullerton (SCCIC), the Los Angeles District, USACE, with the project applicant, and the County of Orange.

California State University, Los Angeles 6 – Comment

Pg. 4.10-14 – Project Impacts: The statements regarding CA-ORA-710 are contradictory and raise doubts regarding whether the site is going to be preserved. If the sit [sic] *is to be protected through the site burial and preserved within a biological mitigation area, then why does the EIR state that data recovery would occur prior to ground disturbing activities. If the site is to be protected, why should there be ground-disturbing activities? In addition, site burial has to be done very carefully to ensure that the site will be protected. The standards/specifications for covering the site should be indicated.*

California State University, Los Angeles 6 – Response

The Draft Revised Subsequent EIR correctly states that the site is to be protected through site burial and preserved within a biological mitigation area (page 4.10-14). The statement, "data recovery would occur prior to ground disturbing activities," is not correct if it refers to CA-ORA-710 and may be better understood if it reads, "Additional mitigation would need to be accomplished if development plans change and the site is to be disturbed" (please see Section 2.0 of this Response to Comments document for this clarification). However, the site would be preserved. Burial of the site will be done "very carefully" and according to accepted archaeological standards and practices.

California State University, Los Angeles 7 – Comment

CA-ORA-1257 has not been subsurface tested and should not be graded without further investigation.

California State University, Los Angeles 7 – Response

The site was originally recorded as a sandstone bedrock feature. The 1995 investigation revisited the site and determined that the sandstone rock was made of a very soft stone, most ineffective as a grinding implement. The site area was also carefully examined for the presence of artifacts. None were found. The lack of any obvious cultural resources, caused researchers to recommended that the site be considered not significant.

California State University, Los Angeles 8 – Comment

CA-ORA-711 is considered to be significant/important. According to the DEIR, only a small fraction of the total site area was tested. Grading with monitoring, as stated on pg. 4.10-14 is not adequate mitigation for the destruction of the site.

California State University, Los Angeles 8 – Response

The comment on page 4.10-14 of the Draft Revised Subsequent EIR is incorrect, but could be read as accurate if it is combined with the previous sentence: "Data recovery would occur prior to ground disturbing activities. If grading operations at CA-ORA-711 uncover additional material . . . *further* (emphasis added) data recovery work may be required." A more accurate statement related to mitigation measures, was included in Section 4.10.5 of the Draft Revised Subsequent EIR, "Level of Significance Before Mitigation" (page 4.10-19). Under the heading "Archaeological/Historical Resources." Here it states, "The project area may have a significant impact on archaeological site CA-ORA-711 unless data recovery excavation is performed."

California State University, Los Angeles 9 – Comment

Pg. 4.10-20: The DEIR makes the assumption that the completion of a data recovery excavation program, (or even worse, monitoring during grading) constitutes a no adverse effect. This is not the case. The implementing regulations for Section 106 of the National Historic Preservation Act (36 CFR 800.5(a)(2)(iii) along with 800.5(a)(2)(I), as amended May 1999, acknowledge the reality that destruction of a site and recovery of its information and artifacts is adverse and no longer consider data recovery as sufficient mitigation to reduce the impacts to a level of insignificance.

Even if this project were not under the jurisdiction of the federal government, CEQA was patterned after the National Environmental Policy Act and the pertinent federal regulations. Therefore, to ignore the reality that the destruction of an archaeological site, including the destructive process of archaeological excavations, is a significant impact seems counter to the spirit and intent of CEQA.

California State University, Los Angeles 9 – Response

The commenter is correct in noting that a reasonable and good faith effort should be made to protect and preserve sites, but is incorrect to say that the significant impact of data recovery excavation was ignored. A reasonable and good faith effort was made to prevent the destruction of significant sites on the property (e.g., CA-ORA-710 will be preserved by capping), but it was deemed infeasible to save CA-ORA-711. As stated in Section 21083.2 (c) of CEQA, "*to the extent that unique archaeological resources are not preserved in place or are not left in an undisturbed state, mitigation measures shall be required...*" Further, CEQA allows excavation as mitigation for archaeological resources per Section 21083.2 (d). As stated in the Draft Revised Subsequent EIR, impacts to archaeological site CA-ORA-711 will be mitigated through data recovery and therefore impacts would not be significant. The remainder of the sites on the property were considered not significant, but a qualified archaeologist will still monitor grading of those sites (see M 10-4 on page 4.10-19 of the Draft Revised Subsequent EIR).

All data recovery work at the site will be guided by a research design that follows the Office of Historic Preservation (OHP) Guidelines for Archaeological Research Designs, and is approved by the USACE and SHPO. The subsequent report documenting the excavation will follow the OHP Archaeological Resource Management Reports (ARMR) guidelines.

California State University, Los Angeles 10 – Comment

According to CEQA: When archaeological resources are involved, avoidance, or preservation in an undisturbed state is the preferable course of action. Section 21083.2 then provides that preservation may include:

a. Planning construction to avoid archaeological sites
b. Deeding sites into permanent conservation easements
c. Capping or covering sites with a layer of soil before building on the sites.
d. Planning parks, greenspace, or other open space to incorporate archaeological sites.

When avoidance is possible, then data recovery excavation may be the only feasible mitigation measure.

California State University, Los Angeles 10 – Response

Please see Section 3.2.4 (California State University, Los Angeles 9 – Response) of this Response to Comments document.

California State University, Los Angeles 11 – Comment

According to CEQA, data recovery is the last resort after the lead agency considers all of the above preservation methods and determines that they are not possible or feasible. With the exception of CA-ORA-710 (but the EIR also implies that the site may be impacted – see above) the only mitigation measures that have been considered for the remaining sites to be impacted by the proposed project are data recovery excavation, or worse yet, grading with monitoring.

California State University, Los Angeles 11 – Response

Please see Section 3.2.4 (California State University, Los Angeles 9 – Response) of this Response to Comments document.

California State University, Los Angeles 12 – Comment

Based on the above comments, the DEIR is inadequate in that (1) There is not sufficient information to support the determinations that all of the sites to be impacted by the project (except two) are not significant/important. (2) The DEIR fails to provide documentation that the CEQA recommended preservation alternatives to the total destruction of six of the seven archaeological sites to be impacted by the proposed project have been considered. The developer should be required to conduct a good faith examination of the feasibility of the preservation measures. They should be encouraged to incorporate one or more of the preservation measures and include the preservation plan in the EIR. If the determination is that none of the preservation measures are possible or feasible, the justification for this determination and documentation that serious consideration was given to preservation methods should be included in the EIR, (3) Grading and monitoring is not adequate mitigation for the destruction of a significant archaeological site.

If it is determined that data recovery excavation and destruction of the sites is the only feasible option, the investigations should be guided by a research design that follows the California Office of Historic Preservation Guidelines for Archaeological Research Designs (Preservation Planning Bulletin No. 5, February 1991. Dept. of Parks and Recreation, Office of Historic Preservation). The report documenting the excavations should follow the Office of Historic Guidelines for Archaeological Resource Management Reports (Preservation Planning Bulletin No. 5, December 1989).

California State University, Los Angeles 12 – Response

Please see Section 3.2.4 (California State University, Los Angeles 9 – Response) of this Response to Comments document.

3.2.5 South Coast Air Quality Management District

Mike A. Nazemi, June 7, 2002

SCAQMD 1 – Comment

The South Coast Air quality Management District (AQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated into the Final Environmental Impact Report.

Pursuant to Public Resources Code Section 21092.5, please provide the AQMD with written responses to all comments contained herein prior to the certification of the Final Environmental Impact Report. The AQMD would be happy to work with the Lead Agency to address these issues and any other questions that may arise. Please contact Charles Blankson, PhD., Transportation Specialist – CEQA Section, at (909) 396-3304 if you have any questions regarding these comments.

SCAQMD 1 – Response

Comment noted. The South Coast Air Quality Management District (SCAQMD) has been provided with a copy of this Response to Comments document.

SCAQMD 2 – Comment

Project Size: In the Public Notice announcing the availability of the DRSEIR, it is stated that the proposed project will occupy an area measuring 229.2 acres and approximately 71 percent of this, or 158.6 acres will be devoted to open space. In the Project Summary in the DRSEIR on page 1-3, it is stated that the proposed project will occupy 222 acres and 70 percent or 155.1 acres will be devoted to open space. It is not clear from the above statements whether the project area is 229.2 acres or 222 acres? Please provide accurate information on the size of the project area since it has implications for grading emissions and subsequently air quality.

SCAQMD 2 – Response

The project size stated in the Draft Revised Subsequent EIR of 222 acres is correct. The Public Notice incorrectly stated the project as 229.2 acres.

SCAQMD 3 – Comment

Emissions Inventory: In table 4.6.2 on page 4.6-7 of the DRSEIR, emissions data are provided for the years 2000 and 2010. While the 2010 forecasts are the same as those reported in the SCAQMD Final 1997 AQMP, the 2000 data is different. See Table B-6 on page III-B of Appendix III of the SCAQMD Final 1997 AQMP. Please correct the discrepancy.

SCAQMD 3 – Response

The year 2000 data in Table 4.6.2 represent an update of those reported in the 1997 AQMP. The year 2000 data represent "actual" emissions reported by the California Air Resources Board for the air basin in the most recent "2000 California Air Quality Almanac." The updated almanac emissions inventory was believed to be more accurate than the AQMP forecasts prepared several years previously.

SCAQMD 4 – Comment

URBEMIS2001: It is reported in Appendix G of the DSEIR that the lead agency used URBEMIS7G to calculate project emissions. There are two points to be noted about this. The first is that both Appendix G and the SDEIR limit the discussion on the construction activity impacts to the fugitive dust and PM_{10} emissions. PM_{10} emissions are reported to be less than the PM_{10} significance threshold. However, as noted on page 4.6-12 of the DRSEIR, construction also entails the use of internal combustion engines and on-road and off-road mobile, semi-mobile and other diesel-powered equipment which generate emissions of NO_x, CO and also PM_{10}. There are also ROG emissions from paints and other architectural coatings. The lead agency fails to mention that the URBEMIS7G output table shows very large ROG construction emissions. At 1,171.19 pounds per day during the Summer, these are very significant emissions. The lead agency needs to address these high ROG emissions and propose measures to reduce them to less than the significance threshold in the Final SEIR. The second point is that URBEMIS2001 is currently available on ARB Webpage and has replaced URBEMIS7G as the model of choice and should be used to estimate project emissions. The lead agency is therefore encouraged to use URBEMIS200 [sic] *which uses current emission factors and therefore reflects project emissions more accurately. In discussing the proposed project's air quality impacts, construction and operational emissions as well as the corresponding significance thresholds should be presented in the main text of the Final SEIR. If construction ROG emissions still exceed the significance threshold, the lead agency should propose mitigation measures accordingly.*

SCAQMD 4 – Response

The algorithm that calculates ROG emissions from paints and coatings in the URBEMIS7G model has a "bug" that grossly distorts the likely daily emissions. The current VOC limit for architectural coatings is 100 grams/liter, or about 0.8 pounds/ gallon. The model estimate of 1,171.19 lbs/day would suggest that there is a daily application of almost 1,500 gallons of paint. Painting 299 homes in the project would occur over many days or even months. Extrapolation of this daily estimate over an extended project phasing would predict the use of tens of thousands of gallons of paint (hundreds of gallons per home). This model output clearly is incorrect. At 0.8 lbs/gallon, the application of 93.75 gallons of paint would create 75 lbs/day of VOC emissions, (SCAQMD threshold) or the paint needed for one to two homes per day is consistent with the probable phasing of the proposed development. VOCs from the application of paint may approach, but not likely exceed, the construction activity emissions significance threshold.

The URBEMIS2001 version of the model was not available when the calculations were initially performed. The result from the "new" model are reasonably identical from the older version. Because of a higher percentage of SUVs in the travel fleet than previously estimated, and because the emissions standards are less stringent on these vehicles, the project-related emissions increase, but remain at less than significant as follows (lbs/day):

	ROG	NOx	CO	PM-10	SOx
URBEMIS7G (Ver 5.1.0)	38.3	41.0	278.0	25.7	0.0
URBEMIS2001° (Ver 6.2.2)	50.0	45.4	504.2	26.4	0.0
SCAQMD Threshold	55	55	550	150	150

° = 75% auto, 10% light truck/SUV, 10% heavy SUV, 2% mid-truck, 1% lite-heavy truck, 1% bus, 1% motorcycle; Year = 2003.

Source: Giroux & Associates, 2002

The updated calculations above do not change any conclusions regarding impact (in)significance of the proposed project.

SCAQMD 5 – Comment

Screening Tables: The lead agency used the Screening Table in the SCAQMD 193 CEQA Air Quality Handbook (Table 6-2) to determine that construction-related equipment combustion emissions from the project will not be significant. See discussion on page 4.6-12 of the DRSEIR. Please note that although the screening tables were developed by the AQMD, the AQMD no longer supports the use of these tables in determining the significance of project emissions. This is because the mobile source emission factors used in computing the tables are from an old version of the California Air Resources Board EMFAC model.

SCAQMD 5 – Response

The construction-related equipment combustion emissions procedures have not changed from when the SCAQMD Handbook Screening Tables for Construction (Table 6-2) were developed. If anything, equipment and on-road vehicles are "cleaner" now than in 1993 when the tables were developed. If the tables were accurate for Conditions in 1993, and if the proposed project is determined to be less than significant under 1993 conditions, the project will be less than significant under current criteria with an even larger margin of safety.

3.2.6 Southern California Association of Governments

Jeffrey M. Smith, May 7, 2002

SCAG 1 – Comment

Thank you for submitting the Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows to SCAG for review and comment. As areawide [sic] *clearinghouse for regionally significant projects, SCAG reviews the consistency of local plans, projects and programs with regional plans. This activity is based on SCAG's responsibilities as a regional planning organization pursuant to state and federal laws and regulations. Guidance provided by these reviews is intended to assist local agencies and project sponsors to take actions that contribute to the attainment of regional goals and policies.*

We have reviewed the Saddleback Meadows, and have determined that the proposed Project is not regionally significant per SCAG Intergovernmental Review (IGR) Criteria and California Environmental Quality Act (CEQA) Guidelines (Section 15208). The proposed project is not a residential development of more than 500 units. Therefore, the proposed Project does not warrant comments at this time. Should there be a change in the scope of the proposed Project, we would appreciate the opportunity to review and comment at that time.

A description of the proposed Project was published in SCAG's April 30, 2002 Intergovernmental Review Clearinghouse Report for public review and comment.

The project title and SCAG Clearinghouse number should be used in all correspondence with SCAG concerning this Project. Correspondence should be sent to the attention of the attention of the Clearinghouse Coordinator. If you have any questions, please contact me at (213) 236-1867. Thank you.

SCAG 1 – Response

The comment has been received and noted. No response is required.

3.2.7 Transportation Corridor Agencies

Macy Cleary-Milan, June 10, 2002

Transportation Corridor Agencies 1 – Comment

Thank you for forwarding the Draft Environmental Impact Report No. 566 for the proposed Saddleback Meadows Project. The Transportation Corridor Agencies (TCA) has reviewed the above-subject draft environmental document and would like to make the following comment for your review:

The DEIR identifies the intersection of Portola Parkway and the FTC-N as being impacted. The DEIR states, "The addition of one southbound left turn lane at the intersection of Portola Parkway (NS) at Foothill Transportation Corridor (EW) would be required for 2005 condition." Mitigation measure M 5-5 specifies that the project shall pay its fair share funding of this improvement. The fair share funding amount agreed to by the TCA must be submitted prior to the issuance of any building permits for the project.

Transportation Corridor Agencies 1 – Response

Comment noted. The mitigation measure M 5-5 has been amended to reflect this comment. Please see Section 2.0 of this Response to Comments document.

3.2.8 Orange County Fire Authority

Gene F. Begnell, June 6, 2002

OCFA 1 – Comment

Thank you for the opportunity to comment on the Draft EIR for the Saddleback Meadows project. In response to our review, we would like to offer the following:

Page 4.12-1, Section 4.12.1, Second paragraph. "61 fire stations" should read "59 fire stations.

Page 4.12-1, Section 4.12.1, Third paragraph, Third bullet. Remove "only available from a medic van" from the sentence. OCFA provides paramedic service both paramedic assessment and full paramedic services through a number of configurations in addition to the medic vans.

Page 4.12-2, Table 4.12.1, Fire Station Locations. Several things are wrong with this table.

- *Fire Station 18 is 4.2 miles from the project, not 1.5. The response time to the project for FS18 would be calculated at 8 minutes and 40 second using an average of 35 mph and 90 seconds of call processing and turnout time.*
- *Fire Station 16 is located 3.5 miles from the project and would calculate at 9 minutes and 30 seconds using the same formula as above with a two minute time period added for the volunteer personnel to get to the fire station. This station does NOT have paramedics or full time firefighters. It is staffed with volunteer firefighters only.*
- *Fire Station 45 is located 5.3 miles away with a response time calculation of 10 minutes and 30 seconds.*
- *Additionally, Fire Station 54 is located 2.8 miles from the project, with a response time calculation of 6 minutes and 20 seconds.*
- *Fire Station 31 is located 3.7 miles away with a response time of 7 minutes and 50 seconds. This is the closest paramedic unit to the project.*

Page 4.12-2, Third paragraph. Change "average response time of 6 minutes" to "average response time of nine minutes".

Page 4.12-2, Forth [sic] *paragraph. Replace the last sentence, "At this location three firefighters are on duty staffing either a paramedci* [sic] *assessment unit or a brush engine." With "At this location, 20 volunteer firefighters staff the engine when called upon to do so."*

Page 4.12-3. First paragraph, last sentence. Should read 7 firefighters rather than 8 firefighters.

OCFA 1 – Response

Comments noted. Section 4.12 of the Draft Revised Subsequent EIR has been amended to reflect these comments. Please see Section 2.0 of this Response to Comments document.

OCFA 2 – Comment

Page 4.12-9. Add new condition SC12-16. Secured Fire Protection Agreement. "Prior to grading, the applicant shall enter into a Secured Fire Protection Agreement with the OCFA. The reason for the timing this agreement is that the service needs for the project increases at the point of grading and continues to increase as the project is built. Service agreements will need to be in place at this time.

OCFA 2 – Response

Comment noted. An additional Standard County Condition has been added to reflect this comment. Please see Section 2.0 of this Response to Comments document.

OCFA 3 – Comment

As noted in Section 4.12.3, Cumulative Impact, the seven related projects in this area may have an effect on the service delivery within the area. Additional staffing and/or equipment may be needed to meet this demand. This issue will be addressed within the Secured Fire Protection Agreement.

OCFA 3 – Response

Comment noted. Section 4.12.3 has been amended to reflect this comment. Please see Section 2.0 of this Response to Comments document. However, this would not change the conclusions included in the Draft Revised Subsequent EIR that as related projects would be individually subject to protection and safety measures as required by the Orange County Fire Authority, no cumulative impacts would occur.

OCFA 4 – Comment

Page 5-9, Alternatives, Alternative 2 – No Project Alternative, this project would have many issues with fuel modification both "onsite" and "offsite."

OCFA 4 – Response

Comment noted. As stated in Section 5.4.2 of the Draft Revised Subsequent EIR, Alternative 2 – No Project Alternative would result in greater fire protection impacts as compared to the proposed project.

OCFA 5 – Comment

Page 5-38 [sic], *Alternatives, Alternative 6 – 44/178 Alternative. It should be noted that the layout of the "Development Area" does not allow for secondary access for emergency vehicles and may require the project to acquire additional easements or other mitigation measures to insure that adequate access to the project is provided.*

OCFA 5 – Response

Comment noted. Section 5.4.6 and Table 5.7 has been amended to reflect this comment. Please see Section 2.0 of this Response to Comments document.

OCFA 6 – Comment

The project area is within the designated Special Fire Protection Area and is as a result a significant wildfire risk. These risks will require special mitigation measures in accordance with OCFA standards. All other standard conditions of development including access will also be applicable to the proposed project.

OCFA 11 – Response

Comment noted. The Draft Revised Subsequent EIR includes Project Design Features, Standard County Conditions, and a mitigation measure to ensure impacts from the potential wildfire risk would be less than significant.

3.2.9 Trabuco Canyon Water District

Bruce Boner, May 8, 2002

TCWD 1 – Comment

Trabuco Canyon Water District (District) is in receipt of the Draft Revised Subsequent Environmental Impact Report No. 566 (DEIR 566) for the above captioned project (Project). Based upon our review of the document, the following comments are being submitted to the County of Orange (County) with regard to the project and the environmental proceedings being undertaken by the County with respect to the Project. Please note that the District reserves the right to provide or submit additional or supplemental comments relative to the DEIR566 and other or further documents provided or furnished by the County with respect to the Project or the environmental proceedings undertaken by the County with respect to the Project during the review and/or public hearing process for this matter.

TCWD 1 – Response

Comment noted. No additional response is required.

TCWD 2 – Comment

Request for Notices

Pursuant to the provisions of the California Environmental Quality Act (CEQA) and Public Resources Code Section 21091.1, the District hereby requests that copies of all notices and other documents mailed in relation to the above-referenced Project be furnished to the District. If there are any fees and charges required for the provision of such notices, please provide us with an invoice for such costs, and we will reimburse the appropriate County department. This request for notice specifically includes, but is not necessarily limited to, notices of all hearings, proposed actions to be taken with regard to the developmental process and, in particular, any Notice of Determination prepared, furnished or filed with regard to this Project.

TCWD 2 – Response

Comment noted. The Trabuco Canyon Water District has been provided with a copy of this Response to Comments document and will be provided with any additional notices with regard to the proposed project.

TCWD 3 – Comment

Background Information

Our general legal counsel, Bowie, Arneson, Wiled & Giannone, provided written comments on behalf of the District on August 11, 1997 and supplemental comments on October 17, 1997, photocopies of which are attached hereto.

We request that these letters be included as part of the record of proceedings for the environmental review of the Project, Including DEIR566.

TCWD 3 – Response

The above referenced letters were responded to in the Response to Comment for Subsequent EIR No. 566 (1997) and are included in Appendix A of this Response to Comments document.

TCWD 4 – Comment

As stated in the October 17, 1997 letter, there remains a "significant question as to whether the mitigation measure referenced includes and covers necessary master plan and in-tract wastewater facilities." We again request that mitigation monitoring language, as required by Public Resources Code Section 21081(a)(1) and Section 21081.6, be incorporated within the final environmental impact report prepared for the Project.

Trabuco Canyon Water District further states that the District's Rules and Regulations require improvement agreements to be entered into in order for the District to approve tract maps and for the District to provide water and wastewater service to any property within its boundaries. The District previously requested of California Quartet to undertake negotiations relative to entering new improvement agreements relative to the Project. No response has been received by the District.

TCWD 4 – Response

Comment noted. Please see Section 2.0 of this Response to Comments document regarding the additional mitigation measures.

TCWD 6 – Comment

In addition to the above, a Sub-Area Master Plan must be prepared and financed by the developer to define needed facility improvements which include:

> *Water: Pump stations, reservoir, pressure reducing valves and pipelines.*
> *Sewer: Local collection lines only. The project has already purchased regional wastewater collection, treatment and capacity.*

All fees and capacity charges must be reevaluated following completion of the Sub-Area Master Plan.

TCWD 6 – Response

See mitigation measures M 16-1 (Section 4.16) and M 17-1 (Section 4.17) included in the Draft Revised Subsequent EIR.

3.2.10 City of Lake Forest

Gayle Ackerman, May 29, 2002

City of Lake Forest 1 – Comment

The City of Lake Forest has received the Draft Environmental Impact Report for the Saddleback Meadows development. Public Works staff has reviewed the Water Quality Technical Report, Appendix E and Traffic Study, Appendix F of the EIR and offers the attached comments. Development Services staff has reviewed the body of the EIR and offers the following comments;

City of Lake Forest 1 – Response

Comment noted. No additional response is required.

City of Lake Forest 2 – Comment

Section 3.7 and Table 3-1 discuss related projects. Please confirm project 3, Los Angeles Athletic Club is the name of the self-storage facility located on the corner of Marguerite Parkway and El Toro Road. In addition, the Gateway Commercial Center Project located on the corner of Portola Parkway and El Toro Road, within the City of Lake Forest, should be considered in the EIR. Please see City staff for information on the approved project.

City of Lake Forest 2– Response

Comment noted. Please see Section 2.0 of this Response to Comments document for clarifications to Table 3.1. However, these revisions did not change any conclusions included in the Draft Revised Subsequent EIR.

City of Lake Forest 3 – Comment

The applicant should be advised that the City of Lake Forest does not permit any off-site signage. Therefore, there shall be no advertising or directional signage placed within the city of Lake Forest or along streets within the City's jurisdiction.

City of Lake Forest 3 – Response

Comment noted. No off-site signage for the proposed project is proposed within the City of Lake Forest.

City of Lake Forest 4 – Comment

We would like to continue to receive information and documents on the project. Please send all further correspondence to myself, Ms. Gayle Ackerman, AICP, Director of Development Services at 2361 Lake Center Drive, Suite 100, Lake Forest, CA 92630, telephone number (949) 461-3460.

City of Lake Forest 4 – Response

Comment noted. The City of Lake Forest will receive all future environmental documents and notices pertaining to the proposed project. No additional response is required.

City of Lake Forest 5 – Comment

I have reviewed the Conceptual Water Quality Management section of Saddleback Meadows EIR. The following are comments for the subject document.

In the Developed Conditions section of the Report, page 6, it states that "The permanent open space will be dedicated to the County of Orange as a regional park and will be maintained by the County or a third-party conservation group." The report indicated that this open space area is 88.2 acres.

- *Has the County of Orange agreed to accept the open space area and the maintenance responsibility associated with it?*
- *What impacts will this dedication have on the City if and when this area is annexed to the City of Lake Forest?*
- *Will the public have access to this regional park?*

Please respond to these questions and provide additional information to clarify this item and its impact on the City of Lake Forest.

City of Lake Forest 5 – Response

Section 2.3 of the Draft Revised Subsequent EIR described the details of the proposed open space, which includes approximately 83.25 acres as a natural resource protection area. This area would be an opportunity to expand O'Neill Regional Park (page 2-16 of the Draft Revised Subsequent EIR).

The proposed project site is not within the City of Lake Forest's sphere of influence and there are no plans at this time to annex any portion of the site to the City. It would therefore be speculative to assume annexation and discuss potential impacts to the City.

City of Lake Forest 6 – Comment

In the Developed Conditions section of the Report, Page 6, states that "Only lots 1 through 37 connect directly to an existing storm drain facility in El Toro Road". Please provide all required Hydrology and Hydraulic backup information to show that the existing facility has enough capacity to accommodate this portion of the development. Furthermore, provide detail information on the watershed that contributes to this existing facility on El Toro Road and the down stream impacts of this development.

City of Lake Forest 6 – Response

Project watershed drainage was discussed in Section 4.3 and Appendix D of the Draft Revised Subsequent EIR, which include all necessary hydrologic data for the proposed project. The water quality analysis was included in Section 4.4 and Appendix E of the Draft Revised Subsequent EIR.

City of Lake Forest 7– Comment

Section 7 entitled "Monitoring, Inspection and Maintenance, page 12, Subsection (g) entitled "Common Area Catch Basin Inspection", the inspection and power wash of the screen for the stormceptor should be performed more than once per year. In fact, the first few years after completion of this project, the inspection rate should be 3-4 times per year, or after a sizeable rainstorm. This rate of inspection will be needed until such time as the newly planted vegetation/landscaping begin to contribute to the reduction of erosion. After that, the rate may be reduced to 2-3 times per year to allow for continuous and proper clean screens for all stormceptors.

City of Lake Forest 7 – Response

As stated in PDF 4-16 included in the Draft Revised Subsequent EIR, structural BMPs (such as the stormceptors) will be maintained for effectiveness and a detailed plan for maintenance, inspection and for assessing effectiveness will be included in the project's final SWPPP and the WQMP (PDF 4-17). These plans will be prepared and approved by the applicable County departments and regional jurisdictions.

City of Lake Forest 8 – Comment

Same section as stated in item 3 above, page 12, subsection (h) entitled "Street Sweeping Private Streets and Parking Lots". Please be more specific in regards to statement "This procedure will be intensified around October 15th of each year... " In other words, is the street sweeping required twice a week or more? The term "intensified" needs to be clearly defined.

City of Lake Forest 8 – Response

"Intensified" is defined to mean an increase above the weekly basis, dependent on site conditions. As stated above, a detailed plan for maintenance will be included in the project's final SWPPP and WQMP.

City of Lake Forest 9 – Comment

75% of this area ultimately drains to Aliso Creek, which is an impaired water body and is under an enforcement action (California Water Code Section 13225) from the San Diego Regional Water Quality Control Board. What specific measures are to be undertaken by this development to eliminate pollutant runoff from entering the curb and gutter as required by the NPDES permit and in support of the enforcement action.

City of Lake Forest 9 – Response

Please see Section 4.4 of the Draft Revised Subsequent EIR for a discussion of detailed stormwater water quality runoff mitigation measures, including by not limited to the following: PDF 4-1, PDF 4-2 PDF 4-3, PDF 4-13, PDF 4-14, PDF 4-16, PDF 4-17, SC 4-1, SC 4-2, SC 4-3, SC 4-4. Please also see Section 3.3.8 (Saddleback Canyons Conservancy 4 – Response) of this Response to Comments document.

City of Lake Forest 10 – Comment

We have reviewed the Saddleback Meadows Traffic Report prepared by Urban Crossroads for the County of Orange. The following comments are for the subject document.

The following intersections are STOP sign controlled and should be analyzed utilizing the 2000 HCM: Santiago Canyon Rd./Modjeska Canyon Rd., Santiago Canyon Rd./Ridgeline Rd. and Santiago Canyon Rd./Live Oak Canyon Rd. The intersection analyses Tables should be updated to reflect the delay/LOS for each of these intersections under each scenario which was analyzed.

City of Lake Forest 10 – Response

Use of the 2000 HCM is used as a general guidance for traffic analysis. All intersections in the Saddleback Meadows Traffic Study were analyzed using the required Intersection Capacity Utilization (ICU) methodology, based on the County of Orange guidelines. The ICU approach is a planning methodology that expresses the volume of traffic as a percentage of the overall intersection capacity and a more appropriate model to analyze traffic impacts associated with the proposed project. To compare the operations at these study area intersections for Year 2005 with and without project conditions, as well as Year 2025 with and without project conditions, the same intersection methodology was utilized. This approach enables the analyst to provide a comparison of intersection peak volume-to-capacity relationships for different conditions. In effect, this methodology assumes that traffic signals will be installed when warranted as the area develops.

City of Lake Forest 11 – Comment

Although the intersection of El Toro Rd./Live Oak Canyon Rd. does not meet a warrant for signalization under existing conditions, the HCM worksheets indicate that this intersection is currently operating at acceptable Levels of Service B during both the AM and PM peak hours. Therefore, further analyses should be completed to determine if signalization is needed based upon other factors such as accident data or safety concerns.

City of Lake Forest 11 – Response

The project traffic analysis completed for the proposed project indicates that a signal is warranted under existing conditions based on the existing peak hour intersection turning movements.

Additional warrant issues should be explored by the County of Orange and City of Lake Forest prior to programming this location for installation of a traffic signal.

City of Lake Forest 12 – Comment

The volumes provided in the count data found in Appendix B do not match the northbound and southbound through volumes at the intersection of Portola Parkway and the Foothill Transportation Corridor Ramps under existing conditions as shown in Figures 2E and 2F. A discussion should be added on how the northbound and southbound existing through volumes were derived for the AM and PM peak hours.

City of Lake Forest 12 – Response

The intersection of Portola Parkway and the Foothill Transportation Corridor is considered an urban interchange. In effect, an urban interchange combines the movements of two intersection locations (the northbound and southbound ramps) into one intersection. The movements presented in Appendix F of the Draft Revised Subsequent EIR do in fact reflect the volumes presented on Exhibit 2-E and 2-F. Due to the configuration of the intersection, some counts actually include multiple movements. For example, the A.M. peak hour northbound through movement count volumes of 1,548 vehicles actually includes the northbound left turn movement of 478 vehicles. The actual A.M. peak hour northbound through movement is 1,070 (1548-478). Exhibits 2-E and 2-F present the actual turning movement counts.

City of Lake Forest 13 – Comment

On Table 2-2. the Level of Service at Portola Parkway/Glenn Ranch Road should be "B" and not "A."

City of Lake Forest 13 – Response

The peak hour Intersection Capacity Utilization (ICU) value of 0.62 presented on Table 2-2 (and Table 4.5.1) is consistent with results presented in Appendix F of the Draft Revised Subsequent EIR. The commenter is correct that this value should have been listed on Table 2-2 (and Table 4.5.1) with Level of Service of "B." The intersection would continue to operate at an acceptable level of service (LOS). Please see Section 2.0 of this Response to Comments document.

City of Lake Forest 14 – Comment

The peak hour project volumes for the AM inbound and PM outbound movements at the project access point on El Toro Road, as shown in Exhibits 3-C and 3-D, do not equate to the projected trip generation provided in Table 3-2. The Figures and intersection analyses worksheets should be revised to reflect the current numbers.

City of Lake Forest 14 – Response

The trip generation values presented in Table 3-2 in Appendix F of the Draft Revised Subsequent EIR are consistent with the project trip generation results shown on Exhibits 3-C and 3-D. For presentation purposes, the trip generation values included in Table 3-2 were rounded to the nearest 5 for all peak hour trips and the nearest 10 for all daily trips. This rounding explains the variation between Table 3-2 and Exhibits 3-C and 3-E.

City of Lake Forest 15 – Comment

Table 3-5 should be revised to reflect the Level of Service on each road segment based upon the roadway capacity values found in Table 2-1.

City of Lake Forest 15 – Response

Table 3-5 in Appendix F of the Draft Revised Subsequent EIR is not intended to provide a roadway capacity analysis. As noted on page 3-22 of Appendix F, Table 3-5 presents a summary of the average daily traffic volumes on Santiago Canyon Road.

City of Lake Forest 16 – Comment

On Table 4-4 the following Levels of Service should be corrected to reflect to following Levels of Service:

El Toro/Valley Vista Way – PM peak hour – LOS B
Saddleback Ranch/Glenn Ranch – PM peak hour – LOS B
Portola Parkway/El Toro – AM peak hour – LOS D
Portola Parkway/El Toro – PM peak hour – LOS C

City of Lake Forest 16 – Response

Comment noted. Please see Section 2.0 of this Response to Comments document for an updated Table 4-4 (Table 4.5.8), which has been corrected for three of these four items. The Saddleback Ranch/Glenn Ranch intersection was reported correctly as LOS A. The analysis conclusions remain unchanged.

City of Lake Forest 17 – Comment

It is unclear as to who is responsible for the Year 2005 improvement (Southbound Left Turn Lane) required at the study intersection of Portola Parkway/Foothill Transportation Corridor. This should be indicated in the study.

City of Lake Forest 17 – Response

This improvement is already accommodated by the overall physical design of the interchange. Project participation in the improvement is addressed in the following mitigation measure included in Section 4.5 of the Draft Revised Subsequent EIR:

M 5-5 The project shall pay its fair share of the improvement of the following intersections: Portola Parkway at Glenn Ranch Road, Portola Parkway at Foothill Transportation Corridor (FTC), and the Portola Parkway at El Toro Road.

The project traffic analysis indicates that the following improvements are needed to serve long-range future (Year 2025) traffic conditions with or without the proposed project:

- Portola Parkway (NS) at Glenn Ranch Road (EW):
  - Signal modification to provide northbound right turn overlap phase
- Portola Parkway (NS) at Foothill Transportation Corridor (EW):
  - Add one northbound through travel lane
  - Add one southbound left turn lane
  - Add one southbound through travel lane
- Portola Parkway (NS) at El Toro Road (EW):
  - Add one southbound through travel lane
  - Add one eastbound left turn lane
  - Signal modification to provide southbound right turn overlap phase

City of Lake Forest 18 – Comment

Table 4-6 should be corrected. The study intersection of El Toro Rd./Valley Vista Way should have a LOS value of E instead of D.

City of Lake Forest 18 – Response

Comment noted. Please see Section 2.0 of this Response to Comments document, for an updated Table 4-6 (Table 4.5.9), which has been corrected. The analysis conclusions remain unchanged.

City of Lake Forest 19 – Comment

A discussion/table should be added to the traffic study regarding the project's impacts at each study intersection where the Level of Service is unacceptable and the project increases the ICU value, and where the intersection's operation is degraded to an unacceptable operation with the project. In addition, the proposed improvements, which would mitigate

the project's impacts, should be shown along with additional improvements which are needed without the project for Year 2025 conditions. Responsibility of the improvements should also be provided.

City of Lake Forest 19 – Response

The County of Orange utilizes a procedure for determination of the project contribution, which focuses on changes in the Intersection Capacity Utilization (ICU) between existing conditions, future no-project conditions, and future with-project conditions. The distinction between new and existing traffic performance is a key point in this analysis. Table 3.2, below summarizes the fair share calculations for 2025 conditions.

Table 3.2
Mitigation Measure (M 5-5) Fair Share Calculations

Intersection Location	Peak Hour	Existing ICU	2025 No Project ICU	2025 With Project ICU	2025 With Project Mitigation ICU	Baseline (ICU)	Total Future Traffic Share (ICU)	Project Traffic Share (ICU)	Project Fair Share (%)
Portola Pkwy. (NS) at:									
• Glenn Ranch Rd. (EW)	A.M.	0.62	0.93	0.96	0.80	0.62	0.34	0.03	8.8%
	P.M.	0.50	1.03	1.07	0.85	0.50	0.57	0.04	7.0%
• Foothill Trans. Corridor (EW)	A.M.	0.54	0.77	0.77	0.67	0.54	0.23	-	0.0%
	P.M.	0.79	1.05	1.06	0.64	0.79	0.27	0.01	3.7%
• El Toro Rd. (EW)	A.M.	0.75	1.14	1.15	0.88	0.75	0.40	0.01	2.5%
	P.M.	0.65	0.95	0.95	0.70	0.65	0.30	-	0.0%

Source: Urban Crossroads, 2002

The baseline traffic share is a function of the existing ICU, the future with project ICU, and the ICU after mitigation. If the ICU after mitigation is acceptable, then all future (new) traffic should contribute equally to the improvement. This is the case for the three intersections shown on Table 3.2, above.

The project contributions to future improvement needs at these intersections range from 2.5 percent at Portola Parkway/El Toro Road to 8.8 percent at Portola Parkway/Glenn Ranch Road.

City of Lake Forest 20 – Comment

Peak hour traffic volumes for some improvements under the Year 2025 without the project scenario are decreasing when compared to volumes under the Year 2025 without the project scenario. The following intersections should be reviewed and changes made to the Figures and ICU worksheets or an explanation provided on why volumes are decreasing in the year 2025.

Santiago Canyon/Modjeska Canyon
El Toro/Live Oak Canyon
El Toro/Valley Vista
Saddleback Ranch/Glenn Ranch
Portola Pkwy/Glenn Ranch
Portola Pkwy/El Toro
Santiago Canyon/Ridgeline
El Toro/Ridgeline
El Toro/Glenn Ranch
Marguerite Parkway/El Toro
Portola Pkwy/Trans. Corr.

City of Lake Forest 20 – Response

As discussed in the Traffic Study (Appendix F of the Draft Revised Subsequent EIR), the 2005 traffic conditions were developed based on an annual background growth rate of three percent over a four-year time period (2001 to 2005). The 2005 traffic conditions also include all known project development such as Live Oak Plaza and the Saddle Creek/Saddle Crest development. Future 2025 traffic conditions were developed based on the latest OCTA traffic model forecasts contained in the Orange County Transportation Analysis Model (OCTAM 3.1) and the Irvine Transportation Analysis Model (ITAM 3.01).

In all cases the overall intersection traffic volumes show a substantial traffic volume increase for future 2025 conditions over 2005 conditions. However, individual turning movements may be lower in the projections for 2025 in some cases. This can occur as land uses change and additional network segments are improved in the circulation system.

City of Lake Forest 21 – Comment

Appendix J contains traffic signal warrants for the intersections of Santiago Canyon Rd./Modjeska Canyon Rd., Santiago Canyon Rd./Ridgeline and El Toro Rd./Live Oak Canyon Road under a variety of analyses and conditions. The body of the report does not discuss why traffic signal warrants were applied or when (under what time-frame) the signal may be required.

City of Lake Forest 21 – Response

Based on the County of Orange guidelines for traffic analysis, all intersections in the Saddleback Meadows Traffic Study were analyzed using the required Intersection Capacity Utilization (ICU) methodology. The ICU approach is a planning methodology that expresses the volume of traffic as

a percentage of the overall intersection capacity. To compare the operations at these study area intersections for Year 2005 with and without project conditions, as well as Year 2025 with and without project conditions, the same intersection methodology was utilized. This approach enables the analyst to provide a comparison of intersection peak volume-to-capacity relationships for different conditions. In effect, this methodology assumes that traffic signals will be installed when warranted as the area develops.

City of Lake Forest 22 – Comment

There is an existing bike path/trail, which runs along the eastside and parallel with El Toro Road. The main project access will intersect this bike path/trail. Provisions should be provided for signing the bike path/trail with the proper controls.

City of Lake Forest 22 – Response

Section 4.5.4 of the Draft Revised Subsequent EIR included a Standard County Condition to ensure that the bike lane along El Toro Road in the project area would meet County requirements (see SC 5-5).

City of Lake Forest 23 – Comment

There is a discrepancy in the trip generation provided in a letter dated October 17, 2001 to Mr. Pike Oliver, California Quarter LTD, from Mr. Bill Lawson, Urban Crossroads, Inc. regarding "Alternative Development Scenarios" for the Saddleback Meadows Alternatives. This letter should be revised so the trip generation data provided in the letter reflects the trip generation information indicated in Table 2 of the aforementioned letter.

City of Lake Forest 23 – Response

The trip generation rates contained in the Draft Revised Subsequent EIR, Appendix F (Traffic Study) are correct.

3.2.11 City of Mission Viejo

Charles E. Wilson, May 30, 2002

City of Mission Viejo 1 – Comment

Thank you for the opportunity to review and comment on Zone Change ZC98-3 and Area Plan AP98-2 for Saddleback Meadows (aka Bridlewood) in the County of Orange. Of particular interest to the City of Mission Viejo are the transportation-related components of the Draft Revised Subsequent Environmental Impact Report (EIR 566) for the Saddleback Meadows project filed with the County of Orange. The City's comments are as follows:

1. *Project Trip Generation:*

   The project traffic study identifies a residential trip distribution assumption wherein twenty-five percent of the daily traffic would enter/leave the project site, using El Toro road north of the project entrance, and with twenty five percent continuing along Santiago Canyon Road. Page 3-5 of the project traffic study states that "trip distribution patterns for this study are consistent with previous traffic studies and were reviewed by the County staff prior to completion of this traffic analysis." The City of Mission Viejo continues to believe that the 25% assignment of traffic to El Toro Road, north of the project access, is high. The City of Mission Viejo recommends that the Draft EIR provide narrative discussion which explains the land uses or destinations that exist or are proposed north of the project site, which would cause one-quarter of the project's daily trips to use this segment of El Toro Road, versus using El Toro Road south of the project site to access freeways, major highways, and public facilities. The assumptions used in the project trip distribution would have a resultant impact on analyzed intersections south of the project entrance to El Toro Road, and, in particular, would increase Intersection Capacity Utilization (ICU) calculations if a greater percentage of project trips were assigned southerly along El Toro Road.

City of Mission Viejo 1 – Response

The project distribution pattern is logical and consistent with other project traffic studies in the area. For example, the project trip distribution for Saddle Creek/Saddle Crest also indicates that 25 percent of the project traffic would be assigned north of El Toro Road.

Exhibit 2-D (Figure 4.5.3) included in the Draft Revised Subsequent EIR, indicates that the existing daily traffic volumes on El Toro Road north of Live Oak Canyon Road range from 5,300 to 5,700 vehicles per day. Existing average daily traffic volumes on El Toro Road south of the proposed project range from 8,400 to 28,700 daily vehicles. The traffic volumes on Santiago Canyon Road north of Live Oak Canyon Road represent approximately 18 percent to 63 percent of the daily traffic volumes on El Toro Road south of the proposed project site. The project traffic distribution pattern is therefore consistent with the relative magnitude of existing traffic activity in the Trabuco Canyon area.

North of the project site, El Toro Road becomes Santiago Canyon Road and continues to an interchange with the Eastern Transportation Corridor (SR-241). Santiago Canyon Road also extends into the City of Orange where it becomes Chapman Avenue. Chapman Avenue connects with the Costa Mesa Freeway (SR-55) and continues westerly to the City of Garden Grove. East of the Costa Mesa Freeway, the Santiago Canyon Road/Chapman Avenue corridor provides direct access from the project to Santiago Canyon College, Irvine Regional Park, numerous City of Orange commercial centers, and the Chapman Medical Center. The Santiago Canyon Road/Chapman Avenue corridor therefore provides access to many destinations, freeways, major highways, and public facilities without toll charges. Utilization of this corridor by at least 20 percent of the project traffic is to be expected.

City of Mission Viejo 2 – Comment

2. *El Toro/Glenn Ranch Road Intersection:*

   The El Toro/Glenn Ranch Road intersection is a Measure M intersection that is fully assigned to the City of Mission Viejo. In compliance with countywide Measure M requirements, the City of Mission Viejo must maintain this intersection at a Level of service "D" or better.

The project traffic study identifies that the El Toro/Glenn Ranch Road intersection will maintain a Level of service A through project buildout in Year 2005, but that the intersection is projected to operate at a Level of Service "E" in the pm peak period in Year 2025 buildout, with or without the project. The project traffic study further identifies that the completion of additional El Toro Road improvements, specifically, the addition of through lanes that increases El Toro Road's lane capacity from a two-lane to a four-lane facility, will allow this intersection to operate at a Level of Service "C" in the pm peak period, thus maintaining consistency with Measure M Growth Management Program level of service standards.

The City of Mission Viejo recognizes that the implementation of additional El Toro Road improvements is not necessitated by the Saddleback Meadows project, since project buildout, and associated levels of service standards, can be maintained at the El Toro/Glen Ranch Road intersection with existing improvements. In conjunction with Measure M Interjurisdictional Planning Forums, the City of Mission Viejo will monitor the operation of El Toro Road and will work with the County of Orange, to allow for the implementation of the additional El Toro Road lane improvements in advance of any failing intersection performance at the El Toro/Glenn Ranch Road intersection.

On behalf of the City of Mission Viejo, I thank you for your consideration of our comments. If you have any questions, please feel free to call Elaine Lister or me at (949) 470-3053.

City of Mission Viejo 2 – Response

As discussed above, future level-of-service issues at this intersection are projected to occur with or without the project. The project traffic contribution would be mitigated (please see Section 4.5 mitigation measure M 5-5, of the Draft Revised Subsequent EIR).

3.2.12 City of Rancho Santa Margarita

Kathleen Haton, May 16, 2002

City of RSM 1 – Comment

Thank you for the opportunity to review and comment on the Zone Change (ZC) 98-3 and Area Plan (AP) 98-2 for the proposed Saddleback Meadows development. It is our understanding that the existing zoning allows for 705 manufactured homes, 1.7 acres of commercial, and 130 acres of open space. The proposed development will include 299 single-family detached dwelling units and 155 acres of open space.

The City of Rancho Santa Margarita has reviewed the Zone Change and Area Plan and has the following comments:

1. *Saddleback Meadows Rural Character Statement Page 6 (graphics): It is not clear from which direction the views from offsite are from.*

City of RSM 1 – Response

The comment refers to the Area Plan for the Saddleback Meadows project and does not pertain to the EIR. However, the illustrations are intended to be conceptual and are not from a specific location.

City of RSM 2 – Comment

Page 6-1: Grading Concept: Contour grading is discussed but there are not any graphics that show where cut and fill areas will occur.

City of RSM 2 – Response

The level of detail requested by the commenter is not required and the comment refers to the Area Plan for the Saddleback Meadows project. However, the extensive amount of remedial grading required will result in cut operations to stabilize existing landslide areas. Fill operations would be associated with the upper limits of areas. Please see Section 4.2 and Appendix C of the Draft Revised Subsequent EIR for a more detailed discussion of grading/landform alteration proposed for the site.

City of RSM 3 – Comment

Please include the City of Rancho Santa Margarita on your mailing list for review of any documents related to this project.

If you have any questions or concerns about our comments, please call me at (949) 635-1800.

City of RSM 3 – Response

Comment noted.

3.3 ORGANIZATIONS/BUSINESS LETTERS

The following organizations/business commented on the Draft Revised Subsequent EIR:

- The Center for Biological Diversity
- Connor, Blake & Griffin, LLP (representing the Vedanta Society of Southern California)
- The Gas Company
- Juaneno Band of Mission Indians
- Mark R. McGuire
- Orange County Regional Recreational Trails Advisory Committee
- Rural Canyon Conservation Fund
- Saddleback Canyons Conservancy
- Sierra Club
- Trails 4 All
- Terrell Watt, AICP (representing National Audubon Society, Endangered Habitats League and Rural Canyons Conservation Fund)

3.3.1 The Center for Biological Diversity

Kassie Siegel, June 24, 2002

TCBD 1 – Comment

These comments are submitted on behalf of the Center for Biological Diversity ("Center"), a non-profit public interest membership organization dedicated to the preservation of native species and their habitats. On June 11, 2001 our Legal Assistant Susie Roe called the County of Orange Environmental Planning and Services Division requesting a copy of the EIR for the Saddleback Meadows Project, SCH No. 1996121072. Ms. Roe was told by staff that the EIR could only be sent via the authority of Mr. Bill Grieman, then on vacation. Ms. Roe left a voicemail for Mr. Grieman, who never returned the call. Today, June 24th, Ms Roe called Mr. Grieman to check on the status of the request for the EIR, and was told that he was unsure when and if it could be sent because the comment period is now over. This is outrageous. First, the comment period is not "over" as it is not yet the close of business. Second, the Center has a right to review the EIR regardless of whether the comment period is "over" or not. Third, the County of Orange Environmental Planning and Services Division should not be incapable of sending out a copy of an EIR while one staff member is on vacation. The actions of the County staff have deprived the Center, our members and staff, and members of the public with an interest in protecting the biological resources of the Saddleback Meadows project site with an opportunity to comment on this project.

From reviewing the comments of the Sierra Club and others, it seems apparent that the Draft Supplemental EIR is deeply flawed, the environmental impacts of this project are unacceptable, and the mitigation proposed is entirely inadequate. The Center will submit further comments once we have received the EIR. The Center requests that the comment period be extended due to the County's failure to timely release a copy of the EIR upon request. Should the deadline not be extended, the Center will submit comments and strongly urges the county to consider them and respond fully in the final EIR. As you know, the CEQA Amendments of 1994 make it clear that an organization exhausts its administrative remedies (and therefore preserves its rights to judicial review of the project approval) by submitting comments at any time prior to the certification of the EIR. Pub. Resources Code § 2177(a)(b); Galante Vineyards v. Monterey Peninsula Water Management District (6th Dist. 1997), 60 Cal. App.4th 1117-1121.

Thank you for your consideration of these comments. Please contact me at (909) 659-6053 x. 302 should you have any questions.

TCBD 1 – Response

Planning & Development Services Dept.

[County to provide further edits]

The County apologizes for the miscommunication regarding the commenter's request for a copy of the Draft Revised Subsequent EIR. However, it should also be noted that copies of the document were available at area libraries (see Section 1.0 of this Response to Comments document) and at the County of Orange. In addition, the commenter will have the opportunity to submit verbal and written comments and raise concerns or issues at the scheduled Planning Commission hearings (July 16 and August 28, 2002). Please see Section 3.3.9 of this Response to Comments document for responses to comments from the Sierra Club.

3.3.2 Connor, Blake & Griffin, LLP (representing the Vedanta Society of Southern California)

Edward M. Connor, June 9, 2002

Connor 1 – Comment

On behalf of the Vedanta Society of Southern California ("Vedanta"), we hereby submit our comments on "Draft Revised Subsequent Environmental Impact Report No. 566" ("DRSEIR 566" or the "DRSEIR") for the 299-unit single family housing project (the 299-Unit Project") proposed for the Saddleback Meadows property (the "Property"). Vedanta's specific comments on DRSEIR 566 are set forth in Exhibit "A" attached hereto and are incorporated herein by reference. We request that each of the comments set forth in Exhibit "A" receives full and complete response pursuant to section 15099 of the State CEQA Guidelines.

Connor 1 – Response

Comment noted, all written comments submitted on the Draft Revised Subsequent EIR are included in this Response to Comments document.

Connor 2 – Comment

We are particularly disappointed that, after having described the "44/178 Alternative" in detail in the letter which we sent you on August 31, 2001, in response to the Notice of Preparation DRSEIR 566, California Quartet's Consultant, HDR, has chosen to address a radically different alternative under the guise of the "44/178 Alternative." In our letter, we clearly described the "44/178 Alternative" as dividing the Property into a 44-acre "Development Parcel" and a 178-acre "Conservation Parcel." We stressed that the "Conservation Parcel" was to be permanently preserved in its natural condition as undeveloped and undisturbed open space, and that no development activities (e.g., remedial grading) were to be permitted outside of the 44-acres of the "Development Parcel." However, in the DRSEIR, the "44/178 Alternative" is inexplicably preserved as a 127-unit single family housing project.

As was disclosed by California Quartet's representatives during Vedanta's settlement negotiations with them and various County officials in 1998, a 127-unit alternative would require a development area of at least 75 acres and would entail massive remedial grading and a 50-foot loeffel wall that would destroy virtually all of the vernal ponds, oak trees, and sensitive habitat areas that would otherwise be preserved by the 44-acre development footprint that is the hallmark of the "44/178 Alternative" proposed by Vedanta.

We consider the unfair and distorted presentation of the "44/178 Alternative" that is contained in DRSEIR 566 to be so deceptive and misleading that it requires the DRSEIR to be redrafted and recirculated. Section 15088.5(a)(3) of the State CEQA Guidelines has clearly been triggered in this regard. Moreover, given the conclusory and deficient nature of many of the other sections of DRSEIR 566, recirculation is also required under section 15088.5(a)(4) of the State CEQA Guidelines.

What is required is a fair and honest evaluation of the merits of the "44/178 Alternative." As the County's own staff members proved in developing the 65-unit "Mathews Alternative" in April 1998, the "44/178 Alternative" would provide California Quartet with a feasible – albeit lower density – housing project which would preserve and protect the environmentally-sensitive resources on this unique "wildlife corridor" property. Regrettably, the County has so far allowed California Quartet's consultant to evade the state law requirements which mandate that this project alternative be adequately analyzed and reported on in the DRSEIR. We cannot believe the County has allowed this blatant misconduct to occur and we hope that you will rectify this immediately.

In the interest of providing the decision-makers of the County if Orange and the members of the public with a complete and non-deceptive evaluation of the project alternatives, environmental impacts, and feasible mitigation measures associated with the 299-Unit Project, we respectfully request that DRSEIR 566 be revised and recirculated before any public hearings are scheduled on this matter.

Connor 2 – Response

As stated in Section 5.1 of the Draft Revised Subsequent EIR, the range of alternatives required within an EIR is governed by the "rule of reason" which requires an EIR to include only those alternatives necessary to permit a reasoned choice. The alternative analysis included in the Draft Revised Subsequent EIR discussed eight alternatives to the proposed project. These alternatives were based on criteria pursuant to CEQA including the potential to reduce or eliminate significant impacts, and attain most of the project objectives. Further, the discussion of alternatives need not be exhaustive, and there is no requirement within CEQA that specific alternatives advocated by an individual or interest group be included. As stated in the *CEQA Guidelines* Section 15126.6(a) "An EIR need not consider every conceivable alternative to a project."

Nevertheless, Alternative 6 (44/178 Alternative) as described in the Draft Revised Subsequent EIR reflects the Memorandum of Understanding executed by the applicant and the Saddleback Lands Conservancy on November 3, 1998. The 65-unit alternative as suggested by the commenter was found by County staff in 1998 to not be economically feasible due to remedial grading requirements and was therefore, not included in the EIR. The remedial grading and fuel modification requirements of this alternative would extend into the area to be encompassed within the 178-acre conservation parcel regardless of whether 65 or 127 lots were included within the 44-acre development parcel.

The alternative analysis included in the Draft Revised Subsequent EIR meets the requirements of CEQA; therefore no revisions or re-circulation of the Draft Revised Subsequent EIR is required.

Connor 3 – Comment

1. *Draft Revised Subsequent Environmental Impact Report No. 566 ("DRSEIR 566" or the "DRSEIR") fails to identify, analyze, and mitigate the impacts associated with the failure of the 299-unit single family*

housing project (the 299-Unit Project") to comply and be consistent with the goals, objectives, components, regulations, and guidelines of the Foothill/Trabuco Specific Plan (the "FTSP"). At page 4.1-12, the DRSEIR simply concludes that the 299-Unit Project "would be in substantial compliance with or consistent with the previously approved and Recorded Map 10692" and, therefore, as a result of the fact that the 705-unit manufactured housing project (the "705-Unit Project") described in Recorded Map 10692 was exempted – due to bankruptcy code concerns – from compliance with the FTSP, the 299-Unit Project should likewise be exempted. However, the DRSEIR fails to provide any legal or factual support for this conclusion. The FTSP provides an exemption for the development of the Saddleback Meadows property (the "Property") only if it is developed in accordance with the Recorded Map 10692 – i.e., if the 705-Unit Project is developed. If any proposed development "deviates" from the Recorded Map 10692, an amendment to the FTSP is required to "(1) determine an appropriate density cap for the property; (2) establish new development regulations for the Bridlewood Residential District; and (3) be consistent with all of the provisions of the Specific Plan." (FTSP at page III-20, para. 3.2(b).) By seeking to create an entirely new exemption from the FTSP for the Property, and by submitting an entirely new subdivision map for the Property, the developer has acknowledged that the 299-Unit Project deviates from Recorded Map 10692 and is not covered by the exemption from the FTSP provided for the 705-Unit Project. DRSEIR 566 incorrectly concludes that the 299-Unit Project is exempt from the FTSP because it "would be in substantial compliance with or consistent with previously approved and Recorded Map 10692." If the DRSEIR seeks to rely on this patently false conclusion, some attempt must be made to support it by providing a good faith comparison to the 705-Unit Project and the 299-Unit Project to prove that they are the same project. If they are essentially the same project, then the environmental analysis set forth in the DRSEIR is fatally flawed because the 299-Unit Project is portrayed as involving far fewer impacts.

Connor 3 – Response

The F/TSP established a specific "residential district" for the Saddleback Meadows property. The principal that either the approved map moves forward or an alternative is considered. The F/TSP never ruled out consideration of an alternative to the 705-lot plan, particularly that which would represent a lessening of environmental impact as compared to the recorded map. Section 3.2 "Special Provisions" of the F/TSP states: "Any development proposal which deviates from the approved Saddleback Meadows Planned Community zoning and Recorded Tract 10692 *and which cannot be found to be in substantial compliance* with these approvals shall require a Specific Plan amendment" (emphasis added). As stated in Section 4.1.2 of the Draft Revised Subsequent EIR, the proposed project would be in substantial compliance with the recorded map with respect to residential gross density and providing for the provision of a substantial increase in open space and the presence of a wildlife corridor as outlined in the F/TSP. Therefore the proposed project is in compliance with the residential district provisions of the F/TSP. Substantial compliance does not require that the proposed project (299 residential units) result in the same impacts as the recorded map (705 units). Many of the impacts associated with the 705-unit project were eliminated or substantially reduced due to compliance with the conditions of the Biological Opinion (BO)

(included as Appendix I.4 of the Draft Revised Subsequent EIR), changes in the existing environment, and reduction of trip generation and other impacts directly correlated with the number of residential units.

Connor 4 – Comment

2. *DRSEIR fails to identify, analyze, and mitigate the impacts – including the adverse precedent – associated with the creation of an entirely new exemption for the Property from the goals, objectives, components, regulations, and guidelines of the FTSP. If a new exemption is to be created, the DRSEIR should (a) identify all other projects, if any, which have received a similar exemption from the FTSP and (b) identify each of the goals, objectives, components, regulations, and guidelines of the FTSP with which the 299-Unit Project is inconsistent, but will nonetheless be exempted from, including, but are not limited to, (a) the goals and objectives relating to rural character and resource preservation; (b) the resources overlay component relating to wildlife corridors, oak woodlands, tree management/preservation, and streambeds; (c) Bridlewood Residential District Regulations; (d) landscaping regulations; (e) grading standards relating to the maximum height of manufactured slopes and the 70% "natural open space" requirement; (f) area plan submittal requirements; (g) grading, drainage and site planning guidelines; and (h) architectural guidelines.*

Connor 4 – Response

As stated in Section 3.3.2 (Connor 3 – Response) above, the proposed project is in substantial compliance with the approved map does not propose development beyond the boundaries of the previously approved impact area, and would not result in the " . . . creation of an entirely new exemption for the property from the goals, objectives, components, regulations and guidelines of the F/TSP." The proposed project is not an exemption from the Bridlewood Residential District. The proposed zone change would amend the F/TSP Bridlewood District.

Connor 5 – Comment

3. *DRSEIR 566 fails to properly identify, analyze, and mitigate the land use compatibility impacts of the 299-Unit Project on the Ramakrishna Monastery and St. Michael's Abbey. At page 4.1-13, under the heading "Level of Significance Before Mitigation," DRSEIR 566 concludes that "due to a natural space buffer, implementation of the proposed project would not result in significant land use compatibility impacts to the Rama Krishna Monastery or St. Michael's Abbey." However, at page 19, under the heading "Significant Impacts of the Project Prior to Mitigation," "Addendum PA980103 to Certified Final Subsequent Environmental Impact Report 566" ("Addendum No. 1") earlier concluded that the 299-Unit Project "would result in significant land use compatibility impacts to O'Neill Regional Park, the Ramakrishna Monastery, St. Michael's Abbey, and surrounding residential communities." Moreover, despite the incorporation of the identical "Project Design Features" which are proposed under DRSEIR 566, "Draft Environmental Impact Report No. 561" ("DEIR 561") concluded that the very similar 318-unit single family housing project which it analyzed would have a significant, unavoidable, adverse impact on land use*

compatibility with O'Neill Regional Park, the Ramakrishna Monastery, and St. Michael's Abbey. (DEIR 561 at page 8-1.) The DRSEIR fails to explain or reconcile these clearly inconsistent and contradictory conclusions.

Connor 5 – Response

It should be noted that Draft EIR 561 was not certified and therefore, its preliminary findings are subject to revision based on refined and/or updated analysis. As stated in Section 9.0 of the Draft Revised Subsequent EIR, as a result of changes in project design and the construction of other developments within the F/TSP, all unavoidable adverse impacts (with the exception of cumulative air quality) included in previous documentation have been eliminated. The proposed project includes additional buffer space between the Abbey and the development (from a 300-foot natural open space buffer to a 1,200-foot buffer). This refinement was in response to specific suggestions from the Abbey.

In addition, the current proposed project includes a 2,000-foot natural open space buffer between the project development and the Rama Krishna Monastery. Although, the dimension of this buffer is the same as for the project evaluated in the previous environmental document (Subsequent EIR No. 566), the impact is no longer significant due to the reduction of units in the project and average lot sizes that are more than twice as large as those included in the project evaluated in the previous environmental document[1] (from 705 manufactured residential units to 299 single-family units). Therefore, no impacts with regard to land use would occur.

Connor 6 – Comment

4. *DRSEIR 566 fails to properly identify, analyze, and mitigate the land use compatibility impacts of the 299-Unit Project on O'Neill Regional Park. At page 4.1-11, the DRSEIR concludes that the 299-Unit Project is "not incompatible" with O'Neill Regional Park. This conclusion is reached based on the fact that a portion of the Property is to be dedicated to the County of Orange (the "County") for incorporation into O'Neill Regional Park and that portion of the Property purportedly would cause O'Neill Regional Park to be "substantially buffered from the development by natural undisturbed, open space and topography." However, a comparison of the Open Space Plan for the 299-Unit Project (Figure 2.11) and any map or diagram indicating the surrounding property boundaries (e.g., Figure 4.1.2, 2.3, or 2.6) reveals that the 299-Unit Project abuts a significant portion of the property boundary shared by the Property and O'Neill Regional Park. Indeed, the 299-Unit Project will require grading and fuel modification activities to be conducted in a portion of O'Neill Regional Park. (See, e.g., Figure 4.2.5 (grading cannot conveniently stop at property boundary as indicated in Removal Area "C") and 4.12.1.) Hence, not only does the DRSEIR fail to provide any factual support for its conclusion that the 299-Unit Project is "not incompatible" with*

[1] *Residential units have been reduced from 705 to 299 and average lot sizes have increased from 3,900 square feet to about 7,000 square feet.*

O'Neill Regional Park, but it actually provides information demonstrating that this conclusion is obviously incorrect. Moreover, as noted in the previous paragraph, earlier environmental documents regarding the 299-Unit Project and the similar 318-Unit Project concluded that such projects did have significant land use compatibility impacts on O'Neill Regional Park, but DRSEIR 566 has not explained or reconciled these inconsistencies.

Connor 6 – Response

Land use compatibility is based on the long-term relationship between the proposed project and O'Neill Regional Park. Temporary construction impacts caused by grading are not considered a land use compatibility issue. Under existing conditions, a portion of the park abuts residential lots in the Hidden Ridge, Painted Trail and Rancho Santa Margarita residential projects (please refer to Figures 3.1 and 4.1.1 of the Draft Revised Subsequent EIR). This exposes park users to existing vistas of residential development. In addition, a portion of the park is operated as a private nursery.

The proposed project includes offsetting residential lots by 320 to 750 feet from the existing park boundary. Some lots are located at approximately 65 feet from the park boundary, but are 25 or more feet below a ridge and thus visually shielded from the park. Therefore, the proposed project would not be incompatible with the adjacent O'Neill Regional Park and no significant impacts would occur. No grading will occur in O'Neill Regional Park.

Please see Section 3.3.2 (Connor 8 – Response) of this Response to Comments document regarding fuel modification and potential grading encroachment.

Connor 7 – Comment

5. *DRSEIR 566 fails to properly identify, analyze, and mitigate any of the environmental impacts which would result if title and possession of a significant portion of O'Neill Regional Park were to revert back to Vedanta due to any construction or other activities associated with the 299-Unit Project. In 1974, Vedanta granted the approximately 245 acres located immediately to the south of the Property, and the west and southwest of the Monastery, to the County so that the land could be made a part of O'Neill Regional Park and be permanently maintained as open space. The grant of this land included several conditions subsequent pursuant to which the land would revert back to Vedanta in the event of a breach of any of those conditions. The conditions expressly prohibit any grading activities, the placement of any soils, and the removal of any trees, shrubs, or natural growth from the land gifted to the County. All of the grading maps in the DRSEIR attempt to show that no grading will be conducted in O'Neill Regional Park. For example, Figure 4.2.5 shows that when the limits of remedial grading– which generally trace the contours of the land and the outline of the geotechnical conditions which purportedly are to be remedied– reach the property line between the Property and O'Neill Regional Park, the limits of remedial grading miraculously make a sharp turn and follow precisely along the property line in order to stay out of O'Neill Regional Park. Clearly, this is not possible and, as currently designed, the 299-Unit Project requires certain grading – and also fuel-*

modification activities – to be conducted within the portion of O'Neill Regional Park which Vedanta gave to the County. Moreover, the 299-Unit Project provides for a storm drain to discharge into the natural drainage course which runs directly into O'Neill Regional Park. (See Figure 4.3.2.) Each of these constitutes a breach of the conditions subsequent to Vedanta's gift of land to the County and would cause such land to revert back to Vedanta. DRSEIR 566 should acknowledge his fact and identify, analyze, and mitigate the environmental impacts which would result therefrom. If the DRSEIR is going to continue to insist that no grading or other activities will be conducted within the O'Neill Regional Park, then DRSEIR 566 should provide an explanation of how grading and all other activities will be excluded from O'Neill Regional Park.

Connor 7 – Response

While the comment related to the remedial grading line for the proposed project is generally correct, the comment does not consider the opportunity to adjust the remedial grading line in response to site specific conditions. The remedial grading line shown in Figure 4.2.5 is located at the top of a back-cut into the development area. As such, the back-cut can be adjusted for short stretches in order to control its precise location and stay away from sensitive areas, such as O'Neill Regional Park. Adjacency to the area in question in the comment is an example of such a site-specific design.

The commenter is also correct regarding Figure 4.12.1 of the Draft Revised Subsequent EIR, which depicts off-site fuel modification. Figure 4.12.1 depicted the standard fuel modification of the Orange County Fire Authority (OCFA). However, the OCFA also allows alternate methods in response to site-specific conditions. A revised Figure 4.12.1 is included in Section 2.0 of this Response to Comments document and depicts the use of an alternative method (i.e., expansion of the 50-foot irrigated wet zone) to confine the fuel modification to the limits of the property.

As shown in Figure 4.3.1 in the Draft Revised Subsequent EIR, the project site currently drains towards O'Neill Regional Park. Post development hydrology would be in substantial conformance with existing hydrologic conditions and thus not result in a significant impact under CEQA. However, this would not constitute a breach of the conditions regarding gifting the land to the County, as it would not change the existing drainage conditions.

Connor 8 – Comment

6. *DRSEIR 566 fails to properly identify, analyze, and mitigate the land use compatibility impacts of the 299-Unit Project on all surrounding residential areas. At page 4.1-10, the DRSEIR states that the 299-Unit Project "has a lower gross density than the surrounding area projects." However, in reaching this conclusion, the DRSEIR 566 relies solely upon two nearby projects which are located outside the FTSP – i.e., Portola Hills and Hidden Hills/Hidden Ridge – while ignoring two nearby residential projects that are within the FTSP. (See Table 4.1.2.) DRSEIR 566 fails to acknowledge or analyze the fact that the "gross density" for the 299-Unit Project (1.3 dwelling units/acre) is double that of Santiago Canyon Estates (gross density*

of 0.66 dwelling units/acre) and four times that of the proposed Saddle Creek/Saddle Crest (gross density 0.33 dwelling units/acre.)

Connor 8 – Response

The commenter is correct in that gross density for that of Santiago Canyon Estates and the proposed Saddle Creek/Saddle Crest would be lower than that for the proposed project. As stated in Section 4.1.1 of the Draft Revised Subsequent EIR, density comparisons were made with two developments adjacent and closest to the proposed project: Hidden Hills/Hidden Ridge (which abuts the project site to the south) and Portola Hills (which is located west of the project site across El Toro Road). The existing density for the neighboring properties Portola Hills and Hidden Hills/Hidden Ridge, if applied to this site, would allow 666 dwelling units for the proposed project. The F/TSP zoning for the Upper Aliso Residential District to the north would allow 222 dwelling units, while the F/TSP zoning for the Trabuco Canyon Residential District to the east would allow 111 dwelling units.

The General Plan designates Saddleback Meadows and neighboring sites to the south and west as "Suburban Residential." Density allowed under this category ranges from 0.5 dwelling units/acre (du/ac) to 18 du/ac. The proposed project includes 1.4 du/ac. Neighboring property to the north and east are designated as "Rural Residential." Saddleback Meadows may be regarded as a rural transition area because of its location along a heavily traveled road (El Toro Road) and at the western edge of the F/TSP area. Thus, 299 units is a reasonable density for this location.

Connor 9 – Comment

7. *DRSEIR 566 fails to properly identify, analyze, and mitigate the impacts associated with the inconsistency between the 299-Unit Project and the Aliso Creek Corridor Specific Plan. At page 4.1-12, the DRSEIR concludes that the 299-Unit Project "would be in conformance with the Aliso Creek Corridor Specific Plan" and, therefore, makes no attempt to mitigate the impact of any inconsistency with such Specific Plan. However, at page 19, Addendum No. 1 concludes that the 299-Unit Project "would also conflict with policies of the Aliso Creek Corridor Specific Plan." DRSEIR 566 fails to explain or reconcile these inconsistent and contradictory conclusions.*

Connor 9 – Response

As stated in Section 4.1.2 of the Draft Revised Subsequent EIR, the Aliso Creek Corridor Specific Plan pre-dates both the F/TSP and Recorded Tract Map 10692 and sets land use goals, objectives and policies for a large regional planning area from the Cleveland National Forest to the Pacific Ocean. The F/TSP further refines these goals, objectives and policies to guide future development in the Foothill-Trabuco area. The proposed project would incorporate several aspects of the Aliso Creek Corridor Specific Plan (i.e., riparian preservation and habitat conductivity, Section 4.8) and

have also been included to reduce impacts to Aliso Creek and the surrounding area (i.e., proposed drain system to reduce sediment transport, Section 4.3).

Connor 10 – Comment

8. *DRSEIR 566 fails to identify, analyze, and mitigate the grading and other geophysical impacts associated with the 299-Unit Project. The impacts and mitigation measures which DRSEIR 566 fails to address, include, but are not limited to, the following:*

   a *The impacts which the grading activities for the 299-Unit Project will have on the Trabuco Canyon area and its residents based on how long it will take to complete the proposed grading. Although all previous environmental impact reports the County has prepared for the Property have likewise failed to fully address these impacts, they did, at least, concede in the "Geophysical Resources" subsection that, depending on the project, grading would take between 10 and 18 months to complete, based on an average daily grading quantity of 30,000 cubic yards. (See Addendum No. 1 at p. 21; "Final Subsequent Environmental Impact Report No. 566" ("FSEIR 566") at p. 4-22; DEIR 561 at p. 4-28.) The "Geophysical Resources" subsection of the DRSEIR, however, is strangely silent on this issue and the "Project Description" section (p. 2-16) now simply contains a single sentence and footnote stating that grading will require approximately 13 months to complete based on an average of 30,000 cubic yards per day and 21-work days per month. Not only is this estimate incorrect using the County's own numbers (a total of 9.25 million cubic yards of grading at an average of 30,000 cubic yard per day and 21-work days per month translates to 14.68 months of grading), but, as Vedanta and its consultants have repeatedly stated in connection with all previously proposed projects, an average of 30,000 cubic yards per day – especially for the remedial grading – is very unrealistic. Although 30,000 cubic yards per say may possibly be achieved for the 2.45 million cubic yards of conventional grading, a figure of 1,000 cubic yards per day is a much more reasonable assumption for the 6.8 million cubic yards of remedial grading that is proposed. Using these figures (and DRSEIR 566's estimate of 21-work days per month), grading would take longer than 36 months or 3 years to complete. The DRSEIR fails to justify its estimate regarding how long grading for the 299-Unit Project will take, and it also fails to address the impacts that conducting grading activities for that amount of time would have on Trabuco Canyon and its residents – including, but not limited to, the excessive noise, dust, and traffic delays associated with excavating and recompacting more than nine million cubic yards of soil which will remain exposed to the wind during dry seasons, and the rain during wet seasons, over the course of the several years it will take to complete all of the proposed rough grading.*

Connor 10 – Response

The commenter is correct, the grading is projected to take about 15 months, not the 13 months stated on page 2-16 of the Draft Revised Subsequent EIR. Please see Section 2.0 of this Response to Comments document. The *average* grading rate of 30,000 cubic yards per day is based on the geotechnical engineer's experience of similar projects and has been confirmed by a local grading firm

based on their experience on similar projects. No traffic delays are projected due to the grading operations. Actual grading production on any given day will vary over the course of the project; however, the average grading rate of 30,000 cubic yards per days can be sustained over the course of the project. Dust and noise issues were analyzed in Sections 4.6 and 4.7, respectively, of the Draft Revised Subsequent EIR.

Connor 11 – Comment

b *The impacts associated with the heavy ground water seepage into the excavations at the site which DRSEIR 566 anticipates will occur (p. 4.2-18 mitigation measure M 2-20), including, but not limited to (i) the impact of the discharge of collected groundwater seepage, (ii) the impact of the interruption in subsurface ground water flow on downstream wells, and (iii) the impacts of the presence of the deep water shear keys for buttress fills on the final groundwater conditions. The DRSEIR also fails to address whether there is a potential for surfacing of ground water behind the effective subsurface dam created by the shear key of the buttress fill.*

Connor 11 – Response

The comment is referred to the full discussion of mitigation (mitigation measure M 2-20) in Section 4.2 of the Draft Revised Subsequent EIR; which indicates that seepage will reach "... maximum discharge in two to five days... decreasing in volume with time... being less at higher site elevations as well as in cuts made in late in the year." Therefore, the discharge of collected groundwater seepage is expected to be minor over the course of the grading effort.

Connor 12 – Comment

c *The impact of buttress backcut failures. DRSEIR 566 projects a buttress backcut failure rate of 10 percent (See DRSEIR 566 at p. 4.2-20, mitigation measure M 2-34.) However, due to the subsurface conditions typified by landslides within landslides, this 10 percent estimate is overly optimistic. Moreover, the effect of backcut failures on upstream and asjacent properties, regardless of the percentage of failures, are not addressed.*

Connor 12 – Response

As noted in mitigation measure M 2-34 (page 4.2-20 of the Draft Revised Subsequent EIR), the ten percent back cut failure rate is a statistical probability and not site specific. The mitigation measure includes industry standards that would be employed to effectively reduce the risk of back cut failures and confine such failures to minor "pop outs" within the limits of grading.

Connor 13 – Comment

d *The impact of new soil stability problems which will be created by increasing the amount of water that is discharged into the Property's natural drainage courses and the ground water table. (As stated in the "Hydrology" and "Water Quality" subsections of DRSEIR 566 daily nuisance and storm water runoff will be discharged into the Property's natural drainage courses.) In particular, (i) the increased erosion that will occur in the Property's natural drainage courses during storm flows due to the fact that the weak alluvial soils which are present in those courses will have been softened by the daily nuisance runoff that will be discharged into such drainage courses, (ii) the weakened support for existing landslides which will also result from the discharge of daily nuisance runoff and increased storm water runoff into the Property's natural drainage courses, and (iii) the new instability problems which will be created by the ground water levels being raised by the infiltration of irrigation and other new sources of water.*

Connor 13 – Response

As noted in Section 4.3 of the Draft Revised Subsequent EIR, the property is currently subject to erosion as can be seen in the highly incised drainage courses that now characterize the property. The revegetation of the open space areas and the natural drainage courses as outlined in Section 4.8 Draft Revised Subsequent EIR would reduce or eliminate most of this erosion. The other two issues raised by the commenter have been considered by the geotechnical consultant and will be further analyzed in the final geotechnical report (Standard County Condition SC 2-1). However, to ensure compliance with these important issues an additional mitigation measures has been added. Please see Section 2.0 of this Response to Comments document.

Connor 14 – Comment

e *The special grading requirements which are necessary to perform the extremely deep fill that are proposed. Although the DRSEIR acknowledges that fill depths will exceed 50 feet and settlement associated with those fills of 4 to 6 inches can be expected (p. 4.2-20) mitigation measure M 2-33), fill depths of up to 130 feet will actually be required to construct the proposed shear keys for the buttress fills. Fills of such great depths require, inter alia, (i) additional evaluation that may necessitate compaction criteria well in excess of code minimums, (ii) special moisture conditioning of fill during compaction, and (iii) long-term settlement monitoring prior to building construction.*

Connor 14 – Response

Comment noted. Standard County Condition SC 2-1 in Section 4.2.4 of the Draft Revised Subsequent EIR requires the preparation of a final geotechnical report prior to issuance of grading permits, which would ensure compliance with the County's Grading Manual, soil compaction component. Additionally, mitigation measure M 2-16 specifies compaction requirements, and mitigation measure M 2-27 requires on-going testing and observation during construction.

Connor 15 – Comment

f *Imposing a 100 percent performance bond to cover the possibility of the developer's failure to complete the extremely large amount of conventional and remedial grading required for the 299-Unit Project.*

Connor 15 – Response

A 100 percent performance bond is a standard condition of obtaining a Grading Permit from the County of Orange. The bond would cover both remedial and mass grading for the proposed project.

Connor 16 – Comment

9. *DRSEIR 566 fails to properly identify, analyze, and mitigate the hydrology impacts associated with the 299-Unit Project. The impacts which the DRSEIR fails to address, include, but are not limited to, the impacts of discharging daily nuisance water runoff and increased storm water runoff into the natural drainage courses of the Property. The natural drainage courses of the Property are dry for a majority of the year (only receiving water during storms). However, the daily nuisance water runoff from the 299-Unit Project will cause the drainage courses to be wet year-round and, therefore, more susceptible to, inter alia, erosion. Moreover, the character of the water being dumped into the natural drainage courses will change from slower-moving water carrying soil and debris to faster-moving water that has less soil and debris and, therefore, is prone to picking up soil and debris. DRSEIR 566 acknowledges that, by increasing the flows in the Property's natural drainage courses, the 299-Unit Project will have erosion and sedimentation impacts, but the DRSEIR fails to address any of these impacts. Instead, any analysis of this issue is improperly deferred until after the certification of DRSEIR 566 – i.e., until a point in the approval process where the public is not permitted an opportunity to review and comment on that analysis, and the County is not required to respond to any public comments.*

Connor 16 – Response

Hydrology impacts have been addressed in both Sections 4.3 and 4.8 of the Draft Revised Subsequent EIR. The biological mitigation measures take into account the addition of nuisance flows and provides for a riparian habitat designed to thrive under the potentially year round flows, thus reducing the potential for increased erosion. In addition, the re-vegetation of the degraded portions of the property (which will remain in open space) will also result in reduced flows over that currently experienced on the project site. The project has been designed to provide more storm drain outlets than typically found in residential subdivisions. This will distribute flows to most of the natural drainages rather than concentrate runoff from the project in one or two of the natural drainages.

Connor 17 – Comment

10. *DRSEIR 566 fails to identify, analyze, or mitigate any of the water quality impacts associated with the 299-Unit Project because the entire "Water Quality" subsection of the DRSEIR is based upon a conceptual water quality management plan for a different project. At page 4.4-1, the DRSEIR states that its "Water Quality" subsection "summarizes the findings and conclusions of the Conceptual Water Quality Management Plan for Saddleback Meadows Proposed VTTM 15230 County of Orange, California" which is included in the DRSEIR as Appendix "E." However, as its complete title indicates, the "Conceptual Water Quality Management Plan for Saddleback Meadows Proposed VTTM 15230, Development Alternative for 283 Residential Home sites, County of Orange, CA" which is found in Appendix "E" was prepared to address a different project – i.e., the 283-unit single unit family housing project which is Alternative No. 8 in the DRSEIR. As such, the entire "Water Quality" subsection must be revised to correctly identify, analyze, and mitigate the water quality impacts of the 299-Unit Project as opposed to the 283-Unit Project which it currently addresses.*

Connor 17 – Response

The commenter is correct that the Conceptual Water Quality Management Plan included as Appendix E of the Draft Revised Subsequent EIR was for one of the project alternatives. The correct plan has been included as Appendix D of this Response to Comment document. However, Section 4.4 of the Draft Revised Subsequent EIR was developed based on a Water Quality Management Plan developed for the 299 proposed project.

Connor 18 – Comment

11. *Assuming arguendo that the "Water Quality" subsection of DRSEIR 566 did address the 299-Unit Project, such subsection nonetheless fails to fully and properly identify, analyze and mitigate the water quality impacts associated with the 299-Unit Project because, inter alia, it fails to fully describe how pollutants will be filtered from the daily nuisance and storm water runoff from the 299-Unit Project and what the impacts will be of discharging polluted runoff into the Property's natural drainage courses and O'Neill Regional Park, and the area's groundwater. The DRSEIR claims that a riverine system will be used to filter pollutants from the daily nuisance and storm water runoff from approximately 80 percent of the 299-Unit Project. (See, e.g., p. 4.4-13 at PDF 4-1.) In reliance on the riverine system, stormceptor filters will be installed on the storm drains serving the 20 percent of the Project which is located in the northeastern quadrant of the Property only. However, nowhere is it depicted or explained in DRSEIR 566 how flows from the 299-Unit Project will be directed into the riverine system. Indeed, Figure 4.3.2, entitled Proposed Drainage Improvements, shows that all of the runoff from the 299-Unit Project will be directed into the storm drain system and discharged into the Property's natural drainage courses, but the storm drains serving a majority of the 299-Unit Project will not have filters to reduce the amount of pollution and runoff. The DRSEIR also acknowledges that the riverine system is designed to accommodate low flows only, but it fails to explain how any flows that exceed the capacity of the riverine system will be filtered for pollutants given that*

the storm drains collecting runoff from 80 percent of the Project will not have filters installed due to the existence of the riverine system. Moreover, the DRSEIR acknowledges that the filters that will be installed will not trap bacterial indicators or toxic constituents. (DRSEIR 566 at p. 4.4-11.) Instead the DRSEIR relies upon 3,300 lineal feet of the Property's natural drainage courses to filter these pollutants. However, the DRSEIR does not in any way address the impacts that these pollutants will have on the Property's natural drainage courses – some of which flow into O'Neill Regional Park – and the area's groundwater.

Connor 18 – Response

Figure 4.3.2 of the Draft Revised Subsequent EIR depicts graphical representations of the storm drain system and is not intended to depict actual storm drain locations. As noted, the design of the riverine system is designed to accommodate low flows since it is the nuisance flows and the first flows of the rainy season that carry the predominant urban pollutants. High stage flows are generally free from pollutants and can bypass the riverine system. As stated in Section 4.3 of the Draft Revised Subsequent EIR, use of the riverine system and the stormceptors would remove the urban pollutants and result in less than significant impacts. Detailed design of the storm drain and water quality components will be accomplished as noted in the Standard County Conditions (SC 3-2 and SC 4-2).

Connor 19 – Comment

12. *DRSEIR 566 fails to properly identify, analyze, and mitigate the impacts the 299-Unit Project would have on the Natural Communities Conservation Plan ("NCCP") program and the County's ability to complete its Southern NCCP Subregion and to link the Southern and Central/Coastal NCCP Subregions. Previous environmental impact reports for the Property included four or more pages of text addressing the NCCP and the impacts of the proposed projects on the NCCP. (See, e.g., FSEIR 566 at pp. 4-127 – 4-130, 4-144; DEIR 561 at 99. 4-123 – 4-126, 4-139 – 4-140.) The DRSEIR, however, contains less than one page of very cursory discussion regarding the NCCP and it fails in any way to address the impacts of the 299-Unit Project on the NCCP and the County's NCCP planning efforts. Moreover, DRSEIR 566 fails to, inter alia, (i) acknowledge that the United States Fish and Wildlife Service and the California Department of Fish and Game (collectively, the "Wildlife Agencies") have repeatedly informed the County that the Property provides a critical habitat corridor/linkage necessary for the completion of the NCCP Southern Subregion and (ii) identify the findings which the NCCP requires to be made with respect to the impacts of the 299-Unit Project will have on the coastal sage scrub habitat located on the Property. The DRSEIR should be revised to include an appropriate and complete discussion of the impacts of the 299-Unit Project on the NCCP.*

Connor 19 – Response

Section 4.8 of the Draft Revised Subsequent EIR discusses the key issues of wildlife connectivity and preservation of significant resources (i.e., Riverside fairy shrimp, wetlands, coastal sage scrub and coast live oak woodland). The goals of the Natural Community Conservation Planning Program (NCCP) are discussed in Section 4.8.1. Please see Section 3.2.1 (USFWS/CDFG 4 – Response) of this Response to Comments document.

Connor 20 – Comment

13. *DRSEIR 566 fails to properly identify, analyze, and mitigate the impact of the 299-Unit Project on wildlife movement on the Property and throughout the NCCP Southern and Central/Coastal Subregions. The DRSEIR touts that the 299-Unit Project has been designed to incorporate a wildlife movement corridor that will permit wildlife to continue to travel safely across the Property. (See, e.g., DRSEIR 566 at p. 4.8-27.) However, the DRSEIR fails to acknowledge that the Wildlife Agencies have previously informed the County that the wildlife corridor proposed as part of the 299-Unit Project does not "retain appropriate topography and habitat to ensure the continued function of the wildlife movement corridor/linkage that exists on Saddleback Meadows." (October 29, 1998 Letter from the Wildlife Agencies to the Orange County Board of Supervisors.) As such, the DRSEIR needs to be revised to contain an analysis of the adequacy of the proposed wildlife movement corridor/linkage and the impact of failing to provide an adequate corridor/linkage.*

Connor 20 – Response

Please see Section 3.2.1 (USFWS/CDFG 4 – Response) of this Response to Comments document.

Connor 21 – Comment

14. *DRSEIR 566 fails to identify, analyze, and mitigate the biological resources impacts associated with the 299-Unit Project because, inter alia:*

    a *The DRSEIR fails to properly identify the sensitivity of the intermediate mariposa lily (calochortus weedii var intermedius) and based thereon erroneously concludes that there will be no significant impact of it requiring any mitigation. (See DRSEIR 566 at p. 4.8-21 and Appendix I.1 at p. 17). In Appendix I.1, the DRSEIR erroneously identifies the sensitivity of the intermediate mariposa lily as California Native Plant Society ("CNPS") List 4. (See Appendix I.1 at p. 9.) In the text, the DRSEIR correctly lists the intermediate mariposa lily as CNPS List 1B, but then proceeds to conclude that, due to its low sensitivity status, the impact of destroying all plants found on the Property is not significant. (See DRSEIR 566 at pp. 4.8-13, 4.8-21.) However, as explained in Appendix "C" to Appendix I..1 of the DRSEIR, the presence of intermediate mariposa lily on the CNPS List 1B means that it is "rare, threatened, or endangered in California and elsewhere and is eligible for state*

listing." Indeed, the only higher listing under the CNPS system is List 1A which includes only those plants that are presumed to be extinct. DRSEIR 566 needs to be revised to correct the inconsistency between its text and Appendix I.1 and, if it is going to maintain its conclusion that there will be no significant impacts on the intermediate mariposa lily, it need to provide facts to support such conclusion because, contrary to how the DRSEIR currently reads, the intermediate mariposa lily does not have a low sensitivity status.

Connor 21 – Response

Section 4.8 and Appendix I of the Draft Revised Subsequent EIR correctly identify the intermediate Mariposa lily as a CNPS list 1B species. However, the commenter is correct regarding an inconsistency as Table 2 of Appendix I.1 incorrectly identifies the species as a list 4 species.

Under CEQA, the Final EIR (which consists of the Draft EIR and the Response to Comments) is the primary document considered during approval or rejection of a project by the lead agency. Although impacts to this sensitive species were not assessed in the Draft EIR as being significant, due to the limited number of individuals impacted, an additional mitigation requirement has been added to the project in response to this and other comments. The applicant has agreed to transplant the potentially impacted bulbs of this species to appropriate open space areas on-site. Please see Section 2.0 of this Response to Comments document.

Connor 22 – Comment

b *The DRSEIR erroneously concludes that the 299-Unit Project will not have a significant impact on the federally-listed endangered Riverside fairy shrimp because the impacts to it will be mitigated to a level of insignificance by the creation of several ephemeral ponds on the Property. However, as the Biological Opinion on the Saddleback Meadows Residential Development Project found in Appendix I.4 states, at pages 19-20, creation of such ponds is experimental and has never been done successfully, especially with respect to the conditions found on the Property.*

Connor 22 – Response

The mitigation for the Riverside fairy shrimp was developed through extensive discussions with USFWS. Additionally, the biological consultant for the project has constructed several restoration sites in San Diego County that currently support Riverside fairy shrimp populations. Many of the known locations of Riverside fairy shrimp, including ponds on-site, occur in man-made ponds. The proposed mitigation basins will be designed to provide appropriate hydrological conditions necessary for the shrimp to persist. The ponds are being created at a greater than 2:1 mitigation ratio, resulting in a net long-term increase in fairy shrimp on-site. The proposed project also provides for a detailed ten-year monitoring program, as well as permanent management of open space on-site including existing ponds proposed for preservation. At the conclusion of the ten-year

monitoring period, the ponds as well as the open space will be managed and maintained by a third-party conservation group. Under existing conditions, that is with no active monitoring or maintenance, two of the ponds have been lost due to siltation or breaching with a third under constant repair by the rancher.

Connor 23 – Comment

c *Although one of the technical reports found in the appendices to the DRSEIR 566 acknowledges that the Property has been designated as critical habitat for the Riverside fairy shrimp and the coastal California gnatcatcher pursuant to the U.S. Endangered Species Act, the text of the DRSEIR fails to acknowledge this fact. Neither the text of DRSEIR 566, nor any of the appendices thereto, address in any way the significance of the designation.*

Connor 23 – Response

The Biological Opinion (BO) referenced and included as Appendix I.4 in the Draft Revised Subsequent EIR specifically addresses critical habitat for both the Riverside fairy shrimp and the coastal California gnatcatcher. As noted in Standard County Conditions SC 8-5 in Section 4.8.4 of the Draft Revised Subsequent EIR, the applicant is required to provide written proof that the activity complies with the Federal Endangered Species Act. SC 8-5 specifically states, "A BO issued by the USFWS shall be considered written proof." The BO issued for the proposed project provides that written proof.

Connor 24 – Comment

d *The DRSEIR fails to properly and adequately mitigate the impacts the 299-Unit Project will have by destroying the hundreds of acres of oak woodlands, vernal ponds, coastal sage scrub habitat, and other biotic communities on the Property which are home to sensitive, threatened, or endangered flora and fauna. The mitigation DRSEIR 566 offers regarding these impacts fall far below that which is required by law, inter alia, the FTSP, the NCCP, the state and federal endanger [sic] species legislation.*

Connor 24 – Response

The biological resources and impacts to those resources were discussed in Section 4.8 and detailed technical reports included as Appendix I of the Draft Revised Subsequent EIR. The proposed project has been subject to review of the regulatory agencies including CDFG, which issued a draft Streambed Alteration Agreement (1603) for the applicant's signature in December 2001; USFWS, which issued a final BO in October 2001; and the U.S. Army Corps of Engineers (USACE) as part of their processing of an Individual 404 Permit. The draft 1603 Permit is included in Appendix B of this Response to Comments document.

See also Section 3.2.1 (USFWS/CDFG comments/responses) of this Response to Comments document.

Connor 25 – Comment

15. *DRSEIR 566 fails to properly identify, analyze and mitigate the "Aesthetic/Visual" impacts associated with the 299-Unit Project. At page 4.9-22 through 4.9-23, the DRSEIR concludes that the 299-Unit Project will not have a significant aesthetic or visual impact prior to mitigation. However, at page 4-192, DEIR 561 concludes that, despite the use of many of the same contoured grading and viewshed screening techniques which are proposed for the 299-Unit Project, the 318-unit single family housing project which was the subject of DEIR 561 would nonetheless have unavoidable significant aesthetic and visual impacts (including night glare impacts) on the Ramakarishna Monastery, St. Michael's Abbey, and O'Neill Regional Park. DRSEIR 566 fails to explain and reconcile these inconsistent and conflicting conclusions.*

Connor 25 – Response

As noted above (Connor 5 – Response), Draft EIR 561 was not certified and therefore its preliminary findings are subject to revision based on refined and/or updated analysis. The state of the art of computer modeling has allowed a more sophisticated analysis of visual impact than was possible at the time Draft EIR 561 was prepared. The commenter is referred to Section 4.9 of the Draft Revised Subsequent EIR for the updated visual analysis provided for the proposed project.

Connor 26 – Comment

16. *DRSEIR 566 fails to fully and properly identify and analyze the importance of the archaeological sites found on the Property. At page 4.10-19, the DRSEIR concludes that archaeological site CA-ORA-711 is the only site on the Property which is deemed to be important or significant. However, at page 104, Addendum No. 1 concludes that there are a total of four archaeological sites on the Property which are deemed to be important or significant. Those sites are CA-ORA-710, CA-ORA-713, CA-ORA-715, and CA-ORA-1435H. DRSEIR 566 should have an analysis explaining and reconciling these inconsistent conclusions regarding the important of certain of the archaeological sites found on the Property.*

Connor 26 – Response

As stated in Appendix J of the Draft Revised Subsequent EIR, CA-ORA-1435H was deemed not eligible for testing per guidelines of the National Registrar of Historic Places, and CA-ORA-713 and CA-ORA-715 were determined to not be significant (see letter dated August 6, 2001 in Appendix J).

Site CA-ORA-710 will be covered and protected as part of a biological mitigation area within the project site (please see Project Design Feature PDF 10-1 on pages 4.10-15/4.10-16 of the Draft Revised Subsequent EIR).

Connor 27 – Comment

17. *DRSEIR 566 fails to identify, analyze, and mitigate the impacts associated with project "Hazards" as both the Initial Study and the Introduction to the DRSEIR (see [page I-4) indicated that it would. Indeed, the Initial Study identifies "Hazards" as one of six areas of potentially significant impacts which might result from the 299-Unit Project, but DRSEIR 566 fails to contain a section identifying and analyzing such impacts. All previous environmental documentation for the Property contained a separate section in which "Hazards" such as wildfire, emergency access, and wildlife interaction were all identified and analyzed. (See Addendum No. 1 at pp. 4-219 – 4-228.) Although the DRSEIR does address certain wildfire hazards and fuel modification requirements under the "Public Services – Fire Protection" subsection, it does not address any other hazards, such as the fact that the Project has only one main access road, which Addendum No. 1 identifies as an area of concern and which the Orange County Fire Authority proposed mitigation measures to specifically address. An analysis of the "Hazards" analyzed in the previous environmental documents for the Property should be conducted with respect to the 299-Unit Project.*

Connor 27 – Response

Section 4.12 of the Draft Revised Subsequent EIR includes an analysis of the appropriate hazards relevant to the proposed project, in the context of existing conditions. The Initial Study identified wildland fire as the only hazard for the proposed project (see Appendix A of the Draft Revised Subsequent EIR). The inconsistency in Section 1.4.2 of the Draft Revision Subsequent EIR is acknowledged. Please see Section 2.0 of this Response to Comments document regarding a revision to page 1-4 of the Draft Revised Subsequent EIR.

Connor 28 – Comment

18. *DRSEIR 566 fails to properly describe the "44/178 Alternative" as initially proposed by Vedanta in October 1998 and again in the comments Vedanta submitted regarding the Notice of Preparation (the "NOP") for the DRSEIR. As proposed by Vedanta, although the developer would be free to develop the project of its choice on the 44-acre "Development Parcel," the 178-acre "Conservation Parcel" would be left in its undisturbed natural state – i.e., no development activities of any kind would be conducted on such parcel, including, but not limited to, grading of any kind. However, as described in the DRSEIR, the "44/178 Alternative" allows for the development of 127 single-family housing units on the "Development Parcel" which, as Vedanta indicated in its comments on the NOP, can only be developed on such Parcel if a substantial amount of remedial grading and other construction activities are conducted on the "Conservation Parcel." Indeed, shortly after Vedanta proposed the "44/178 Alternative" in October 1998, the developer conceded that, in order to develop 127 single-family housing units on the "Development Parcel" – which is not contemplated under the "44/178 Alternative" as proposed by Vedanta. Therefore, a new analysis of the "44/178 Alternative" should be conducted based upon a proper description of the alternative which identifies a range of units which can safely be accommodated within the "Development Parcel." This analysis should include, inter alia, an analysis of the geotechnical conditions to determine the greatest number of units*

that can be developed on the 44-acre "Development Parcel" with the least amount of rough grading. The grading study is of critical importance because it will not only address the economic feasibility of the "44/178 Alternative," but also determines the nature and extent of the environmental resources which can be spared from the bulldozer's blade. As requested in Vedanta's comments on the NOP, this analysis should consider two versions of the "44/178 Alternative," one in which the developer is required to dedicate the 178-acre "Conservation Parcel" to the County (which has been the County's standard practice on all other major development projects approved during the past 25 years) and another in which the "Conservation Parcel" is purchased by a governmental entity (such as the United States Fish and Wildlife Service and the California Department of Fish and Game), a private entity, private person (s), or any combination thereof.

Connor 28 – Response

Please see Section 3.3.2 (Connor 2 – Response) of this Response to Comments document regarding alternatives.

Connor 29 – Comment

19. *DRSEIR 566 fails to provide sufficient factual information about each of the proposed alternatives to allow for meaningful evaluation, analysis, and comparison with the 299-Unit Project. The DRSEIR provides very little factual information regarding the proposed alternatives and their environmental impacts. Instead, DRSEIR 566 simply makes very general and conclusory statements regarding whether each impact will be greater or less than the 299-Unit Project and each of the other alternatives. Very little factual information is provided which permits differential impacts to be quantified and meaningfully analyzed. For example, no information is provided to allow the number of acres of oak trees, vernal ponds, coastal sage scrub, or any of the other biological resources which are affected under each alternative to be compared with the 299-Unit Project. Similarly, the extent to which each of the alternatives comply with the various goals, objectives, components, regulations, and guidelines of the FTSP is not provided so as to allow a comparison of the alternatives with the 299-Unit Project. Indeed, the alternatives analysis in DRSEIR 566 is almost entirely devoid of any factual information which would support its conclusions regarding the relative impacts of the 299-Unit Project and each of the alternatives. Accordingly, an entirely new analysis of each of the alternatives is necessary to provide the factual information required to conduct a meaningful evaluation, analysis, and comparison of the alternatives with the 299-Unit Project. (Note: Although the DRSEIR provides grading quantities for many of the alternatives, it curiously fails to state a remedial grading quantity for the "44/178 Alternative" while nonetheless conceding that remedial grading will be required for that alternative.)*

Connor 29 – Response

The discussion of alternatives need not be exhaustive. As stated in the *CEQA Guidelines* Section 15126.6(d), "the EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. A matrix displaying the major

characteristics and significant environmental effects of each alternative may be used to summarize the comparison." The alternative analysis included in Section 5.0 of the Draft Revised Subsequent EIR included the appropriate level of detail per the requirements of CEQA; therefore no revisions or new alternative analysis would be required.

Connor 30 – Comment

20. *DRSEIR 566 fails to provide any factual information which supports its conclusion that, except for the "No Project Alternative," Alternative No. 8 is the environmentally superior alternative. Alternative 8 is a "reduced density alternative" which simply lowers the number of single family dwelling units by 16 units – i.e., from 299 down to 283. In reaching this conclusion, the DRSEIR provides absolutely no explanation or factual support for how a 283-unit single family housing project – which has virtually the identical environmental impacts as a 299-Unit Project – could possibly be an environmentally superior alternative to Alternative 4 (a 100-unit single family housing project which leaves 85% of the Property as natural open space), Alternative 6 (the "44/178 Alternative") or Alternative 7 (the "Acquisition Alternative" in which the entire property is purchased by a governmental entity, private entity, or private person (s) for preservation as permanent open space).*

Connor 30 – Response

As stated in Section 5.1 of the Draft Revised Subsequent EIR, the *CEQA Guidelines* require an EIR to "describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives" (*CEQA Guidelines* Section 15126.6(a)).

As noted by the commenter, Alternative 4 (Foothill Trabuco Specific Plan EIR 531 Staff Alternative B) is the development alternative that is most environmentally superior to the proposed project. This is correctly summarized in a review of each impact by alternative in Table 5.7 of the Draft Subsequent Revised EIR. Further, as correctly identified by the commenter, although Alternative No. 8 is environmentally superior to the proposed project, Alternative 4 is environmentally superior to Alternative 8. This clarification has been made in Section 2.0 of this Final EIR.

However, it should be noted that economic feasibility is inherent to any project and the *CEQA Guidelines* state, "Among factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, . . . " (Section 15126.6(f)(1)). Although Alternative 4 is environmentally superior, it would be economically infeasible to develop. Land acquisition, engineering, construction, and implementation of mitigation measures could not be amortized over 100 single-family units. These costs combined with mitigation costs such as those associated with stabilizing the geotechnical hazards would exceed project revenues.

Similarly, Alternatives 6 (44/178 Alternative) and 7 (Acquisition Alternative) would not be feasible. Alternative 6 would meet the project objectives, but would result in an increase in impacts to recreation resources and fire protection as compared to the proposed project (see Section 5.4.6 of the Draft Revised Subsequent EIR and Section 2.0 of this Response to Comments document). In addition, it should be noted that full property acquisition is necessary for Alternative No. 7 and partial acquisition of the "Conservation Parcel" is integral to the feasibility of Alternative 6. No party with the resources and willingness to consummate a transaction has materialized, in spite of intensive exploration regarding this issue in late 1996, early 1997, early 1998 and from late spring through fall 1998.

Connor 31 – Comment

21. *DRSEIR 566 fails to consider a residential housing alternative which complies with the goals, objectives, components, regulations, and guidelines of the FTSP, nor does it explain why such an alternative would be unacceptable. In its comments on the NOP, Vedanta specifically requested that the DRSEIR identify and analyze at least one reduced-density alternative which complies with all of the goals, objectives, components, regulations, and guidelines of the FTSP. Instead, in Alternative No. 8, the DRSEIR identifies and analyzes a reduced-density alternative that eliminates only 16 out of 299 dwelling units and which complies with virtually none of the goals, objectives, components, regulations, and guidelines of the FTSP. Indeed, DRSEIR 566 fails to provide any explanation for why an FTSP-compliant alternative was not considered.*

Connor 31 – Response

Please see Section 3.3.2 (Connor 2 – Response) regarding the range of alternatives required for an EIR. The commenter is incorrect in indicating that no alternatives were discussed in the Draft Revised Subsequent EIR that would meet the goals, objectives, components, regulations and guidelines of the F/TSP. Alternative 4 would meet the requirements of the F/TSP. In addition, Alternative 2 would also meet the F/TSP goals, as the Bridlewood Residential District was established to recognize the existing zoning and tract map approvals for the Bridlewood (Saddleback Meadows) property.

3.3.3 The Gas Company

Robert S. Warth, May 16, 2002

The Gas Company 1 – Comment

This letter is not to be interpreted as a contractual commitment to serve the proposed project but only as an information service. Its intent is to notify you that the Southern California Gas Company has facilities in the area where the above named project is proposed. Gas service to the project could be served without any significant impact on the environment. Gas facility additions for the expansion would be in accordance with the company's policies and extension rules on file with the California Public Utilities Commission at the time contractual arrangements are made.

The availability of natural gas service, as set forth in this letter, is based upon present conditions of gas supply and regulatory policies. As a public utility, the Southern California Gas Company is under the jurisdiction of the California Public Utilities Commission. We can also be affected by actions of gas supply or the condition under which service is available, gas service will be provided in accordance with revised conditions.

Estimates of gas usage for non-residential and residential projects are developed on an individual basis and are obtained from the Commercial-Industrial/Residential Market Services Staff by calling (800) 427-2000. We have developed several programs, which are available upon request to provide assistance in selecting the most energy efficient appliances or systems for a particular project. If you desire further information on any of our energy conservation programs, please contact this office for assistance.

The Gas Company 1 – Response

Section 4.20 of the Draft Revised Subsequent EIR includes an evaluation of the impact of the proposed project on existing natural gas utilities and service systems. The ability of The Gas Company to serve the proposed project, without any significant impact on the environment is noted.

3.3.4 Juaneño Band of Mission Indians, Acjachemen Nation

Damien Shilo, June 10, 2002

Juaneño Band of Mission Indians 1 – Comment

After review of the cultural resources section of the DEIR, we, the Juaneño Band of Mission Indians ("tribe") are concerned about the protection of this land regarding both archaeological and anthropological impact. We feel that there has been an inadequate investigation into the significance/importance of the archaeological sites. The report indicates that there were three 1 x 1 meter units used to determine the archaeological significance/importance. This is an inadequate sampling of the area to make a determination for the size of this project. Also, we feel that the monitors should be from the local tribe. The practice of finding out of area monitors who do not understand the cultural significance of the local area needs to be corrected. There is also a concern for the wildlife corridor and endangered species, neither of which are adequately addressed.

Juaneño Band of Mission Indians 1 – Response

Please see Section 3.2.4 (California State University, Los Angeles 2 – Response, and California State University, Los Angeles 3 – Response) of this Response to Comments document.

Juaneño Band of Mission Indians 2 – Comment

There is not sufficient information to support the determinations made. The DEIR fails to provide documentation that the CEQA recommended preservation alternatives to the total destruction of archaeological sites be impacted. The developer should be required to conduct a good faith examination of the feasibility of the preservation measures. They should be encouraged to incorporate one or more of the preservation measures and include the preservation plan in the EIR. Grading and monitoring is not adequate mitigation for the destruction of a significant archaeological site.

Juaneño Band of Mission Indians 2 – Response

Prior to the commencement of the current study, a Native American Contacts List and Sacred Lands File Search was requested from Rob Wood of the Native American Heritage Commission. Any Native American monitor hired for the project will be selected from this list.

Juaneño Band of Mission Indians 3 – Comment

If it is determined that date recovery excavation and destruction of the sites is the only feasible option, the investigations should be guided by a research design that follows the California Office of Historic Preservation Guidelines for Archaeological Research Designs (Preservation Planning Bulletin No. 5, February 1991. Dept. of Parks and Recreation, Office of Historic Preservation). The report documenting the excavations should follow the Office of Historic Preservation Guidelines for Archaeological Resource Management Reports (Preservation Planning Bulletin No. 5, December 1989).

Juaneño Band of Mission Indians 3 – Response

Please see Section 3.2.4 (California State University, Los Angeles 10 – Response) of this Response to Comments document.

3.3.5 Mark R. McGuire
June 25, 2002

McGuire 1 – Comment

I represent the Rutter Development Corporation in connection with its entitlement and natural resources permitting efforts for the Saddle Crest and Saddle Creek residential development projects near the Saddleback Meadows project site. The southern boundary of the Saddle Creek project constitutes the northern border of the Saddleback Meadows project. Rutter Development supports the current proposed project and certainly sees it as preferable to the massive mobilehome [sic] park previously approved for the site. However, Rutter Development takes exception to Figures 4.8.2 and 4.8.4 in the Biological Resources section of the SEIR.

Figure 4.8.2 is labeled "Proposed NCCP Southern Subregional Planning Area," but it does more than simply delineate the subregional boundaries. The "reserve area" overlay on this exhibit has no basis in any approved or even proposed plan. Consequently, this exhibit should be replaced with one that simply shows the boundaries of the southern subregional planning are and overlays the project's boundaries. Similarly, Figure 4.8.4 is labeled "Proposed Regional Wildlife Movement Corridors" but there is no discussion regarding who is "proposing" the establishment of these corridors or for what species they are proposed to function as corridors. The "proposed" corridors in the exhibit do not correspond to the wildlife corridors shown in the adopted Foothill Trabuco Specific Plan or any other formally adopted or even proposed plan. Therefore, this exhibit should also be deleted, replaced or modified in the Final SEIR.

McGuire 1 – Response

Please refer to Section 3.2.1 (USFWS/CDFG 4 - Response) of this Response to Comments document. The wildlife corridor locations shown in Figures 4.8.2 and 4.8.4 are conceptual and are intended to depict local small mammal wildlife movement between localized areas. Regional wildlife movement corridors are located to the east and north within and adjacent to the Cleveland National Forest. The depicted wildlife movement corridors have been the subject of numerous meeting with both USFWS and CDFG and the exhibits depict the conceptual locations of these corridors.

Figure 4.8.2 shows the proposed boundary of the NCCP Southern Subregional Planning Area and depicts the draft NCCP proposal which was in place at the time of Draft Revised Subsequent EIR circulation.

McGuire 2 – Comment

Thank you for the opportunity to comment on the draft SEIR for the Saddleback Meadows project. Please feel free to call if you have any questions or wish to discuss this matter.

McGuire 2 – Response

Comment noted.

3.3.6 Orange County Regional Recreational Trails Advisory Committee
Alice Sorenson, May 31, 2002

RRTAC 1 – Comment

As you know, the Regional Recreational Trails Advisory Committee (RRTAC) is a Board-appointed committee composed of equestrians, mountain bicyclists, and hikers. Recently, the RRTAC approved a motion to provide an additional riding and hiking trail through the proposed Saddleback Meadows project site.

The Committee was given a presentation regarding the subject project. Staff noted that the project is already proposing a local trail (referred to in this letter as "Trail A") along the main entry road extending west to east through the project. To provide a loop route we suggest an additional local trail ("Trail B"), to begin at Trail A and go north around the east side of St. Michael's Abbey. Trail B would then connect with the proposed Live Oak Plaza project site and connect to the Live Oak Canyon Regional Trail. We also request an additional link from Trail B to the proposed Saddle Creek project at the north edge of the Saddleback Meadows project near the connection to Live Oak Plaza. Mr. Jeff Dickman, County's Chief of Trail Planning, concurred with this concept.

The RRTAC hereby expresses its support for the additional local trail through the proposed Saddleback Meadows project ("Trail B"). We appreciate your department's efforts to provide this trail, and we would like to be kept informed of its progress.

RRTAC 1 – Response

Recreational impacts associated with implementation of the proposed project have been mitigated to less than significant and therefore, no further mitigation (such as the additional trail suggested by the commenter) is required. However, the commenter's suggestion will be forwarded on to the decision makers.

3.3.7 Rural Canyons Conservation Fund

Ray Chandos, May 28, 2002

Rural Canyons 1 – Comment

The Rural Canyons Conservation Fund, founded in 1983, advocates for the preservation of Orange County's unique inland rural canyon areas through a program of public education and participation in land use decisions affecting the area's unique scenic natural resources.

We comment as follows on the above referenced proposals:

1. *The area plan application is incomplete.*

The Foothill Trabuco Specific Plan (FTSP) lists certain informational items that must be provided when a proposed area plan is submitted. Several such items are missing from the subject proposal, including:

- *a site-specific resources assessment by a qualified field biologist;*
- *a site-specific oak woodlands analysis;*
- *a site-specific wildlife corridor analysis;*
- *a hydrological analysis;*
- *detailed mapping of areas within 50 vertical feet or 200 horizontal feet of designated major ridgelines or rock outcroppings;*
- *a detailed viewshed analysis of the proposed development as viewed from scenic highways;*
- *a conceptual grading plan at a minimum scale of 1:40 clearly delineating existing and proposed contour elevations, the location and elevation of all building pads, access roads, driveways, slope percentages, heights of manufactured slopes, the total area of disturbance, area of the flat graded pad on each parcel, and the location of retaining and crib walls;*
- *clear delineation of the building lines for assessing setbacks;*
- *a consistency report evaluating the project's consistency with each of the regulations and guidelines contained in the FTSP; and*
- *three-dimensional models of the site before and after proposed grading.*

(FTSP III G.2.0(e), pages III-90 through III-93.)

Because key information is missing from the application we received, we cannot fully assess the extent of non-compliance with the FTSP at this time, and therefore reserve the right to comment further if and when complete information becomes available.

Rural Canyons 1 – Response

The comments refer to the Area Plan for the Saddleback Meadows project and do not raise a direct or indirect significant physical environmental issue or other issue pursuant to CEQA. No additional response is required. However, the commenter is directed to additional information regarding the project included in Tentative Tract Map 15230 and the Draft Revised Subsequent EIR. See also Section 3.3.2 (Connor 3 – Response) of this Response to Comments document regarding consistency with the F/TSP.

Rural Canyons 2 – Comment

2. *The proposed spot amendment of the Foothill Trabuco Specific Plan improperly renders the FTSP internally inconsistent and inequitable, and is therefore invalid in its face.*

State law requires that general and specific plans maintain internal consistency. However, the FTSP amendment proposed as part of this project renders the FTSP internally inconsistent. This inconsistency arises from the following language contained in the proposed spot amendment:

> *"Any development shall be in compliance with every regulation of this District (BWR) and* shall be exempt from all of the Regulations and Guidelines included in this Specific Plan other than those provided for by this District." (Proposed Draft Ordinance, Exhibit 1, paragraph 3.4 (c) italics added.)

This spot amendment conflicts with other general language within the FTSP:

> *"This specific plan is adopted pursuant to regulations contained in the Orange County Zoning Code. It is specifically intended by such adoption that the development standards and provisions contained herein shall regulate* all development *within the Specific Plan area." (FTSP III.C.3.0, page II-29, emphasis added.)*

> *"It is uncertain whether this development cap can be achieved* since all development is required to be consistent with the Specific Plan regulations and guidelines." *(FTSP II.D.3.0(b), page II-29, emphasis added.)*

> *"All development within the Specific Plan Area shall be required to be phased in a manner, which is consistent with the requirements of the Growth Management Plan (GMP) Element." (FTSP II.F.1.0(a), page II-43.)*

> *"For all development projects, a minimum of 50 percent of all shrubs to be planted should be native species." (FTSP IV.G.1.0(a), page IV-16.)*

Moreover, as will be shown below, the proposed development which the above spot amendment attempts to legitimize actually conflicts with and undermines the overarching goals and objectives for the Specific Plan area at the expense of the Specific Plan's integrity.

The proposed "wildcard" zoning also creates a class of unwarranted special privileges for this project's applicant, effectively denying other persons subject to the FTSP the equal protection of the law, in violation of the state and federal constitutions.
The proposed spot zoning amendment, therefore, is invalid on its face and thereby subject to nullification by the courts.

Rural Canyons 2 – Response

This comment does not raise a direct or indirect significant physical environmental issue or other issue pursuant to CEQA.

Rural Canyons 3 – Comment

3. *The proposed spot amendment of the FTSP is barred by the FTSP itself.*

The FTSP explicitly provides how the Specific Plan may be amended to allow for development, as is now being proposed, that deviates from the recorded tract map for the Saddleback Meadows site:

> *"If a development proposal on the aforementioned [Bridlewood, Lyon Ranch, Santiago Ranch, and Zadeh] sites deviates from these approvals and cannot be found to be in substantial compliance with these approvals, a Specific Plan Amendment shall be required for the individual site. Said Specific Plan Amendment* shall *1) determine an appropriate density cap for the property; 2) establish new Land Use District Regulations for the site; and 3) be consistent with all of the provisions of the Specific Plan, as amended." (FTSP III.C.10.0(d), page III-4.)*

> *"Any development proposal, which deviates from the approved Saddleback Meadows Planned Community zoning and Recorded Tract 10692 and which cannot be found in substantial compliance with these approvals shall require a Specific Plan Amendment which* shall: *1) determine an appropriate density cap for the property; 2) establish new development regulations for the Bridlewood Residential District; and 3) be consistent with all the provisions of the Specific Plan." (FTSP III.D.3.2.(b), page III-20, italics added.)*

The proposed spot amendment exempting Saddleback Meadows from all but the revised district regulations clearly conflicts with the above requirements of the FTSP, which unequivocally mandate that the amended zoning regulations for Saddleback Meadows must be consistent with all *of the provisions of the FTSP. Thus the proposed spot amendment is facially invalid, and, as will be shown below, the proposed area plan is in actual conflict with numerous of the FTSP's substantive requirements.*

Rural Canyons 3 – Response

This comment does not raise a direct or indirect significant physical environmental issue or other issue pursuant to CEQA.

Rural Canyons Conservation Fund 4 – Comment

4. *A site development or use permit is required prior to any grading.*

The proposed spot amendment explicitly allows issuance of a "preliminary grading permit" prior to approval of a site development or use permit. (Proposed Draft Ordinance, Exhibit 1, paragraph 3.4(d).) This flies directly in the face of the following general regulation of the FTSP:

> *"Grading: Grading shall be permitted within the Specific Plan Area only upon approval of a site development permit or use permit by the Planning Commission. No grading permits shall be issued without the approval of a precise plan of development, i.e., site development permit or use permit." (FTSP III.C.6.1, page III-2.)*

Rural Canyons 4 – Response

This comment does not raise a direct or indirect significant physical environmental issue or other issue pursuant to CEQA.

Rural Canyons Conservation Fund 5 – Comment

5. *Development depicted on the proposed area plan improperly conflicts with the FTSP.*

Since, as shown above, the proposed wildcard exemption from all of the FTSP's general substantive and procedural requirements is invalid, all of the FTSP's general provisions apply to this project. Unfortunately, the proposed development violates numerous of these provisions, including:

- *"Rural Character/Forest Buffer: To preserve the rural character of the area and provide a buffer between urban development and the Cleveland National Forest." (FTSP I.C.1.0(a)," Goals and Objectives," page I-5.)*

By any measure of the term, the proposed development, due to its extreme intensity and scale, is anything but "rural" in character. On the contrary, it is a conventional suburban housing tract, to be constructed after mass grading the site in the amount of 11.7 million cubic yards. At 5,000 square feet minimum, the lot sizes are far below the minimum ½ acre permitted in the adjacent FTSP areas, and the proposed average density of 1.35 dwelling units per acre vastly exceeds the prevailing minimum of 1 dwelling unit per 2 acres. The proposal includes manufactured slopes 120 feet high, contour elevation changes of 91 vertical feet, and retaining walls 40 feet high.

Characterizing such a proposal as "rural" can only be described as "Orwellian." The submitted area plan application does include a "Rural Character Statement." However, this document merely sets forth general platitudes and idealized sketches on the subject, not specific to the proposed project, and not demonstrating how the concepts would actually be implemented. In the context of this project, "rural" must in large measure be defined in terms of compliance *with the regulations and guidelines of the FTSP, which purport and serve to implement the general goal of* preserving *the area's rural character. Thus the subject proposal is rural to the extent of its compliance with the detailed requirements of the FTSP, and that compliance leaves much to be desired.*

- *"Except for those legal building sites existing at the time of Specific Plan adoption where compliance with this requirement would preclude development of a single residence on the existing building site, mapping shall identify a minimum corridor width (other than for the wildlife corridor parallel to Live Oak Canyon Road) at all locations of 400 feet measured perpendicular to the corridor's boundary." (FTSP II.C.2.2(c)(3), page II-11, underlining in original.)*

The proposal fails to delineate a 400-foot-wide wildlife corridor through the project. The corridor mentioned in the text of the area plan actually diminishes to under 200 feet wide where it passes between the main spine road on the south and St. Michael's Abbey on the north.

- *"Development shall maintain a 50-foot setback of all structures and barrier fencing from all corridors. Uses within the setback zone shall be limited to low-intensity, residential-related activities such as recreation and private open space." (FTSP II.C.2.4(a), page II-14.)*

The proposed wildlife corridor violates this setback requirement where it passes between the southern and northern clusters of housing units.

Please include this letter in the official record of proceedings for this project. Thank you for the opportunity to comment.

Rural Canyons 5 – Response

Please see Section 3.3.2 (Connor 3 - Response) of this Response to Comments document regarding the proposed project's consistency with the F/TSP.

3.3.8 Saddleback Canyons Conservancy
Gloria D. Sefton, June 10, 2002

Saddleback Canyons Conservancy 1 – Comment

The Saddleback Canyons Conservancy is dedicated to protecting and enhancing the environment and quality of life in the Foothill/Trabuco Canyon Specific Plan (FTSP) area and surrounding areas of Orange County. The following comments are provided in response to the DEIR.

NONCOMPLIANCE WITH THE FTSP

The proposed project lies within the FTSP area. The proponents of the project have proposed a zone change (ZC 98-3) that would be required to amend the FTSP for the project ("Bridlewood Residential District"). Such an amendment to the FTSP would exempt the project from all regulations and guidelines ion the FTSP other than those provided by Bridlewood Residential District.

Upholding the integrity of the FTSP is of utmost concern to the Saddleback Canyons Conservancy. The proposed project site serves as a transitional buffer between the suburban developments of Lake Forest and Mission Viejo to the rural canyons area. The project's proximity to the Cleveland National Forest (within 1 mile) speaks to the need to for compliance to – not exemption from – the development guidelines set forth in the FTSP.

The proposed development violates the spirit and letter of the FTSP. The primary goals of the FTSP are to "preserve the rural character of the area and provide a buffer between urban development and the Cleveland National Forest." The project in no way conforms to such a goal. Indeed, 299 tract homes on a mass-graded site is anything but "rural." It is time to stop suburban sprawl, say "no" to continued mass development, and "yes" to a preservation and conservation plan.

Saddleback Canyons Conservancy 1 – Response

Please see Section 3.3.2 (Connor 3 - Response) of this Response to Comments document regarding the proposed project's consistency with the F/TSP.

Saddleback Canyons Conservancy 2 – Comment

DESTRUCTION OF HABITAT AND INTERFERENCE WITH WILDLIFE CORRIDORS

The project site is within the Southern Orange County Natural Communities Conservation Plan (NCCP) and provides a critical wildlife connector between the Central and Southern NCCP subregions and the Cleveland National Forest. In addition, the site itself provides habitat for the federally endangered Riverside fairy shrimp, and the federally threatened coastal California gnatcatcher, among other special status species. In view of the fact that the County, the U.S. Fish and Wildlife Service, and the California Department of Fish and Game have initiated the Southern

Subregion NCCP process and that preliminary reserve designs are scheduled for completion in July 2002, a revised environmental document should be prepared to incorporate this critical information.

Saddleback Canyons Conservancy 2 – Response

Please see Section 3.3.2 (Connor 19 - Response) of this Response to Comments document regarding the NCCP. The Southern Subregion NCCP process was started several years ago, while a preliminary reserve design is protected for July 2002, it will be two or three years before the reserve design is adopted.

Saddleback Canyons Conservancy 3 – Comment

FAILURE TO ADEQUATELY ANALYZE CUMULATIVE IMPACTS

The list of "related" projects is limited to a small area near the project and excludes other major projects on the NCCP Southern Subregion. Among the major projects that must be included in a revised cumulative analysis include but are not limited to the massive Rancho Mission Viejo project (14,000 homes and 427 acres of "urban activity"). Additionally the DEIR fails to mention the Rancho Protrero Leadership Academy, which also lies within the FTSP area, for which the Board of Supervisors filed a Notice of Determination in December 2001. The cumulative analysis of land use and planning, geology and soils, hydrology and water quality, traffic and transportation, biological resources, public services and utilities, aesthetics and growth inducement must consider all foreseeable projects.

Saddleback Canyons Conservancy 3 – Response

It would be inappropriate to include the Rancho Mission Viejo project in the cumulative analysis as it is in the early planning stages and not within the project study area. Please see Section 2.0 of this Response to Comments document for a revised Table 3.1, which includes the Rancho Protero Leadership Academy. However, it should be noted that this additional information did not change the conclusions of the EIR.

Saddleback Canyons Conservancy 4 – Comment

NONCOMPLIANCE WITH NEW WATER QUALITY REGULATIONS

Aliso Creek, adjacent to the project site, is listed as a Category I Priority Impaired Water Body in the EPA's National Water Quality Report (2000). New water quality regulations have recently been ordered against the County of Orange by the Regional Water Quality Control Board. These stricter regulations supplant the 1994 NPDES permit referenced in the DEIR, and were enacted due, in part, to the extremely impaired water quality existing in Aliso Creek. The DEIR fails to explain how the project can comply with these new water quality regulations.

Saddleback Canyons Conservancy 4 – Response

Section 4.4.2 of the Draft Revised Subsequent EIR describes in detail potential impacts to water quality and Aliso Creek. Implementation of the Project Design Features and compliance with the Standard County Conditions, in addition to other applicable regulatory requirements, impacts to water quality would be less than significant. In addition, a mitigation measure was included to facilitate the implementation of alternate and/or supplemental regional water quality mitigation to ensure the proposed project is consistent with the requirements of the new storm water NPDES permit (see M 4-1 on page 4.4-17 through 4.4-18 of the Draft Revised Subsequent EIR).

Saddleback Canyons Conservancy 5 – Comment

LACK OF WATER TO SUPPORT THE DEVELOPMENT

The Orange County Register recently reported (May 18, 2002) that "drought conditions have dried up two wells that the Trabuco Canyon Water District relies on to supply Trabuco Canyon and Rancho Santa Margarita residents." The TCWD is seeking additional appropriative water rights from the State Water Resources Control Board. Yet, as reported in correspondence to me dated May 14, 2002 from the State Water Resources Control Board, further processing of the TCWD's request for additional water rights is being held in abeyance until several senior priority applications in the watershed are processed. This water shortage should be recognized as an impediment to the advancement of any new development in the area served by the TCWD.

Saddleback Canyons Conservancy 5 – Response

As stated in Section 4.16.2 of the Draft Revise Subsequent EIR, the Trabuco Canyon Water District (TCWD) indicates that it would be able to accommodate the required water supply demand for the proposed project. A letter received from TCWD on July 15, 2002 indicates that the district has sufficient capacity to serve the site.[1]

Saddleback Canyons Conservancy 6 – Comment

CONCLUSION

The project is out of compliance with the FTSP. The project is not rural. The project significantly and negatively impacts biological resources and wildlife corridors. The project site is adjacent to the impaired Aliso Creek. The water district has severe water shortage problems. An additional 299 homes adds to suburban sprawl and downstream negative environmental impacts. The project should not proceed. The site should be set aside as a preserved habitat/wildlife corridor, and protected as open space for generations to come.

[1] *Letter to Kris Weber, Hunsaker & Associates, dated July 15, 2002 from Brian Bertsch, Project Manager, Trabuco Canyon Water District*

Please incorporate this letter in to the official record of proceedings for this project.

Saddleback Canyons Conservancy 6 – Response

This comment is a summary of comments included above. No additional response is required.

3.3.9 Sierra Club

Gail Prothero, June 23, 2002

Sierra Club 1 – Comment

The Sierra Club appreciates the opportunity to comment upon the Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows – EIR 566 (DRSEIR). As strong supporters of protecting the ecological integrity and aesthetic value of the remaining open space in Orange County, our members are closely monitoring projects proposed for properties in the vicinity of the Cleveland National Forest. To facilitate this monitoring process, as well as to properly inform the general public and decision-makers, it is essential that all environmental assessment related to such projects be conducted in strict compliance with the provisions of CEQA and the CEQA Guidelines.

Unfortunately, as it is currently written, the DRSEIR does not adequately address significant issues related to the proposed Saddleback Meadows residential development and its effect on the local environment. These issues include those justifiably raised by a number of individuals in comments already provided to you; therefore, the Sierra Club wishes to incorporate into this letter, by reference, each of the following documents:

- *Comments by Terrell Watt, AICP, submitted in a letter dated June 7, 2002, on behalf of the National Audubon Society, Endangered Habitats League, and Rural Canyons Conservation Fund*
- *Comments by Edmond M. Connor, submitted in a letter dated June 9, 2002, in behalf of the Vedanta Society of Southern California*
- *Comments by Ray Chandos, submitted in a letter to Frank McGill dated May 28, 2002, in behalf of the Rural Canyons Conservation Fund*
- *Comments by Patricia Martz, PhD., submitted in a letter dated June 10, 2002*

Sierra Club 1 – Response

The Draft Revised Subsequent EIR was completed in compliance with the provisions of Public Resources Code, Division 13, Sections 21000 et seq. and the California Code of Regulations, Title 14, Division 6, Chapter 3, Sections 15000, et seq. The comment letters and responses listed above have been included in this Response to Comments document.

Sierra Club 2 – Comment

Although the Sierra Club believes that all of the issues discussed in the above documents warrant full consideration and thorough analysis in a revised DRSEIR, two are of overarching significance to our members and deserve particular emphasis.

Suburban Sprawl

The significant negative impacts of the proposed Saddleback Meadows development are all attributable to the fact that the project would further extend suburban-style development into the remaining wildlands of Eastern Orange County. Attendant to such sprawl are the inevitable habitat destruction and fragmentation; watershed and water quality degradation; increases in vehicle miles traveled, traffic congestion, and air pollution; and deterioration of viewsheds and noisesheds. An adequate DRSEIR must honestly identify the true nature of the proposed Saddleback Meadows development as suburban sprawl, analyze the cumulative impacts of allowing similar sprawl-type projects to encroach upon remaining wildlands, and propose alternative locations for providing similar amounts of housing within the existing footprint of urban/suburban Orange County.

Sierra Club 2 – Response

Impacts associated with implementation of the proposed project were discussed in Section 4.0 and various technical appendices of the Draft Revised Subsequent EIR. Cumulative impacts to biological resources were discussed in Section 4.8.3.

Alternative locations for development of the proposed project were discussed in Section 5.3 of the Draft Revised Subsequent EIR. This alternative was eliminated from further consideration due to the fact that the project applicant does not own or control any other project sites within the region and the fact that no other property within the vicinity of the project site exhibits similar existing project specific General Plan and Zoning designations that would accommodate the proposed project. Further, it is speculative and unlikely that the project applicant would assemble other contiguous properties within the area to accommodate the number and type of residences proposed. Moreover, if such properties were identified and acquired, the properties would likely have resources and environmental constraints similar to the project site. Development of the proposed project at an alternative location is unlikely to be economically viable and would be unlikely to reduce impacts in comparison to the proposed project.

Sierra Club 4 – Comment

Benefits of Preservation

Although serious and ongoing consideration has been given to acquiring the Saddleback Meadows site for preservation in its natural state, only passing attention is given to acquisition in the DRSEIR. An adequate DRSEIR would thoroughly analyze the environmental and economic benefits of acquisition, potential sources of funding and the relationship of acquisition to fulfilling the goals and objectives of all of the following: The Orange County General Plan, Foothill/Trabuco Specific Plan, Aliso Creek Corridor Specific Plan, and Central-Coastal Subregion National Community Conservation Planning/Habitat Conservation Plan.

Sierra Club 4 – Response

Section 5.0 of the Draft Revised Subsequent EIR included a discussion of various no development and/or conservation alternatives. The project applicant has engaged in numerous discussions regarding acquisition of the project site for open space and conservation purposes, with each discussion resulting in no action based upon a lack of appropriate acquisition funding.

Please see Section 3.3.2 (Connor 2 – Response) of this Response to Comments document for a discussion of the feasibility of property acquisition.

Sierra Club 5 – Comment

The Sierra Club recommends that the DRSEIR be revised to properly address all issues raised in this letter, both directly and by reference, and recirculated for public comment.

Sierra Club 5 – Response

Please refer to Section 3.3.9 (Sierra Club 1 – Response) of this Response to Comments document. No recirculation of the document is required.

3.3.10 Trails 4 All

Jim Meyer, June 4, 2002

Trails 4 All 1 – Comment

Recently the County's Regional Riding and Hiking Trails Advisory Committee (RRHTAC) that I serve on was given a presentation regarding the subject project. Staff noted that the project is already proposing a local trail (referred to in this letter as "Trail A") along the main entry road extending west to east through the project. To provide a loop route, the RRHTAC supported an additional local trail ("Trail B"), to begin at Trail A and go north around the east side of St. Michael's Abbey. Trail B would them connect with the proposed Love Oak Plaza project site and connect to the Live Oak Canyon Regional Trail.

Upon review, Trails4All would also like to offer our support for the additional local trails through the proposed Saddleback Meadows project, linking with Live Oak Plaza and the Saddle Creek projects. We appreciate your department's efforts to provide this trail, and we would like to be kept informed of its progress.

Trails 4 All 1 – Response

Please see Section 3.3.6 (RRTAC 1 – Response) of this Response to Comments document.

3.3.11 Terrell Watt, AICP

June 7, 2002

Watt 1 – Comment

This comment letter on the Draft Revised Subsequent Environmental Impact Report ("DRSEIR") for the proposed Saddleback Meadows development project ("project") is submitted on behalf of National Audubon Society, Endangered Habitats League and Rural Canyons Conservation Fund ("the commenting groups"). These comments provide a detailed and explicit outline of the problems and inadequacies presented by: (1) the project itself, including its geological impacts and impacts to the habitat of several endangered and sensitive species; (2) the DRSEIR, including fatal deficiencies under the California Environmental Quality Act ("CEQA") (Pub. Res. Code §§ 21000 et seq.) and the CEQA Guidelines (14 Cal. Code Regs. §§ 15000 et seq.); and (3) the project's inconsistency with the County General Plan.[1]

Watt 1 – Response

This comment presents an overview of the comments detailed below. Please see responses to detailed comments.

Watt 2 – Comment

A summary of the DRSEIR's major defects follows:

Inadequate Project Description: The DRSEIR's project description remains incomplete and, therefore, inadequate. Specifically, the project description lacks important details about the project that are critical to an adequate analysis of project-related and cumulative impacts. Such details include, but are not limited to: (1) fundamental engineering aspects of the project related to mass grading and the probable need for export of unsuitable cut and importation of suitable fill; (2) a detailed description and proposed uses of open space; (3) the complete Project Design Feature that includes the final drainage plan; (4) proposed home size and total development contemplated, including accessory structures and paving; (5) hazards and hazards-related project features, such as possible presence of on-site contamination; among other information about the project. Without this information, the evaluation of impacts cannot be complete.

Watt 2 – Response

As stated in Section 2.0 of the Draft Revised Subsequent EIR, the purpose of the Project Description is to describe the project in a way that will be meaningful to the public, reviewing agencies, and decision-makers. Section 15124 of the CEQA Guidelines requires that a complete Project Description contain the following information: (1) the location and boundaries of the proposed project; (2) a statement of project objectives; (3) a general description of the project's technical, economic, and environmental characteristics; and (4) a statement briefly describing the intended uses of the EIR, including a list of the agencies that are expected to use the EIR in their decision making, and a list of the approvals for which the EIR will be used. According to CEQA

(Section 15124) an adequate Project Description need not be exhaustive, but should supply the detail that is necessary for project evaluation.

The Project Description meets the requirements of CEQA and discusses grading, open space, drainage, land use and hazards. The details requested by the commenter (i.e., specific housing design, etc.) are not required.

Watt 3 – Comment

Inadequate Project Setting: The DRSEIR fails to describe key elements of the project setting adequately and completely. Such elements include, but are not limited to: (1) key general plan policies and regional policies relating to habitat planning, in particular the Southern Orange County Natural Communities Conservation Plan (NCCP); and (2) a list of cumulative projects, geographic study area for the cumulative analysis or plan based approach to cumulative impacts. This information is critical to the analysis of project-related and cumulative impacts.

Watt 3 – Response

The existing general plan designation and zoning are discussed in Section 2.1.2 and general plan policies and regional policies are discussed in Section 4.1.1 of the Draft Revised Subsequent EIR. Applicable plans and policies related to biological issues are discussed in Section 4.8 and Appendix I of the Draft Revised Subsequent EIR. Cumulative projects were summarized in Table 3.1 of the Draft Revised Subsequent EIR, please see Section 2.0 of this Response to Comments document for an updated table.

Watt 4 – Comment

Failure to Identify or Analyze the Full Extent of Significant Environmental Impacts: The DRSEIR is riddled with conclusions unsupported by facts and analysis on the significance of environmental impacts. Specifically the DRSEIR concludes, based on improperly deferred mitigation measures and mitigation measures of unproven efficacy, that all potentially significant impacts except cumulative air quality will be reduced to less than significant with mitigation. Insufficient evidence is provided to support the conclusion that all but one impact will be less than significant after mitigation.

Watt 4– Response

The Draft Revised Subsequent EIR was prepared according to the requirements of CEQA. The commenter offers no specific areas where the EIR is deficient. No further response is required.

Watt 5 – Comment

Inadequate Cumulative Impacts Analyses: The DRSEIR's cumulative impacts section is non-existent. The DRSEIR fails to provide a complete list of cumulative projects or to outline a plan based approach to the cumulative

analysis. The list of "related" projects is limited to a small area near the project and excludes other major projects in the NCCP Southern Subregion. Brief, conclusory statements are made concerning cumulative impacts throughout the DRSEIR. Moreover, the DRSEIR fails to consider feasible mitigation for the project's incremental contribution to cumulative impacts. Notwithstanding this complete lack of analysis, the DRSEIR concludes that all cumulative impacts will be less than significant with the exception of cumulative air quality.

Watt 5 – Response

Cumulative impacts were discussed under each environmental issue area within Section 4.0 of the Draft Revised Subsequent EIR. As stated in Section 3.7 of the Draft Revised Subsequent EIR, the cumulative analysis for each respective environmental subsection was described based on the related projects, as appropriate. The Natural Community Conservation Planning Program (NCCP) is discussed in Section 4.8 and Appendix I. Additionally, the NCCP represents 64,100 acres as compared to the proposed project's 222 acres.

Watt 6 – Comment

Inadequate Growth-Inducing Impacts Analysis: The DRSEIR's growth-inducing impacts section is likewise inadequate. For example, the DRSEIR fails to analyze the potentially significant growth-inducing impacts associated with the extension of utilities and roads, and the placement of a water tank and access road beyond the project site. The DRSEIR offers no analysis or even recognition of the precedent-setting effect the proposed project would have on development in the area, and development on sites where the topography and presence of biological habitat and wildlife corridors should limit such projects.

Watt 6 – Response

The F/TSP and Tract Map 10692 allow for a 705-unit manufactured housing development within the boundary of the project site. As stated in Section 2.3.4 of the Draft Revised Subsequent EIR, the water tank site was previously dedicated to the Trabuco Canyon Water District when the existing Final Tract Map 10692 was recorded, to be used for development of the water distribution facility for the proposed project site. The proposed on-site roadways and utility systems would serve only the proposed project and would not accommodate any additional development. No off-tract infrastructure improvements are proposed.

Watt 7 – Comment

Inappropriate Deferral of Feasible Mitigation Measures: The DRSEIR improperly defers mitigation measures. Many of the deferred mitigation measures, including measures related to drainage and hazards mitigation, are relied upon to reduce significant impacts without any supporting facts or analysis.

Watt 7 – Response

The mitigation measures included in the Draft Revised Subsequent EIR are based on current regulations and do not defer mitigation requirements. It is unclear as to what specific mitigation measures the commenter is regarding drainage. Upon implementation of the identified Project Design Features and Standard County Conditions, no mitigation measures would be required (see Section 4.3.6 of the Draft Revised Subsequent EIR).

Watt 8 – Comment

Failure to Analyze a Reasonable Range of Alternatives: The DRSEIR includes numerous alternatives, but fails to analyze an alternative that fully mitigates for on- and off-site impacts. Moreover, the DRSEIR fails to properly identify the environmentally superior alternative, after the no-project alternatives, as Alternative 4.

These and other major defects in the DRSEIR described below render the document inadequate as a basis for informed decision-making and legally deficient under CEQA and the planning and zoning law. The County should give no further consideration to the project until an EIR is prepared and circulated that fully complies with CEQA and the CEQA Guidelines.

Watt 8 – Response

Please see Section 3.3.2 (Connor 2 – Response and Connor 30 – Response) of this Response to Comments document.

Watt 9 – Comment

CONSIDERATION OF THE PROJECT IS PREMATURE

The County, the U.S. Fish and Wildlife Service and the Department of Fish and Game have initiated the Southern Subregion NCCP process. Preliminary reserve designs are scheduled for completion in July 2002. The project site is within the Southern Subregion and provides a critical wildlife connector between the Central and Southern NCCP subregions and the Cleveland National Forest. In addition, the site itself provides habitat for a number of special status species.

The NCCP reserve design(s) will suggest where development should and should not occur based on biological resources. This new information is fundamental to a determination of whether all or a portion of the project site should be included in a "reserve," or alternatively in a development area. A revised environmental document must include this information.

Watt 9 – Response

Please see Section 3.2.1 (USFWS/CDFG 4 – Response) and Section 3.3.2 (Connor 19 – Response) of this Response to Comments document. The NCCP process was initiated in 1993 and is only now proposing alternative palns for consideration by the public and decision makers. Final approval of the NCCP is not expected for another year or two. CEQA has no requirement that a project be evaluated against a planning or regulatory document that has not been adopted/approved. The project applicant has been in communication with U.S. Army Corps of Engineers (USACE), California Department of Fish and Game (CDFG), and U.S. Fish and Wildlife Service (USFWS) regarding NCCP related issues and has included a detailed Biological Resources Mitigation Plan (including a wildlife movement corridor) as a Project Design Feature (see Section 4.8 of the Draft Revised Subsequent EIR). Additionally, the proposed project seeks to replace the existing 705 residential lot subdivision with a new development plan that provides a wildlife corridor.

Watt 10 – Comment

BACKGROUND AND PROJECT CONTEXT

The property is located in the lower, southeastern foothills of the Santa Ana Mountains and is currently used for horse and cattle grazing. The site's topography is hilly with several steep slopes and ravines. Soils on site are highly erodable. Aliso Creek is located nears the western site boundary and generally follows El Toro Road. Drainage from the site flows to the west into Aliso Creek, which drains into the Pacific Ocean at Aliso Beach, and Oso Creek, a tributary of Trabuco and San Juan Creeks, and south to O'Neill Regional Park. DRSEIR at page 4.2-2. The site provides an essential low elevation wildlife corridor between the Central and Southern NCCP areas and the Cleveland National Forest. Such a low elevation corridor is needed for gnatcatchers and other species. The site also supports important wetlands that provide habitat for Riverside fairy shrimp and western spade foot toad.

Watt 10 – Response

This comment restates the existing setting of the proposed project. No response is required.

Watt 11 – Comment

Under the proposed project, a gated community of 299 single-family residential lots would be built on approximately 222 acres. The total developed area would be approximately 66.9 acres and the total open space would be on approximately 155.1 acres. Only a portion of the area, approximately 83.25 acres would be in "natural resource preservation area." However, this area is subject to remedial grading and biological enhancement activities, thereby potentially degrading the resources even within this "natural resource preservation area." DRSEIR at page 2-16. Massive grading is needed to accommodate the project on this site. Grading would involve 70%+ of the site. It is still unclear to what extent remedial grading will extend beyond the area illustrated in the preliminary grading plan.

Watt 11 – Response

Project Design Features (PDF 8-1) and Standard County Conditions (SC 2-3) have been included to protect the natural resource preservation area (see Sections 4.8.4 and 4.2.4 of the Draft Revised Subsequent EIR). The biological impact analysis considered areas that would be impacted by both conventional and remedial grading. No grading would occur outside the project site boundary.

The final Grading Plan will be reviewed and approved by the Manager, PDS/Subdivision and Grading Services Division prior to issuance of a grading permit (Standard County Condition SC 2-2). The level of detail included in Section 4.2 and Appendix C of the Draft Revised Subsequent EIR is appropriate.

Watt 12 – Comment

In summary, the site plan can best be characterized as "suburban sprawl," with roads and units extending across the entire site, thereby fragmenting the open space areas and extending into wildlands and interfering with wildlife corridors. This pattern of development would severely impact biological resource values on- and off-site and impede wildlife migration.

Watt 12 – Response

A Final Subdivision Map (Final Map 10692) for 705 manufactured housing/mobile home units was recorded for the property in 1988. Furthermore, the property is surrounded by existing development or approved projects on nearly 50 percent of its perimeter. A Biological Resource Mitigation Plan has been incorporated into the proposed project to mitigate impacts to biological resources and enhance currently degraded habitat. In addition, the proposed project leaves a substantial amount of the site (approximately 70 percent) as open space and/or biological reserve.

Watt 13 – Comment

ANALYSIS

I. THE DRSEIR IS INADEQUATE UNDER CEQA.

The DRSEIR is deeply flawed under CEQA. An EIR must provide enough analysis and detail about environmental impacts to enable decision-makers to make intelligent judgments in light of the environmental consequences of their decisions. See CEQA Guidelines § 15151; Kings County Farm Bureau v. City of Hanford, 221 Cal.App.3d 692 (1990). Under the law, the lead agency must make a good faith effort to fully disclose the environmental impacts of the project. This requirement cannot be met unless the project is adequately described and existing setting information is complete. See County of Inyo v. City of Los Angeles, 71 Cal.App.3d 185, 199(1977). Both the public and decision-makers need to fully understand the implications of the choices presented by

the project, mitigation measures, and alternatives. See Laurel Heights Improvement Ass'n v Regents of University of California (Laurel Heights I), 6 Cal.4th 1112,1123 (1988). The DRSEIR fails to provide sufficient information to enable informed decision-making by the County, the public, and the permitting agencies. Much important information remains improperly omitted or deferred until a later date in violation of CEQA; what information is provided remains vague and flawed.

The DRSEIR is a construction level EIR and therefore would allow for the issuance of a rough grading permit. Many of the most significant impacts are irreversible after rough grading has occurred. Thus, detailed information concerning project level impacts must be provided at this stage of project consideration so that the public, agencies and County decision-makers can fully understand the impacts of the proposed project and alternatives. Deferral of information concerning project-related and cumulative impacts, mitigation measures and alternatives is improper and unacceptable given the types of activities that will result from the approval of the project at this stage.

Watt 13 – Response

The commenter is correct in citing Section 15151 of the *CEQA Guidelines*, which states "An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. However, this section goes on to state, "An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible." The Draft Revised Subsequent EIR includes a detailed analysis of environmental factors based on a publicly circulated Initial Study and technical appendices for the following: geology, hydrology, water quality, traffic, air quality, noise, biology, and archaeology.

Please see Section 3.3.12 (Watt 11 – Response) of this Response to Comments document regarding grading.

Watt 14– Comment

- *The DRSEIR Fails to Describe the Project Adequately.*

The DRSEIR fails to describe the project and its setting accurately and completely. It omits key project features that have the potential to result in significant impacts.

The CEQA Guidelines define "project" as "the whole of an action, which has a potential for resulting in a physical change in the environment, directly or ultimately . . .." CEQA Guidelines § 15378. Among other components, an EIR's project description must contain a "general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals if any and supporting public service facilities." CEQA Guidelines § 15124(c). As the Court of Appeal has noted, "The defined project and not some other project must be the EIR's bona fide subject." County of Inyo, 71 Cal.App.3d at 185. An accurate and complete project description

is indispensable because, "[a] curtailed or distorted project description may stultify the objectives of the reporting process. Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal . . . and weigh other alternatives in the balance. An accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR" id. at 192.

The DRSEIR also fails to provide an adequate description of the setting for the project. Such a failure is fatal under CEQA. CEQA and the CEQA Guidelines mandate that an EIR include a description of "the physical environmental conditions in the vicinity of the project... from both a local and a regional perspective . . . Knowledge of the regional setting is critical to the assessment of environmental impacts." CEQA Guidelines §§ 15125(a) and (c). This requirement derives from the principle that without an adequate description of the project's local and regional context, the EIR, and thus the decision-makers and the public who rely on the EIR, cannot accurately assess the potentially significant impacts of the proposed project.

The DRSEIR for the project is inadequate. It fails to describe key aspects of the proposed project with the potential to result in significant environmental impacts. Additionally, it fails to describe accurately and completely the environmental setting impacted by the project. Accordingly, potentially significant environmental impacts cannot be adequately analyzed or addressed by the DRSEIR and, for this reason, the DRSEIR is fatally deficient under CEQA.

Watt 14 – Response

Please see Section 3.3.12 (Watt 2 – Response) of this Response to Comments document. In addition, the environmental setting for the proposed project is described in Sections 2.1, 3.0 and throughout 4.0 of the Draft Revised Subsequent EIR for each environmental issue area. The environmental setting is adequately described under the requirements of CEQA.

Watt 15 – Comment

1. *The DRSEIR Fails to Describe Adequately the Source and Placement of Cut and Fill Material and the Extent of Grading Required to Accommodate Roads and Dwelling Units.*

Massive earthwork will be required to prepare the site for access roads and houses. More than ½ of the site (126 acres) has slopes in excess of 26% with about 32 acres with slopes exceeding 50%. Preliminary estimates in the DRSEIR are that about 2.45 million cubic yards of conventional excavation (cut) and an equal amount of fill will be required. In addition, about 6.8 million cubic yards of remedial grading are required. The DRSEIR states that cut and fill (including several areas exceeding 50 feet in depth) will be balanced on site. However, the DRSEIR and geotechnical report present information that indicates on-site materials may not be suitable to support the project without imported materials. See DRSEIR at page 4.2-11. Moreover, mitigation measures M 2-14 and M 2-15 suggests that off-site borrow materials will be needed and on-site material removed:

M 2-14 Any objectionable material, as determined by the Soil Engineer, shall be subject to relocation in deeper fill areas or removal off-site. DRSEIR at page 4.2-l 8

M 2-15 All borrow sites shall be approved by the Soil Engineer/Geologist prior to on-site delivery. This will permit the timely allocation of such available materials for use on the project site.

To the extent that exportation of cut and importation of fill will be required to implement the project, this information must be provided. Related impacts to air quality, off-site grading and stockpiling and traffic, among other issues must be disclosed and analyzed in a revised environmental document.

Watt 15 – Response

The mitigation measures referenced above are standard with regard to material selection and have been included in case small amounts of on-site material would not be acceptable. It is not meant to indicate that large quantities of material will have to exported or imported. As indicated in the Draft Revised Subsequent EIR, all grading operations would be balanced on-site and import/export of cut/fill material is not proposed. However, the commenter is correct in noting that mitigation measures M 2-14 and M 2-15 could be misleading or misinterpreted. Please see Section 2.0 of this Response to Comments document for a clarification of M 2-14. M 2-15 has been deleted.

Watt 16 – Comment

Although the DRSEIR fails to provide adequate information concerning proposed cuts and fills in terms of their location and extent, the document does refer to fills in excess of 50 feet in height. The DRSEIR provides virtually no information regarding the source and placement of cut and fill material, the full extent of grading required to accommodate roads and dwelling units, and the phasing of the cut and fill operation. Without this information, the DRSEIR environmental impacts analysis does not and cannot analyze the impacts of transporting such a significant amount of fill to the project site in terms of increased traffic and air pollutants, or the impacts of the cutting and filling itself including impacts to air quality, open space, habitat, and special status species. Without an accurate and complete description of the proposed site grading and fill, the DRSEIR cannot adequately analyze environmental impacts or comment on the proposed project's consistency with the County's General Plan and grading ordinance.

A revised environmental document should include clear graphics that show cross sections where cuts and fills will exceed 50 feet. In addition, a revised environmental document must identity the sources of fill that are suitable to support the proposed development. Additional information must be provided concerning the suitability of on-site material for fill if the DRSEIR continues to assume that cut and fill will balance on-site.

Watt 16 – Response

Please see Section 3.2.12 (City of RSM 2 – Response) and Section 3.3.12 (Watt 15 – Response) of this Response to Comments document. As stated in Section 2.4 of the Draft Revised Subsequent

EIR, the proposed project includes the approval of Vesting Tentative Tract Map 15230, which provides a greater level of detail. The tentative map is on file with the County of Orange and is incorporated by reference.

Watt 17 -- Comment

2. *The DRSEIR Fails to Describe Adequately the "Open Space" Areas.*

The DRSEIR fails to provide a complete description of the "open space" areas of the proposed project. Little or no information is provided regarding, among other aspects: the extent of grading to the open space; to what degree the open space will be altered from its present natural condition; the uses to which the open space will be put and the extent of those uses, including trails and recreation; and, the presence and location in the open space of utility lines, access roads and other services.

The lack of a complete description in the DRSEIR of alteration to, and ultimate uses of the open space areas renders any analysis of either project-related or cumulative impacts thoroughly inadequate. A revised description of any alteration to the open space and the uses proposed for the open space land, including the proposed water reservoir, must be completed. Once a complete description has been obtained, the DRSEIR's analysis of the environmental impacts to biological resources, geology, and air quality, among others, must be revised.

Watt 17 – Response

The Draft Revised Subsequent EIR includes descriptions of open space areas in Sections 2.1; 4.1.2; 4.8.4 and 4.8.6; 4.9.4; and 4.11.2, 4.11.4 and 4.11.6. Open space is also discussed in Table 2.1 and shown on Figures 2.8; 2.10; 2.11; 4.8.7; 4.9.10 and 4.11.2.

Watt 18 – Comment

3. *The DRSEIR Fails to Describe Adequately the Project's Master Drainage Concept and Project Features Directed as Maintaining Water Quality.*

The DRSEIR fails to adequately describe the project's drainage concept and project features purportedly directed at maintaining water quality. Specifically, the DRSEIR's environmental impacts analysis concerning hydrology states that the "Project Design Feature" to mitigate drainage impacts is "being prepared in consultation with USACE." DRSEIR at page 4.3-7. Thus, the complete master drainage concept is not included in the DRSEIR for public, decision-maker and agency review. Although a final description of the master drainage concept is still being developed, the DRSEIR nonetheless concludes that no significant impacts associated with drainage will occur. In part, this is correct: no significant impacts can be identified based on such an inadequate project description. Without a complete description of the necessary drainage facilities, the DRSEIR fails under CEQA because impacts to water quality, biological resources, habitat, special status species, and human safety cannot be assessed. Once a complete description has been obtained, a revised impacts analysis must be completed.

The DRSEIR continues to describe other aspects of the project intended to mitigate water quality impacts:

"The remainder of the project site (the northerly development area) does not have sufficient room to accommodate the land-intensive requirements of the riverine system Therefore, runoff from the balance of the developed portion of the project site would be primarily cleansed through stormceptors prior to discharge into natural drainage courses. Stormceptors trap trash, sediment, and oils. They would also trap phosphorus that is attached to the sediment. However, they have no known effect on bacterial indicators or toxic constituents, both of which are constituents of concern for Aliso Creek. Removal of bacterial indicators would occur as the runoff continues through 3,300 linear feet of natural [sic] *before reaching Aliso Creek. As part of the final design ponds and swales would be incorporated to the maximum extent feasible in the development area within many small-scale features, such as, medians, parkways, and other developed open space in order to maximize the opportunity for removal of bacterial indicators and toxic constituents prior to outletting in the natural drainages." DRSEIR at page 4.4-12.*

This paragraph suggests that:

> *Key elements of the project that are critical to reducing significant impacts to drainage and water quality have not been designed. Therefore, the project description lacks key information to support both an adequate analysis of impacts and to support a conclusion that project impacts will be less than significant.*
>
> *Mitigation may not be sufficient to address impacts associated with bacterial indicators or toxic constituents.*

A revised environmental document, based on a complete description of drainage and water quality features and feasible mitigation measures must be completed.

Watt 18 – Response

Tentative map level hydrology and water quality analysis is included in Sections 4.3 (Hydrology) and 4.4 (Water Quality) of the Draft Revised Subsequent EIR, which is consistent with the manner in which development projects are processed. Additional technical information was also included in Appendix D and Appendix E of the Draft Revised Subsequent EIR.

Watt 19 – Comment

4. *The DRSEIR Fails to Describe Adequately the Characteristics of Residential Uses*

The DRSEIR lacks a complete description of proposed uses at the project site. Specifically, the DRSEIR fails to describe key aspects of the proposed residential project including, but not limited to: the size of the houses; their lot coverage; paving for roads driveways and parking lots; and accessory uses, such as swimming pools and storage. Without an adequate description of home size, lot coverage, and accessory uses, significant environmental impacts to aesthetics and water quality, among other impacts, cannot be identified or assessed and suitable mitigation measures

cannot be proposed. To the extent this information is not available, a worst-case estimate of total site soft and hard cover must be developed and used to determine the extent of environmental impacts associated with site coverage. Without a clear understanding of how much land is to be covered by development, potentially significant environmental impacts to drainage, water quality, habitat, and special status species, among others, and the creation of geologic and flooding hazards cannot be identified, let alone assessed.

Watt 19 – Response

[County to provide further edits]

The level of detail requested in this comment such as a description of swimming pools and accessory uses is not required for an EIR. Residences will be developed in accordance with County zoning standards for the lot sizes shown on the Vesting Tentative Tract Map. Paving for roads and driveways have been incorporated into analyses regarding geologic and flood hazards.

Watt 20 – Comment

5. *The DRSEIR Fails to Describe Adequately the Proposed Project's Construction Activities and Phasing.*

The project description provides a cursory description of construction phasing and activities. Among the information that is not sufficient is information about the extent and duration of grading activities. Without a description of these activities and phasing and the assumptions underlying the air quality estimates, the DRSEIR cannot adequately identify and analyze environmental impacts to air and water quality, among others, due to truck traffic and emissions, construction noise and dust. An EIR for a project such as this must include a description of the construction period activities, including, but not limited to: phasing; types of equipment; construction employment; staging areas, borrow sites and spoils disposal sites, among other details of the construction that could result in impacts. A revised environmental document must be prepared that includes this information and revised impact analyses as warranted based on the information.

Watt 20 – Response

Please see Section 3.3.2 (Connor 10 – Response) of this Response to Comments document.

Watt 21 – Comment

6. *The DRSEIR Fails to Describe the Project Site's Biological Resources and Habitats Adequately.*

The DRSEIR fails to adequately describe biological resources on- and off-site. The document contains inadequate information concerning on-site biological resources, including oak woodlands, aquatic resources, raptor nesting locations and wildlife corridors, and fails to provide any description of biological resources within an adequate cumulative study area, which at a minimum should include the entire Southern Subregion and Central NCCP areas.

Finally, the relationship of the project site to the Southern Orange County NCCP is not described or analyzed. There is a Figure in the DRSEIR, which illustrates a proposed Southern reserve, but the DRSEIR fails to state how this related to the proposed project. See Figure 4.8-2. Clarification is needed concerning the Southern NCCP process and its implications for this project. Without the inclusion of these, and other, key details of the on- and off-site biological regime, the DRSEIR cannot adequately analyze project-related and cumulative impacts.

Watt 21 – Response

Biological resources are described in Section 4.8 and in detail in Appendix I of the Draft Revised Subsequent EIR. Please also see Section 3.3.2 (Connor 19 – Response) of this Response to Comments document.

The commenter's request for inclusion of the entire Central and Southern Sub regions of the NCCP is not appropriate. These tow sub regions represent over 87,300 acres, as compared to the project's 222 acres.

Watt 22 – Comment

7. *The DRSEIR Fails to Describe Project Inconsistencies with Applicable Plans.*

A number of plans are applicable to the project site including, but not limited to:

The Orange County General Plan
The Foothill/Trabuco Specific Plan
Aliso Creek Corridor Specific Plan
The Central-Coastal Subregion Natural Community Conservation Planning/Habitat Conservation Plan (NCCP/HCP)

The DRSEIR provides a very cursory policy consistency review in the Land Use section and the biological resources sections. The consistency review does not include a table of key policies and "findings" as to project consistency with these policies. It appears that the section omits several key policy inconsistencies, including the following:

Orange County General Plan

The Orange County General Plan Resources Element includes several policies concerning protection of natural resources as follows:

Goal 1: Protect wildlife and vegetation resources and promote development that preserves these resources.

Goal 3: Manage and utilize wisely the County's landform resources.

Objective 3.1: To minimize to the extent feasible the disruption of significant natural landforms in Orange County.

Policy 1. To identify and preserve the significant wildlife and vegetation habitats of the County.

Policy 5. To protect the unique variety of significant landforms in Orange County through environmental review procedures and community and corridor planning activities.

The project as proposed appears to conflict with these overarching goals, objectives and policies of the Orange County General Plan. A revised analysis of project consistency with applicable General Plan policies must be included in a revised and recirculated environmental document.

Watt 22 – Response

Section 4.1 of the Draft Revised Subsequent EIR includes a discussion of the proposed project's consistency with applicable plans. Further, the proposed project would not conflict with the goals objective or policies of the plans identified by the commenter. As discussed in Section 2.0 of the Draft Revised Subsequent EIR, approximately 70 percent of the site would remain as open space and detailed mitigation has been developed to protect and enhance the biological resources on-site (Goal 1 and Policy 1), and contour grading would provide for edge treatments responsive to the natural terrain (Goal 3, Objective 3.1, and Policy 5).

Watt 23 – Comment

The Foothill Trabuco Specific Plan

The Foothill Trabuco Specific Plan calls for preservation of significant landform, biological, cultural and scenic resources on-site. According to the DRSEIR's alternatives analysis, only Alternative 4 is consistent with the Specific Plan requirements. Also according to the DRSEIR, "[t]he proposed project would be in substantial compliance with or consistent with the previously approved and Recorded Map 10692 with respect to proposed residential gross density and providing for the provision of a substantial increase in open space and the presence of a wildlife corridor as outlined in the F/TSP." DRSEIR at page 4.1-12. However, the proposed project would amend the F/TSP. DRSEIR at page 4.1-12. Nowhere in the DRSEIR are the proposed amendments to the F/TSP outlined.

The proposed project is inconsistent with the F/TSP in other major respects, including, but not limited to its failure to provide information required by the F/TSP (see Letter submitted by Rural Canyons Conservation Fund, dated May 28,2002, hereby incorporated by reference).

Watt 23 – Response

Please see Section 3.3.2 (Connor 3 – Response and Connor 4 – Response) of this Response to Comments document.

As stated in Section 2.4 of the Draft Revised Subsequent EIR, the project requires approval of the following discretionary approvals: Area Plan 98-2, Zone Change 98-3, Tentative Tract Map 15784 and Vesting Tentative Tract Map 15230, all of which are incorporated by reference. These documents provide the level of information required by the F/TSP.

Watt 24 – Comment

The Central-Coastal Subregion Natural Community Conservation Planning/Habitat Conservation Plan (NCCPHCP)

Figure 4.8.2 indicates that the entire project site is located within an NCCP "reserve area." The DRSEIR fails to point this out or to analyze the implications of this for the project. A significant theme of all of these plans is the protection of key wildlife corridors in the area. It is clear from the project site plan that minimal provisions will be made for continued wildlife movement and those species that attempt to traverse the on-site corridor will be subject to significant additional constraints including: modified topography, new road corridors, presence of new residents in the area, increased noise and lighting as well as residential units in the path of the Northern Corridor. See Figure 4.8.4. The project will have significant impacts on wildlife migration that must be identified in the environmental document and called out as inconsistencies with applicable policies in the above-listed Plans. To the extent that wildlife corridors are assumed on adjacent privately owned properties, the revised environmental document should explain how these corridors would be maintained and not destroyed by cumulative development projects.

Watt 24 – Response

Please see Section 3.2.1 (USFWS/CDFG 4 - Response) of this Response to Comments document.

Watt 25 – Comment

B. The DRSEIR's Analysis of Environmental Impacts Is Inadequate.

The DRSEIR's analysis of environmental impacts fails to provide the necessary facts and analysis to allow the County and the public to make an informed decision. Without such detail, the DRSEIR is deficient under CEQA. The role of the EIR is to make manifest a fundamental goal of CEQA: to "inform the public and responsible officials of the environmental consequences of their decisions before they are made." Laurel Heights I, 6 Cal.4th at 1123. To do this, an EIR must contain facts and analysis, not merely bare conclusions. See Citizens of Goleta Valley v. Board of Supervisors, 52 Cal.3d 553,568 (1990). Any conclusion regarding the significance of an environmental impact not based on analysis of the relevant facts fails to achieve CEQA's informational goal.

As set forth below, the DRSEIR is riddled with conclusory statements regarding environmental impacts, unsupported by facts and necessary analysis. Furthermore, the DRSEIR attempts to defer analysis of environmental impacts to a later date. As discussed below, such deferral is not an option. CEQA mandates that environmental impacts be

identified and analyzed in the EIR, not at a later date. See Sundstom v County of Mendocino, 202 Cal.App.3d 296 (1988) (holding that a negative declaration was invalid when county approved a project while postponing the resolution of uncertainties regarding environmental impacts to a later date).

Watt 25 – Response

Please see Section 3.3.12 (Watt 4 – Response) of this Response to Comments document. It is unclear as to what the commenter is referring to regarding "... defer analysis..." The Draft Revised Subsequent EIR fully analyzed impacts to each environmental resource area, please see Section 4.0.

Watt 26 – Comment

1. *The DRSEIR Fails to Analyze Impacts to Biological Resources Adequately.*

The DRSEIR's biological impacts analysis is inadequate in numerous respects, including, but not limited to:

Underestimation of project-related impacts to biological resources: The DRSEIR fails to adequately characterize the extent of project-related impacts to biological resources: First, the uses and management of the open spaces on the project-site are not sufficiently defined and "locked-in" to ensure that biological resources located in these areas will not be impacted. For example, if there are recreational uses in the open space areas, wildlife may not use these migration corridors. In addition, impacts could be associated with the public and private landscaping plans, which are not required to be prepared until after project approval and EIR certification. See SC 8-7 and SC 8-8. No criteria are specified in the DRSEIR for these plans. Moreover, because the full extent of grading and importation of fill/exportation of cut is not disclosed, there are likely to be additional impacts to biological resources on- and off-site that are not described in the DRSEIR. If recreation and other uses are to be prohibited in the open space areas, a revised DRSEIR must state how these restrictions will be enforced and cite examples where similar restrictions have been effective (e.g. more effective than "fencing," which is a proposed mitigation measure).

Watt 26 – Response

The proposed project's potential impacts to biological resources have been thoroughly analyzed and detailed mitigation has been developed. The project was re-designed at the request of the U.S. Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG) to provide an east/west wildlife corridor to connect the project area to the Cleveland National Forest. Please see Section 4.8 and Appendix I of the Draft Revised Subsequent EIR and Appendix B of this Final Revised Subsequent EIR.

SC 8-7 and SC 8-7 both include detailed criteria regarding the preparation of public and private area landscape plans (please see page 4.8-30 of the Draft Revised Subsequent EIR). These Standard County Conditions require review and approval of all landscape plans by the County. Said plans must take into account the County standard plans for landscaped areas, adopted plant palette guides,

applicable scenic requirements, and water conservation measures. The level of detail required regarding landscape plans for the proposed project is consistent with the standard manner in which development projects are processed.

Please see Section 3.3.11 (Watt 16 – Response) of this Response to Comments document regarding grading.

Watt 27 – Comment

Deferral of analysis and mitigation: The DRSEIR improperly defers surveys for trees that host nesting raptors. Trees on the project site that provide nesting should be identified prior to certification of the EIR and protection provided as required under the federal MTBA. DRSEIR at page 4.8-22.

Watt 27 – Response

PDF 8-1 included in Section 4.8.4 of the Draft Revised Subsequent EIR does not defer surveys for trees that host raptors but instead requires an *additional* survey prior to the start of construction. Please see Section 4.8.1 and Appendix I of the Draft Revised Subsequent EIR for details of all of the biological surveys, including raptor surveys, completed for the proposed project.

Watt 28 – Comment

Insufficient evidence to support a conclusion that indirect effects would be insignificant. The DRSEIR's conclusion that indirect effects are insignificant is not supported by evidence. The proposed site plan results in a pattern of development (roads and houses) that fragments the property, extends to adjacent undeveloped lands and has an extensive edge. Moreover, the project would introduce lighting, noise and residents in a wildlife area - the effects of which are not adequately disclosed or analyzed in the DRSEIR. Mitigation measures recommend "fencing" adjacent to undisturbed areas of open space. DRSEIR at page 4.8-32. Not only could such fencing result in additional impacts (e.g. impeding wildlife migration), but there is no evidence such fencing will effectively protect open space areas from trespass by children, pets and the like. Additional evidence must be provided in a revised environmental document to support the conclusion that these indirect effects are not significant, particularly where there are a number of alternative projects that would significant [sic] avoid these impacts (e.g. Alternatives 4 and 7).

Watt 28 – Response

The project site is currently being used for horse and cattle grazing. Portions of the site have been previously grazed, cleared or disturbed. As stated in Section 4.8.2 of the Draft Revised Subsequent EIR, indirect impacts would not be significant due to the inclusion of a primary wildlife corridor and the proposed open space. This would minimize indirect impacts such as fragmentation, edge effects, lighting and noise.

Fencing described in M 8-2 of the Draft Revised Subsequent EIR was included at the request of USFWS. Please see Section 3.2.1 (USFWS/CDFG 2 – Response) of this Response to Comments document regarding wildlife corridors.

Watt 29 – Comment

Insufficient evidence is provided that mitigation measures will be effective. The DRSEIR does not provide sufficient evidence that proposed mitigation measures will actually mitigate impacts to less than significant levels. First, the DRSEIR implies that the biological resource mitigation plan has the blessing of the resource agencies:

"The biological resource mitigation plan has been reviewed by the effectual regulatory agencies and a biological opinion has been issued by USFWS. The biological resource mitigation plan mitigates project related impacts to wetland/riparian habitats, sensitive upland habitats and wildlife movement..." DRSEIR at page 4.8-23

Yet, there are no letters in the DRSEIR which document that these agencies have agreed that the biological resource mitigation plan will adequately mitigate project related impacts to biological resources. Furthermore, the referenced biological opinion purports only to "transmit our biological opinion based on our review of the proposed Saddleback Meadows Residential Development Project located in Orange County, California and its effects on the federally endangered Riverside fairy shrimp (Streptocephalus woottoni "fairy shrimp") and its designated critical habitat, and designated critical habitat for the threatened coastal California gnatcatcher (Polioptila californica californica, "gnatcatcher"), in accordance with section 7 of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.)." (Biological Opinion, dated October 26, 2001, at page 1.) I.e., this biological opinion is confined to assessing the project's effects on two species, only, and their designated critical habitats, under the federal Endangered Species Act, not CEQA. If these agencies have not signed off on the adequacy of the biological resource plan under CEQA, the DRSEIR should not leave the impression that they have done so. A revised DRSEIR must include information from the agencies concerning the adequacy of the biological resources plan so that the public and the decision-makers are fully informed about the likely changes these agencies will require in order to issue permits for the project (such changes may include additional mitigation or reconfiguration of the site plan).

Watt 29 – Response

Please see Section 3.2.1 (USFWS/CDFG Responses) of this Response to Comments document.

Watt 30 – Comment

The letters previously submitted by the wildlife agencies on prior project environmental documents raise significant concerns about the project's impacts on biological resources. Specifically, the October 29th letter states:

"Our biologists' professional opinion is that neither of the two previously submitted preferred projects (318 DU and 705 DU) nor the 299 DU Contingency Plan retain appropriate topography and habitat to ensure the continued function of the wildlife movement corridor/linkage that exists on Saddleback Meadows. As currently proposed, the

299 DU Contingency Plan development "footprint" would severely constrain wildlife movement from O'Neill Regional Park (i.e. southern NCCP planning area) to the Central NCCP reserve and Cleveland National Forest and is not acceptable." October 29, 1998 letter at page 2. See Letters from the wildlife agencies dated October 29, 1998 and August 8, 1997, hereby attached as attachments 2 and 3 and incorporated herein by reference.

Watt 30 – Response

Please see Section 3.3.2 (Connor 20 – Response) of this Response to Comments document.

Watt 31 – Comment

Second, the DRSEIR assumes that Project Features and mitigation measures will reduce project-related impacts to biological resources to less than significant levels. Such measures include highly experimental elements such as creation of new ponds and relocation of species (fairy shrimp) the possible failure of which is explicitly anticipated by the cited biological opinion. No documentation is provided about projects that have successfully used these techniques.

Watt 31 – Response

Please see Section 3.3.2 (Connor 22 – Response) of this Response to Comments document.

Watt 32 – Comment

Third, the DRSEIR makes clear that drainage and water quality mitigation "features" are not yet completely designed. Questions remain whether the proposed system will maintain water quality, particularly with respect to bacterial indicators and toxic constituents. DRSEIR at page 4.4-1. Yet, the DRSEIR contains no mention of, or analysis concerning the potentially significant project-related and cumulative impacts of bacterial and toxic constituents on species in the creek system downstream of the project site. This analysis must be included in a revised environmental document. Nor does the DRSEIR explain how the project can comply with new water quality regulations recently ordered against the County of Orange by the Regional Water Quality Control Board (CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD SAN DIEGO REGION ORDER NO. R9-2002-0001 NPDES NO. CAS0108740 WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES OF URBAN RUNOFF FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE WATERSHEDS OF THE COUNTY OF ORANGE, THE INCORPORATED CITIES OF ORANGE COUNTY, AND THE ORANGE COUNTY FLOOD CONTROL DISTRICT WITHIN THE SAN DIEGO REGION), February 13.2001.) These stricter regulations supplant the 1994 NPDES permit referenced in the DSEIR and were enacted due, in part, to the extremely impaired water quality existing in Aliso Creek, adjacent to the project, resulting in numerous beach closures at Aliso Beach.

Watt 32 – Response

Please see Section 3.3.8 (Saddleback Canyons Conservancy 4 – Response) of this Response to Comments document. The proposed project will meet the permit requirements of the RWQCB.

Watt 33 – Comment

Fourth, the DRSEIR clearly relies on the long-term maintenance of wildlife corridors on adjacent privately owned properties, some of which are planned for future development. Yet, there is no description of how these corridors would be protected from development, and no analysis of the cumulative impact of future developments that could interfere with essential corridors.

Watt 33 – Response

Figure 4.8.4 of the Draft Revised Subsequent EIR depicts the relationship between the proposed on-site wildlife movement corridor and the regional wildlife movement corridors. The project site currently has a recorded map for 705 manufactured housing/mobile home units with no provision for a wildlife corridor. Future developments would be subject to the same requirements as the proposed project with regard to potential impacts to wildlife corridors and would be required to mitigate any impacts to less than significant.

Watt 34 – Comment

Finally, the DRSEIR fails to state how the project will comply with the NCCP/Coastal Sage Scrub agreement. This information must be included in a revised DRSEIR.

Watt 34 – Response

Although the proposed project is consistent with the NCCP, the plan for this portion of the County has not been completed. The project applicant has worked with wildlife agencies to minimize impacts to coastal sage scrub and provide for significant on-site preservation and off-site acquisition. Combined, these measures fully mitigate impacts to coast sage scrub.

Watt 35 – Comment

Inadequate cumulative analysis. Similar to other cumulative discussions in the DRSEIR the biological resource section cumulative "analysis" is nonexistent. The brief discussion concludes that "... all identified related projects in the region would have to mitigate biological impacts to less than significant." DRSEIR at page 4.8-22. This statement is not sufficient to support finding that there would be no cumulatively significant impacts to biological resources in the region. A revised discussion must identify cumulative projects and their collective impacts (by species, habitat and acreage), disclose the mitigation measures that would be required, provide evidence that the mitigation would be effective and document the conclusion that there would be no significant cumulative impacts.

Watt 35 – Response

Cumulative biological impacts were discussed in Section 4.8.3 of the Draft Revised Subsequent EIR. In addition, as shown on Table 4.8.3, the project would mitigate for more habitat (on-site/off-site) than it would actually impact (53.07 acres impacted/80.48 acres as mitigation).

Watt 36 – Comment

Failure to identify potential inconsistencies with applicable plans and policies. The preliminary reserve design for the Southern Subregion NCCP, Figure 4.8-2, appears to include the site in the reserve. Not only does the DRSEIR fail to discuss the fact that the Southern Subregion NCCP is underway, with updated reserve designs due in July 2002, the DRSEIR fails to disclose that the site is identified as part of the reserve on Figure 4.8-2. A revised environmental document must discuss how the NCCP process applies to the proposed project. Specifically, since the Board of Supervisors agreed to participate in the NCCP process in 1993, can the Board properly take action on this project in advance of the NCCP process reaching major milestones concerning proposed reserve design or even more advanced outcomes? What is the relevance of the site being shown as part of the "reserve" in Figure 4.8-2?

Watt 36 – Response

Please see Section 3.3.12 (Watt 34 – Response) of this Response to Comments document. The entire project is not included as preserve in Figure 4.3.2 of the Draft Revised Subsequent EIR. As noted, the proposed project has been designed to ensure connectivity through the project and meet the objectives of the NCCP for this portion of the County.

Watt 37 – Comment

2. *The DRSEIR Fails to Disclose and Analyze Impacts to Geology and Soils Adequately.*

The DRSEIR is deficient in its analysis of geologic impacts. As noted above, the project description and the DRSEIR as a whole provide little information regarding the massive grading and fill required to actualize this proposed project. The extent of cut and fill also appears to underestimate what could be required to accommodate the project as proposed. It is not clear from the DRSEIR whether importation and exportation of fill will be necessary. If necessary, no analysis is provided of the additional impacts of such activities, including, but not limited to: traffic associated with hauling materials, direct impacts to borrow and spoils sites, air quality implications and the like. A revised analysis must include evidence that supports the DRSEIR's assertion that grading will balance on site, or in the alternatives, the true extent of project-related impacts must be disclosed. Also, clearer graphics showing the extent and location of cuts and fills must be included in a revised document so that the public and decision-makers can fully appreciate the impacts of this project on the topography.

Watt 37 – Response

Please see Section 3.3.12 (Watt 16 – Response) of this Response to Comments document.

Watt 38 – Comment

3. *The DRSEIR's Analysis of Air Quality Impacts Is Incomplete.*

The Air Quality section states:

"A reasonable reduction percentage through the implementation of an aggressive transportation system management (TSM) would achieve a measurable reduction when applied to such a large baseline emissions level. If the air quality impact from mobile source emissions is to be maintained at an acceptable level, a viable TSM program is an imperative strategy toward achieving that end."

The discussion fails to discuss the fact that a leading contributor to emissions, and the least likely land use configuration to successfully result in TSM program trip reductions is suburban sprawl - the land use configuration proposed by the project. No discussion is included in the DRSEIR about meaningful ways to address air quality in terms of major policy changes to how the County uses and develops land (e.g. the County could refocus its efforts to accommodate new housing in "infill" areas, and the like). No TSM mitigation measure is included for the project, because the type of land use proposed by the project is not conducive to TSM programs. In light of the fact the County is located within a non-attainment basin, the County should evaluate bolder land use policy measures to address air quality emissions. Such measures (alternatives such as locating housing in infill areas) should be discussed in the DRSEIR.

The DRSEIR appears to understate the impacts on air quality that will be generated both by project construction and by the built project itself. As noted above, the DRSEIR fails to adequately describe construction activities and phasing, and fails to analyze potential air quality impacts associated with hauling cut and fill on-and off-site. Therefore, the DRSEIR fails to analyze and disclose the potentially significant impacts associated with these activities. As stated above, additional information concerning the suitability of on-site soils as fill for the project must be provided if the DRSEIR is going to assume that cut and fill will balance on-site. Alternatively, a revised environmental document must analyze the impacts associated with exportation of unsuitable cut material and importation of suitable fill material. This analysis must include disclosure of both 1) where the materials will be disposed of and 2) locations for imported fill.

The other major deficiency in the analysis is the lack of any meaningful analysis of cumulative air quality impacts. A revised environmental document must include such an analysis (e.g. other construction projects in the area generating air pollutants; etc.).

Watt 38 – Response

Please see Section 3.3.2 (Connor 10 – Response) of this Response to Comments document regarding construction activities. As stated above, the reference to export/import of material is

incorrect. The air quality analysis correctly analyzed impacts with regard to construction activities and phasing.

As stated in Section 4.6.3, a related project with a similar timeframe as the proposed project would increase the short-term emissions for concurrent activities during any day of the construction period. Any additional construction activity during this time and in the vicinity of the project would add additional air pollutant emissions. However, these other projects would be required to include mitigation to reduce these emissions to less than significant levels.

Watt 39 – Comment

4. *The DRSEIR Fails to Analyze Hazards Adequately.*

The DRSEIR defers analysis of potential on-site contamination. Specifically, the potential for on-site contamination is deferred until prior to recordation of the subdivision map. See SC 2-13 at page 4.2-l 6 of the DRSEIR. At a minimum the results of a phase I site assessment should be included in a revised environmental document.

Watt 39 – Response

As stated in Section 2.1.1 of the Draft Revised Subsequent EIR, the project site is largely undeveloped and portions of the site have been previously grazed, cleared or disturbed. The site is currently being used for horse and cattle grazing and there is no historical use that would indicate the potential for on-site contamination. A Phase I study was completed in 1978 and included as Appendix O of the Draft EIR No. 561, which was incorporated by reference in Section 1.1 of the Draft Revised Subsequent EIR.

Watt 40 – Comment

5. *The DRSEIR Fails to Analyze Land Use and Planning Impacts Adequately.*

The DRSEIR fails to describe all relevant policies and plans, and fails to evaluate the consistency of the project with each policy. Each relevant County and other agency policy, general plan policy, regulation, guideline or standard should be summarized in a table, noting whether the project is consistent with the applicable provision and what must be done to reconcile the two [sic] *where they are inconsistent. Instead, the DRSEIR fails to identify key County policies and fails to discuss the applicable policies and regulations of other agencies (e.g., policies of the U.S. Fish and Wildlife Service and the Regional Water Quality Control Board among others). A revised environmental document must include this analysis.*

Watt 40 – Response

Please see Section 3.3.12 (Watt 22 – Response) of this Response to Comments document. All applicable plans and policies related to the proposed project were discussed in the EIR. In addition to the land use policies included in Section 4.1; Section 4.4 included a discussion of regulatory policies of the State Water Resources Control Board and the Regional Water Quality Control Board; Section 4.5 included a discussion of Congestion Management Plans and traffic related policies of the County of Orange General Plan and the F/TSP; Section 4.6 included a discussion of the federal and state clean air standards, the Air Quality Management Plan; and Section 4.8 included a discussion of the Endangered Species Act, California Fish and Game Code, the Clean Water Act and the NCCP.

Watt 41 – Comment

6. *The DRSEIR Fails to Analyze Impacts to Traffic Adequately.*

The DRSEIR fails to disclose that the project's proposed land use pattern would not support sound transportation management practices because of its location, low density and contribution to the suburban sprawl pattern in Orange County. As a result, the project will perpetuate the exclusive use of automobiles for transportation, the very practice that has contributed to the traffic and air quality problems that are so acute in the County.

The Air Quality section states:

> *"A reasonable reduction percentage through the implementation of an aggressive transportation system management (TSM) would achieve a measurable reduction when applied to such a large baseline emissions level. If the air quality impact from mobile source emissions is to be maintained at an acceptable level, a viable TSM program is an imperative strategy toward achieving that end."*

No TSM mitigation measure is included for the project because the type of land use proposed by the project is not conducive to TSM programs. The DRSEIR should disclose this fact and acknowledge the poor pattern of land uses represented by this and other projects in the area, will continue to frustrate the County's progress toward acceptable traffic flows and clean air quality. A revised environmental document should discuss alternatives to the general plan land uses in the area - and explore the potential for transferring these planned units to infill sites.

Finally, the DRSEIR fails to adequately analyze cumulative traffic impacts including how projects of this type are likely to frustrate the County's attempts at a meaningful TSM program. The geographic study area for the analysis of cumulative projects is artificially small in size, and fails to provide a sufficiently large study area for many impacts, including traffic, air quality and biological resources. See Table 3.1, Related projects. Moreover, there is no information provided on construction period traffic for even these related projects; information which must be provided and included in a revised cumulative analysis for traffic and air quality. The study area for the revised analysis should extend at least to the likely areas where new residents in the proposed project and related projects are employed. No such information is included in the DRSEIR. Thus, it is unclear how the study area was selected. Information concerning

where new residents in these areas work and therefore commute, must be developed and used to form the basis for the new analysis of traffic and transit impacts.

Watt 41 - Response

Traffic issues related to land use and development of this site have been analyzed in the context of the Orange County Congestion Management Program (CMP) and the County of Orange Growth Management Program (GMP). Although each of these programs involves different specific objectives and requirements, the underlying goal from a transportation perspective is to eliminate or mitigate the impact of changes in land use on the transportation system. The CMP recommends that the study area for CMP highway system links be defined by a measure of significant traffic impact represented by three percent of roadway capacity. The GMP utilizes a more stringent test (than the CMP) of the effect of the project traffic on existing intersection operations to determine whether or not an intersection should be included in a project traffic impact analysis study effort. Intersections where the existing plus project intersection capacity utilization (ICU) increases by one percent (or more) compared to the existing ICU are included within the traffic impact analysis study area. The analysis area addresses project impacts based on direction from the County of Orange and in accordance with the GMP one percent test.

The basic approach taken in assessing the effects of the proposed project on traffic circulation in the study area has assumed that the worst case conditions would occur in association with the build-out of the General Plan land uses (as reflected in the officially adopted countywide population and employment growth forecasts) in the vicinity of the project site. A comprehensive travel demand forecasting analysis has, therefore, been undertaken for the express purpose of developing long-range traffic projections for a variety of conditions. Future conditions both with and without the proposed project have been evaluated.

The CMP also requires that the basic inputs to any model being used for traffic analysis purposes must be compared to the official regional projections of growth to verify model consistency with the official regional projections. The OCP-2000 growth forecasts are the currently adopted official projections for the County of Orange. These data has been incorporated into the OCTAM 3.1 tool used for this analysis.

The approach taken to this analysis was to use a computerized forecasting tool or traffic model to represent the interaction of the proposed project with the surrounding study area. The computerized traffic modeling forecasts used to evaluate future build-out conditions for this traffic study were produced using a derivative of the Orange County Transportation Analysis Model (OCTAM). The OCTAM was developed by the Orange County Transportation Authority (OCTA). Inputs to OCTAM include the MPAH roadway structure and most current OCP-2000 socioeconomic data. Documentation of the traffic model is contained in the report OCTAM 3.1 Orange County

Transportation Analysis Model Summary Documentation and Validation Report (OCTA, June, 2001). The commenter is also referred to that report for information concerning development of the traffic model and validation of the model. The area encompassed by the OCTAM contains the five Southern California Counties (Ventura, Los Angeles, Riverside, San Bernardino, and Orange) with most focus on Orange County.

Both the CMP and GMP are based on the evaluation of peak hour intersection operations using the ICU methodology. LOS "D" is the limit of acceptable peak hour intersection operations, with LOS "E" being defined as the beginning of deficient operations. Any peak hour intersection operations of LOS "E" or worse are, therefore, considered deficient in the project traffic analysis.

A traffic impact is considered significant if the project both: (1) contributes measurable traffic to; and (2) substantially and adversely changes the level of service to any intersection projected to experience deficient operations under foreseeable worst-case conditions.

Project Design Features, Standard County Conditions, and mitigation measures have been identified to reduce the project impact to a level of insignificance (see Section 4.5. of the Draft Revised Subsequent EIR). The feasibility of proposed mitigation measures has been evaluated on the basis of field reconnaissance and/or review of aerial photographs of the study area. The CMP and GMP then require that a project contribute a pro-rata contribution for improvements at locations requiring improvements.

Watt 42 – Comment

7. *The DRSEIR Fails to Analyze Adequately Impacts to Hydrology, Drainage and Water Quality.*

Pollution carried by storm water and urban runoff is the largest source of contamination to surface water both in California and nationwide. Construction sites, in particular, have been identified as significant dischargers of polluted storm water, involving high concentrations of silt and turbidity as well as oil and grease, trash, sewage, and other chemicals used in construction activities and equipment maintenance. Despite this well-known and well-documented problem, the DRSEIR fails to adequately describe construction activities and on-site and off-site drainage "improvements," both of which could impact the water quality of the area. See concerns raised above about the inadequate and incomplete description of the project drainage and water quality features.

Watt 42 – Response

Hydrology and drainage (Section 4.2 and Appendix D), and water quality (Section 4.4 and Appendix F) were discussed in detail in the Draft Revised Subsequent EIR.

Watt 43 – Comment

The DRSEIR concludes that there will be no significant drainage impacts after mitigation because of a highly engineered system of storm drains, catch basins, inlet/outlet structures, energy dissipators and slope drains to "control project drainage." DRSEIR at page 4.3-7. A "riverine water quality titration system" is proposed next to the road to "cleanse low flow urban runoff." DRSEIR at page 4.3-7. There is no evidence in the DRSEIR that confirms this combination of features will mitigate for the impacts associated with the introduction of impervious surfaces, the complete alteration of the on-site drainage system and redirection of the natural drainages. No examples of successful projects that are similar in features are provided in the DRSEIR.

Moreover, there is no discussion of what kind of long-term maintenance and monitoring will be needed to maintain this highly engineered system The DRSEIR merely states that the "structural and non-structural BMPs would be owned, operated and maintained by the home owner's association (HOA) or community services district." DRSEIR at page 4.4-12. Specific information about the drainage and water quality features and how they will be maintained and monitored over the long-term (including information about the cost of maintenance and monitoring) is essential to determine: first, whether the extent of drainage alterations is an acceptable project feature; and second, whether the proposed system of drainage features will actually be a viable system over the long-term, and effectively mitigate significant impacts to the natural drainage system Specific information about the Riverine system, and the fact that the northerly development area does not have sufficient room to continue this system, suggests that the proposed project features may fall short of ensuring water quality is not adversely impacted by the project. DRSEIR at page 4.4- 11.

The revised document should include examples of projects that incorporated similar features and have been demonstrated to result in effectively addressing drainage and water quality impacts. Absent this information, the conclusion reached in the DRSEIR that "[u]pon implementation of the Project Design Features and compliance with the Standard County Conditions, water quality impacts would be mitigated to a less than significant level," is not supported by evidence.

Watt 43 – Response

The master drainage concept for the proposed project has been prepared in consultation with the County of Orange and utilizes standards and criteria of the Orange County Flood Control District (page 4.3-7 of the Draft Revised Subsequent EIR). The proposed Drainage Master Plan provides a series of water quality enhancement features designed to reduce stormwater quality impacts to Aliso Creek

Watt 44 – Comment

Finally, the significance of project-related impacts requires that the analysis of cumulative impacts to drainage and water quality be extensive. The DRSEIR fails to complete any analysis of these admittedly significant cumulative impacts, yet concludes that as a result of "required mitigation," cumulative impacts would not be significant. DRSEIR at pages 4.3-7 and 4.4-13.

Watt 44 – Response

The Draft Revised Subsequent EIR includes a comprehensive evaluation of project impacts on hydrology and water quality and a series of Project Design Features and mitigation to reduce impacts to less than significant (see Sections 4.3 and 4.4 and Appendices D and E).

Watt 45 – Comment

C. The DRSEIR Fails to Analyze Cumulative Impacts Adequately.

The DRSEIR utterly fails to analyze cumulative impacts in the manner or to the degree required by CEQA. The CEQA Guidelines define cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." CEQA Guidelines §§ 15355(a). "[I]ndividual effects may be changes resulting from a single project or a number of separate projects." Id.

A legally adequate cumulative impacts analysis views a particular project over time and must consider the impact of the project combined with other projects causing related impacts, including past, present, and probable future projects. CEQA Guidelines 15130(b)(l). Projects currently under environmental review unequivocally qualify as reasonably probable future projects to be considered in a cumulative impacts analysis. See San Franciscans for Reasonable Growth v. City and County of San Francisco, 151 Cal.App.3d 61, 74 & n. 13 (1984). In addition, projects anticipated beyond the near future should be analyzed for their cumulative effect if they are reasonably foreseeable. See Bozung v. Local Agency Formation Comm'n, 13 Cal.3d 263.284(1975). Alternatively, an EIR may utilize:

A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or areawide conditions contributing to the cumulative impact.

CEQA Guidelines § 15130(b)(l)(B). Any such planning document shall be referenced and made available to the public at a location specified by the lead agency. Id.

The discussion of cumulative impacts must include a summary of the expected environmental effects to be produced by those projects, a reasonable analysis of the cumulative impacts, and full consideration of all feasible mitigation measures that could reduce or avoid any significant cumulative effects of a proposed project. See CEQA Guidelines §§ 15126.4(a)(1) and 15130(b)(3).

The cumulative impacts concept recognizes that "[t]he full environmental impact of a proposed... action cannot be gauged in a vacuum." Whitman v. Board of Supervisors, 88 Cal.App.3d 397,408 (1097). The requirement of a cumulative impacts analysis of a project's regional impacts is considered a "vital provision" of CEQA. Bozung, 13 Cal.3d at 283. Moreover, an EIR must examine not only the anticipated cumulative impacts, but also reasonable

options for mitigating or avoiding the project's contribution to significant cumulative impacts. CEQA Guidelines § 15130(b)(3). The DRSEIR does not come close to meeting these requirements for the reasons described below.

Watt 45 – Response

Please see Section 3.3.12 (Watt 3 – Response) of this Response to Comments document.

Watt 46 – Comment

1. *The DRSEIR's Cumulative Impacts Analysis' Geographic Study Area Is Too Small and Thus Inadequate Under CEQA.*

The DRSEIR considers a geographic study area far to small to reveal the true nature of the proposed project's cumulative impacts and, thus, is deficient under CEQA. The analysis of cumulative impacts appears to be based on a short list of "related" projects in the immediate area of the project. See Table 3.1 and Figure 3.2.

Among the major projects that must be included in a revised cumulative analysis include but are not limited to the massive Mission Viejo project and other projects in the Southern Subregion NCCP area. In September of 2001, the Mission Viejo Company filed an application for development of its land. As such, the cumulative analyses of land use and planning, geology and soils, hydrology and water quality, air quality, traffic and transportation, biological resources, public services and utilities, aesthetics and growth inducement must consider this potentially massive foreseeable project.

Furthermore, the document does not provide even minimal information regarding other projects within the Southern Orange County NCCP Study area. Analysis of these additional projects is particularly important given the project's location in the Southern Orange County Natural Community Conservation Program Study area.

Although the DRSEIR concludes that the project's cumulative impacts, with the exception of air quality, will not be significant, such a conclusion cannot be supported in light of the inadequacy of the geographic study area. The DRSEIR's failure to consider the 14,000 home Rancho Mission Viejo Project alone renders its scope inadequate. The DRSEIR must also acknowledge and analyze the project's significant cumulative impact on the existing severely "impacted" water quality in adjacent Aliso Creek. This failure to consider regional or area wide cumulative impacts is fatal under CEQA and, as such, the document must be revised.

Watt 46 – Response

The geographic study area used for the cumulative analysis in the Draft Revised Subsequent EIR was appropriate for this size and scale of project. Please see Section 3.2.6 of the Response to Comments document, which includes a letter from the Southern California Association of Governments (SCAG). As stated in SCAG's letter, the proposed project is not of regional significance. The project's cumulative impacts have been adequately addressed.

Watt 47 – Comment

2. *The DRSEIR Fails to Analyze any of the Cumulative Impacts Adequately.*

In addition to relying on a far too small geographic study area, the level of analysis in the DRSEIR's cumulative impacts analysis is far too cursory. An EIR must include objective measurements of a cumulative impact when such data are available or can be produced by further study and are necessary to ensure disclosure of the impact. See Kinas County, 221 Cal.App.3d at 729. Despite this mandate, the DRSEIR fails to analyze adequately a number of cumulative impacts, including, but not limited to, impacts to biological resources, water quality and drainage, and aesthetics, among others.

For example, with regard to cumulative water quality impacts, the DRSEIR states that "Ultimate development planned in the watershed in conjunction with the proposed project would potentially impact both surface and groundwater quality. Without controls, both short-term construction-related and long-term impacts due to pollutants in urban runoff could substantially impact water quality." DRSEIR at page 4.4-13. Despite this finding and despite the project's location in the watershed streams, the DRSEIR concludes that: "... as with the proposed project, related projects would be required to mitigate impacts to water quality to less than significant levels." Id. The DRSEIR fails to adequately summarize any information that would support the conclusion, and offers no supporting analysis itself. A revised environmental document must include analysis of cumulative impacts in order to support the conclusions throughout the DRSEIR that cumulative impacts will be reduced to less than significant levels. Statements such as: "cumulative projects are required to mitigate their impacts, therefore they will," are insufficient to support findings that all cumulative impacts, except air quality, will be less than significant.

Moreover, none of the cumulative impact discussions provide quantified information concerning cumulative project impacts, including, but not limited to: acres of habitat types directly/indirectly impacted by development or total construction trips. This information must be provided in revised cumulative analyses in a revised environmental document. Without such information, there is insufficient evidence to support the DRSEIR's conclusion that cumulative impacts to biological resources, traffic and water quality, among other impacts, will be insignificant. A revised document must also specify mitigation measures for cumulative impacts. Currently, the DRSEIR includes conclusory statements in each section concerning potentially significant cumulative impacts. In each case, "required mitigation" is assumed to reduce significant cumulative impacts to less than significant levels. For example, the biology section contains the following statement concerning cumulative impacts:

"However, as with the proposed project, all identified related projects within the region would have to mitigate biological project impacts to less than significant." DRSEIR at page 4.8-22.

This conclusory statement provides no evidence that cumulative impacts to biological impacts will or can in fact be mitigated, nor is there any legal requirement that "all proposed projects" mitigate biological project impacts to less than significant. CEQA requires only that such impacts be mitigated to the extent feasible, which may not be to a less

than significant level. See also DRSEIR at pages 4.1-12 (cumulative loss of open space would be adverse, but not significant); 4.4-13 (ultimate development in the watershed would potentially impact both surface and groundwater quality, but such impacts would be required to be mitigated to less than significant levels); 4.12-4, and other cumulative sections throughout the DRSEIR.

Watt 47 – Response

Cumulative impacts of the proposed and related projects were evaluated for each environmental factor in Section 4.0 of the Draft Revised Subsequent EIR.

Watt 48 – Comment

Finally, as described above, the DRSEIR fails to explore the full range of mitigation measures that could potentially reduce cumulative impacts below a level of significance. An EIR must examine reasonable options for mitigating or avoiding the project's contribution to cumulative impacts. See CEQA Guidelines §15130(b)(3).

Watt 48 – Response

Project Design Features and mitigation measures were included in the Draft Revised Subsequent EIR that would serve to incrementally reduce cumulative impacts. These include, but are not limited to, remedial grading activities that would stabilize slopes currently subject to landslides above El Toro Road (PDF 2-1); reduce sediment and pollutant transport to Aliso and Oso Creeks (PDF 3-1, PDF 4-4, PDF 4-6, and PDF 4-12); transportation improvements (M 5-3, M 5-4, and M 5-5); enhancement of biological resources (PDF 8-1); and additional recreational resources (PDF 11-1, PDF 11-2, PDF 11-3, PDF 11-4, PDF 11-5).

Watt 49 – Comment

D. The DRSEIR's Discussion of Growth-Inducing Impacts is Inadequate Under CEQA.

The DRSEIR must consider the growth-inducing potential of the project in this undeveloped area. CEQA requires that an EIR include a "detailed statement" setting forth the growth-inducing impacts of the proposed project .See Public Resources Code § 21100(b)(5); City of Antioch v City Council of Pittsburg, 187 Cal.App.3d 1325, 1337 (1986). The statement must "[d]iscuss the ways in which the proposed project could foster economic growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment." CEQA Guidelines § 15126.2(d). It must also discuss how a project may "encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively" or "remove obstacles to population growth." Id.

The DRSEIR's brief growth-inducing section concludes that the project is consistent with growth management policies of SCAG's RCP and would not extend or serve beyond the project boundaries. There is no analysis of whether the extension of roads and services on-site, and the development of a water tank and access road off-site, would facilitate

growth on adjacent properties. Nor does the discussion reach any conclusion as to whether the project is or is not growth inducing as required by CEQA. The DRSEIR fails to address the potential for the off-site water tank to support development on adjacent, currently undeveloped parcels. In addition, wastewater pipes would be extended on site. The DRSEIR fails to describe the potential for these pipes to support development beyond the project site. A revised environmental document must include an adequate analysis of the project's potential for growth inducement.

Finally, the DRSEIR fails to consider the precedent set by approval of this project. Specifically, the project interprets the general plan and other County plan policies to allow this development. No information is provided on the status of "permitted" development under the applicable plans for the area including the site and beyond. Figure 4.1.3, Foothill/Trabuco Specific Plan Land Use Designations, indicates development potential on a number of presently undeveloped properties that are contiguous to the project site. No information is provided in the DRSEIR concerning the status of development within the Specific Plan (e.g., the current statistical summary). It is clear that the development of the project site could have a growth inducing effect on these adjacent properties. Overall, the DRSEIR provides little evidence that the improvements to infrastructure, it will involve and the precedent it will set will not induce growth to adjacent undeveloped properties.

Watt 49 – Response

The proposed project would not effect growth inducement related to adjacent property, as the project does not extend access or utility infrastructure to accommodate additional growth. Furthermore, the project site has a recorded Final Subdivision Map for 705 manufactured/mobile home units, which was record in 1988.

Please see Section 3.2.6 of the Response to Comments document, which includes a letter from (SCAG). As stated in SCAG's letter, the proposed project is not of regional significance.

Watt 50 – Comment

In addition, the DRSEIR must analyze the potentially eviscerating effect of all other undeveloped sites within the Foothill Trabuco Specific Plan area seeking to follow the precedent of spot-amending the Specific Plan to explicitly exempt proposed development from all of the regulations and guidelines of the Specific Plan.

A revised growth inducing analysis must be prepared and include the status of development permitted on adjacent properties under all applicable plan and policies. This analysis should inform a revised analysis of cumulative impacts, including, but not limited to the long-term sustainability of an adequate wildlife corridor system.

Watt 50 – Response

Please see Section 3.3.12 (Watt 49 – Response) of this Response to Comments document. As stated previously, an amendment to the F/TSP is not proposed or required.

Watt 51 – Comment

E. The DRSEIR Improperly Attempts to Defer Mitigation to a Later Date, Fails to Identify Feasible Mitigation Measures, and Relies on Inadequate Mitigation Measures.

CEQA requires that mitigation measures be identified and analyzed. "The purpose of an environmental impact report is... to list ways in which the significant effects of such a project might be minimized..." Pub. Res. Code § 21061. The Supreme Court has described the mitigation and alternative sections of the EIR as the "core" of the document. Citizens of Goleta Valley v Board of Supervisors, 52 Cal. 3d 553 (1990). As explained below, the DRSEIR's identification and analysis of mitigation measures, like its analysis throughout, is thoroughly inadequate. An EIR is inadequate if it fails to suggest mitigation measures, or if its suggested mitigation measures are so undefined that it is impossible to evaluate their effectiveness. See San Franciscans for Reasonable Growth v City and County of San Francisco, 15 1 Cal.App.3d 61,79 (1984). Moreover, an EIR may not use the inadequacy of its impacts review to avoid mitigation: "The agency should not be allowed to hide behind its own failure to collect data." Sundstrom v County of Mendocino, 202 Cal.App.3d 296,361 (1988). Nor may the agency use vague mitigation measures to avoid disclosing impacts. See Stanislaus Natural Heritage Project v County of Stanislaus, 48 Cal.App.4th 182, 195 (1996). Lastly, the formulation of mitigation measures may not properly be deferred until after Project approval; rather, "[m]itigation measures must be fully enforceable through permit conditions, agreements, or legally biding instruments." 14 CCR § 15126.4 (a). In the present case, the DRSEIR does not come close to satisfying these basic CEQA requirements regarding impact mitigation. Most egregiously, it attempts to defer discussion and development of suitable mitigation measures until after the certification of the environmental document and the conclusion of public review

Watt 51– Response

Please see Section 3.3.12 (Watt 7 – Response) of this Response to Comments document.

Watt 52 – Comment

1. The DRSEIR Improperly Defers Mitigation

The DRSEIR impermissibly concludes that all of the project's environmental impacts, with the exception of cumulative air quality, will be mitigated below a level of significance, while at the same time deferring necessary analysis of mitigation measures. DRSEIR at page 9-1. Under CEQA, an EIR may conclude that impacts are insignificant only if it provides an adequate analysis of the magnitude of the impacts and the degree to which they will be mitigated. See Sundstrom, 202 Cal.App.3d at 306-07. Thus, if an agency fails to investigate a potential impact, its finding of insignificance simply will not stand. Id. Further, CEQA generally requires that all mitigation measures be adopted simultaneously with, or prior to, project approval. An agency may defer preparation of a plan for mitigation only when the agency commits itself and/or the project proponent to satisfying specified performance standards that will ensure the avoidance of any significant effects. Id.

In the present case, the DRSEIR violates CEQA by deferring critical analyses of project impacts and necessary mitigation. The following is a non-exhaustive list of the project design features and mitigation measures that the DRSEIR improperly defers to a later date:

a. *PDF 3-1. A master drainage concept has been incorporated into project design to mitigate hydrology impacts to existing OCFCDs requirement sand standards... This Project Design Feature is being prepared in consultation with USACE.*
b. *M 4-l. The applicant shall have the option to research off-site water quality improvements to determine the technical and economic feasibility of implementing improvements that have regional water quality benefits and can also mitigate project-related impacts...*
c. *PDF 4-9. The storm drain system shall be designed to mimic natural drainage patterns as closely as possible. Emphasis added.*
d. *As part of final design, ponds and swales would be incorporated to the maximum extent feasible... DRSEIR at page 4.4-l 2.*

The DRSEIR's failure to adequately analyze the potentially significant effects of the project, and to design proper mitigation measures prior to project approval, renders the document inadequate and vulnerable to legal challenge. With the DRSEIR in its current form, decision-makers, the public and permitting agencies cannot evaluate the advisability of project approval. Too little is known, and too much is entirely unknown, about the project's environmental impacts.

Watt 52 – Response

Please see Section 3.3.12 (Watt 7 – Response) of this Response to Comment document.

Watt 53 – Comment

2. *The DRSEIR Fails to Identify Feasible Mitigation Measures.*

The DRSEIR's consideration of mitigation is inadequate because it fails to identify several feasible measures that could reduce or eliminate identified significant impacts. Mitigation is defined by CEQA as including:

a. *Avoiding the impact altogether by not taking a certain action or parts of an action.*
b. *Minimizing impacts by limiting the degree or magnitude of the action and its implementation.*
c. *Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.*
d. *Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.*
e. *Compensating for the impact by replacing or providing substitute resources or environments.*

CEQA Guidelines § 15370. The DRSEIR fails to consider measures, which could mitigate in the fashion described above significant impacts in several resource categories, including, but not limited to, biology, geologic hazards, hydrology and water quality, among others.

Watt 53 – Response

Project Design Features, Standard County Conditions, and mitigation measures have been included to mitigate impacts associated with the proposed project. Please see the following sections of the Draft Revised Subsequent EIR: Sections 4.8.4 and 4.8.6 regarding biology; Sections 4.2.4 and 4.2.6 regarding geologic hazards; and Section 4.3.4 regarding water quality.

Watt 54 – Comment

Furthermore, the DRSEIR improperly concludes that all impacts except cumulative air quality, are mitigated to below a level of significance based either on deferred mitigation measures, as discussed above, incomplete and "future" project features, or on mitigation measures of unproven efficacy. These determinations are not supported by substantial evidence. A partial list of impacts that should be identified as significant and unavoidable in a revised environmental document include, but are not limited to the following:

Project impacts to biological resources: *There is insufficient information in the DRSEIR to establish the efficacy of proposed mitigation measures including wildlife corridors and replacement ponds, and to support a finding that the impacts to biological resources will be less than significant with mitigation. Moreover, the applicant has not secured all of the necessary permits for the project and the agencies have not signed off on the adequacy of the proposed measures. Even with such agency approvals, significant impacts may remain. For these reasons, and because a feasible project alternative is proposed that would significantly reduce impacts to resources (Alt. 4), a revised environmental document should identify project related impacts to biological resources as significant and unavoidable.*

Cumulative impacts to biological resources. *In the USFWS biological opinion, the Service states under cumulative impacts:*

"At this time, we do not have adequate information to fully evaluate the potential impacts of the Saddlecreek/Saddlecrest Residential Development Project, Whispering Hills Development Project, and the Capistrano Valley Water District Pipeline Project on designated critical habitat for the gnatcatcher." Biological Opinion at page 23.

Another major project in the Southern NCCP area, the Mission Viejo Project, implicates some of the same species and habitats as the proposed project. Based on: 1) the significant amount of habitat loss involved with these development projects in combination with properties surrounding the project site "planned" for development; 2) the lack of information concerning the efficacy of proposed mitigation measures; and 3) the lack of information concerning mitigation measures for cumulative projects, a revised environmental document should identify cumulative impacts to biological resources as a cumulatively significant and unavoidable impact.

Watt 54 – Response

Please see Section 3.3.12 (Watt 35 – Response) of this Response to Comments document.

Watt 55 – Comment

Project-related aesthetic impacts: The DRSEIR finds that impacts to aesthetic and visual resources would be less than significant. DRSEIR at page 4.9-23. In support of this finding, the text of the document states:

> *"The proposed project would not have a substantial negative aesthetic effect. As depicted in the visual simulations, Saddleback Meadows would be low-density and rural in character and would not conflict with the surrounding environment... " DRSEIR at page 4.9-23.*

The project is not "rural in character." Figure 2.9, Conceptual Streetscape, clearly illustrates a project that is suburban in character. Lot sizes averaging 6,672 square feet clearly represent urban/suburban development densities. The protection of fragmented areas of the project site in open space does not "transform" this suburban development into "rural" character. Based on Appendix G of the CEQA Guidelines, the transformation of this site from undeveloped to suburban in the midst of wildlife habitat would constitute a substantial degradation of the existing visual character of the site and its surroundings. Therefore, this impact should be identified as significant and unavoidable as clearly demonstrated by the visual simulations (Compare figures 4.8.4 and 4.9.1, and see Figures 4.9.4, 4.9.5, and 4.9.9, among other exhibits in the DRSEIR, which demonstrate the significant change in character of the site and surrounding area with development as proposed.)

Cumulative Aesthetic Impacts. Figure 2.6 and 4.1.3 clearly indicate that other properties in the project area are designated for development. Cumulative development in the area should have been analyzed and mitigation measures proposed to ensure that the area's visual resources are not further degraded by planned development. Since no cumulative analysis was undertaken, and no cumulative mitigation measures are proposed, the potential for cumulatively significant and unavoidable aesthetic and visual impacts should be identified in a revised environmental document.

Watt 55 – Response

As stated in Section 4.9 of the Draft Revised Subsequent EIR, with implementation of Project Design Features and Standard County Conditions, impacts to visual resources would be less than significant.

Watt 56 – Comment

Other impacts that should be identified as significant and unavoidable in a revised environmental document include, but are not limited to: plan and policy inconsistencies; landform alteration; project-related and cumulative drainage and water quality impacts; cumulative traffic impacts; and cumulative impacts to public services and utilities. Growth inducement should also be identified as a significant adverse result of the project. The DRSEIR does not include sufficient evidence to identity these and other impacts as less than significant after mitigation

Watt 56 – Response

These environmental factors were evaluated in the Draft Revised Subsequent EIR and found to be less than significant with implementation of Project Design Features, Standard County Conditions and mitigation measures.

Please see Section 3.3.11 (Watt 49 – Response) of this Response to Comments document.

Watt 57 – Comment

F. The DRSEIR Does Not Adequately Discuss Alternatives to the Proposed Project.

Although the alternatives section of the DRSEIR describes a number of alternatives, this section continues to fall short of the standard set by CEQA. Under CEQA, an EIR must analyze a reasonable range of alternatives to the project, or to the location of the project, that would feasibly attain most of the basic objectives while avoiding or substantially lessening the project's significant impacts. See Pub. Res. Code § 21100(b)(4); CEQA Guidelines § 15126.6(a); Citizens for Quality Growth v. City of Mount Shasta, 198 Cal.App.3d 433,443-45 (1988). As stated in Laurel Heights I, "Without meaningful analysis of alternatives in the EIR, neither the courts nor the public can fulfill their proper roles in the CEQA process... [Courts will not] countenance a result that would require blind trust by the public, especially in light of CEQA's fundamental goal that the public be fully informed as to the consequences of action by their public officials." 47 Cal.3d 376,404 (1988). The DRSEIR's discussion of alternatives fails to meet these standards.

First, none of the development alternatives are "transparently" based on a comprehensive constraints map that identifies areas of high resource values and areas that should be avoided based on County plan policies. However, one of the alternatives, Alternative 4 – F/TSP EIR 531 Staff Alternative B, appears to avoid substantially more of the impacts than the proposed project and the other development alternatives. Alternative 7 - Acquisition Alternative, would protect key on-site resources because the site would be acquired rather than developed. Because of the resource values represented on the site, the site's sensitive location and its topography, all development alternatives, including Alternatives 4 and 6 would result in substantial grading of sensitive areas, impacts to water quality and biological resources and other significant impacts. A revised analysis should include an alternative based on a site constraints map, which represents current information about high value resources.

Watt 57 – Response

Please see Section 3.3.2 (Connor 2 – Response, Connor 29 – Response, and Connor 30 – Response) of this Response to Comments document.

Watt 58 – Comment

Second, the DRSEIR fails to describe an alternative location for the project housing. Therefore, no off-site alternative was evaluated. No information is contained in the DRSEIR concerning the potential for in-fill housing within the County, including on sites assembled by the applicant within incorporated and unincorporated areas to accommodate the units proposed by the project. Such sites should include "infill" sites with reuse, redevelopment and additional development potential (e.g. under performing shopping centers and other underutilized/vacant sites). The explanation in the DRSEIR concerning such sites is not supported by a methodology, analysis or facts. Moreover, the DRSEIR applied criteria to alternative sites that is unreasonably constrained. According to the DRSEIR:

"It is speculative, but unlikely that the project applicant could assemble other contiguous properties within the area to accommodate the number and type or [f] residences proposed for the project. Moreover, if such properties were identified and acquired by the applicant, the properties would likely have resources and environmental constraints similar to Saddleback Meadows. Development of the proposed project at an alternative location, therefore, is unlikely to be economically viable and would probably not reduce environmental impacts in comparison to the proposed project." DRSEIR at page 5-3.

Off-site alternatives to accommodate housing in the County should not be limited to contiguous properties. Recently, the Planning Center completed an analysis of where development could be accommodated in Orange County. See LA Times, June 17,2001 article. The study concluded that there are sufficient underutilized shopping center sites to accommodate significant development demand. Based on this information and a reasonable methodology for off-site locations, a revised analysis must describe specifically the methodology used to determine that alternative sites do not exist.

Watt 58– Response

Section 5.3 of the Draft Revised Subsequent EIR included a discussion of alternative locations for the proposed project. However, this alternative was eliminated from consideration due to the limited number of developable sites remaining in Orange County and alternative sites within outlying areas of the County are neither within the control of the applicant or unlikely to meet the project objectives. Further, it is speculative but unlikely that the applicant would assemble other contiguous properties within the area to accommodate the number and type of residences included as part of the proposed project. No additional analysis is required.

Watt 59 – Comment

Third, the DRSEIR fails to identify appropriate environmentally superior alternatives as required by CEQA. Specifically, the DRSEIR fails to identify Alternative 4 as the environmentally superior development alternative. See Table 5.7, which clearly indicates that Alternative 4 is the superior development alternative and meets the applicant's objectives. The DRSEIR improperly identities Alternative 8 as the environmentally superior alternative of the "non-no project alternatives." DRSEIR at page 5-47. This section of the DRSEIR must be revised to report the

appropriate environmentally superior alternative based on the facts contained in the DRSEIR. Moreover, because Alternative 4 has fewer impacts than the proposed project, and meets project objectives, facts must be presented that this alternative is infeasible if it is rejected in favor of another development alternative.

Watt 59 – Response

Please see Section 3.3.2 (Connor 30 – Response) of this Response to Comments document.

Watt 60 – Comment

Finally, the DRSEIR fails to adequately analyze the feasibility of Alternative 7 – Acquisition Alternative. No information is provided concerning interest expressed by agencies and other conservation organizations to purchase the property and whether the applicant is a "willing seller." This information is critical to the County's consideration of the project and must be provided in a revised analysis. Moreover, this section should identify potential funding sources for purchase of the property, including Proposition 40 funding and the possibility of funding under the NCCP program if the site is upheld as important for inclusion in a reserve. The DRSEIR's statement that this alternative would not meet project objectives assumes that the County cannot develop an aggressive infill program as part of its housing element to provide for needed housing in the County. Information about the feasibility of meeting housing needs without relying on parcels that contain sensitive biological and environmental resources must be included in a revised analysis.

Watt 60 – Response

Please see Section 3.3.2 (Connor 30 – Response) of this Response to Comments document.

Watt 61 – Comment

II. THE PROJECT MUST BE DISAPPROVED OR THE DEIR MUST AGAIN BE REVISED AND RECIRCULATED.

The serious inadequacies of the DRSEIR are symptomatic of fundamental deficiencies in the project itself. Only a project as deeply flawed as this would fail to result in an adequate revised DEIR after the extensive and highly detailed comments provided by the groups and many others on the first DEIR. The enormous mass grading and placement of fill on erosion-prone soils required for the project seriously call into question the suitability of the site for residential development. The project would wreak unnecessary havoc on the habitat and corridors of several sensitive and endangered species, including the gnatcatcher. For these reasons, the project application should be denied as inadequate and infeasible.

In the alternative and at a minimum, the County may not approve the project unless the DRSEIR is again revised and recirculated to fully disclose and analyze the project's impacts and a proper range of alternatives. Given the multiple inadequacies discussed above, this DRSEIR cannot properly form the basis of a final EIR. CEQA and the

CEQA Guidelines require recirculation of a draft EIR where, as here, the document is so fundamentally inadequate in nature that meaningful public review and comment are precluded. See CEQA Guidelines § 15088.5.

CONCLUSION

As set forth above, the DRSEIR suffers from numerous deficiencies, many of which would independently render it inadequate under CEQA. Taken as a whole, the deficiencies of the DRSEIR are so pervasive as to necessitate further extensive revision of the document- and recirculated for public comment. National Audubon Society, Endangered Habitats League and Rural Canyons Conservation Fund respectfully request that the County deny the project at this time. The project should not be reconsidered until a legally adequate EIR is prepared.

Watt 61 – Response

This comment is a summary of statements included in the above comments. Responses to specific comments have been provided. The commenter's opposition to the project is noted and will be forwarded on to the decision makers.

3.4 INDIVIDUAL COMMENT LETTERS

The following individuals commented on the Draft Revised Subsequent EIR:

- Richard and Patti Gomez
- Mr. and Mrs. Michael Hodges
- Kathleen Stockwell
- Andy Wing

3.4.1 Richard T. Gomez And Patti A. Gomez
June 10, 2002

Gomez 1 – Comment

My wife and I are members of The Saddleback Canyons Conservancy which is dedicated to protecting and enhancing the environment and quality of life in the Foothill/Trabuco Specific Plan (FTSP) area and surrounding areas of Orange County; however, we submit these comments as residents and members of the concerned general public.
Compliance with the FTSP:

The FTSP was chartered by the Orange County Board of Supervisors to assure the "rural character of the area and preserve, forever, open space." The current request for exemption to the FTSP is not in keeping with the spirit or letter of the plan. Furthermore, such exemptions only serve those who would gain financially by such exemptions and do not serve the intended constituents, area residents or the planned protection envisioned by the plan.

We find this request inappropriate, unfair and a blatant disregard for the development guidelines that all residents must comply with. It is no coincidence the new project cannot comply with FTSP guidelines; it is simply too destructive. Just because a project cannot comply foes not warrant exemption; it is simply inappropriate planning, and that planning process must be revisited.

Gomez 1 – Response

Please see Section 3.3.2 (Connor 3 – Response) of this Response to Comments document regarding the proposed project's consistency with the F/TSP.

Gomez 2 – Comment

Cumulative impacts:

As you know this is not the only project currently being considered for this area. Unfortunately, each project is only evaluated with regard to itself and not for its cumulative impact on the environment. Water quality is a key component of this certain degradation and to ignore such cumulative impacts is not only a dereliction of duty and responsibility but an error in favor if an exception for a special interest project.

We encourage you to be diligent and objective in your analysis, not cursory and subjective.

Specific projects include the planned RPLA facility, SaddleCreek and SaddleCrest and the development at the Rancho Mission Viejo. All projects will increase overall pollutant loads and receiving waters should be properly analyzed. We ask that your agency require the applicant to comply with this request and address critical concerns of the FTSP compliance and protection of precious water quality resources.

Gomez 2 – Response

As stated in Section 4.4.2 of the Draft Revised Subsequent EIR, no significant impacts to water quality would occur with implementation of Project Design Features and compliance with Standard County Conditions. Please also see Section 3.3.8 (Saddleback Canyons Conservancy 4 – Response) of this Response to Comments document.

3.4.2 Mr. And Mr. Michael Hodges
April 30, 2002

Hodges 1 – Comment

As a longtime resident of Orange County, my wife and I are strongly opposed to further residential growth in South County and cannot support a zone change to the Foothill/Trabuco Specific Plan. Mission Viejo has done enough already with the enormous amount of homes and apartments being developed off El Toro road between Live Oak and Marguerite.

Hodges 1 – Response

The comment is noted and will be forwarded on to the decision makers. No additional response is required.

3.4.3 Kathleen Stockwell

June 7, 2002

Stockwell 1 – Comment

My name is Kathleen Stockwell and I reside in Mission Viejo, Please include my entire comment in the official record of proceedings for this project.

Of major concern are the sensitive biological resources that are present at Saddleback Meadows, and in particular the proposed mitigation and related hydrological/water quality issues closely related to the preservation of those resources. The Riverside fairy shrimp (Streptocephalus woottoni), present at Saddleback Meadows, is a Federal endangered species with a USFWS recovery priority of 5C, indicating "that it is a species facing a high degree of threat and having a low potential for recovery" (USFWS Recovery Plan for Vernal Pools of Southern California, Sept. 1998, pg. 19). This extremely rare, beautiful, and wonderful species has very limited geographical distribution, existing only in Southern California. Another Branchiopod that exists in one of the Saddleback Meadows ephemeral pools, Cyzicus californicus (a "clam shrimp") is equally fascinating and beautiful, and is related to fossil clam shrimps that date back in the fossil record ca. 350 million years!

DRSEIR566 implies that the "pilot" mitigation proposed to artificially create "ephemeral ponds/vernal pools" will bring the direct and significant impact to the existing ephemeral pools and the Riverside fairy shrimp to a less than significant level. This assumption is based on insufficient scientific evidence, since ***this type of mitigation is "experimental in nature with many uncertainties"*** *(USFWS Biological Opinion for Saddleback Meadows, pg. 19). The Riverside fairy shrimp, as a highly endangered species having a low potential for recovery, deserves the highest level of protection where it exists, and it is not being afforded this protection by allowing experimental mitigation that has a high potential for failure.*

Stockwell 1 – Response

Please see Section 3.3.2 (Connor 19 – Response) of this Response to Comments document. Additionally, the proposed project has attempted to avoid impacts to ponds supporting fairy shrimp. Without human maintenance of the ponds, they would eventually breach and/or silt in. The long-term management of the ponds and creation of additional ponds provides for significant long-term protection.

Stockwell 2 – Comment

The "Implementation Plan/Rationale for Expecting Implementation Success" (Appendix I.2, Section VI. Pg. 9) cites as justification for this mitigation a "recent review of vernal pool rehabilitation and creation projects" which mentions:

- *Ephemeral ponds created in San Diego County where one obligate vernal pool plant (Pogogyne abramsii) was sustained 5-10 years adjacent to existing habitat.*
- *A Del Sol Reserve vernal pool project in Santa Barbara County that demonstrated "pools created and restored in 1986 are self-sustaining and support native vernal pool plant species".*

- *One vernal pool construction project in Folsom, California where density and composition of microinvertebrae populations, including "several" species of fairy shrimp, were similar to adjacent reference pools. (Rogers 1998).*

What justification do these few and poorly explained examples provide? *The first two give vernal pool plant restoration examples. Furthermore, upon examination of the Folsom project in Sacramento County, California (Aquatic Macroinvertebrate Occurrences and Population Trends in Constructed and Natural Vernal Pools in Folsom, California, D. Christopher Rogers, 1996):*

- *This project is geographically far removed from southern California, and cannot represent unique ecological parameters that exist here.*

- *The two kinds of fairy shrimp occurring in the pools at the Folsom project are different species with requirements that vary from the southern California Riverside Fairy Shrimp. For example, both of these species, the Vernal Pool Fairy Shrimp (Branchinecta lynchi) and the California Fairy Shrimp (Linderiella packardi), develop to maturity in less time than the Riverside Fairy Shrimp. The Riverside Fairy Shrimp needs 1-2 weeks to hatch and another 7-8 weeks to reach maturity. The span in which the right conditions can occur must cover several month, not just two. This strongly suggests that created pools that are* ***only required to hold rainwater for a minimum of 60 days*** *at depths required for the Riverside Fairy Shrimp will not be adequate for long term survival of the Riverside Fairy Shrimp. Ephemeral pools in which large numbers of Riverside Fairy Shrimp can successfully breed in Orange County are deep pools that persist for four to five months, or even longer.* ***"Because these constructed pools are mitigation for impacted vernal pools, they need to demonstrate that they are functioning ecologically like naturally occurring vernal pools to be considered adequate compensation".*** *This takes time, a minimum of 10 years, according to the USFWS, and should not be allowed as an experiment unless the original ephemeral pools and their watersheds are left entirely intact until success is proven.*

Stockwell 2 – Response

Please see Section 3.3.2 (Connor 19 – Response) of this Response to Comments document. The reference cited is relevant in that it shows that pools with sensitive resources, including other fairy shrimp species can be successfully created. More importantly, as noted in Section 3.3.2 (Connor 19 – Response), ponds supporting Riverside fairy shrimp have been successfully created. The standard will be to create ponds capable of supporting Riverside Fairy shrimp over the long-term, not the creation of vernal pools since vernal pools are not the sensitive resource being impacted.

Stockwell 3 – Comment

Why is it that only a five year monitoring program is mentioned in the EIR, when 10 years is required? Why is deferral of mitigation allowed in case of failure? This is not acceptable.

- *The Folsom project that is quoted in the EIR only presented the results of the first two years in a nine year monitoring program, which began in 1994.* ***What is the current status of its results, and how does this relate to such projects in Orange County?***

- *The Folsom project site contains 273 natural vernal pools on 246.0 hectares, where 37 pools were constructed. The high number of natural vernal pools alone points to a higher chance for success of the created pools, in my opinion. This project, although admirable, does not seem to be in itself adequate justification for experimental mitigation for an entirely different species of endangered fairy shrimp and a different set of ecological circumstances in Orange County, where such high numbers of natural vernal pools never occur in one complex.*

*The USFWS Biological Opinion for Saddleback Meadows, pg. 13 and 18, state: "The 9 ponds at Saddleback Meadows represent 53 percent of the 17 remaining occupied pools/ponds, making it the largest fairy shrimp habitat complex found in Unit 2" (L.A. Basin-Orange Management Area). "Implementation of the proposed project... represents a 56 percent loss of fairy shrimp ponds, and a 68 percent loss of the pond basin area, onsite." **Why is it deemed acceptable to gamble with perhaps the most valuable habitat complex for the Riverside Fairy Shrimp in Orange County?** Page 19 of this same Biological Opinion states that "..construction of an artificial impervious layer to retain water [in sandy soils] for a minimum of 60 days..has never been done successfully. It is obvious to me that there should be a more concentrated effort to acquire the Saddleback Meadows property and preserve it as it now is. It is a real treasure for Orange County and very important for the NCCP process as well, since it "**represents the only low elevation wildlife corridor/linkage between the Central and Southern Subregions of the Orange County NCCP planning areas.**" (page 18) Much effort has gone into the NCCP, but it seems the endangered fairy shrimp species and their ephemeral/vernal pond habitats of Orange County were never an integral part of the NCCP planning as they should have been. **The proposed wildlife corridor as presented in DSEIR 566 is also inadequate,** being much too narrow and poorly designed. Other sensitive species certainly exist at Saddleback Meadows, such as the Catalina and Intermediate Mariposa Lily populations, which have not been adequately considered either. Two well known host plants for the endangered Quino checkerspot butterfly also exist on this site, and should be in the preservation plan since existence of the Quino in Orange County is still possible.*

Stockwell 3 – Response

The Biological Opinion (BO) for the proposed project requires a ten-year monitoring program for the ponds (see Section 4.8.4 and Appendix I of the Draft Revised Subsequent EIR). The ponds on-site currently supporting fairy shrimp were created in the same soils as proposed for in the restoration plan. Soils tests conducted by the project geologist indicate that appropriate soils are available on-site to create an impervious layer capable of holding water for in excess of 60 days. The proposed project has been analyzed within the context of the Natural Community Conservation Planning Program (NCCP) and provides for wildlife movement through the project (please see Section 3.2.1, USFWS/CDFG 4 - Response, of this Response to Comments document).

Please see Section 3.3.2 (Connor 20 – Response) of this Response to Comments document regarding the intermediate Mariposa lily.

No Quino checkerspot butterflies were observed on-site and none are anticipated to occur.

Stockwell 4 – Comment

DSEIR566 fails to adequately define, analyze, and show mitigation for the hydrological aspects of the project, my concern is especially related to the proposed ephemeral pool mitigation. Nuisance water and non-point source pollution appear to be directed into the natural drainage courses, and may seriously alter any chance for a successful mitigation.

It seems obvious that such a drastic change in the watershed caused by grading, etc. will alter that natural regime of the ephemeral ponds no matter what "mitigation" takes place, further placing them in jeopardy.

Stockwell 4 – Response

The mitigation for the Riverside fairy shrimp was developed through extensive discussions with USFWS. The hydrological design for the proposed project reflects these discussions with USFWS and the proposed mitigation basins are being carefully designed to provide appropriate hydrological conditions necessary for the shrimp to persist. With implementation of the mitigation measures, impacts to Riverside fairy shrimp would be less than significant.

Stockwell 5 – Comment

Will you please explain in specific detail how Basins 1,3,4,5, and 6 (shown directly below houses and slopes on Fig.4 of Appendix I.2) will be unaffected by changes in hydrology and water quality? I have observed the "mitigation" carried out at the Santiago Canyon Estates/Beazer project for the Riverside Fairy Shrimp, and it appears to be sadly inadequate for long term survival of this endangered species. It is directly below homes and slopes similar to the illustration in Fig. 4 mentioned above, has multiple rows of PVC irrigation pipe (made of a very toxic material that may leach into the rainwater?) in and around it (for what purpose?), and cement drainage structures of some kind that look very foreign to a so-called "ephemeral pond". The slopes directly above it are landscaped with non-native plants that may require chemicals. Will you please tell me where the "inoculent" of Riverside fairy shrimp/cysts originated that were put there? Is this questionable mitigation being used as a model for Saddleback Meadows? Please explain the status of the Santiago Canyon Estates "mitigation", and how it relates to Saddleback Meadows.

Stockwell 5 – Response

All of the proposed watershed areas for ponds on Saddleback Meadows will be planted only with native species, and no irrigation is proposed within the pond watersheds. The Santiago Canyon Estates project is not being used as a "model" for Saddleback Meadows, and a comparison of the two is not warranted.

Stockwell 6 – Comment

My last questions/comments are these:

Page 5 of the USFWS Biological Opinion states that the created ponds must demonstrate the ability to hold "water" for a minimum of 60 days. As I have stated above in more detail, a 60 day minimum is not long enough. Does the term "water" mean natural rainwater only? Professor Emeritus Clyde Ericksen has stated, "Attempts to maintain these pools, and thus their fairy shrimp populations, by keeping them full with tap water has proven useless. Tap water chloramines which kills living shrimps."

Why does the first sentence of point C (Schedule) under section VI of Appendix I.2, pg. 9, state that, "Grading is to be completed no later than December 31, 2000". Please explain?

The following should be incorporated into the project proposal as mitigation measures:

1. *A 10 year monitoring program for the ephemeral pool mitigation plan should be in place, not 5 years. No development impacts should be allowed to proceed in any of the nine existing occupied ephemeral pools or their watersheds until this 10 year period has proven that successful mitigation can occur.*

2. *The 60 day minimum requirement for created mitigation pools to hold rainwater at depths required for the Riverside Fairy Shrimp (Streptocephalus woottoni) should be increased to a period appropriate to the life cycle of this particular species.*

Stockwell 6 – Response

Sixty days of natural rainwater is the time necessary for the Riverside fairy shrimp to complete its life cycle. No tap water would be used; only natural runoff. The reference to completing grading by December 31, 2000 is incorrect. As noted above, ten years of monitoring is required for the Riverside fairy shrimp.

3.4.4 Andy Wing

June 23, 2002

Wing 1 – Comment

The question which occurs to me, having experienced weekly for several years severe eye irritation with each trip to Saddleback Valley, continually seen the great brown haze of smog, and read that the area ranks among the top as most polluted on the country, how ANY development of the area can be contemplated?

Wing 1 – Response

As stated in Section 4.6 of the Draft Revised Subsequent EIR, impacts to air quality would not be significant (with the exception of cumulative impacts), with incorporation of Standard County Conditions and mitigation measures.

Wing 2 – Comment

Anything more than "open space, habitat preservation, recreation", and agriculture should not be permitted because it will further exacerbate the already horrendous existing problems, including traffic.

Wing 2 – Response

As stated in Section 4.5 of the Draft Revised Subsequent EIR, impacts to traffic from implementation of the proposed project would not be significant with implementation of Project Design Features, Standard County Conditions and mitigation measures.

The commenter's opposition to the project is noted and will be forwarded on to the decision makers.

DRAFT SUPPLEMENTAL EIR DISTRIBUTION AND COMMENTS

APPENDIX A.1

PUBLIC NOTICE / DISTRIBUTION LIST

PUBLIC NOTICE
of Time Extension

DRAFT ENVIRONMENTAL IMPACT REPORT

PROJECT: SADDLEBACK MEADOWS

DESCRIPTION: Pursuant to the California Environmental Quality Act (CEQA), the Orange County Planning & Development Services Department has prepared Environmental Impact Report No. 566 to evaluate the environmental impacts resulting from the proposed Saddleback Meadows project. The project proposes the phased development of 299 single-family residential units on a 220.2-acre site. The gross density proposed is 1.4 dwelling units per acre, with average lot sizes of 6,672 square feet and a minimum lot size of 5,000 square feet. Approximately 71 percent (158.6-acres) of the project site is proposed to remain in open space. In addition to the residential component, the project also proposes a wildlife movement corridor, regional riding & hiking trail connections and biological resource enhancement. Project implementation requires the approval of Zone Change (Foothill/Trabuco Specific Plan Amendment), Area Plan and Vesting Tentative Tract Map.

EIR 566 examines the potential impacts generated by the proposed project in relation to the following CEQA Checklist categories: Land Use & Planning; Geophysical; Hydrology & Drainage; Water Quality; Transportation/Circulation; Air Quality; Noise; Biological Resources; Aesthetics; Cultural/Scientific Resources; Recreation; Hazards; Public Services; and, Utilities & Service Systems. The proposal will result in unavoidable adverse impacts to air quality.

The purpose of this notice is to inform local residents, institutions and other interested parties about a TIME EXTENSION for the review of the Draft EIR. THE REVISED PUBLIC COMMENT PERIOD IS: APRIL 25TH, 2002 TO JUNE 24TH, 2002. Written comments on the Draft EIR must be submitted by June 24th, 2002, by 5:00 p.m. to: anager, OCPDS/Environmental Planning Services Division, 300 N. Flower St., Box 4048, Santa Ana, California 92702-4048.

Location: Easterly side of El Toro Road, approximately ½ mile south of the intersection of Santiago Canyon Road/El Toro and Live Oak Canyon Road, in east-central unincorporated Orange County.

REVIEWING LOCATIONS

COPIES OF THE DRAFT EIR ARE AVAILABLE FOR PUBLIC REVIEW AT THE FOLLOWING LOCATIONS:

County of Orange/Planning & Development Services Department/
Environmental Planning Services Division
Contacts: Bill Grieman 834-5550
Chuck Shoemaker 834-5550

ORANGE COUNTY BRANCH LIBRARIES:
25209 Marguerite Parkway, Mission Viejo
28192 Silverado Canyon Road, Silverado
24672 Raymond Avenue, El Toro
30902 La Promesa Drive, Rancho Santa Margarita
California State University, Fullerton, Library Documents Section

Re: Draft Revised Subsequent Environmental Impact Report (State Clearing House No. 19996121072) for the Saddleback Meadows Project, County of Orange, California

Dear Mr. Neely:

The U.S. Fish and Wildlife Service (Service) and the California Department of Fish and Game (Department), hereafter referred to as the Wildlife Agencies, have reviewed the Draft Revised Subsequent Environmental Impact Report (DEIR) for the construction of the Saddleback Meadows Project, in the County of Orange, California. The project proposes development of 299 single-family houses on a 229.2-acre site in the lower foothills of the Santa Ana Mountains in southern Orange County. The proposed project also includes two new paved access roads off of El Toro Road and an adjacent offsite 1.4 million-gallon water reservoir. The Wildlife Agencies have commented on various development proposals and environmental documents for this project since 1994. As we have stated in our previous comments, the proposed project poses significant unmitigated impacts to future Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP) reserve design for the Southern Subregion of Orange County.

Responsibilities of the Wildlife Agencies

The Department is identified as a Trustee Agency pursuant to the California Environmental Quality Act (CEQA) section 15386 and is responsible for the conservation, protection, and management of the State's biological resources. The Department is also responsible, pursuant to the California Endangered Species Act, California Fish and Game Code 2050 *et seq.*, for the protection of species listed by the State as endangered or threatened or identified as species of concern, and the habitats they require. The Department also manages the NCCP Program (California Fish and Game Code 2800 *et seq.*), a regional conservation planning effort, that includes southern Orange County.

The Service's primary mission is to work "with others to conserve, protect, and enhance fish, wildlife, and plants and their habitats for the continuing benefit of the American people." The

Service has legal responsibility for the welfare of migratory birds, anadromous fish, and endangered animals and plants occurring in the United States. Specifically, we administer the Endangered Species Act of 1973 (Act), as amended (16 U.S.C. 1531 *et seq.*), and work in accordance with the provisions of the Fish and Wildlife Coordination Act (48 Stat. 401 as amended,16 U.S.C. 661 *et seq.*). Section 7 of the Act requires Federal agencies to consult with the Service should it be determined that their actions may affect federally listed threatened or endangered species. Take incidental to otherwise lawful activities can be permitted under the provisions of sections 7 (Federal consultations) or 10 (permits) of the Act.

As noted in the DEIR, the Service has completed formal consultation with the U.S. Army Corps of Engineers (Corps) and issued a biological opinion (FWS-OR-1023.8) on the Saddleback Meadows Project's effects on the federally endangered Riverside fairy shrimp (*Streptocephalus woottoni*, "fairy shrimp") and its designated critical habitat and designated critical habitat for the threatened coastal California gnatcatcher (*Polioptila californica californica*, "gnatcatcher"), in accordance with section 7 of the Act. To clarify, however, our biological opinion evaluated the 283-unit alternative, not the proposed 299-unit alternative discussed in the DEIR. If the 299-unit Alternative is pursued, reinitiation of consultation with the Corps would be required. Although impacts to federally listed species and their designated critical habitat have been addressed in the cited biological opinion for the Saddleback Meadows project, evaluation of impacts to wildlife movement for non-listed species in relation to development of an NCCP/HCP is outside the purview of section 7 of the Act.

Relationship of the Project to Regional Conservation Planning Efforts

The NCCP Act was approved in 1991 and established a program to provide for regional protection and perpetuation of natural wildlife diversity while allowing compatible land use and appropriate development growth. The program provides an alternative to "single-species" conservation via the formulation of regional, natural community-based habitat protection programs. The first NCCP/HCP projects in California focused on providing adequate conservation and mitigation for impacts to coastal sage scrub vegetation, the preferred plant community of the gnatcatcher.

Following the Federal listing of the gnatcatcher in 1993, the Service adopted a Special Rule for the gnatcatcher pursuant to section 4(d) of the Act incorporating the conservation and process guidelines established by the State under the NCCP Act. The guidelines set forth procedures for the creation of regional and subregional conservation plans. In accordance with the guidelines, jurisdictions enrolled in the NCCP planning program can authorize a limited amount of interim loss of coastal sage scrub during the planning period subject to six interim habitat loss provisions[1]. However, the interim habitat loss provisions are only applicable until adoption of a regional or

[1] The following mandatory findings must be met for a project to be approved pursuant to the interim habitat loss provisions of the Special 4(d) Rule: 1) The habitat loss does not cumulatively exceed the 5% guideline; 2) The habitat loss will not preclude connectivity between areas of high habitat values; 3) The habitat loss will not preclude or prevent the preparation of the subregional Natural Community Conservation Plan; 4) The habitat loss has been minimized and mitigated to the maximum extent practicable in accordance with the Conservation Guidelines; 5) The habitat loss will not appreciably reduce the likelihood of the survival and recovery of listed species in the wild; and 6) The habitat loss is incidental to otherwise lawful activities.

subregional conservation plan. In summary, per the NCCP program, conservation planning within enrolled jurisdictions may be governed by an adopted regional or subregional conservation plan, or is subject to the interim habitat loss provisions of the Special 4(d) Rule.

As an enrolled jurisdiction in the NCCP program, the County of Orange (County) has both an adopted subregional conservation plan that applies to its Central and Coastal subregions (the Orange County Central-Coastal NCCP/HCP) and is participating in development of the Southern Subregion NCCP/HCP. The County has committed to work with the Wildlife Agencies to ensure that projects within its jurisdiction do not prevent connectivity between areas of high habitat values or preclude reserve design options for the Southern Subregion NCCP/HCP.

Reserve Design Inconsistency

Our primary concern with the proposed project is the significant impact it poses to the major lower elevation wildlife movement corridor/linkage along the Santa Ana Mountain foothills of southern Orange County. Saddleback Meadows, together with the adjacent Saddle Creek and Live Oak properties, represents the only remaining unobstructed low elevation wildlife corridor/linkage between the Central and Southern Subregions of the Orange County NCCP/HCP planning areas. To highlight its importance, Orange County's Central-Coastal NCCP/HCP identifies this area as a key corridor/linkage between the subregions. The proposed development on Saddleback Meadows along the eastern and northern portions of the site as shown in Alternative 2 (the No Project, "Existing Entitlement" Alternative), Alternative 3 (the F/TSP EIR 531 Staff Alternative A), Alternative 5 (the Cluster/Single-Family/Multi-Family Residential Alternative), or Alternative 8 (the Reduced Residential Alternative) of the DEIR could substantially eliminate this corridor/linkage and, thereby, severely constrain movement of mule deer, coyote, mountain lion and other large mammals from O'Neill Regional Park in the Southern Subregion to the Central Subregion NCCP/HCP reserve. We raised similar concerns regarding the proposed development on the Saddle Creek property in our comments on the recently circulated DEIR- State Clearing House No. 199111120 (FWS-OR-1309.1).

Pursuant to the CEQA Guidelines (Section 15130), a revised DEIR should discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable and should review the impacts in light of past, present and future probable projects that could result in related impacts, including those outside of the control of the lead agency. However, this current, revised DEIR does not adequately address cumulative impacts to the low-elevation wildlife corridor/linkage through the Saddleback Meadows, Saddle Creek and Live Oak properties. Also, it appears that a comprehensive plan for maintaining a viable corridor/linkage through these properties has not been completed. For example, the Saddleback Meadows DEIR shows a northern wildlife corridor extending from Saddleback Meadows through the adjacent Saddle Creek property. However, the Saddle Creek DEIR does not show this corridor, which would be blocked by the residential development proposed in the DEIR. In addition, development on the Live Oak property could further limit wildlife movement between the subregions. Therefore, the Saddleback Meadows DEIR should evaluate cumulative impacts to wildlife movement in consideration of past development, the proposed development on the Saddle Creek and Live Oak properties and other probable developments, and demonstrate that the Saddleback Meadows

project will not preclude the retention of a viable low-elevation wildlife corridor/linkage connecting the Central and Southern Subregions through all three properties. We wish to work with the County and property owners to develop a comprehensive plan to accomplish this vital component of the Southern Subregion NCCP/HCP.

To address our concerns for Saddleback Meadows, the Wildlife Agencies recommend further consideration of Alternative 4 (F/TSP EIR 531 Staff Alternative B) of the DEIR as it would allow continued movement of wildlife through the area while still meeting the project's objective of "develop(ing) a single-family, rural community that balances residential development with protection of on-site sensitive resources and values of the surrounding community." Alternative 6 (the 44/178 Alternative) may be able to mitigate significant impacts to wildlife movement if remedial grading requirements can be limited within the corridor/linkage area.

Geotechnical

According to the DEIR, the site is characterized by several unfavorable geotechnical conditions including unstable landslides and presence of ground water that could compromise the site's ability to support the project. Mitigation would include the construction of canyon subdrains and back drains to minimize or eliminate the effects of ground water. The Final EIR (FEIR) should discuss how these changes would affect groundwater availability and timing for use by riparian vegetation in upper Aliso Creek.

Hydrology/Beneficial Uses

The Santa Ana Regional Water Quality Control Board has designated the existing biological beneficial uses of "warm freshwater habitat," "wildlife habitat," and "rare, threatened, or endangered species" for portions of Aliso Creek, including the reach downstream from the proposed Saddleback Meadows project. The Wildlife Agencies are concerned about the onsite and downstream effects the project-related changes in the surface flows may have on these beneficial uses and on the habitats and biological resources supported by Aliso Creek. In addition to modifications in peak flows resulting from an increase in impervious surface, we are concerned about changes in the velocity, volume, duration, and frequency of dry-weather and non-peak wet-weather flows. Even small changes in the flow regime often effect changes in the stream community that, over time, can seriously damage stream habitats. Increases in flows from impervious surfaces associated with urbanization can result in: 1) stream bed scouring and habitat degradation; 2) shoreline erosion and stream bank widening; 3) loss of aquatic species; and 4) decreased baseflow (USEPA 1999). Downstream sections of Aliso Creek are known to be sediment-deficient and have already been adversely affected by scour, erosion and subsequent habitat degradation. The Wildlife Agencies recommend that every effort be made to integrate measures to ensure full protection of the beneficial uses and biological resources of Aliso Creek. The development design and construction operations should minimize the modifications of dry and wet-weather flows and integrate onsite best management practices (BMPs) that would attenuate the flows to reduce impacts on the stream morphology and habitats onsite and downstream. Examples of BMPs to consider include appropriately sized grassy swales and vegetated detention basins. Proper design of structural BMPs will require analyses of the

sediment transport and hydrological regime of the headwaters of Aliso Creek. The project is located within Reach 1 of the *Aliso Creek Watershed Management Feasibility Study, Orange County, California* prepared for the Corps. We recommend this study be consulted to determine possible effects of the project on the Aliso Creek watershed.

Significance Criteria for Biological Resources

The thresholds of significance for biological resources provided in section 4.8.2 of the DEIR do not appear to be consistent with the CEQA definition of rare, threatened, and endangered species (see CEQA Guidelines, § 15380). In addition, The Department recommends that the significance criteria in the body of the DEIR be revised to be consistent with CEQA Sections 15064.7 and 15065, and Appendix G of the CEQA guidelines.

Annual Grasslands

The project proposes that mitigation requirements for cumulative impacts to raptor foraging habitat (consisting primarily of coastal sage scrub and grasslands) will be met in conjunction with the proposed coastal sage scrub habitat mitigation. The Department recommends mitigation measures be incorporated specifically for impacts to annual grassland. These areas provide foraging areas for raptors and small mammals and proposed impacts to a total of 103.7 acres on- and offsite should be considered significant. Appendix I.1 of the DEIR indicates that raptor species including Cooper's hawk (*Accipiter cooperii*), a state species of special concern (CSC), sharp-shinned hawk (*A. striatus*, CSC), red tailed hawk (*Buteo jamaicensis*) red shouldered hawk (*B. strianus*), and American kestrel (*Falco sparverius*) were observed during surveys of the project site, and other species including northern harrier (*Circus cyaneus*, CSC) and loggerhead shrike (*Lanius ludovicianus*, CSC) have at least a moderate potential of using the grasslands onsite for foraging. We therefore recommend that annual grassland mitigation at a 0.5:1 preservation-to-impact ratio in an offsite area with long-term conservation potential be included in the FEIR.

Intermediate Mariposa Lily

The DEIR states that impacts to intermediate mariposa lily (*Calochortus weeddii* var. *intermedius*) would not be significant. This species is listed by the California Native Plant Society as a "1B" plant (Plants rare, threatened, or endangered in California and elsewhere). Species included on List 1B must be fully considered under CEQA. The Department recommends that the FEIR include mitigation for impacts to this species (for example, see Rancho Potrero Leadership Academy EIR, County of Orange, 2001).

Cactus Wren

According to the DEIR, impacts to the cactus wren (*Campylorhynchus brunneicapillus cousei*) are not considered significant. As proposed in Appendix I.3 to the DEIR, the coastal sage scrub mitigation plan does not specifically include salvage or container stock planting of prickly-pear

(*Opuntia* spp.) required for cactus wren nesting and foraging. By providing suitable replacement habitat, a potentially significant impact to cactus wren may be mitigated. To provide replacement habitat for cactus wren impacted by implementation of the project, we recommend that the coastal sage scrub plant palette is revised to include a substantial amount of prickly-pear. This may be achieved by salvage of existing plant material followed by direct replanting within the mitigation area or by collecting pads prior to impact and rooting them in containers. In addition, we recommend that reference sites currently supporting cactus wren be chosen to provide an appropriate baseline for comparison.

Oak Woodland Mitigation Plan

Mitigation for oak woodland impacts is described on page 4.8-26 of the DEIR and we concur with the restoration approach in concept. However, unlike the coastal sage scrub mitigation plan, details of the oak woodland mitigation strategy are not adequately described in Appendix L3 such that the impacts can be shown to be mitigated below a level of significance. For example, the proposed locations for oak woodland restoration should be depicted and described. In addition, container sizes, understory species, and maintenance activities specific to the oak woodland restoration should be detailed.

The Wildlife Agencies appreciate the opportunity to review and comment on the DEIR. If you have any questions please contact Mr. David Zoutendyk of the Service at (760) 431-9440 or Mr. Brad Henderson of the Department at (310) 214-9950.

Sincerely,

Karen A. Evans

RE: Saddleback Meadows
SCH#: 1996121072

This is to acknowledge that the State Clearinghouse has received your environmental document for state review. The review period assigned by the State Clearinghouse is:

Review Start Date: April 26, 2002
Review End Date: June 10, 2002

We have distributed your document to the following agencies and departments:

California Highway Patrol
Caltrans, District 12
Department of Conservation
Department of Fish and Game, Region 5
Department of Forestry and Fire Protection
Department of Housing and Community Development
Department of Parks and Recreation
Department of Water Resources
Native American Heritage Commission
Office of Historic Preservation
Regional Water Quality Control Board, Region 9
Resources Agency
State Lands Commission

The State Clearinghouse will provide a closing letter with any state agency comments to your attention on the date following the close of the review period.

Thank you for your participation in the State Clearinghouse review process.

Dear Bill Grieman/Chuck Shoemaker:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on June 10, 2002, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

> "A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Terry Roberts

Subject: Saddleback Meadows

Dear Mr. Grieman,

Thank you for the opportunity to review and comment on the Draft EIR dated April 2002 for **Saddleback Meadows.** The project is located on the eastern side of El Toro Road, one half mile from the Santiago Canyon/Live Oak Canyon Road junction.

The project consists of the development of 299 detached single family residences on 66.9 acres out of a total 222-acre site. The nearest State Routes are SR-241 and I-5.

Caltrans District 12 status is a reviewing agency on this project and has the following comments:

1. As indicated in the report, the proposed project will generate 3690 trips per day that mostly use El Toro Road. This report has not included west/south of El Toro beyond Santa Margarita Parkway towards I-5 interchange in the Traffic study section. We have concerns that this development will ultimately contribute to the cumulative impacts at El Toro Road/I-5.

2. We recommend that the project proponents work to coordinate their efforts with the City of Lake Forest and their project " The Arbor on El Toro Specific Plan" in terms of project phasing, filing a traffic management plan during construction, and avoiding impacts to El Toro Road and ultimately the I-5 during traffic peak periods.

3. Other than identifying the County Bikeway network, this project doesn't evaluate or stipulate the use of alternative modes of transportation, such as buses, to be incorporated into the development. Such alternatives would work to reduce future congestion in the region while at the same time help to improve the overall air quality.

4. The project proponents will insure that during construction all loads will be contained that may use state routes and that no net runoff increase will flow over, onto or under State Right of Way.

Please continue to keep us informed of this project and other future developments, which could potentially impact our transportation facilities. If you have any questions or need to contact us, please do not hesitate to call Maureen El Harake at (949) 724-2086.

PUBLIC NOTICE
of Time Extension
DRAFT ENVIRONMENTAL IMPACT REPORT

RECEIVED
JUN 1 4 2002
STATE CLEARING HOUSE

PROJECT: SADDLEBACK MEADOWS SCH# 1996121072

DESCRIPTION: Pursuant to the California Environmental Quality Act (CEQA), the Orange County Planning & Development Services Department has prepared Environmental Impact Report No. 566 to evaluate the environmental impacts resulting from the proposed Saddleback Meadows project. The project proposes the phased development of 299 single-family residential units on a 229.2-acre site. The gross density proposed is 1.4 dwelling units per acre, with average lot sizes of 6,672 square feet and a minimum lot size of 5,000 square feet. Approximately 71 percent (158.6-acres) of the project site is proposed to remain in open space. In addition to the residential component, the project also proposes a wildlife movement corridor, regional riding & hiking trail connections and biological resource enhancement. Project implementation requires the approval of Zone Change (Foothill/Trabuco Specific Plan Amendment), Area Plan and Vesting Tentative Tract Map.

EIR 566 examines the potential impacts generated by the proposed project in relation to the following CEQA Checklist categories: Land Use & Planning; Geophysical; Hydrology & Drainage; Water Quality; Transportation/Circulation; Air Quality; Noise; Biological Resources; Aesthetics; Cultural/Scientific Resources; Recreation; Hazards; Public Services; and, Utilities & Service Systems. The proposal will result in unavoidable adverse impacts to air quality.

The purpose of this notice is to inform local residents, institutions and other interested parties about a TIME EXTENSION for the review of the Draft EIR. THE REVISED PUBLIC COMMENT PERIOD IS: APRIL 25TH, 2002 TO JUNE 24TH, 2002. Written comments on the Draft EIR must be submitted by June 24th, 2002, by 5:00 p.m. to: Manager, OCPDS/Environmental Planning Services Division, 300 N. Flower St., Box 4048, Santa Ana, California 92702-4048.

Location: Easterly side of El Toro Road, approximately ½ mile south of the intersection of Santiago Canyon Road/El Toro and Live Oak Canyon Road, in east-central unincorporated Orange County.

REVIEWING LOCATIONS

Dear Bill Grieman/Chuck Shoemaker:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on June 24, 2002, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

> "A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Terry Roberts

RE: Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows

I have reviewed the cultural resources section of the DEIR and have the following comments:

1. The cultural resources section of the EIR does not accurately reflect the findings and recommendations provided in the cultural resources appendix. In some cases there are serious contradictions.

2. The cultural resources appendix indicates that this project is subject to a Corps of Engineers 404 permit and therefore the cultural resources are subject to the provisions of Section 106 of the National Historic Preservation Act. The EIR does not indicate this and the treatment of the archaeological sites is not in compliance with the Act as amended in 1999

3. The investigations to determine the significance/importance of the archaeological sites are inadequate. The excavation of three 1 X 1 meter units in CA-ORA-713 is not sufficient to determine the depth, nature, condition and extent of a site of this size. Since the site appears to be dispersed over a large area, remote sensing and/or geomorphological studies should be conducted to locate areas of the site that contain buried cultural deposits and features. The discovery of buried cultural deposits and features or human burials should not be done by bulldozer.

4. Likewise the determination that CA-ORA-715 is based on the excavation of four 1 X 1 meter units. This is not sufficient to determine the depth, nature, condition, and extent of this site and to determine that it is not "significant/important".

5. Pg. 4.10-12 of the EIS states that a final test excavation of site CA-ORA-1437 was undertaken in November 2001, but does not indicate the methods used or the results. There is no information to support the determination that the site is not "significant/important".

6. Pg. 4.10-14 – Project impacts: The statements regarding CA-ORA-710 are contradictory and raise doubts regarding whether the site is going to be preserved. If

5151 State University Drive, Los Angeles, CA 90032-8220 (323) 343-2440 FAX: (323) 343-2445 www.calstatela.edu

The California State University: Bakersfield, Channel Islands, Chico, Dominguez Hills, Fresno, Fullerton, Hayward, Humboldt, Long Beach, Los Angeles, Maritime Academy, Monterey Bay, Northridge, Pomona, Sacramento, San Bernardino, San Diego, San Francisco, San Jose, San Luis Obispo, San Marcos, Sonoma, Stanislaus

the sit is to be protected through site burial and preserved within a biological mitigation area, then why does the EIR state that data recovery would occur prior to ground disturbing activities. If the site is to be protected, why should there be ground-disturbing activities? In addition, site burial has to be done very carefully to ensure that the site will be protected. The standards/specifications for covering the site should be indicated.

7. CA-ORA-1257 has not been subsurface tested and should not be graded without further investigation.

8. CA-ORA-711 is considered to be significant/important. According to the DEIR, only a small fraction of the total site area was tested. Grading with monitoring as stated on pg. 4.10-14 is not adequate mitigation for the destruction of the site.

9. Pg. 4.10-20: The DEIR makes the assumption that the completion of a data recovery excavation program, (or even worse, monitoring during grading) constitutes a no adverse effect. This is not the case. The implementing regulations for Section 106 of the National Historic Preservation Act (36 CFR 800.5(a)(2)(iii) along with 800.5(a)(2)(I), as amended May 1999, acknowledge the reality that destruction of a site and recovery of its information and artifacts is adverse and no longer consider data recovery as sufficient mitigation to reduce the impacts to a level of insignificance.

10. Even if this project were not under the jurisdiction of the federal government, CEQA was patterned after the National Environmental Policy Act and the pertinent federal regulations. Therefore, to ignore the reality that the destruction of an archaeological site, including the destructive process of archaeological excavations, is a significant impact seems counter to the spirit and intent of CEQA.

11. According to CEQA: **When archaeological resources are involved, avoidance, or preservation in an undisturbed state is the preferable course of action.** Section 21083.2 then provides that preservation methods may include:
a. Planning construction to avoid archaeological sites
b. Deeding sites into permanent conservation easements
c. Capping or covering sites with a layer of soil before building on the sites.
d. Planning parks, greenspace, or other open space to incorporate archaeological sites.

When avoidance is not possible, then data recovery excavation may be the only feasible mitigation measure.

11. According to CEQA data recovery is the last resort after the lead agency considers all of the above preservation methods and determines that they are not possible or feasible. With the exception of CA-ORA-710 (but the EIR also implies that the site may be impacted – see above) the only mitigation measures that have been considered for the remaining sites to be impacted by the proposed project are data recovery excavation, or worse yet, grading with monitoring.

Attachment F

Based on the above comments, the DEIR is inadequate in that (1) There is not sufficient information to support the determinations that all of the sites to be impacted by the proposed project (except two) are not significant/important. (2) The DEIR fails to provide documentation that the CEQA recommended preservation alternatives to the total destruction of six of the seven archaeological sites to be impacted by the proposed project have been considered. The developer should be required to conduct a good faith examination of the feasibility of the preservation measures. They should be encouraged to incorporate one or more of the preservation measures and include the preservation plan in the EIR. If the determination is that none of the preservation measures are possible or feasible, the justification for this determination and documentation that serious consideration was given to preservation methods should be included in the EIR. (3) Grading and monitoring is not adequate mitigation for the destruction of a significant archaeological site.

If it is determined that data recovery excavation and destruction of the sites is the only feasible option, the investigations should be guided by a research design that follows the California Office of Historic Preservation Guidelines for Archaeological Research Designs (Preservation Planning Bulletin No. 5, February 1991. Dept. of Parks and Recreation, Office of Historic Preservation). The report documenting the excavations should follow the Office of Historic Preservation Guidelines for Archaeological Resource Management Reports (Preservation Planning Bulletin No. 5, December 1989).

If you have any questions or comments I can be reached at (323) 343-2445 or pmartz@calstatela.edu.

Dear Mr. Shoemaker

Draft Revised Subsequent Environmental Impact Report (DRSEIR)
Saddleback Meadows

The South Coast Air Quality Management District (AQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the Lead Agency and should be incorporated in the Final Environmental Impact Report.

Pursuant to Public Resources Code Section 21092.5, please provide the AQMD with written responses to all comments contained herein prior to the certification of the Final Environmental Impact Report. The AQMD would be happy to work with the Lead Agency to address these issues and any other questions that may arise. Please contact Charles Blankson, Ph.D., Transportation Specialist – CEQA Section, at (909) 396-3304 if you have any questions regarding these comments.

Sincerely

Draft Revised Subsequent Environmental Impact Report (DRSEIR)
Saddleback Meadows

1. **Project Size**: In the Public Notice announcing the availability of the DRSEIR, it is stated that the proposed project will occupy an area measuring 229.2 acres and approximately 71 percent of this or 158.6 acres will be devoted to open space. In the Project Summary in the DRSEIR on page 1-3, it is stated that the proposed project will occupy 222 acres and 70 percent or 155.1 acres will be devoted to open space. It is not clear from the above statements whether the project area is 229.2 acres or 222 acres? Please provide accurate information on the size of the project area since it has implications for grading emissions and subsequently air quality.

2. **Emissions Inventory**: In Table 4.6.2 on page 4.6-7 of the DRSEIR, emissions data are provided for the years 2000 and 2010. While the 2010 forecasts are the same as those reported in the SCAQMD Final 1997 AQMP, the 2000 data is different. See Table B-6 on page III-B-18 of Appendix III of the SCAQMD Final 1997 AQMP. Please correct the discrepancy.

3. **URBEMIS2001**: It is reported in Appendix G of the DSEIR that the lead agency used URBEMIS7G to calculate project emissions. There are two points to be noted about this. The first is that both Appendix G and the SDEIR limit the discussion on construction activity impacts to fugitive dust and PM_{10} emissions. PM_{10} emissions are reported to be less than the PM_{10} significance threshold. However, as noted on page 4.6-12 of the DRSEIR, construction also entails the use of internal combustion engines in on-road and off-road mobile, semi-mobile and other diesel-powered equipment which generate emissions of NO_X, CO and also PM_{10}. There are also ROG emissions from paints and other architectural coatings. The lead agency fails to mention that the URBEMIS7G output table shows very large ROG construction emissions. At 1,171.19 pounds per day during the Summer, these are very significant emissions. The lead agency needs to address these high ROG emissions and propose measures to reduce them to less than the significance threshold in the Final SEIR. The second point is that URBEMIS2001 is currently available on ARB Webpage and has replaced URBEMIS7G as the model of choice and should be used to estimate project emissions. The lead agency is therefore encouraged to use URBEMIS200 which uses current emission factors and therefore reflects project emissions more accurately. In discussing the proposed project's air quality impacts, both construction and operational emissions as well as the corresponding significance thresholds should be presented in the main text of the Final SEIR. If construction ROG emissions still exceed the significance threshold, the lead agency should propose mitigation measures accordingly.

4. **Screening Tables**: The lead agency uses the Screening Table in the SCAQMD 1993 CEQA Air Quality Handbook (Table 6-2) to determine that construction-related equipment combustion emissions from the project will not be significant. See discussion on page 4.6-12 of the DRSEIR. Please note that although the screening tables were developed by the AQMD, the AQMD no longer supports the use of these tables in determining the significance of project emissions. This is because the mobile source emission factors used in computing the tables are from an old version of the California Air Resources Board EMFAC model.

RE: SCAG Clearinghouse No. I 20020232 Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows

Dear Mr. Grieman:

Thank you for submitting the **Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows** to SCAG for review and comment. As areawide clearinghouse for regionally significant projects, SCAG reviews the consistency of local plans, projects and programs with regional plans. This activity is based on SCAG's responsibilities as a regional planning organization pursuant to state and federal laws and regulations. Guidance provided by these reviews is intended to assist local agencies and project sponsors to take actions that contribute to the attainment of regional goals and policies.

We have reviewed the **Saddleback Meadows**, and have determined that the proposed Project is not regionally significant per SCAG Intergovernmental Review (IGR) Criteria and California Environmental Quality Act (CEQA) Guidelines (Section 15206). The proposed project is not a residential development of more than 500 units. Therefore, the proposed Project does not warrant comments at this time. Should there be a change in the scope of the proposed Project, we would appreciate the opportunity to review and comment at that time.

A description of the proposed Project was published in SCAG's **April 30, 2002** Intergovernmental Review Clearinghouse Report for public review and comment.

The project title and SCAG Clearinghouse number should be used in all correspondence with SCAG concerning this Project. Correspondence should be sent to the attention of the Clearinghouse Coordinator. If you have any questions, please contact me at (213) 236-1867. Thank you.

Sincerely,

JEFFREY M. SMITH, AICP
Senior Planner

Subject: DEIR No. 566; Saddleback Meadows

To Whom It May Concern:

Thank you for forwarding the Draft Environmental Impact Report No. 556 for the proposed Saddleback Meadows Project. The Transportation Corridor Agencies (TCA) has reviewed the above-subject draft environmental document and would like to offer the following comment for your review:

- The DEIR identifies the intersection of Portola Parkway and the FTC-N as being impacted. The DEIR states; "The addition of one southbound left turn lane at the intersection of Portola Parkway (NS) at Foothill Transportation Corridor (EW) would be required for 2005 condition." Mitigation measure M 5-5 specifies that the project shall pay its fair share funding of this improvement. The fair share funding amount agreed to by the TCA must be submitted to the TCA prior to the issuance of any building permits for the project.

Should you have any questions regarding this letter, or the submission of payment, please contact me at (949) 754-3483.

Sincerely,

Macie Cleary-Milan

Re: Draft EIR Saddleback Meadows

Dear Sir(s):

Thank you for the opportunity to comment on the Draft EIR for the Saddleback Meadows project. In response to our review, we would like to offer the following:

Page 4.12-1, Section 4.12.1, Second paragraph. "61 fire stations" should read "59 fire stations"

Page 4.12-1, Section 4.12.1, Third paragraph, Third bullet. Remove "only available from a medic van" from the sentence. OCFA provides paramedic service both paramedic assessment and full paramedic services through a number of configurations in addition to the medic vans.

Page 4.12-2, Table 4.12.1, Fire Station Locations. Several things are wrong with this table.

- Fire Station 18 is 4.2 miles from the project not 1.5. The response time to the project for FS18 would be calculated at 8 minutes and 40 second using an average of 35 mph and 90 seconds of call processing and turnout time.
- Fire Station 16 is located 3.5 miles from the project and would calculate at 9 minutes and 30 seconds using the same formula as above with a two minute time period added for the volunteer personnel to get to the fire station. This station does NOT have paramedics or full time firefighters. It is staffed with volunteer firefighters only.
- Fire Station 45 is located 5.3 miles away with a response time calculation of 10 minutes and 30 seconds.
- Additionally, Fire Station 54 is located 2.8 miles from the project with a response time calculation of 6 minutes and 20 seconds.
- Fire Station 31 is located 3.7 miles away with a response time of 7 minutes and 50 seconds. This is the closest paramedic unit to the project.

Page 4.12-2, Third paragraph. Change "average response time of six minutes" to "average response time of nine minutes".

Page 4.12-2, Forth paragraph. Replace the last sentence, "At this location three firefighters are on duty staffing either a paramedci assessment unit or a brush engine." With "At this location, 20 volunteer firefighters staff the engine when called upon to do so."

Page 4.12-3. First paragraph, last sentence. Should read 7 firefighters rather than 8 firefighters.

Page 4.12-9. Add new Condition SC12-16. Secured Fire Protection Agreement. "Prior to grading, the applicant shall enter into a Secured Fire Protection Agreement with the OCFA. The reason for the timing this agreement is that the service needs for the project increases at the point of grading and continues to increase as the project is built. Service agreements will need to be in place at this time.

As noted in Section 4.12.3, Cumulative Impact, the seven related projects in this area have an effect on the service delivery within the area. Additional staffing and/or equipment may be needed to meet this demand. This issue will be addressed within the Secured Fire Protection Agreement.

Page 5-9, Alternatives, Alternative 2 – No project Alternative, this project would have many issues with fuel modification both "onsite" and "offsite".

Page 5-38, Alternatives, Alternative 6 – 44/178 Alternative. It should be noted that the layout of the "Development Area" does not allow for secondary access for emergency vehicles and may require the project to acquire additional easements or other mitigation measures to insure that adequate access to the project is provided.

The project area is within the designated Special Fire Protection Area and is as a result a significant wildfire risk. These risks will require special mitigation measures an accordance with OCFA standards. All other standard conditions of development including access will also be applicable to the proposed project. Guidelines for these issues are available on the OCFA website at (http://www.ocfa.org/business/pandd/guidelin.htm).

If you have any additional questions or concerns regarding this project, please contact my officer at (714) 744-0484 or at genebegnell@ocfa.org.

Sincerely,

Gene F. Begnell

Re: Comments of Trabuco Canyon Water District
Draft Revised Subsequent Environmental Impact, Report No. 566
Saddleback Meadows
Planning Application 980103, Zone Change (ZC) 98-3, Area Plan (AP) 98-2
Tentative Tract Map 15784, Vesting Tentative Tract Map 15230

Gentlemen:

Trabuco Canyon Water District (District) is in receipt of the Draft Revised Subsequent Environmental Impact Report No. 566 (DEIR 566) for the above-captioned project (Project). Based upon our review of the document, the following comments are submitted to the County of Orange (County) with regard to the Project and the environmental proceedings being undertaken by the County with respect to the Project. Please note that the District reserves its right to provide or submit additional or supplemental comments relative to the DEIR566 and any other or further documents provided or furnished by the County with respect to the Project or the environmental proceedings undertaken by the County with respect to the Project during the review period and/or public hearing process for this matter.

Request for Notices

Pursuant to the provisions of the California Environmental Quality Act (CEQA) and Public Resources Code Section 21091.1, the District hereby requests that copies of all notices and other documents mailed in relation to the above-referenced Project be furnished to the District. If there are any fees and charges required for the provision of such notices, please provide us with an invoice for such costs, and we will reimburse the appropriate County department. This

32003 Dove Canyon Drive, Trabuco Canyon, CA 92679 · 949/858-0277 · Fax: 949/858-3025
Mailing Address: P.O. Box 500, Trabuco Canyon, CA 92678
www.tcwd.ca.gov

request for notice specifically includes, but is not necessarily limited to, notices of all hearings, proposed actions to be taken with regard to the developmental process and, in particular, any Notice of Determination prepared, furnished or filed with regard to this Project.

Background Information

Our general legal counsel, Bowie, Arneson, Wiles & Giannone, provided written comments on behalf of the District on August 11, 1997 and supplemental comments on October 17, 1997, photocopies of which are attached hereto. We request that these letters be included as part of the record of proceedings for the environmental review of the Project, Including DEIR566.

As stated in the October 17, 1997 letter, there remains a "significant question as to whether the mitigation measure referenced includes and covers necessary master plan and in-tract water transmission and distribution facilities, and necessary master plan in-tract wastewater facilities." We again request that mitigation monitoring language, as required by Public Resources Code Section 21081(a)(1) and Section 21081.6, be incorporated within the final environmental impact report prepared for the Project.

Trabuco Canyon Water District further states that the District's Rules and Regulations require improvement agreements to be entered into in order for the District to approve tract maps and for the District to provide water and wastewater service to any property within its boundaries. The District previously requested of California Quartet to undertake negotiations relative to entering new improvement agreements relative to the Project. No response has been received by the District.

In addition to the above, a Sub-Area Master Plan must be prepared and financed by the developer to define needed facility improvements which include:

> Water: Pump stations, reservoir, pressure reducing valves and pipelines.
> Sewer: Local collection lines only. The project has already purchased regional wastewater collection, treatment and disposal capacity.

All fees and capacity charges must be reevaluated following completion of the Sub-Area Master Plan.

Sincerely,

Bruce Boner
General Manager

SUBJECT: Saddleback Meadows Draft EIR

Dear County Staff:

The City of Lake Forest has received the Draft Environmental Impact Report for the Saddleback Meadows development. Public Works staff has reviewed the Water Quality Technical Report, Appendix E and Traffic Study, Appendix F of the EIR and offers the attached comments. Development Services staff has reviewed the body of the EIR and offers the following comments;

1. Section 3.7 and Table 3-1 discuss related projects. Please confirm project 3, Los Angeles Athletic Club is the name of the self-storage facility located on the corner of Marguerite Parkway and El Toro Road. In addition, the Gateway Commercial Center Project located on the corner of Portola Parkway and El Toro Road, within the City of Lake Forest, should be considered in the EIR. Please see City staff for information on the approved project.

2. The applicant should be advised that the City of Lake Forest does not permit any off-site signage. Therefore, there shall be no advertising or directional signage placed within the City of Lake Forest or along streets within the City's jurisdiction.

We would like to continue to receive information and documents on the project. Please send all further correspondence to myself, Ms. Gayle Ackerman, AICP, Director of Development Services at 23161 Lake Center Drive, Suite 100, Lake Forest, CA 92630, telephone number (949) 461-3460.

Sincerely,
CITY OF LAKE FOREST

Gayle Ackerman

MEMORANDUM

DATE: JUNE 4, 2002

TO: STEPHANIE EKLUND
DEVELOPMENT SERVICES PLANNER

FROM: NABIL KASSIH, P.E.
CIVIL ENGINEERING ASSOCIATE

SUBJECT: REVIEW OF WATER QUALITY MANAGEMENT PLAN FOR THE SADDLEBACK MEADOWS DRAFT EIR

I have reviewed the Conceptual Water Quality Management Plan section of Saddleback Meadows EIR. The following are comments for the subject document.

1. In the Developed Conditions section of the Report, page 6, it states that "The permanent open space will dedicated to the County of Orange as a regional park and will be maintained by the County or a third-party conservation group". The report indicated that this open space area is 88.2 acres.

   - Has the County of Orange agreed to accept the open space area and the maintenance responsibility associated with it?
   - What impacts will this dedication have on the City if and when this area is annexed to the City of Lake Forest?
   - Will the public have access to this regional park?

   Please respond to these questions and provide additional information to clarify this item and its impact on the City of Lake Forest.

2. In the Developed Conditions section of the Report, Page 6, states that "Only lots 1 through 37 connect directly to an existing storm drain facility in El Toro Road". Please provide all required Hydrology and Hydraulic backup information to show that the existing facility has enough capacity to accommodate this portion of the development. Furthermore, provide detail information on the watershed that contributes to this existing facility on El Toro Road and the down stream impacts of this development.

3. Section 7 entitled "Monitoring, Inspection and Maintenance, page 12, Subsection (g) entitled "Common Area Catch Basin Inspection", the inspection and power wash of the screen for the stormceptor should be performed more than once per year. In fact,

the first few years after completion of this project, the inspection rate should be 3-4 times per year, or after a sizeable rainstorm. This rate of inspection will be needed until such time the newly planted vegetation/landscaping begin to contribute to the reduction of erosion. After that, the rate may be reduced 2-3 times per year to allow for continuos and proper clean screens for all stormceptors.

4. Same section as stated in item 3 above, page 12, subsection (h) entitled "Street Sweeping Private Streets and Parking Lots". Please be more specific in regards to statement "This procedure will be intensified around October 15th of each year..." In other words, is the street sweeping required twice a week or more? The term "intensified" needs to be clearly defined.

5. 75% of this area ultimately drains to Aliso Creek, which is an impaired water body and is under an enforcement action (California Water Code Section 13225) from the San Diego Regional Water Quality Control Board. What specific measures are to be undertaken by this development to eliminate pollutant runoff from entering the curb and gutter as required by the NPDES permit and in support of the enforcement action.

SUBJECT: Saddleback Meadows Traffic Impact Report

DATE: May 23, 2002

We have reviewed the *Saddleback Meadows Traffic Report* prepared by Urban Crossroads for the County of Orange. The following are comments for the subject document.

1. The following intersections are STOP sign controlled and should be analyzed utilizing the 2000 HCM: Santiago Canyon Rd./Modjeska Canyon Rd., Santiago Canyon Rd./Ridgeline Rd. and Santiago Canyon Rd./Live Oak Canyon Rd. The intersection analyses Tables should be updated to reflect the delay/LOS for each of these intersections under each scenario which was analyzed.

2. Although the intersection of El Toro Rd./Live Oak Canyon Rd. does meet a warrant for signalization under existing conditions, the HCM worksheets indicate that this intersection is currently operating at acceptable Levels of Service B during both the AM and PM peak hours. Therefore, further analyses should be completed to determine if signalization is needed based upon other factors such as accident data or safety concerns.

3. The volumes provided in the count data found in Appendix B do not match the northbound and southbound through volumes at the intersection of Portola Parkway and the Foothill Transportation Corridor Ramps under existing conditions as shown in Figures 2E and 2F. A discussion should be added on how the northbound and southbound existing through volumes were derived for the AM and PM peak hours.

4. On Table 2-2, the Level of Service at Portola Parkway/Glenn Ranch Road should be "B" and not "A".

5. The peak hour project volumes for the AM inbound and PM outbound movements at the project access point on El Toro Road, as shown in Exhibits 3-C and 3-D, do not equate to the projected trip generation provided in Table 3-2. The Figures and intersection analyses worksheets should be revised to reflect the correct numbers.

6. Table 3-5 should be revised to reflect the Level of Service on each road segment based upon the roadway capacity values found in Table 2-1.

7. On Table 4-4 the following Levels of Service should be corrected to reflect to following Levels of Service:

   El Toro/Valley Vista Way - PM peak hour - LOS B
   Saddleback Ranch/Glenn Ranch - PM peak hour - LOS B
   Portola Parkway/El Toro - AM peak hour - LOS D
   Portola Parkway/El Toro - PM peak hour - LOS C

8. It is unclear who is responsible for the Year 2005 improvement (Southbound Left Turn Lane) required at the study intersection of Portola Parkway/Foothill Transportation Corridor. This should be indicated in the study.

9. Table 4-6 should be corrected. The study intersection of El Toro Rd./Valley Vista Way should have a LOS value of E instead of D.

10. A discussion/table should be added to the traffic study regarding the project's impacts at each study intersection where the Level of Service is unacceptable and the project increases the ICU value, and where the intersection's operation is degraded to an unacceptable operation with the project. In addition, the proposed improvements, which would mitigate the project's impacts, should be shown along with additional improvements which are needed without the project for Year 2025 conditions. Responsibility of the improvements should also be provided.

11. Peak hour traffic volumes for some movements under the Year 2025 without the project scenario are decreasing when compared to volumes under the Year 2005 without the project scenario. The following intersections should be reviewed and changes made to the Figures and ICU worksheets or an explanation provided on why the volumes are decreasing in the Year 2025.

Santiago Canyon/Modjeska Canyon	Santiago Canyon/Ridgeline
El Toro/Live Oak Canyon	El Toro/Ridgeline
El Toro/Valley Vista	El Toro/Glenn Ranch
Saddleback Ranch / Glenn Ranch	Marguerite Parkway/El Toro
Portola Pkwy/Glenn Ranch	Portola Pkwy/Foothill Trans. Corr.
Portola Pkwy/El Toro	

12. Appendix J contains traffic signal warrants for the intersections of Santiago Canyon Rd./Modjeska Canyon Rd., Santiago Canyon Rd./Ridgeline and El Toro Rd./Live Oak Canyon Road under a variety of analyses conditions. The body of the report does not discuss why traffic signal warrants were applied or when (under what time-frame) the signal may be required. This should be included in the text of the report.

13. There is an existing bike path/trail, which runs along the eastside and parallel with El Toro Road. The main project access will intersect this bike path/trail. Provisions should be provided for signing the bike path/trail with the proper controls.

14. There is a discrepancy in the trip generation provided in a letter dated October 17, 2001 to Mr. Pike Oliver, California Quartet LTD, from Mr. Bill Lawson, Urban Crossroads, Inc regarding "Alternative Development Scenarios" for the *Saddleback Meadows* Alternatives. This letter should be revised so the trip generation data provided in the letter reflects the trip generation information indicated in Table 2 of the aforementioned letter.

City of Mission Viejo

Community Development Department

May 30, 2002

Frank McGill
Senior Planner
County of Orange
P.O. Box 4048
Santa Ana, CA 92702

SUBJECT: Zone Change ZC98-3 and Area Plan AP98-2 for Saddleback Meadows (aka Bridlewood) in the County of Orange

Dear Mr. McGill:

Thank you for the opportunity to review and comment on Zone Change ZC98-3 and Area Plan AP98-2 for Saddleback Meadows (aka Bridlewood) in the County of Orange. Of particular interest to the City of Mission Viejo are the transportation-related components of the Draft Revised Subsequent Environmental Impact Report (EIR 566) for the Saddleback Meadows project filed with the County of Orange. The City's comments are as follows:

1. Project Trip Generation:
   The project traffic study identifies a residential trip distribution assumption wherein twenty-five percent of the daily traffic would enter/leave the project site, using El Toro Road north of the project entrance, and with twenty percent continuing along Santiago Canyon Road. Page 3-5 of the project traffic study states that "trip distribution patterns for this study are consistent with previous traffic studies and were reviewed by County staff prior to completion of this traffic analysis." The City of Mission Viejo continues to believe that the 25% assignment of traffic to El Toro Road, north of the project access, is high. The City of Mission Viejo recommends that the Draft EIR provide narrative discussion which explains the land uses or destinations that exist or are proposed north of the project site, which would cause one-quarter of the project's daily trips to use this segment of El Toro Road, versus using El Toro Road south of the project site to access freeways, major highways, and public facilities. The assumptions used in the project trip distribution would have a resultant impact on analyzed intersections south of the project entrance to El Toro Road, and, in particular, would increase Intersection Capacity Utilization (ICU) calculations if a greater percentage of project trips were assigned southerly along El Toro Road.

2. El Toro/Glenn Ranch Road Intersection:
   The El Toro/Glenn Ranch Road intersection is a Measure M intersection that is fully assigned to the City of Mission Viejo. In compliance with countywide Measure M

200 Civic Center • Mission Viejo, California 92691
http://www.ci.mission-viejo.ca.us
949/470-3053
FAX 949/951-7176

requirements, the City of Mission Viejo must maintain this intersection at a Level of Service "D" or better.

The project traffic study identifies that the El Toro/Glenn Ranch Road intersection will maintain a Level of Service A through project buildout in Year 2005, but that the intersection is projected to operate at a Level of Service "E" in the pm peak period in Year 2025 buildout, with or without the project. The project traffic study further identifies that the completion of additional El Toro Road improvements, specifically, the addition of through lanes that increases El Toro Road's lane capacity from a two-lane to a four-lane facility, will allow this intersection to operate at a Level of Service "C" in the pm peak period, thus maintaining consistency with Measure M Growth Management Program level of service standards.

The City of Mission Viejo recognizes that the implementation of additional El Toro Road improvements is not necessitated by the Saddleback Meadows project, since project buildout, and associated levels of service standards, can be maintained at the El Toro/Glenn Ranch Road intersection with existing improvements. In conjunction with Measure M Interjurisdictional Planning Forums, the City of Mission Viejo will monitor the operation of El Toro Road and will work with the County of Orange, to allow for the implementation of the additional El Toro Road lane improvements in advance of any failing intersection performance at the El Toro/Glenn Ranch Road intersection.

On behalf of the City of Mission Viejo, I thank you for your consideration of our comments. If you have any questions, please feel free to call Elaine Lister or me at (949) 470-3053.

Sincerely,

Charles E. Wilson, AICP

RE: Saddelback Meadows Zone Change and Area Plan

Dear Mr. McGill:

Thank you for the opportunity to review and comment on the Zone Change (ZC) 98-3 and Area Plan (AP) 98-2 for the proposed Saddleback Meadows development. It is our understanding that the existing zoning allows for 705 manufactured homes, 1.7 acres of commercial, and 130 acres of open space. The proposed development will include 299 single-family detached dwelling units and 155 acres of open space.

The City of Rancho Santa Margarita has reviewed the Zone Change and Area Plan and has the following comments:

1. Saddleback Meadows Rural Character Statement Page 6 (graphics): It is not clear which direction the views from off-site are from.

2. Page 6-1: Grading Concept: Contour grading is discussed but there are not any graphics that show where cut and fill areas will occur.

Please include the City of Rancho Santa Margarita on your mailing list for review of any documents related to this project.

RE: Comments on Draft Revised Subsequent EIR 565 (SCH No. 1996121072) for Saddleback Meadows.

Dear Mr. Britton:

These comments are submitted on behalf of the Center for Biological Diversity ("Center"), a non-profit public interest membership organization dedicated to the preservation of native species and their habitats. On June 11, 2001 our Legal Assistant Susie Roe called the County of Orange Environmental Planning and Services Division requesting a copy of the EIR for the Saddleback Meadows Project, SCH No. 1996121072. Ms. Roe was told by staff that the EIR could only be sent via the authority of Mr. Bill Grieman, then on vacation. Ms. Roe left a voicemail for Mr. Grieman, who never returned the call. Today, June 24th, Ms. Roe called Mr. Grieman to check on the status of the request for the EIR, and was told that he was unsure when and if it could be sent because the comment period is now over. This is outrageous. First, the comment period is not "over" as it is not yet the close of business. Second, the Center has right to review the EIR regardless of whether the comment period is "over" or not. Third, the County of Orange Environmental Planning and Services Division should not be incapable of sending out a copy of an EIR while one staff member is on vacation. The actions of County staff have deprived the Center, our members and staff, and members of the public with an interest in protecting the biological resources of the Saddleback Meadows project site with an opportunity to comment on this project.

From reviewing the comments of the Sierra Club and others, it seems apparent that the Draft Supplemental EIR is deeply flawed, the environmental impacts of this project are unacceptable, and the mitigation proposed is entirely inadequate. The Center will submit further comments once we have received the EIR. The Center requests that the comment period be extended due to the County's

failure to timely release a copy of the EIR upon request. Should the deadline not be extended, the Center will still submit comments and strongly urges the County to consider them and respond fully in the Final EIR. As you know, the CEQA Amendments of 1994 make it clear that an organization exhausts its administrative remedies (and therefore preserves its right to judicial review of the project approval) by submitting comments at any time prior to the certification of the EIR. Pub. Resources Code § 21177(a),(b); *Galanta Vineyards v. Monterey Peninsula Water Management District* (6th Dist. 1997), 60 Cal. App.4th 1117-1121.

Thank you for your consideration of these comments. Please contact me at (909) 659-6053 x. 302 should you have any questions.

Sincerely,

Kassie Siegel

Re: *Draft Revised Subsequent Environmental Impact Report No. 566 for Saddleback Meadows 299-Unit Single Family Housing Project*

Dear Mr. Britton:

On behalf of the Vedanta Society of Southern California ("Vedanta"), we hereby submit our comments on "Draft Revised Subsequent Environmental Impact Report No. 566" ("DRSEIR 566" or the "DRSEIR") for the 299-unit single family housing project (the "299-Unit Project") proposed for the Saddleback Meadows property (the "Property"). Vedanta's specific comments on DRSEIR 566 are set forth in Exhibit "A" attached hereto and are incorporated herein by reference. We request that each of the comments set forth in Exhibit "A" receives a full and complete response pursuant to section 15088 of the State CEQA Guidelines.

We are particularly disappointed that, after having described the "44/178 Alternative" in detail in the letter which we sent to you on August 31, 2001, in response to the Notice of Preparation for DRSEIR 566, California Quartet's consultant, HDR, has chosen to address a *radically different* alternative under the guise of the "44/178 Alternative." In our letter, we clearly described the "44/178 Alternative" as dividing the Property into a 44-acre "Development Parcel" and a 178-acre "Conservation Parcel" with all residential dwelling units and related improvements being confined to the "Development Parcel." We stressed that the "Conservation Parcel" was to be permanently preserved in its natural condition as undeveloped and undisturbed open space, and that no development activities (*e.g.*, remedial

grading) were to be permitted outside the 44-acres of the "Development Parcel." However, in the DRSEIR, the "44/178 Alternative" is inexplicably presented as a 127-unit single family housing project.

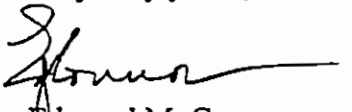
As was disclosed by California Quartet's representatives during Vedanta's settlement negotiations with them and various County officials in 1998, a 127-unit alternative would require a development area of at least 75 acres and would entail massive remedial grading and a 50-foot loeffel wall that would destroy virtually all of the vernal ponds, oak trees, and sensitive habitat areas that would otherwise be preserved by the 44-acre development footprint that is the hallmark of the "44/178 Alternative" proposed by Vedanta.

We consider the unfair and distorted presentation of the "44/178 Alternative" that is contained in DRSEIR 566 to be so deceptive and misleading that it requires the DRSEIR to be redrafted and recirculated. Section 15088.5(a)(3) of the State CEQA Guidelines has clearly been triggered in this regard. Moreover, given the conclusory and deficient nature of many of the other sections of DRSEIR 566, recirculation is also required under section 15088.5(a)(4) of the State CEQA Guidelines.

What is required is a fair and honest evaluation of the merits of the "44/178 Alternative." As the County's own staff members proved in developing the 65-unit "Mathews Alternative" in April 1998, the "44/178 Alternative" would provide California Quartet with a feasible--albeit lower density--housing project which would preserve and protect the environmentally-sensitive resources on this unique "wildlife corridor" property. Regrettably, the County has so far allowed California Quartet's consultant to evade the state law requirements which mandate that this project alternative be adequately analyzed and reported on in the DRSEIR. We cannot believe that the County has allowed this blatant misconduct to occur and we hope that you will rectify it immediately.

In the interest of providing the decision-makers of the County of Orange and the members of the public with a complete and non-deceptive evaluation of the project alternatives, environmental impacts, and feasible mitigation measures associated with the 299-Unit Project, we respectfully request that DRSEIR 566 be revised and recirculated before any public hearings are scheduled on this matter.

Very truly yours,



Edmond M. Connor

Enclosure

EXHIBIT "A"

COMMENTS OF VEDANTA SOCIETY OF SOUTHERN CALIFORNIA ON DRAFT REVISED SUBSEQUENT ENVIRONMENTAL IMPACT REPORT NO. 566

1. Draft Revised Subsequent Environmental Impact Report No. 566 ("DRSEIR 566" or the "DRSEIR") fails to identify, analyze, and mitigate the impacts associated with the failure of the 299-unit single family housing project (the "299-Unit Project") to comply and be consistent with the goals, objectives, components, regulations, and guidelines of the Foothill/Trabuco Specific Plan (the "FTSP"). At page 4.1-12, the DRSEIR simply concludes that the 299-Unit Project "would be in substantial compliance with or consistent with the previously approved and Recorded Map 10692" and, therefore, as a result of the fact that the 705-unit manufactured housing project (the "705-Unit Project") described in Recorded Map 10692 was exempted--due to bankruptcy code concerns--from compliance with the FTSP, the 299-Unit Project should likewise be exempted. However, the DRSEIR fails to provide any legal or factual support for this conclusion. The FTSP provides an exemption for the development of the Saddleback Meadows property (the "Property") *only* if it is developed in accordance with Recorded Map 10692--*i.e.*, if the 705-Unit Project is developed. If any proposed development "deviates" from Recorded Map 10692, an amendment to the FTSP is required to "(1) determine an appropriate density cap for the property; (2) establish new development regulations for the Bridlewood Residential District; and (3) be consistent with all of the provisions of the Specific Plan." (FTSP at page III-20, para. 3.2(b).) By seeking to create an entirely new exemption from the FTSP for the Property, and by submitting an entirely new subdivision map for the Property, the developer has acknowledged that the 299-Unit Project deviates from Recorded Map 10692 and is not covered by the exemption from the FTSP provided for the 705-Unit Project. DRSEIR 566 incorrectly concludes that the 299-Unit Project is exempt from the FTSP because it "would be in substantial compliance with or consistent with previously approved and Recorded Map 10692." If the DRSEIR seeks to rely on this patently false conclusion, some attempt must be made to support it by providing a good faith comparison of the 705-Unit Project and the 299-Unit Project to prove that they are the same project. If they are essentially the same project, then the environmental analysis set forth in the DRSEIR is fatally flawed because the 299-Unit Project is portrayed as involving far fewer impacts.

2. DRSEIR 566 fails to identify, analyze, and mitigate the impacts--including the adverse precedent--associated with the creation of an entirely new exemption for the Property from the goals, objectives, components, regulations, and guidelines of the FTSP. If a new exemption is to be created, the DRSEIR should (a) identify all other projects, if any, which have received a similar exemption from the FTSP and (b) identify each of the goals, objectives, components, regulations, and

guidelines of the FTSP with which the 299-Unit Project is inconsistent, but will nonetheless be exempted from, including, but are not limited to, (a) the goals and objectives relating to rural character and resource preservation; (b) the resources overlay component relating to wildlife corridors, oak woodlands, tree management/preservation, and streambeds; (c) the Bridlewood Residential District Regulations; (d) landscaping regulations; (e) grading standards relating to the maximum height of manufactured slopes and the 70% "natural open space" requirement; (f) area plan submittal requirements; (g) grading, drainage and site planning guidelines; and (h) architectural guidelines.

3. DRSEIR 566 fails to properly identify, analyze, and mitigate the land use compatibility impacts of the 299-Unit Project on the Ramakrishna Monastery and St. Michael's Abbey. At page 4.1-13, under the heading "Level of Significance Before Mitigation," DRSEIR 566 concludes that "due to a natural space buffer, implementation of the proposed project would not result in significant land use compatibility impacts to the Rama Krishna Monastery or St. Michael's Abbey." However, at page 19, under the heading "Significant Impacts of the Project Prior to Mitigation," "Addendum PA980103 to Certified Final Subsequent Environmental Impact Report 566" ("Addendum No. 1") earlier concluded that the 299-Unit Project "would result in significant land use compatibility impacts to O'Neill Regional Park, the Ramakrishna Monastery, St. Michael's Abbey, and surrounding residential communities." Moreover, despite the incorporation of the identical "Project Design Features" which are proposed by DRSEIR 566, "Draft Environmental Impact Report No. 561" ("DEIR 561") concluded that the very similar 318-unit single family housing project which it analyzed would have a significant, *unavoidable*, adverse impact on land use compatibility with O'Neill Regional Park, the Ramakrishna Monastery, and St. Michael's Abbey. (DEIR 561 at page 8-1.) The DRSEIR fails to explain or reconcile these clearly inconsistent and contradictory conclusions.

4. DRSEIR 566 fails to properly identify, analyze, and mitigate the land use compatibility impacts of the 299-Unit Project on O'Neill Regional Park. At page 4.1-11, the DRSEIR concludes that the 299-Unit Project is "not incompatible" with O'Neill Regional Park. This conclusion is reached based on the fact that a portion of the Property is to be dedicated to the County of Orange (the "County") for incorporation into O'Neill Regional Park and that portion of the Property purportedly would cause O'Neill Regional Park to be "substantially buffered from the development by natural undisturbed, open space and topography." However, a comparison of the Open Space Plan for the 299-Unit Project (Figure 2.11) and any map or diagram indicating the surrounding property boundaries (*e.g.*, Figure 4.1.2, 2.3, or 2.6) reveals that the 299-Unit Project abuts a significant portion of the property boundary shared by the Property and O'Neill Regional Park. Indeed, the 299-Unit Project will require grading and fuel modification activities to be conducted in a portion of O'Neill Regional Park. (*See, e.g.*, Figure 4.2.5 (grading cannot conveniently stop at property boundary as indicated in Removal Area "C")

and 4.12.1.) Hence, not only does the DRSEIR fail to provide any factual support for its conclusion that the 299-Unit Project is "not incompatible" with O'Neill Regional Park, but it actually provides information demonstrating that this conclusion is obviously incorrect. Moreover, as noted in the previous paragraph, earlier environmental documents regarding the 299-Unit Project and the similar 318-Unit Project concluded that such projects did have significant land use compatibility impacts on O'Neill Regional Park, but DRSEIR 566 has not explained or reconciled these inconsistencies.

5. DRSEIR 566 fails to properly identify, analyze, and mitigate any of the environmental impacts which would result if title and possession of a significant portion of O'Neill Regional Park were to revert back to Vedanta due to any construction or other activities associated with the 299-Unit Project. In 1974, Vedanta granted the approximately 245 acres located immediately to the south of the Property, and the west and southwest of the Monastery, to the County so that the land could be made a part of O'Neill Regional Park and be permanently maintained as open space. The grant of this land contained several conditions subsequent pursuant to which the land would revert back to Vedanta in the event of a breach of any of those conditions. The conditions expressly prohibit any grading activities, the placement of any soils, and the removal of any trees, shrubs, or natural growth from the land gifted to the County. All of the grading maps in the DRSEIR attempt to show that no grading will be conducted in O'Neill Regional Park. For example, Figure 4.2.5 shows that when the limits of remedial grading--which generally trace the contours of the land and the outline of the geotechnical conditions which purportedly are to be remedied--reach the property line between the Property and O'Neill Regional Park, the limits of remedial grading miraculously make a sharp turn and follow precisely along the property line in order to stay out of O'Neill Regional Park. Clearly, this is not possible and, as currently designed, the 299-Unit Project requires certain grading--and also *fuel-modification* activities--to be conducted within the portion of O'Neill Regional Park which Vedanta gave to the County. Moreover, the 299-Unit Project provides for a storm drain to discharge into the natural drainage course which runs directly into O'Neill Regional Park. (*See* Figure 4.3.2.) Each of these constitutes a breach of the conditions subsequent to Vedanta's gift of land to the County and would cause such land to revert back to Vedanta. DRSEIR 566 should acknowledge this fact and identify, analyze, and mitigate the environmental impacts which would result therefrom. If the DRSEIR is going to continue to insist that no grading or other activities will be conducted within O'Neill Regional Park, then DRSEIR 566 should provide an explanation of how grading and all other activities will be excluded from O'Neill Regional Park.

6. DRSEIR 566 fails to properly identify, analyze, and mitigate the land use compatibility impacts of the 299-Unit Project on all surrounding residential areas. At page 4.1-10, the DRSEIR states that the 299-Unit Project "has a lower gross density than the surrounding area projects." However, in reaching this

conclusion, DRSEIR 566 relies solely upon two nearby projects which are located *outside* the FTSP--*i.e.*, Portola Hills and Hidden Hills/Hidden Ridge--while ignoring two nearby residential projects that are *within* the FTSP. (*See* Table 4.1.2.) DRSEIR 566 fails to acknowledge or analyze the fact that the "gross density" for the 299-Unit Project (1.3 dwelling units/acre) is double that of Santiago Canyon Estates (gross density of 0.66 dwelling units/acre) and four times that of the proposed Saddle Creek/Saddle Crest (gross density of .33 dwelling units/acre).

7. DRSEIR 566 fails to properly identify, analyze, and mitigate the impacts associated with the inconsistency between the 299-Unit Project and the Aliso Creek Corridor Specific Plan. At page 4.1-12, the DRSEIR concludes that the 299-Unit Project "would be in conformance with the Aliso Creek Corridor Specific Plan" and, therefore, makes no attempt to mitigate the impact of any inconsistency with such Specific Plan. However, at page 19, Addendum No. 1 concludes that the 299-Unit Project "would also conflict with policies of the Aliso Creek Corridor Specific Plan." DRSEIR 566 fails to explain or reconcile these inconsistent and contradictory conclusions.

8. DRSEIR 566 fails to properly identify, analyze, and mitigate the grading and other geophysical impacts associated with the 299-Unit Project. The impacts and mitigation measures which DRSEIR 566 fails to address, include, but are not limited to, the following:

   (a) The impacts which the grading activities for the 299-Unit Project will have on the Trabuco Canyon area and its residents based on how long it will take to complete the proposed grading. Although all previous environmental impact reports the County has prepared for the Property have likewise failed to fully address these impacts, they did, at least, concede in the "Geophysical Resources" subsection that, depending on the project, grading would take between 10 and 18 months to complete, based on an average daily grading quantity of 30,000 cubic yards. (*See* Addendum No. 1 at p. 21; "Final Subsequent Environmental Impact Report No. 566" ("FSEIR 566") at p.4-22; DEIR 561 at p.4-28.) The "Geophysical Resources" subsection of the DRSEIR, however, is strangely silent on this issue and the "Project Description" section (p. 2-16) now simply contains a single sentence and footnote stating that grading will require approximately 13 months to complete based on an average of 30,000 cubic yards per day and 21-work days per month. Not only is this estimate incorrect using the County's own numbers (a total of 9.25 million cubic yards of grading at an average of 30,000 cubic yard per day and 21-work days per month translates to 14.68 months of grading), but, as Vedanta and its consultants have repeatedly stated in connection with all previously proposed projects, an average of 30,000 cubic yards per day--especially for the remedial grading--is very unrealistic. Although

30,000 cubic yards per day may possibly be achieved for the 2.45 million cubic yards of conventional grading, a figure of 10,000 cubic yards per day is a much more reasonable assumption for the 6.8 million cubic yards of remedial grading that is proposed. Using these figures (and DRSEIR 566's estimate of 21-work days per month), grading would take longer than 36 months or 3 years to complete. The DRSEIR fails to justify its estimate regarding how long grading for the 299-Unit Project will take, and it also fails to address the impacts that conducting grading activities for that amount of time would have on Trabuco Canyon and its residents--including, but not limited to, the excessive noise, dust, and traffic delays associated with excavating and recompacting more than nine million cubic yards of soil which will remain exposed to the wind during dry seasons, and the rain during wet seasons, over the course of the several years it will take to complete all of the proposed rough grading.

(b) The impacts associated with the heavy ground water seepage into the excavations at the site which DRSEIR 566 anticipates will occur (p.4.2-18 mitigation measure M 2-20), including, but not limited to, (i) the impact of the discharge of collected ground water seepage, (ii) the impact of the interruption in subsurface ground water flow on downstream wells, and (iii) the impacts of the presence of the deep shear keys for buttress fills on the final ground water conditions. The DRSEIR also fails to address whether there is a potential for surfacing of ground water behind the effective subsurface dam created by the shear key of the buttress fill.

(c) The impact of buttress backcut failures. DRSEIR 566 projects a buttress backcut failure rate of 10 percent. (*See* DRSEIR 566 at p. 4.2-20, mitigation measure M 2-34.) However, due to the subsurface conditions typified by landslides within landslides, this 10 percent estimate is overly optimistic. Moreover, the effect of backcut failures on upstream and adjacent properties, regardless of the percentage of failures, are not addressed.

(d) The impact of new soil stability problems which will be created by increasing the amount of water that is discharged into the Property's natural drainage courses and the ground water table. (As stated in the "Hydrology" and "Water Quality" subsections of DRSEIR 566 daily nuisance and storm water runoff will be discharged into the Property's natural drainage courses.) In particular, (i) the increased erosion that will occur in the Property's natural drainage courses during storm flows due to the fact that the weak alluvial soils which are present in those courses will have been softened by the daily nuisance runoff that will be discharged into such drainage courses, (ii) the weakened support for existing landslides which will also result from the discharge of daily nuisance runoff and increased storm water runoff into the Property's natural

drainage courses, and (iii) the new instability problems which will be created by the ground water levels being raised by the infiltration of irrigation and other new sources of water.

(e) The special grading requirements which are necessary to perform the extremely deep fill that are proposed. Although the DRSEIR acknowledges that fill depths will exceed 50 feet and settlement associated with those fills of 4 to 6 inches can be expected (p. 4.2-20 mitigation measure M 2-33), fill depths of up to 130 feet will actually be required to construct the proposed shear keys for the buttress fills. Fills of such great depths require, *inter alia*, (i) additional evaluation that may necessitate compaction criteria well in excess of code minimums, (ii) special moisture conditioning of fill during compaction, and (iii) long-term settlement monitoring prior to building construction.

(f) Imposing a 100 percent performance bond to cover the possibility of the developer's failure to complete the extremely large amount of conventional and remedial grading required for the 299-Unit Project.

9. DRSEIR 566 fails to properly identify, analyze, and mitigate the hydrology impacts associated with the 299-Unit Project. The impacts which the DRSEIR fails to address, include, but are not limited to, the impacts of discharging daily nuisance water runoff and increased storm water runoff into the natural drainage courses of the Property. The natural drainage courses of the Property are dry for a majority of the year (only receiving water during storms). However, the daily nuisance water runoff from the 299-Unit Project will cause the drainage courses to be wet year-round and, therefore, more susceptible to, *inter alia*, erosion. Moreover, the character of the water being dumped into the natural drainage courses will change from slower-moving water carrying soil and debris to faster-moving water that has less soil and debris and, therefore, is prone to picking up soil and debris. DRSEIR 566 acknowledges that, by increasing the flows in the Property's natural drainage courses, the 299-Unit Project will have erosion and sedimentation impacts, but the DRSEIR fails to address any of these impacts. Instead, any analysis of this issue is improperly deferred until *after* the certification of DRSEIR 566--*i.e.*, until a point in the approval process where the public is not permitted an opportunity to review and comment on that analysis, and the County is not required to respond to any public comments.

10. DRSEIR 566 fails to identify, analyze, or mitigate any of the water quality impacts associated with the 299-Unit Project because the entire "Water Quality" subsection of the DRSEIR is based upon a conceptual water quality management plan for a *different* project. At page 4.4-1, the DRSEIR states that its "Water Quality" subsection "summarizes the findings and conclusions of the *Conceptual Water Quality Management Plan for Saddleback Meadows Proposed VTTM 15230 County of Orange, California*" which is included in the DRSEIR as

Appendix "E." However, as its complete title indicates, the "Conceptual Water Quality Management Plan for Saddleback Meadows Proposed VTTM 15230, Development Alternative for 283 Residential Home Sites, County of Orange, CA" which is found in Appendix "E" was prepared to address a different project—*i.e.*, the 283-unit single family housing project which is Alternative No. 8 in the DRSEIR. As such, the entire "Water Quality" subsection must be revised to correctly identify, analyze, and mitigate the water quality impacts of the 299-Unit Project as opposed to the 283-Unit Project which it currently addresses.

11. Assuming *arguendo* that the "Water Quality" subsection of DRSEIR 566 did address the 299-Unit Project, such subsection nonetheless fails to fully and properly identify, analyze, and mitigate the water quality impacts associated with the 299-Unit Project because, *inter alia*, it fails to fully describe how pollutants will be filtered from the daily nuisance and storm water runoff from the 299-Unit Project and what the impacts will be of discharging polluted runoff into the Property's natural drainage courses and O'Neill Regional Park, and the area's groundwater. The DRSEIR claims that a riverine system will be used to filter pollutants from the daily nuisance and storm water runoff from approximately 80 percent of the 299-Unit Project. (*See, e.g.*, p.4.4-13 at PDF 4-1.) In reliance on the riverine system, stormceptor filters will be installed on the storm drains serving the 20 percent of the Project which is located in the northeastern quadrant of the Property only. However, nowhere is it depicted or explained in DRSEIR 566 how flows from the 299-Unit Project will be directed into the riverine system. Indeed, Figure 4.3.2, entitled Proposed Drainage Improvements, shows that all of the runoff from the 299-Unit Project will be directed into the storm drain system and discharged into the Property's natural drainage courses, but the storm drains serving a majority of the 299-Unit Project will not have filters to reduce the amount of pollution in the runoff. The DRSEIR also acknowledges that the riverine system is designed to accommodate low flows only, but it fails to explain how any flows that exceed the capacity of the riverine system will be filtered for pollutants given that the storm drains collecting runoff from 80 percent of the Project will not have filters installed due to the existence of the riverine system. Moreover, the DRSEIR acknowledges that the filters that will be installed will not trap bacterial indicators or toxic constituents. (DRSEIR 566 at p. 4.4-11.) Instead, the DRSEIR relies upon 3,300 lineal feet of the Property's natural drainage courses to filter these pollutants. However, the DRSEIR does not in any way address the impacts that these pollutants will have on the Property's natural drainage courses--some of which flow into O'Neill Regional Park--and the area's groundwater.

12. DRSEIR 566 fails to properly identify, analyze, and mitigate the impacts the 299-Unit Project would have on the Natural Communities Conservation Plan ("NCCP") program and the County's ability to complete its Southern NCCP Subregion and to link the Southern and Central/Coastal NCCP Subregions. Previous environmental impact reports for the Property included four or more

pages of text addressing the NCCP and the impacts of the proposed projects on the NCCP. (*See, e.g.*, FSEIR 566 at pp. 4-127 -- 4-130, 4-144; DEIR 561 at pp. 4-123 -- 4-126, 4-139 -- 4-140.) The DRSEIR, however, contains less than one page of very cursory discussion regarding the NCCP and it fails in any way to address the impacts of the 299-Unit Project on the NCCP and the County's NCCP planning efforts. Moreover, DRSEIR 566 fails to, *inter alia*, (i) acknowledge that the United States Fish and Wildlife Service and the California Department of Fish and Game (collectively, the "Wildlife Agencies") have repeatedly informed the County that the Property provides a critical habitat corridor/linkage necessary for the completion of the NCCP Southern Subregion and (ii) identify the findings which the NCCP requires to be made with respect to the impacts the 299-Unit Project will have on the coastal sage scrub habitat located on the Property. The DRSEIR should be revised to include an appropriate and complete discussion of the impacts of the 299-Unit Project on the NCCP.

13. DRSEIR 566 fails to properly identify, analyze, and mitigate the impact of the 299-Unit Project on wildlife movement on the Property and throughout the NCCP Southern and Central/Coastal Subregions. The DRSEIR touts that the 299-Unit Project has been designed to incorporate a wildlife movement corridor that will permit wildlife to continue to travel safely across the Property. (*See, e.g.*, DRSEIR 566 at p. 4.8-27.) However, the DRSEIR fails to acknowledge that the Wildlife Agencies have previously informed the County that the wildlife corridor proposed as part of the 299-Unit Project does not "retain appropriate topography and habitat to ensure the continued function of the wildlife movement corridor/linkage that exists on Saddleback Meadows." (October 29, 1998 Letter from the Wildlife Agencies to the Orange County Board of Supervisors.) As such, the DRSEIR needs to be revised to contain an analysis of the adequacy of the proposed wildlife movement corridor/linkage and the impact of failing to provide an adequate corridor/linkage.

14. DRSEIR 566 fails to properly identify, analyze, and mitigate the biological resources impacts associated with the 299-Unit Project because, *inter alia*:

(a) The DRSEIR fails to properly identify the sensitivity of the intermediate mariposa lily (*calochortus weedii var. intermedius*) and based thereon erroneously concludes that there will be no significant impact of it requiring any mitigation. (*See* DRSEIR 566 at p. 4.8-21 and Appendix I.1 at p.17.) In Appendix I.1, the DRSEIR erroneously identifies the sensitivity of the intermediate mariposa lily as California Native Plant Society ("CNPS") List 4. (*See* Appendix I.1 at p. 9.) In the text, the DRSEIR correctly lists the intermediate mariposa lily as CNPS List 1B, but then proceeds to conclude that, due to its low sensitivity status, the impact of destroying all plants found on the Property is not significant. (*See* DRSEIR 566 at pp. 4.8-13, 4.8-21.) However, as explained in Appendix "C" to Appendix I.1 of the DRSEIR, the presence of the

intermediate mariposa lily on the CNPS List 1B means that it is "rare, threatened, or endangered in California and elsewhere and is eligible for state listing." Indeed, the only higher listing under the CNPS system is List 1A which includes only those plants that are presumed to be extinct. DRSEIR 566 needs to be revised to correct the inconsistency between its text and Appendix I.1 and, if it is going to maintain its conclusion that there will be no significant impacts on the intermediate mariposa lily, it need to provide facts to support such conclusion because, contrary to how the DRSEIR currently reads, the intermediate mariposa lily does not have a low sensitivity status.

(b) The DRSEIR erroneously concludes that the 299-Unit Project will not have a significant impact on the federally-listed endangered Riverside fairy shrimp because the impacts to it will be mitigated to a level of insignificance by the creation of several ephemeral ponds on the Property. However, as the Biological Opinion on the Saddleback Meadows Residential Development Project found in Appendix I.4 states at pages 19-20, creation of such ponds is experimental and has *never* been done successfully, especially with respect to the conditions found on the Property.

(c) Although one of the technical reports found in the appendices to DRSEIR 566 acknowledges that the Property has been designated as critical habitat for the Riverside fairy shrimp and the coastal California gnatcatcher pursuant to the U.S. Endangered Species Act, the text of the DRSEIR fails to acknowledge this fact. Neither the text of DRSEIR 566, nor any of the appendices thereto, address in any way the significance of this designation.

(d) The DRSEIR fails to properly and adequately mitigate the impacts the 299-Unit Project will have by destroying the hundreds of acres of oak woodlands, vernal ponds, coastal sage scrub habitat, and other biotic communities on the Property which are home to sensitive, threatened, or endangered flora and fauna. The mitigation DRSEIR 566 offers regarding these impacts fall far below that which is required by, *inter alia*, the FTSP, the NCCP, the state and federal endanger species legislation

15. DRSEIR 566 fails to properly identify, analyze, and mitigate the "Aesthetic/Visual" impacts associated with the 299-Unit Project. At page 4.9-22 through 4.9-23, the DRSEIR concludes that the 299-Unit Project will not have a significant aesthetic or visual impact prior to mitigation. However, at page 4-192, DEIR 561 concludes that, despite the use of many of the same contoured grading and viewshed screening techniques which are proposed for the 299-Unit Project, the 318-unit single family housing project which was the subject of DEIR 561 would nonetheless have *unavoidable* significant aesthetic and visual impacts (including night glare impacts) on the Ramakrishna Monastery, St. Michael's

Abbey, and O'Neill Regional Park. DRSEIR 566 fails to explain and reconcile these inconsistent and conflicting conclusions.

16. DRSEIR 566 fails to fully and properly identify and analyze the importance of the archaeological sites found on the Property. At page 4.10-19, the DRSEIR concludes that archaeological site CA-ORA-711 is the only site on the Property which is deemed to be important or significant. However, at page 104, Addendum No. 1 concludes that there are a total of four archeological sites on the Property which are deemed to be important or significant. Those sites are CA-ORA-710, CA-ORA-713, CA-ORA-715, and CA-ORA-1435H. DRSEIR 566 should have an analysis explaining and reconciling these inconsistent conclusions regarding the importance of certain of the archeological sites found on the Property.

17. DRSEIR 566 fails to properly identify, analyze, and mitigate the impacts associated with project "Hazards" as both the Initial Study and the Introduction to the DRSEIR (*see* page 1-4) indicated that it would. Indeed, the Initial Study identifies "Hazards" as one of six areas of potentially significant impacts which might result from the 299-Unit Project, but DRSEIR 566 fails to contain a section identifying and analyzing such impacts. All previous environmental documentation for the Property contained a separate section in which "Hazards" such as wildfire, emergency access, and wildlife interaction were all identified and analyzed. (*See* Addendum No. 1 at pp. 113-17; FSEIR 566 at pp. 4-203 -- 4-212, and DEIR 561 at pp. 4-219 -- 4-228.) Although the DRSEIR does address certain wildfire hazards and fuel modification requirements under the "Public Services--Fire Protection" subsection, it does not address any other hazards, such as the fact that the Project has only one main access road, which Addendum No. 1 identifies as an area of concern and which the Orange County Fire Authority proposed mitigation measures to specifically address. An analysis of the "Hazards" analyzed in the previous environmental documents for the Property should be conducted with respect to the 299-Unit Project.

18. DRSEIR 566 fails to properly describe the "44/178 Alternative" as initially proposed by Vedanta in October 1998 and again in the comments Vedanta submitted regarding the Notice of Preparation (the "NOP") for the DRSEIR. As proposed by Vedanta, although the developer would be free to develop the project of its choice on the 44-acre "Development Parcel," the 178-acre "Conservation Parcel" would be left in its undisturbed natural state--*i.e.*, no development activities of any kind would be conducted on such parcel, including, but not limited to, grading of any kind. However, as described in the DRSEIR, the "44/178 Alternative" allows for the development of 127 single-family housing units on the "Development Parcel" which, as Vedanta indicated in its comments on the NOP, can only be developed on such Parcel if a substantial amount of remedial grading and other construction activities are conducted on the "Conservation Parcel." Indeed, shortly after Vedanta proposed the "44/178

Alternative" in October 1998, the developer conceded that, in order to develop 127 single-family housing units on the "Development Parcel" it would have to grade at least 30 acres of the "Conservation Parcel"--which is not contemplated under the "44/178 Alternative" as proposed by Vedanta. Therefore, a new analysis of the "44/178 Alternative" should be conducted based upon a proper description of the alternative which identifies a range of units which can safely be accommodated within the "Development Parcel." This analysis should include, *inter alia*, an analysis of the geotechnical conditions to determine the greatest number of units that can be developed on the 44-acre "Development Parcel" with the least amount of rough grading. The grading study is of critical importance because it will not only address the economic feasibility of the "44/178 Alternative," but it also determines the nature and extent of the environmental resources which can be spared from the bulldozer's blade. As requested in Vedanta's comments on the NOP, this analysis should consider two versions of the "44/178 Alternative," one in which the developer is required to dedicate the 178-acre "Conservation Parcel" to the County (which has been the County's standard practice on all other major development projects approved during the past 25 years) and another in which the "Conservation Parcel" is purchased by a governmental entity (such as the United States Fish and Wildlife Service and the California Department of Fish and Game), a private entity, private person(s), or any combination thereof.

19. DRSEIR 566 fails to provide sufficient factual information about each of the proposed alternatives to allow for meaningful evaluation, analysis, and comparison with the 299-Unit Project. The DRSEIR provides very little factual information regarding the proposed alternatives and their environmental impacts. Instead, DRSEIR 566 simply makes very general and conclusory statements regarding whether each impact will be greater or less than the 299-Unit Project and each of the other alternatives. Very little factual information is provided which permits differential impacts to be quantified and meaningfully analyzed. For example, no information is provided to allow the number or acres of oak trees, vernal ponds, coastal sage scrub, or any of the other biological resources which are affected under each alternative to be compared with the 299-Unit Project. Similarly, the extent to which each of the alternatives comply with the various goals, objectives, components, regulations, and guidelines of the FTSP is not provided so as to allow a comparison of the alternatives with the 299-Unit Project. Indeed, the alternatives analysis in DRSEIR 566 is almost entirely devoid of any factual information which would support its conclusions regarding the relative impacts of the 299-Unit Project and each of the alternatives. Accordingly, an entirely new analysis of each of the alternatives is necessary to provide the factual information required to conduct a meaningful evaluation, analysis, and comparison of the alternatives with the 299-Unit Project. (Note: Although the DRSEIR provides grading quantities for many of the alternatives, it curiously fails to state a remedial grading quantity for the "44/178 Alternative" while nonetheless conceding that remedial grading will be required for that alternative.)

20. DRSEIR 566 fails to provide any factual information which supports its conclusion that, except for the "No Project Alternative," Alternative No. 8 is the environmentally superior alternative. Alternative 8 is a "reduced density alternative" which simply lowers the number of single family dwelling units by 16 units--*i.e.*, from 299 down to 283. In reaching this conclusion, the DRSEIR provides absolutely no explanation or factual support for how a 283-unit single family housing project--which has virtually the identical environmental impacts as the 299-Unit Project--could possibly be an environmentally superior alternative to Alternative 4 (a 100-unit single family housing project which leaves 85% of the Property as natural open space), Alternative 6 (the "44/178 Alternative"), or Alternative 7 (the "Acquisition Alternative" in which the entire property is purchased by a governmental entity, private entity, or private person(s) for preservation as permanent open space).

21. DRSEIR 566 fails to consider a residential housing alternative which complies with the goals, objectives, components, regulations, and guidelines of the FTSP, nor does it explain why such an alternative would be unacceptable. In its comments on the NOP, Vedanta specifically requested that the DRSEIR identify and analyze at least one reduced-density alternative which complies with all of the goals, objectives, components, regulations, and guidelines of the FTSP. Instead, in Alternative No. 8, the DRSEIR identifies and analyzes a reduced-density alternative that eliminates only 16 out of 299 dwelling units and which complies with virtually none of the goals, objectives, components, regulations, and guidelines of the FTSP. Indeed, DRSEIR 566 fails to provide any explanation for why an FTSP-compliant alternative was not considered.

Attention: Manager

Subject: Draft Environmental Impact Report – Saddleback Meadows.

This letter is not to be interpreted as a contractual commitment to serve the proposed project but only as an information service. Its intent is to notify you that the Southern California Gas Company has facilities in the area where the above named project is proposed. Gas service to the project could be served without any significant impact on the environment. Gas facility additions for the expansion would be in accordance with the company's policies and extension rules on file with the California Public Utilities Commission at the time contractual arrangements are made.

The availability of natural gas service, as set forth in this letter, is based upon present conditions of gas supply and regulatory policies. As a public utility, the Southern California Gas Company is under the jurisdiction of the California Public Utilities Commission. We can also be affected by actions of gas supply or the condition under which service is available, gas service will be provided in accordance with revised conditions.

Estimates of gas usage for non-residential and residential projects are developed on an individual basis and are obtained from the Commercial-Industrial/Residential Market Services Staff by calling (800) 427-2000. We have developed several programs, which are available upon request to provide assistance in selecting the most energy efficient appliances or systems for a particular project. If you desire further information on any of our energy conservation programs, please contact this office for assistance.

Sincerely,

Robert S. Warth
Technical Supervisor

Re: Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows

After review of the cultural resources section of the DEIR, we, the Juaneño Band of Mission Indians ("tribe") are concerned about the protection of this land regarding both archaeological and anthropological impact. We feel that there has been an inadequate investigation into the significance/importance of the archaeological sites. The report indicates that there were three 1 x 1 meter units used to determine the archaeological significance /importance. This is an inadequate sampling of the area to make a determination for the size of this project. Also, we feel that the monitors should be from the local tribe. The practice of finding out of area monitors who do not understand the cultural significance of the local area needs to be corrected. There is also a concern for the wildlife corridor and endangered species, neither of which are adequately addressed.

There is not sufficient information to support the determinations made. The DEIR fails to provide documentation that the CEQA recommended preservation alternatives to the total destruction of archaeological sites to be impacted. The developer should be required to conduct a good faith examination of the feasibility of the preservation measures. They should be encouraged to incorporate one or more of the preservation measures and include the preservation plan in the EIR. Grading and monitoring is not adequate mitigation for the destruction of a significant archaeological site.

If it is determined that data recovery excavation and destruction of the sites is the only feasible option, the investigations should be guided by a research design that follows the California Office of Historic Preservation Guidelines for Archaeological Research Designs (Preservation Planning Bulletin No. 5, February 1991. Dept. of Parks and Recreation, Office of Historic Preservation). The report documenting the excavations should follow the Office of Historic Preservation Guidelines for Archaeological Resource Management Reports (Preservation Planning Bulletin No. 5, December 1989).

Sincerely,

Damien Shilo, Chairman

Re: Saddleback Meadows Revised SEIR No. 566

Dear Mr.Grieman:

I represent Rutter Development Corporation in connection with its entitlement and natural resources permitting efforts for the Saddle Crest and Saddle Creek residential development projects near the Saddleback Meadows project site. The southern boundary of the Saddle Creek project constitutes the northern border of the Saddleback Meadows project. Rutter Development supports the current proposed project and certainly sees it as preferable to the massive mobilehome park previously approved for the site. However, Rutter Development takes exception to Figures 4.8.2 and 4.8.4 in the Biological Resources section of the SEIR.

Figure 4.8.2 is labeled "Proposed NCCP Southern Subregional Planning Area," but it does more than simply delineate the subregional boundaries. The "reserve area" overlay on this exhibit has no basis in any approved or even proposed plan. Consequently, this exhibit should be replaced with one that simply shows the boundaries of the southern subregional planning area and overalys the project's boundaries. Similarly, Figure 4.8.4 is labeled "Proposed Regional Wildlife Movement Corridors" but there is no discussion regarding who is "proposing" the establishment of these corridors or for what species they are proposed to function as corridors. The "proposed" corridors in the exhibit do not correspond to the wildlife corridors shown in the adopted Foothill Trabuco Specific Plan or any other formally adopted or even proposed plan. Therefore, this exhibit should also be deleted, replaced or modified in the Final SEIR.

Thank you for the opportunity to comment on the draft SEIR for the Saddleback Meadows project. Please feel free to call if you have any questions or wish to discuss this matter.

Very truly yours,

Mark R. McGuire

ORANGE COUNTY
REGIONAL RECREATIONAL TRAILS
ADVISORY COMMITTEE

May 31, 2002

Thomas Mathews, Director
Planning and Development Services Department
300 North Flower Street, 3rd Floor
Santa Ana, CA 92703-5000

Subject: Saddleback Meadows Residential Project – Additional Trail Alignment

Dear Mr. Mathews:

As you know, the Regional Recreational Trails Advisory Committee (RRTAC) is a Board-appointed committee composed of equestrians, mountain bicyclists, and hikers. Recently, the RRTAC approved a motion to provide an additional riding and hiking trail through the proposed Saddleback Meadows project site.

The Committee was given a presentation regarding the subject project. Staff noted that the project is already proposing a local trail (referred to in this letter as "Trail A") along the main entry road extending west to east through the project. To provide a loop route we suggest an additional local trail ("Trail B"), to begin at Trail A and go north around the east side of St. Michael's Abbey. Trail B would then connect with the proposed Live Oak Plaza project site and connect to the Live Oak Canyon Regional Trail. **We also request an additional link from Trail B to the proposed Saddle Creek project at the north edge of the Saddleback Meadows project near the connection to Live Oak Plaza.** Mr. Jeff Dickman, County's Chief of Trail Planning, concurred with this concept.

The RRTAC hereby expresses its support for the additional local trail through the proposed Saddleback Meadows project ("Trail B"). We appreciate your department's efforts to provide this trail, and we would like to be kept informed of its progress.

Should you have any questions, please feel free to contact me at (714) 456-1157.

Sincerely,

Alice Sorenson
Chair, RRTAC

Re: Proposed Zone Change (ZC) 98-3 and Area Plan (AP) 98-2 for Saddleback Meadows

Dear Mr. McGill:

The Rural Canyons Conservation Fund, founded in 1983, advocates for the preservation of Orange County's unique inland rural canyon areas through a program of public education and participation in land use decisions affecting the area's unique and scenic natural resources.

We comment as follows on the above referenced proposals:

1. THE AREA PLAN APPLICATION IS INCOMPLETE.

The Foothill Trabuco Specific Plan (FTSP) lists certain informational items that must be provided when a proposed area plan is submitted. Several such items are missing from the subject proposal, including:

- a site-specific resources assessment by a qualified field biologist;
- a site-specific oak woodlands analysis;
- a site-specific wildlife corridor analysis;
- a hydrological analysis;
- detailed mapping of areas within 50 vertical feet or 200 horizontal feet of designated major ridgelines or rock outcroppings;
- a detailed viewshed analysis of the proposed development as viewed from scenic highways;

- a conceptual grading plan at a minimum scale of 1:40 clearly delineating existing and proposed contour elevations, the location and elevation of all building pads, access roads, driveways, slope percentages, heights of manufactured slopes, the total area of disturbance, area of the flat graded pad on each parcel, and the location of retaining and crib walls;

- clear delineation of the building lines for assessing setbacks;

- a consistency report evaluating the project's consistency with each of the regulations and guidelines contained in the FTSP; and,

- three-dimensional models of the site before and after proposed grading.

(FTSP III.G.2.0(e), pages III-90 through III-93.)

Because key information is missing from the application we received, we cannot fully assess the extent of non-compliance with the FTSP at this time, and therefore reserve the right to comment further if and when complete information becomes available.

2. THE PROPOSED SPOT AMENDMENT OF THE FOOTHILL TRABUCO SPECIFIC PLAN IMPROPERLY RENDERS THE FTSP INTERNALLY INCONSISTENT AND INEQUITABLE, AND IS THEREFORE INVALID ON ITS FACE.

State law requires that general and specific plans maintain internal consistency. However, the FTSP amendment proposed as part of this project renders the FTSP internally inconsistent. This inconsistency arises from the following language contained in the proposed spot amendment:

> "Any development shall be in compliance with every regulation of this District (BWR) *and shall be exempt from all of the Regulations and Guidelines included in this Specific Plan other than those provided for by this District.*" (Proposed Draft Ordinance, Exhibit 1, paragraph 3.4(c), italics added.)

This spot amendment conflicts with other general language within the FTSP:

> "This specific plan is adopted pursuant to regulations contained in the Orange County Zoning Code. It is specifically intended by such adoption that the development standards and provisions contained herein shall regulate *all development* within the Specific Plan area." (FTSP III.C.3.0, page III-1, emphasis added.)

> "It is uncertain whether this development cap can be achieved *since all development is required to be consistent with the Specific Plan regulations and guidelines.*" (FTSP II.D.3.0(b), page II-29, emphasis added.)

> "All development within the Specific Plan Area shall be required to be phased in a manner, which is consistent with the requirements of the Growth Management Plan (GMP) Element." (FTSP II.F.1.0(a), page II-43.)

> "For all development projects, a minimum of 50 percent of all shrubs to be planted should be native species." (FTSP IV.G.1.0(a), page IV-16.)

> "For all development projects, a minimum of 50 percent of all shrubs to be planted should be native species." (FTSP IV.G.1.0(a), page IV-16.)

Moreover, as will be shown below, the proposed development which the above spot amendment attempts to legitimize actually conflicts with and undermines the overarching goals and objectives for the Specific Plan area at the expense of the Specific Plan's integrity.

The proposed "wildcard" zoning also creates a class of unwarranted special privileges for this project's applicant, effectively denying other persons subject to the FTSP the equal protection of the law, in violation of the state and federal constitutions.

The proposed spot zoning amendment, therefore, is invalid on its face and thereby subject to nullification by the courts.

3. THE PROPOSED SPOT AMENDMENT OF THE FTSP IS BARRED BY THE FTSP ITSELF.

The FTSP explicitly provides how the Specific Plan may be amended to allow for development, as is now being proposed, that deviates from the recorded tract map for the Saddleback Meadows site:

> "If a development proposal on the aforementioned [Bridlewood, Lyon Ranch, Santiago Ranch, and Zadeh] sites deviates from these approvals and cannot be found to be in substantial compliance with these approvals, a Specific Plan Amendment shall be required for the individual site. Said Specific Plan Amendment *shall*: 1) determine an appropriate density cap for the property; 2) establish new Land Use District Regulations for the site; and 3) *be consistent with all of the provisions of the Specific Plan, as amended.*" (FTSP III.C.10.0(d), page III-4.)

> "Any development proposal, which deviates from the approved Saddleback Meadows Planned Community zoning and Recorded Tract 10692 and which cannot be found to be in substantial compliance with these approvals shall require a Specific Plan Amendment which *shall:* 1) determine an appropriate density cap for the property; 2) establish new development regulations for the Bridlewood Residential District; and 3) *be consistent with all of the provisions of the Specific Plan.*" (FTSP III.D.3.2.(b), page III-20, italics added.)

The proposed spot amendment exempting Saddleback Meadows from all but the revised district regulations clearly conflicts with the above requirements of the FTSP, which unequivocally mandate that the amended zoning regulations for Saddleback Meadows must be consistent with *all* of the provisions of the FTSP. Thus the proposed spot amendment is facially invalid, and, as will be shown below, the proposed area plan is in actual conflict with numerous of the FTSP's substantive requirements.

4. A SITE DEVELOPMENT OR USE PERMIT IS REQUIRED PRIOR TO ANY GRADING.

The proposed spot amendment explicitly allows issuance of a "preliminary grading permit" prior to approval of a site development or use permit. (Proposed Draft Ordinance, Exhibit 1, paragraph 3.4(d).) This flies directly in the face of the following general regulation of the FTSP:

> "Grading: Grading shall be permitted within the Specific Plan Area only upon approval of a site development permit or use permit by the Planning Commission. No grading permits shall be issued without the approval of a precise plan of development, i.e., site development permit or use permit." (FTSP III.C.6.1, page III-2.)

issued without the approval of a precise plan of development, i.e., site development permit or use permit." (FTSP III.C.6.1, page III-2.)

5. DEVELOPMENT DEPICTED ON THE PROPOSED AREA PLAN IMPROPERLY CONFLICTS WITH THE FTSP.

Since, as shown above, the proposed wildcard exemption from all of the FTSP's general substantive and procedural requirements is invalid, all of the FTSP's general provisions apply to this project. Unfortunately, the proposed development violates numerous of these provisions, including:

⇒"Rural Character/Forest Buffer: To preserve the rural character of the area and provide a buffer between urban development and the Cleveland National Forest." (FTSP I.C.1.0(a), "Goals and Objectives," page I-5.)

By any measure of the term, the proposed development, due to its extreme intensity and scale, is anything but "rural" in character. On the contrary, it is a conventional suburban housing tract, to be constructed after mass grading the site in the amount of 11.7 million cubic yards. At 5,000 square feet minimum, the lot sizes are far below the minimum ½ acre permitted in the adjacent FTSP areas, and the proposed average density of 1.35 dwelling units per acre vastly exceeds the prevailing minimum of 1 dwelling unit per 2 acres. The proposal includes manufactured slopes 120 feet high, contour elevation changes of 91 vertical feet, and retaining walls 40 feet high.

Characterizing such a proposal as "rural" can only be described as Orwellian. The submitted area plan application does include a "Rural Character Statement." However, this document merely sets forth general platitudes and idealized sketches on the subject, not specific to the proposed project, and not demonstrating how the concepts would actually be implemented. In the context of this project, "rural" must in large measure be defined in terms of *compliance* with the regulations and guidelines of the FTSP, which purport and serve to implement the general goal of *preserving* the area's rural character. Thus the subject proposal is rural to the extent of its compliance with the detailed requirements of the FTSP, and that compliance leaves much to be desired.

⇒"Except for those legal building sites existing at the time of Specific Plan adoption where compliance with this requirement would preclude development of a single residence on the existing building site, mapping shall identify a minimum corridor width (other than for the wildlife corridor parallel to Live Oak Canyon Road) at all locations of 400 feet measured perpendicular to the corridor's boundary." (FTSP II.C.2.2(c)(3), page II-11, underlining in original.)

The proposal fails to delineate a 400-foot-wide wildlife corridor through the project. The corridor mentioned in the text of the area plan actually diminishes to under 200 feet wide where it passes between the main spine road on the south and St. Michael's Abbey on the north.

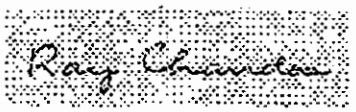
⇒"Development shall maintain a minimum 50-foot setback of all structures and barrier fencing from all corridors. Uses. within the setback zone shall be limited to low-intensity, residential-related activities such as recreation and private open space." (FTSP II.C.2.4(a), page II.14.)

The proposed wildlife corridor violates this setback requirement where it passes between the southern and northern clusters of housing units.

The proposed wildlife corridor violates this setback requirement where it passes between the southern and northern clusters of housing units.

Please include this letter in the official record of proceedings for this project. Thank you for the opportunity to comment.

Sincerely,



Ray Chandos

Re: Comments of Saddleback Canyons Conservancy on the Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows (DEIR), State Clearinghouse No. 1996121072

Dear Sir or Madam:

The Saddleback Canyons Conservancy is dedicated to protecting and enhancing the environment and quality of life in the Foothill/Trabuco Specific Plan (FTSP) area and surrounding areas of Orange County. The following comments are provided in response to the DEIR.

NONCOMPLIANCE WITH THE FTSP

The proposed project lies within the FTSP area. The proponents of the project have proposed a zone change (ZC 98-3) that would be required to amend the FTSP for the project ("Bridlewood Residential District"). Such an amendment to the FTSP would exempt the project from all regulations and guidelines in the FTSP other than those provided for by the Bridlewood Residential District.

Upholding the integrity of the FTSP is of utmost concern to the Saddleback Canyons Conservancy. The proposed project site serves as a transitional buffer between the suburban developments of Lake Forest and Mission Viejo to the rural canyons area. The project's proximity to the Cleveland National Forest (within 1 mile) speaks to the need for compliance to – not exemption from – the development guidelines set forth in the FTSP.

The proposed development violates the spirit and letter of the FTSP. The primary goals of the FTSP are to "preserve the rural character of the area and provide a buffer between urban development and the Cleveland National Forest." The project in no way conforms to such a goal. Indeed, 299 tract

homes on a mass-graded site is anything but "rural." It is time to stop suburban sprawl, say "no" to continued mass development, and "yes" to a preservation and conservation plan.

DESTRUCTION OF HABITAT AND INTERFERENCE WITH WILDLIFE CORRIDORS

The project site is within the Southern Orange County Natural Communities Conservation Plan (NCCP) and provides a critical wildlife connector between the Central and Southern NCCP subregions and the Cleveland National Forest. In addition, the site itself provides habitat for the federally endangered Riverside fairy shrimp, and the federally threatened coastal California gnatcatcher, among other special status species. In view of the fact that the County, the U.S. Fish and Wildlife Service, and the California Department of Fish and Game have initiated the Southern Subregion NCCP process and that preliminary reserve designs are scheduled for completion in July 2002, a revised environmental document should be prepared to incorporate this critical information.

FAILURE TO ADEQUATELY ANALYZE CUMULATIVE IMPACTS

The list of "related" projects is limited to a small area near the project and excludes other major projects in the NCCP Southern Subregion. Among the major projects that must be included in a revised cumulative analysis include but are not limited to the massive Rancho Mission Viejo project (14,000 homes and 427 acres of "urban activity"). Additionally, the DEIR fails to mention the Rancho Potrero Leadership Academy, which also lies within the FTSP area, for which the Board of Supervisors filed a Notice of Determination in December 2001. The cumulative analyses of land use and planning, geology and soils, hydrology and water quality, air quality, traffic and transportation, biological resources, public services and utilities, aesthetics and growth inducement must consider all foreseeable projects.

NONCOMPLIANCE WITH NEW WATER QUALITY REGULATIONS

Aliso Creek, adjacent to the project site, is listed as a Category 1 Priority Impaired Water Body in the EPA's National Water Quality Report (2000). New water quality regulations have recently been ordered against the County of Orange by the Regional Water Quality Control Board. These stricter regulations supplant the 1994 NPDES permit referenced in the DEIR, and were enacted due, in part, to the extremely impaired water quality existing in Aliso Creek. The DEIR fails to explain how the project can comply with these new water quality regulations.

LACK OF WATER TO SUPPORT THE DEVELOPMENT

The Orange County Register recently reported (May 18, 2002) that "drought conditions have dried up two wells that the Trabuco Canyon Water District relies on to supply Trabuco Canyon and Rancho Santa Margarita residents." The TCWD is seeking additional appropriative water rights from the State Water Resources Control Board. Yet, as reported in correspondence to me dated May 14, 2002 from the State Water Resources Control Board, further processing of the TCWD's request for

additional water rights is being held in abeyance until several senior priority applications in the watershed are processed. This water shortage should be recognized as an impediment to the advancement of any new development in the area served by the TCWD.

CONCLUSION

The project is out of compliance with the FTSP. The project is not rural. The project significantly and negatively impacts biological resources and wildlife corridors. The project site is adjacent to the impaired Aliso Creek. The water district has severe water shortage problems. An additional 299 homes adds to suburban sprawl and downstream negative environmental impacts. The project should not proceed. The site should be set aside as a preserved habitat/wildlife corridor, and protected as open space for generations to come.

Please incorporate this letter into the official record of proceedings for this project.

Very truly yours,

Subject: Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows—EIR 566

Dear Manager:

The Sierra Club appreciates the opportunity to comment upon the Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows—EIR 566 (DRSEIR). As strong supporters of protecting the ecological integrity and aesthetic value of the remaining open space in Orange County, our members are closely monitoring projects proposed for properties in the vicinity of the Cleveland National Forest. To facilitate this monitoring process, as well as to properly inform the general public and decision-makers, it is essential that all environmental assessment related to such projects be conducted in strict compliance with the provisions of CEQA and the CEQA Guidelines.

Unfortunately, as it is currently written, the DRSEIR does not adequately address significant issues related to the proposed Saddleback Meadows residential development and its effect on the local environment. These issues include those justifiably raised by a number of individuals in comments already provided to you; therefore, the Sierra Club wishes to incorporate into this letter, by reference, each of the following documents:

- Comments by Terrell Watt, AICP, submitted in a letter dated June 7, 2002, on behalf of the National Audubon Society, Endangered Habitats League, and Rural Canyons Conservation Fund
- Comments by Edmond M. Connor, submitted in a letter dated June 9, 2002, on behalf of the Vedanta Society of Southern California
- Comments by Ray Chandos, submitted in a letter to Frank McGill dated May 28, 2002, on behalf of the Rural Canyons Conservation Fund
- Comments by Patricia Martz, Ph.D., submitted in a letter dated June 10, 2002

Although the Sierra Club believes that *all* of the issues discussed in the above documents warrant full consideration and thorough analysis in a revised DRSEIR, two are of overarching significance to our members and deserve particular emphasis.

SIERRA CLUB

Suburban Sprawl
The significant negative impacts of the proposed Saddleback Meadows development are all attributable to the fact the project would further extend suburban-style development into the remaining wildlands of eastern Orange County. Attendant to such sprawl are the inevitable habitat destruction and fragmentation; watershed and water quality degradation; increases in vehicle miles traveled, traffic congestion, and air pollution; and deterioration of viewsheds and noisesheds. An adequate DRSEIR must honestly identify the true nature of the proposed Saddleback Meadows development as suburban sprawl, analyze the cumulative impacts of allowing similar sprawl-type projects to encroach upon remaining wildlands, and propose alternative locations for providing similar amounts of housing within the existing footprint of urban/suburban Orange County.

Benefits of Preservation
Although serious and ongoing consideration has been given to acquiring the Saddleback Meadows site for preservation in its natural state, only passing attention is given to acquisition in the DRSEIR. An adequate DRSEIR would thoroughly analyze the environmental *and* economic benefits of acquisition, potential sources of funding, and the relationship of acquisition to fulfilling the goals and objectives of all of the following: The Orange County General Plan, Foothill/Trabuco Specific Plan, Aliso Creek Corridor Specific Plan, and Central-Coastal Subregion Natural Community Conservation Planning/Habitat Conservation Plan.

The Sierra Club recommends that the DRSEIR be revised to properly address all issues raised in this letter, both directly and by reference, and recirculated for public comment.

Respectfully submitted,

Santa Ana, CA 92703-5000

Subject: Saddleback Meadows Residential Project – Additional Trail Alignment

Dear Tom:

Recently, the County's Regional Riding and Hiking Trails Advisory Committee (RRHTAC) that I serve on was given a presentation regarding the subject project. Staff noted that the project is already proposing a local trail (referred to in this letter as "Trail A") along the main entry road extending west to east through the project. To provide a loop route, the RRHTAC supported an additional local trail ("Trail B"), to begin at Trail A and go north around the east side of St. Michael's Abbey. Trail B would then connect with the proposed Live Oak Plaza project site and connect to the Live Oak Canyon Regional Trail.

Upon review, Trails4All would also like to offer our support for the additional local trails through the proposed Saddleback Meadows project, linking with Live Oak Plaza and the Saddle Creek projects. We appreciate your department's efforts to provide this trail, and we would like to be kept informed of its progress.

Should you have any questions, please feel free to contact me at (714) 834-3136.

Sincerely,

Jim Meyer,
Executive Director

Re: Comments on the Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows (DRSEIR), State Clearinghouse No. 1996121072

Manager

This comment letter on the Draft Revised Subsequent Environmental Impact Report ("DRSEIR") for the proposed Saddleback Meadows development project ("project') is submitted on behalf of National Audubon Society, Endangered Habitats League and Rural Canyons Conservation Fund ("the commenting groups"). These comments provide a detailed and explicit outline of the problems and inadequacies presented by: (1) the project itself, including its geological impacts and impacts to the habitat of several endangered and sensitive species; (2) the DRSEIR, including fatal deficiencies under the California Environmental Quality Act ("CEQA") (Pub. Res. Code §§ 21000 et seq.) and the CEQA Guidelines (14 Cal. Code Regs. §§ 15000 et seq.); and (3) the project's inconsistency with the County General Plan.[1]

[1] This comment letter was prepared by Terrell Watt, Planning Consultants, with assistance from legal counsel to the commenting groups. Terrell Watt has over twenty years of land use and environmental planning experience. She has expertise in conservation planning, "smart growth" development projects, CEQA and NEPA, NCCPs/HCPs and government reorganization projects. Her recent projects include: (1) development of conservation plans for the Central Coast under a grant from the David and Lucile Packard Foundation; (3) project management of a Sphere of Influence Study for Marin County; (3) consulting on a habitat conservation planning program for the City of Livermore, partially funded with a grant from the California Department of Fish and Game; and (4) project management of the Los Angeles Infill Working Group Project under a grant from Caltrans. The latter is a joint effort by the State Department of Housing and Community Development, the City and County of Los Angeles and Environment Now. A current resume for Ms. Watt is attached.

A summary of the DRSEIR's major defects follows:

Inadequate Project Description: The DRSEIR's project description remains incomplete and, therefore, inadequate. Specifically, the project description lacks important details about the project that are critical to an adequate analysis of project-related and cumulative impacts. Such details include, but are not limited to: (1) fundamental engineering aspects of the project related to mass grading and the probable need for export of unsuitable cut and importation of suitable fill; (2) a detailed description and proposed uses of open space; (3) the complete Project Design Feature that includes the final drainage plan; (4) proposed home size and total development contemplated, including accessory structures and paving; (5) hazards and hazards-related project features, such as possible presence of on-site contamination; among other information about the project. Without this information, the evaluation of impacts cannot be complete.

Inadequate Project Setting: The DRSEIR fails to describe key elements of the project setting adequately and completely. Such elements include, but are not limited to: (1) key general plan policies and regional policies relating to habitat planning, in particular the Southern Orange County Natural Communities Conservation Plan (NCCP); and (2) a list of cumulative projects, geographic study area for the cumulative analysis or plan based approach to cumulative impacts. This information is critical to the analysis of project-related and cumulative impacts.

Failure to Identify or Analyze the Full Extent of Significant Environmental Impacts: The DRSEIR is riddled with conclusions unsupported by facts and analysis on the significance of environmental impacts. Specifically the DRSEIR concludes, based on improperly deferred mitigation measures and mitigation measures of unproven efficacy, that all potentially significant impacts except cumulative air quality will be reduced to less than significant with mitigation. Insufficient evidence is provided to support the conclusion that *all but one* impact will be less than significant after mitigation.

Inadequate Cumulative Impacts Analyses: The DRSEIR's cumulative impacts section is non-existent. The DRSEIR fails to provide a complete list of cumulative projects or to outline a plan based approach to the cumulative analysis. The list of "related" projects is limited to a small area near the project and excludes other major projects in the NCCP Southern Subregion. Brief, conclusory statements are made concerning cumulative impacts throughout the DRSEIR. Moreover, the DRSEIR fails to consider feasible mitigation for the project's incremental contribution to cumulative impacts. Notwithstanding this complete lack of analysis, the DRSEIR concludes that all cumulative impacts will be less than significant with the exception of cumulative air quality.

Inadequate Growth-Inducing Impacts Analysis: The DRSEIR's growth-inducing impacts section is likewise inadequate. For example, the DRSEIR fails to analyze the potentially significant growth-inducing impacts associated with the extension of utilities and roads, and the placement of a water tank and access road beyond the project site. The DRSEIR

offers no analysis or even recognition of the precedent-setting effect the proposed project would have on development in the area, and development on sites where the topography and presence of biological habitat and wildlife corridors should limit such projects.

Inappropriate Deferral of Feasible Mitigation Measures: The DRSEIR improperly defers mitigation measures. Many of the deferred mitigation measures, including measures related to drainage and hazards mitigation, are relied upon to reduce significant impacts without any supporting facts or analysis.

Failure to Analyze a Reasonable Range of Alternatives: The DRSEIR includes numerous alternatives, but fails to analyze an alternative that fully mitigates for on- and off-site impacts. Moreover, the DRSEIR fails to properly identify the environmentally superior alternative, after the no-project alternatives, as Alternative 4.

These and other major defects in the DRSEIR described below render the document inadequate as a basis for informed decision-making and legally deficient under CEQA and the planning and zoning law. The County should give no further consideration to the project until an EIR is prepared and circulated that fully complies with CEQA and the CEQA Guidelines.

CONSIDERATION OF THE PROJECT IS PREMATURE

The County, the U.S. Fish and Wildlife Service and the Department of Fish and Game have initiated the Southern Subregion NCCP process. Preliminary reserve designs are scheduled for completion in July 2002. The project site is within the Southern Subregion and provides a critical wildlife connector between the Central and Southern NCCP subregions and the Cleveland National Forest. In addition, the site itself provides habitat for a number of special status species.

The NCCP reserve design(s) will suggest where development should and should not occur based on biological resources. This new information is fundamental to a determination of whether all or a portion of the project site should be included in a "reserve," or alternatively in a development area. A revised environmental document must include this information.

BACKGROUND AND PROJECT CONTEXT

The property is located in the lower, southeastern foothills of the Santa Ana Mountains and is currently used for horse and cattle grazing. The site's topography is hilly with several steep slopes and ravines. Soils on site are highly erodable. Aliso Creek is located nears the western site boundary and generally follows El Toro Road. Drainage from the site flows to the west into Aliso Creek, which drains into the Pacific Ocean at Aliso Beach, and Oso Creek, a tributary of Trabuco and San Juan Creeks, and south to O'Neill Regional Park. DRSEIR at page 4.2-2. The site provides an essential low elevation wildlife corridor between the Central and Southern NCCP areas and the Cleveland National Forest. Such a low elevation corridor is needed for gnatcatchers and other species. The site also supports important wetlands that provide habitat for Riverside fairy shrimp and western spade foot toad.

Under the proposed project, a gated community of 299 single-family residential lots would be built on approximately 222 acres. The total developed area would be approximately 66.9 acres and the total open space would be on approximately 155.1 acres. Only a portion of the area, approximately 83.25 acres would be in "natural resource preservation area." However, this area is subject to remedial grading and biological enhancement activities, thereby potentially degrading the resources even within this "natural resource preservation area." DRSEIR at page 2-16. Massive grading is needed to accommodate the project on this site. Grading would involve 70%+ of the site. It is still unclear to what extent remedial grading will extend beyond the area illustrated in the preliminary grading plan.

In summary, the site plan can best be characterized as "suburban sprawl," with roads and units extending across the entire site, thereby fragmenting the open space areas and extending into wildlands and interfering with wildlife corridors. This pattern of development would severely impact biological resource values on- and off-site and impede wildlife migration.

ANALYSIS

I. THE DRSEIR IS INADEQUATE UNDER CEQA.

The DRSEIR is deeply flawed under CEQA. An EIR must provide enough analysis and detail about environmental impacts to enable decision-makers to make intelligent judgments in light of the environmental consequences of their decisions. See CEQA Guidelines § 15151; Kings County Farm Bureau v. City of Hanford, 221 Cal.App.3d 692 (1990). Under the law, the lead agency must make a good faith effort to fully disclose the environmental impacts of the project. This requirement cannot be met unless the project is adequately described and existing setting information is complete. See County of Inyo v. City of Los Angeles, 71 Cal.App.3d 185, 199 (1977). Both the public and decision-makers need to fully understand the implications of the choices presented by the project, mitigation measures, and alternatives. See Laurel Heights Improvement Ass'n v. Regents of University of California (Laurel Heights I), 6 Cal.4th 1112, 1123 (1988). The DRSEIR fails to provide sufficient information to enable informed decision-making by the County, the public, and the permitting agencies. Much important information remains improperly omitted or deferred until a later date in violation of CEQA; what information is provided remains vague and flawed.

The DRSEIR is a construction level EIR and therefore would allow for the issuance of a rough grading permit. Many of the most significant impacts are irreversible after rough grading has occurred. Thus, detailed information concerning project level impacts must be provided at this stage of project consideration so that the public, agencies and County decision-makers can fully understand the impacts of the proposed project and alternatives. Deferral of information concerning project-related and cumulative impacts, mitigation measures and alternatives is improper and unacceptable given the types of activities that will result from the approval of the project at this stage.

A. The DRSEIR Fails to Describe the Project Adequately.

The DRSEIR fails to describe the project and its setting accurately and completely. It omits key project features that have the potential to result in significant impacts.

The CEQA Guidelines define "project" as "the whole of an action, which has a potential for resulting in a physical change in the environment, directly or ultimately . . .." CEQA Guidelines § 15378. Among other components, an EIR's project description must contain a "general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals if any and supporting public service facilities." CEQA Guidelines § 15124(c). As the Court of Appeal has noted, "The defined project and not some other project must be the EIR's bona fide subject." County of Inyo, 71 Cal.App.3d at 185. An accurate and complete project description is indispensable because, "[a] curtailed or distorted project description may stultify the objectives of the reporting process. Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal . . . and weigh other alternatives in the balance. An accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR." Id. at 192.

The DRSEIR also fails to provide an adequate description of the setting for the project. Such a failure is fatal under CEQA. CEQA and the CEQA Guidelines mandate that an EIR include a description of "the physical environmental conditions in the vicinity of the project . . . from both a local and a regional perspective . . . Knowledge of the regional setting is critical to the assessment of environmental impacts." CEQA Guidelines §§ 15125(a) and (c). This requirement derives from the principle that without an adequate description of the project's local and regional context, the EIR, and thus the decision-makers and the public who rely on the EIR, cannot accurately assess the potentially significant impacts of the proposed project.

The DRSEIR for the project is inadequate. It fails to describe key aspects of the proposed project with the potential to result in significant environmental impacts. Additionally, it fails to describe accurately and completely the environmental setting impacted by the project. Accordingly, potentially significant environmental impacts cannot be adequately analyzed or addressed by the DRSEIR and, for this reason, the DRSEIR is fatally deficient under CEQA.

1. **The DRSEIR Fails to Describe Adequately the Source and Placement of Cut and Fill Material and the Extent of Grading Required to Accommodate Roads and Dwelling Units.**

Massive earthwork will be required to prepare the site for access roads and houses. More than ½ of the site (126 acres) has slopes in excess of 26% with about 32 acres with slopes exceeding 50%. Preliminary estimates in the DRSEIR are that about 2.45 million cubic yards of conventional excavation (cut) and an equal amount of fill will be required. In addition, about 6.8 million cubic yards of remedial grading are required. The DRSEIR states that cut and fill (including several areas exceeding 50 feet in depth) will be balanced on site. However, the DRSEIR and geotechnical report present information that indicates on-site materials may not be suitable to support the project without imported materials. See DRSEIR at page 4.2-11. Moreover, mitigation measures M 2-14 and M 2-15 suggests that off-site borrow materials will be needed and on-site material removed:

> M 2-14 Any objectionable material, as determined by the Soil Engineer, shall be subject to relocation in deeper fill areas or removal off-site. DRSEIR at page 4.2-18
>
> M 2-15 All borrow sites shall be approved by the Soil Engineer/Geologist prior to on-site delivery. This will permit the timely allocation of such available materials for use on the project site.

To the extent that exportation of cut and importation of fill will be required to implement the project, this information must be provided. Related impacts to air quality, off-site grading and stockpiling and traffic, among other issues must be disclosed and analyzed in a revised environmental document.

Although the DRSEIR fails to provide adequate information concerning proposed cuts and fills in terms of their location and extent, the document does refer to fills in excess of 50 feet in height. The DRSEIR provides virtually no information regarding the source and placement of cut and fill material, the full extent of grading required to accommodate roads and dwelling units, and the phasing of the cut and fill operation. Without this information, the DRSEIR environmental impacts analysis does not and cannot analyze the impacts of transporting such a significant amount of fill to the project site in terms of increased traffic and air pollutants, or the impacts of the cutting and filling itself, including impacts to air quality, open space, habitat, and special status species. Without an accurate and complete description of the proposed site grading and fill, the DRSEIR cannot adequately analyze environmental impacts or comment on the proposed project's consistency with the County's General Plan and grading ordinance.

A revised environmental document should include clear graphics that show cross sections where cuts and fills will exceed 50 feet. In addition, a revised environmental document must identify the sources of fill that are suitable to support the proposed development. Additional information

must be provided concerning the suitability of on-site material for fill if the DRSEIR continues to assume that cut and fill will balance on-site.

2. The DRSEIR Fails to Describe Adequately the "Open Space" Areas.

The DRSEIR fails to provide a complete description of the "open space" areas of the proposed project. Little or no information is provided regarding, among other aspects: the extent of grading to the open space; to what degree the open space will be altered from its present natural condition; the uses to which the open space will be put and the extent of those uses, including trails and recreation; and, the presence and location in the open space of utility lines, access roads and other services.

The lack of a complete description in the DRSEIR of alteration to, and ultimate uses of the open space areas renders any analysis of either project-related or cumulative impacts thoroughly inadequate. A revised description of any alteration to the open space and the uses proposed for the open space land, including the proposed water reservoir, must be completed. Once a complete description has been obtained, the DRSEIR's analysis of the environmental impacts to biological resources, geology, and air quality, among others, must be revised.

3. The DRSEIR Fails to Describe Adequately the Project's Master Drainage Concept and Project Features Directed as Maintaining Water Quality.

The DRSEIR fails to adequately describe the project's drainage concept and project features purportedly directed at maintaining water quality. Specifically, the DRSEIR's environmental impacts analysis concerning hydrology states that the "Project Design Feature" to mitigate drainage impacts is "being prepared in consultation with USACE." DRSEIR at page 4.3-7. Thus, the complete master drainage concept is not included in the DRSEIR for public, decision-maker and agency review. Although a final description of the master drainage concept is still being developed, the DRSEIR nonetheless concludes that no significant impacts associated with drainage will occur . In part, this is correct: no significant impacts <u>can</u> be identified based on such an inadequate project description. Without a complete description of the necessary drainage facilities, the DRSEIR fails under CEQA because impacts to water quality, biological resources, habitat, special status species, and human safety cannot be assessed. Once a complete description has been obtained, a revised impacts analysis must be completed.

The DRSEIR continues to describe other aspects of the project intended to mitigate water quality impacts:

"The remainder of the project site (the northerly development area) does not have sufficient room to accommodate the land-intensive requirements of the riverine system. Therefore, runoff from the balance of the developed portion of the project site would be primarily cleansed through stormceptors prior to discharge into natural drainage courses. Stormceptors trap trash, sediment,

and oils. They would also trap phosphorus that is attached to the sediment. However, they have no known effect on bacterial indicators or toxic constituents, both of which are constituents of concern for Aliso Creek. Removal of bacterial indicators would occur as the runoff continues through 3,300 linear feet of natural before reaching Aliso Creek. As part of the final design, ponds and swales would be incorporated to the maximum extent feasible in the development area within many small-scale features, such as, medians, parkways, and other developed open space in order to maximize the opportunity for removal of bacterial indicators and toxic constituents prior to outletting in the natural drainages." DRSEIR at page 4.4-12.

This paragraph suggests that:

> Key elements of the project that are critical to reducing significant impacts to drainage and water quality have not been designed. Therefore, the project description lacks key information to support both an adequate analysis of impacts and to support a conclusion that project impacts will be less than significant.
>
> Mitigation may not be sufficient to address impacts associated with bacterial indicators or toxic constituents.

A revised environmental document, based on a complete description of drainage and water quality features and feasible mitigation measures must be completed.

4. The DRSEIR Fails to Describe Adequately the Characteristics of Residential Uses

The DRSEIR lacks a complete description of proposed uses at the project site. Specifically, the DRSEIR fails to describe key aspects of the proposed residential project including, but not limited to: the size of the houses; their lot coverage; paving for roads driveways and parking lots; and accessory uses, such as swimming pools and storage. Without an adequate description of home size, lot coverage, and accessory uses, significant environmental impacts to aesthetics and water quality, among other impacts, cannot be identified or assessed and suitable mitigation measures cannot be proposed. To the extent this information is not available, a worst-case estimate of total site soft and hard cover must be developed and used to determine the extent of environmental impacts associated with site coverage. Without a clear understanding of how much land is to be covered by development, potentially significant environmental impacts to drainage, water quality, habitat, and special status species, among others, and the creation of geologic and flooding hazards cannot be identified, let alone assessed.

5. The DRSEIR Fails to Describe Adequately the Proposed Project's Construction Activities and Phasing.

The project description provides a cursory description of construction phasing and activities.

Among the information that is not sufficient is information about the extent and duration of grading activities. Without a description of these activities and phasing and the assumptions underlying the air quality estimates, the DRSEIR cannot adequately identify and analyze environmental impacts to air and water quality, among others, due to truck traffic and emissions, construction noise and dust. An EIR for a project such as this must include a description of the construction period activities, including, but not limited to: phasing; types of equipment; construction employment; staging areas, borrow sites and spoils disposal sites, among other details of the construction that could result in impacts. A revised environmental document must be prepared that includes this information and revised impact analyses as warranted based on the information.

6. The DRSEIR Fails to Describe the Project Site's Biological Resources and Habitats Adequately.

The DRSEIR fails to adequately describe biological resources on- and off-site. The document contains inadequate information concerning on-site biological resources, including oak woodlands, aquatic resources, raptor nesting locations and wildlife corridors, and fails to provide any description of biological resources within an adequate cumulative study area, which at a minimum, should include the entire Southern Subregion and Central NCCP areas.

Finally, the relationship of the project site to the Southern Orange County NCCP is not described or analyzed. There is a Figure in the DRSEIR, which illustrates a proposed Southern reserve, but the DRSEIR fails to state how this related to the proposed project. See Figure 4.8-2. Clarification is needed concerning the Southern NCCP process and its implications for this project. Without the inclusion of these, and other, key details of the on- and off-site biological regime, the DRSEIR cannot adequately analyze project-related and cumulative impacts.

7. The DRSEIR Fails to Describe Project Inconsistencies with Applicable Plans.

A number of plans are applicable to the project site including, but not limited to:

The Orange County General Plan

The Foothill/Trabuco Specific Plan

Aliso Creek Corridor Specific Plan

The Central-Coastal Subregion Natural Community Conservation Planning/Habitat Conservation Plan (NCCP/HCP)

The DRSEIR provides a very cursory policy consistency review in the Land Use section and the biological resources sections. The consistency review does not include a table of key policies and

"findings" as to project consistency with these policies. It appears that the section omits several key policy inconsistencies, including the following:

Orange County General Plan

The Orange County General Plan Resources Element includes several policies concerning protection of natural resources as follows:

Goal 1: Protect wildlife and vegetation resources and promote development that preserves these resources.

Goal 3: Manage and utilize wisely the County's landform resources.

Objective 3.1: To minimize to the extent feasible the disruption of significant natural landforms in Orange County.

Policy 1. To identify and preserve the significant wildlife and vegetation habitats of the County.

Policy 5. To protect the unique variety of significant landforms in Orange County through environmental review procedures and community and corridor planning activities.

The project as proposed appears to conflict with these overarching goals, objectives and policies of the Orange County General Plan. A revised analysis of project consistency with applicable General Plan policies must be included in a revised and recirculated environmental document.

The Foothill/Trabuco Specific Plan

The Foothill/Trabuco Specific Plan calls for preservation of significant landform, biological, cultural and scenic resources on-site. According to the DRSEIR's alternatives analysis, only Alternative 4 is consistent with the Specific Plan requirements. Also according to the DRSEIR, "[t]he proposed project would be in substantial compliance with or consistent with the previously approved and Recorded Map 10692 with respect to proposed residential gross density and providing for the provision of a substantial increase in open space and the presence of a wildlife corridor as outlined in the F/TSP." DRSEIR at page 4.1-12. However, the proposed project would amend the F/TSP. DRSEIR at page 4.1-12. Nowhere in the DRSEIR are the proposed amendments to the F/TSP outlined.

The proposed project is inconsistent with the F/TSP in other major respects, including, but not limited to its failure to provide information required by the F/TSP (see Letter submitted by Rural Canyons Conservation Fund, dated May 28, 2002, hereby incorporated by reference).

The Central-Coastal Subregion Natural Community Conservation Planning/Habitat Conservation Plan (NCCP/HCP)

Figure 4.8.2 indicates that the entire project site is located within an NCCP "reserve area." The DRSEIR fails to point this out or to analyze the implications of this for the project.

A significant theme of all of these plans is the protection of key wildlife corridors in the area. It is clear from the project site plan that minimal provisions will be made for continued wildlife movement and those species that attempt to traverse the on-site corridor will be subject to significant additional constraints including: modified topography, new road corridors, presence of new residents in the area, increased noise and lighting as well as residential units in the path of the Northern Corridor. See Figure 8.4.4. The project will have significant impacts on wildlife migration that must be identified in the environmental document and called out as inconsistencies with applicable policies in the above-listed Plans. To the extent that wildlife corridors are assumed on adjacent privately owned properties, the revised environmental document should explain how these corridors would be maintained and not destroyed by cumulative development projects.

B. The DRSEIR's Analysis of Environmental Impacts Is Inadequate.

The DRSEIR's analysis of environmental impacts fails to provide the necessary facts and analysis to allow the County and the public to make an informed decision. Without such detail, the DRSEIR is deficient under CEQA. The role of the EIR is to make manifest a fundamental goal of CEQA: to "inform the public and responsible officials of the environmental consequences of their decisions before they are made." Laurel Heights I, 6 Cal.4th at 1123. To do this, an EIR must contain facts and analysis, not merely bare conclusions. See Citizens of Goleta Valley v. Board of Supervisors, 52 Cal.3d 553, 568 (1990). Any conclusion regarding the significance of an environmental impact not based on analysis of the relevant facts fails to achieve CEQA's informational goal.

As set forth below, the DRSEIR is riddled with conclusory statements regarding environmental impacts, unsupported by facts and necessary analysis. Furthermore, the DRSEIR attempts to defer analysis of environmental impacts to a later date. As discussed below, such deferral is not an option. CEQA mandates that environmental impacts be identified and analyzed in the EIR, not at a later date. See Sundstom v. County of Mendocino, 202 Cal.App.3d 296 (1988) (holding that a negative declaration was invalid when county approved a project while postponing the resolution of uncertainties regarding environmental impacts to a later date).

1. The DRSEIR Fails to Analyze Impacts to Biological Resources Adequately.

The DRSEIR's biological impacts analysis is inadequate in numerous respects, including, but not limited to:

Underestimation of project-related impacts to biological resources: The DRSEIR fails to adequately characterize the extent of project-related impacts to biological resources: First, the uses and management of the open spaces on the project-site are not sufficiently defined and "locked-in" to ensure that biological resources located in these areas will not be impacted. For example, if there are recreational uses in the open space areas, wildlife may not use these migration corridors. In addition, impacts could be associated with the public and private landscaping plans, which are not required to be prepared until after project approval and EIR certification. See SC 8-7 and SC 8-8. No criteria are specified in the DRSEIR for these plans. Moreover, because the full extent of grading and importation of fill/exportation of cut is not disclosed, there are likely to be additional impacts to biological resources on- and off-site that are not described in the DRSEIR. If recreation and other uses are to be prohibited in the open space areas, a revised DRSEIR must state how these restrictions will be enforced and cite examples where similar restrictions have been effective (e.g. more effective than "fencing," which is a proposed mitigation measure).

Deferral of analysis and mitigation: The DRSEIR improperly defers surveys for trees that host nesting raptors. Trees on the project site that provide nesting should be identified prior to certification of the EIR and protection provided as required under the federal MTBA. DRSEIR at page 4.8-22.

Insufficient evidence to support a conclusion that indirect effects would be insignificant. The DRSEIR's conclusion that indirect effects are insignificant is not supported by evidence. The proposed site plan results in a pattern of development (roads and houses) that fragments the property, extends to adjacent undeveloped lands and has an extensive edge. Moreover, the project would introduce lighting, noise and residents in a wildlife area – the effects of which are not adequately disclosed or analyzed in the DRSEIR. Mitigation measures recommend "fencing" adjacent to undisturbed areas of open space. DRSEIR at page 4.8-32. Not only could such fencing result in additional impacts (e.g. impeding wildlife migration), but there is no evidence such fencing will effectively protect open space areas from trespass by children, pets and the like. Additional evidence must be provided in a revised environmental document to support the conclusion that these indirect effects are not significant, particularly where there are a number of alternative projects that would significant avoid these impacts (e.g. Alternatives 4 and 7).

Insufficient evidence is provided that mitigation measures will be effective. The DRSEIR does not provide sufficient evidence that proposed mitigation measures will actually mitigate impacts to less than significant levels. First, the DRSEIR implies that the biological resource mitigation plan has the blessing of the resource agencies:

"The biological resource mitigation plan has been reviewed by the effectual regulatory agencies and a biological opinion has been issued by USFWS. The biological resource mitigation plan mitigates project related impacts to wetland/riparian habitats, sensitive upland habitats and wildlife movement..." DRSEIR at page 4.8-23

Yet, there are no letters in the DRSEIR which document that these agencies have agreed that the biological resource mitigation plan will adequately mitigate project related impacts to biological resources. Furthermore, the referenced biological opinion purports only to "transmit[] our biological opinion based on our review of the proposed Saddleback Meadows Residential Development Project located in Orange County, California and its effects on the federally endangered Riverside fairy shrimp (*Streptocephalus woottoni*, "fairy shrimp") and its designated critical habitat, and designated critical habitat for the threatened coastal California gnatcatcher (*Polioptila californica californica*, "gnatcatcher"), in accordance with section 7 of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*)." (Biological Opinion, dated October 26, 2001, at page 1.) I.e., this biological opinion is confined to assessing the project's effects on two species, only, and their designated critical habitats, under the federal Endangered Species Act, not CEQA. If these agencies have not signed off on the adequacy of the biological resource plan under CEQA, the DRSEIR should not leave the impression that they have done so. A revised DRSEIR must include information from the agencies concerning the adequacy of the biological resources plan so that the public and the decision-makers are fully informed about the likely changes these agencies will require in order to issue permits for the project (such changes may include additional mitigation or reconfiguration of the site plan).

The letters previously submitted by the wildlife agencies on prior project environmental documents raise significant concerns about the project's impacts on biological resources. Specifically, the October 29th letter states:

"Our biologists' professional opinion is that neither of the two previously submitted preferred projects (318 DU and 705 DU) nor the 299 DU Contingency Plan retain appropriate topography and habitat to ensure the continued function of the wildlife movement corridor/linkage that exists on Saddleback Meadows. As currently proposed, the 299 DU Contingency Plan development "footprint" would severely constrain wildlife movement from O'Neill Regional Park (i.e. southern NCCP planning area) to the Central NCCP reserve and Cleveland National Forest and is not acceptable." October 29, 1998 letter at page 2. See Letters from the wildlife agencies dated October 29, 1998 and August 8, 1997, hereby attached as attachments 2 and 3 and incorporated herein by reference.

Second, the DRSEIR assumes that Project Features and mitigation measures will reduce project-related impacts to biological resources to less than significant levels. Such measures include highly experimental elements such as creation of new ponds and relocation of species (fairy shrimp) the possible failure of which is explicitly anticipated by the cited biological opinion No documentation is provided about projects that have successfully used these techniques.

Third, the DRSEIR makes clear that drainage and water quality mitigation "features" are not yet completely designed. Questions remain whether the proposed system will maintain water quality, particularly with respect to bacterial indicators and toxic constituents. DRSEIR at page 4.4-1. Yet, the DRSEIR contains no mention of, or analysis concerning the potentially significant project-related and cumulative impacts of bacterial and toxic constituents on species in the creek

system downstream of the project site. This analysis must be included in a revised environmental document. Nor does the DRSEIR explain how the project can comply with new water quality regulations recently ordered against the County of Orange by the Regional Water Quality Control Board (CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD SAN DIEGO REGION ORDER NO. R9-2002-0001 NPDES NO. CAS0108740 WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES OF URBAN RUNOFF FROM THE MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) DRAINING THE WATERSHEDS OF THE COUNTY OF ORANGE, THE INCORPORATED CITIES OF ORANGE COUNTY, AND THE ORANGE COUNTY FLOOD CONTROL DISTRICT WITHIN THE SAN DIEGO REGION), February 13, 2001.) These stricter regulations supplant the 1994 NPDES permit referenced in the DSEIR, and were enacted due, in part, to the extremely impaired water quality existing in Aliso Creek, adjacent to the project, resulting in numerous beach closures at Aliso Beach.

Fourth, the DRSEIR clearly relies on the long-term maintenance of wildlife corridors on adjacent privately owned properties, some of which are planned for future development. Yet, there is no description of how these corridors would be protected from development, and no analysis of the cumulative impact of future developments that could interfere with essential corridors.

Finally, the DRSEIR fails to state how the project will comply with the NCCP/Coastal Sage Scrub agreement. This information must be included in a revised DRSEIR.

Inadequate cumulative analysis. Similar to other cumulative discussions in the DRSEIR, the biological resource section cumulative "analysis" is nonexistent. The brief discussion concludes that "...all identified related projects in the region would have to mitigate biological impacts to less than significant." DRSEIR at page 4.8-22. This statement is not sufficient to support a finding that there would be no cumulatively significant impacts to biological resources in the region. A revised discussion must identify cumulative projects and their collective impacts (by species, habitat and acreage), disclose the mitigation measures that would be required, provide evidence that the mitigation would be effective and document the conclusion that there would be no significant cumulative impacts.

Failure to identify potential inconsistencies with applicable plans and policies. The preliminary reserve design for the Southern Subregion NCCP, Figure 4.8-2, appears to include the site in the reserve. Not only does the DRSEIR fail to discuss the fact that the Southern Subregion NCCP is underway, with updated reserve designs due in July 2002, the DRSEIR fails to disclose that the site is identified as part of the reserve on Figure 4.8-2. A revised environmental document must discuss how the NCCP process applies to the proposed project. Specifically, since the Board of Supervisors agreed to participate in the NCCP process in 1993, can the Board properly take action on this project in advance of the NCCP process reaching major milestones concerning proposed reserve design or even more advanced outcomes? What is the relevance of the site being shown as part of the "reserve" in Figure 4.8-2?

2. The DRSEIR Fails to Disclose and Analyze Impacts to Geology and Soils Adequately.

The DRSEIR is deficient in its analysis of geologic impacts. As noted above, the project description and the DRSEIR as a whole provide little information regarding the massive grading and fill required to actualize this proposed project. The extent of cut and fill also appears to underestimate what could be required to accommodate the project as proposed. It is not clear from the DRSEIR whether importation and exportation of fill will be necessary. If necessary, no analysis is provided of the additional impacts of such activities, including, but not limited to: traffic associated with hauling materials, direct impacts to borrow and spoils sites, air quality implications and the like. A revised analysis must include evidence that supports the DRSEIR's assertion that grading will balance on site, or in the alternatives, the true extent of project-related impacts must be disclosed. Also, clearer graphics showing the extent and location of cuts and fills must be included in a revised document so that the public and decision-makers can fully appreciate the impacts of this project on the topography.

3. The DRSEIR's Analysis of Air Quality Impacts Is Incomplete.

The Air Quality section states:

"A reasonable reduction percentage through the implementation of an aggressive transportation system management (TSM) would achieve a measurable reduction when applied to such a large baseline emissions level. If the air quality impact from mobile source emissions is to be maintained at an acceptable level, a viable TSM program is an imperative strategy toward achieving that end."

The discussion fails to discuss the fact that a leading contributor to emissions, and the least likely land use configuration to successfully result in TSM program trip reductions is suburban sprawl – the land use configuration proposed by the project. No discussion is included in the DRSEIR about meaningful ways to address air quality in terms of major policy changes to how the County uses and develops land (e.g. the County could refocus its efforts to accommodate new housing in "infill" areas, and the like). No TSM mitigation measure is included for the project, because the type of land use proposed by the project is not conducive to TSM programs. In light of the fact the County is located within a non-attainment basin, the County should evaluate bolder land use policy measures to address air quality emissions. Such measures (alternatives such as locating housing in infill areas) should be discussed in the DRSEIR.

The DRSEIR appears to understate the impacts on air quality that will be generated both by project construction and by the built project itself. As noted above, the DRSEIR fails to adequately describe construction activities and phasing, and fails to analyze potential air quality impacts associated with hauling cut and fill on-and off-site. Therefore, the DRSEIR fails to analyze and disclose the potentially significant impacts associated with these activities. As stated above, additional information concerning the suitability of on-site soils as fill for the project must

be provided if the DRSEIR is going to assume that cut and fill will balance on-site. Alternatively, a revised environmental document must analyze the impacts associated with exportation of unsuitable cut material and importation of suitable fill material. This analysis must include disclosure of both 1) where the materials will be disposed of and 2) locations for imported fill.

The other major deficiency in the analysis is the lack of any meaningful analysis of cumulative air quality impacts. A revised environmental document must include such an analysis (e.g. other construction projects in the area generating air pollutants; etc.).

4. The DRSEIR Fails to Analyze Hazards Adequately.

The DRSEIR defers analysis of potential on-site contamination. Specifically, the potential for on-site contamination is deferred until prior to recordation of the subdivision map. See SC 2-13 at page 4.2-16 of the DRSEIR. At a minimum, the results of a phase I site assessment should be included in a revised environmental document.

5. The DRSEIR Fails to Analyze Land Use and Planning Impacts Adequately.

The DRSEIR fails to describe all relevant policies and plans, and fails to evaluate the consistency of the project with each policy. Each relevant County and other agency policy, general plan policy, regulation, guideline or standard should be summarized in a table, noting whether the project is consistent with the applicable provision and what must be done to reconcile the two where they are inconsistent. Instead, the DRSEIR fails to identify key County policies and fails to discuss the applicable policies and regulations of other agencies (e.g., policies of the U.S. Fish and Wildlife Service and the Regional Water Quality Control Board, among others). A revised environmental document must include this analysis.

6. The DRSEIR Fails to Analyze Impacts to Traffic Adequately.

The DRSEIR fails to disclose that the project's proposed land use pattern would not support sound transportation management practices because of its location, low density and contribution to the suburban sprawl pattern in Orange County. As a result, the project will perpetuate the exclusive use of automobiles for transportation, the very practice that has contributed to the traffic and air quality problems that are so acute in the County.

The Air Quality section states:

"A reasonable reduction percentage through the implementation of an aggressive transportation system management (TSM) would achieve a measurable reduction when applied to such a large baseline emissions level. If the air quality impact from mobile source emissions is to be maintained at an acceptable level, a viable TSM program is an imperative strategy toward

achieving that end."

No TSM mitigation measure is included for the project because the type of land use proposed by the project is not conducive to TSM programs. The DRSEIR should disclose this fact and acknowledge the poor pattern of land uses represented by this and other projects in the area, will continue to frustrate the County's progress toward acceptable traffic flows and clean air quality. A revised environmental document should discuss alternatives to the general plan land uses in the area – and explore the potential for transferring these planned units to infill sites.

Finally, the DRSEIR fails to adequately analyze cumulative traffic impacts including how projects of this type are likely to frustrate the County's attempts at a meaningful TSM program. The geographic study area for the analysis of cumulative projects is artificially small in size, and fails to provide a sufficiently large study area for many impacts, including traffic, air quality and biological resources. See Table 3.1, Related projects. Moreover, there is no information provided on construction period traffic for even these related projects; information which must be provided and included in a revised cumulative analysis for traffic and air quality. The study area for the revised analysis should extend at least to the likely areas where new residents in the proposed project and related projects are employed. No such information is included in the DRSEIR. Thus, it is unclear how the study area was selected. Information concerning where new residents in these areas work and therefore commute, must be developed and used to form the basis for the new analysis of traffic and transit impacts.

7. The DRSEIR Fails to Analyze Adequately Impacts to Hydrology, Drainage and Water Quality.

Pollution carried by storm water and urban runoff is the largest source of contamination to surface water both in California and nationwide. Construction sites, in particular, have been identified as significant dischargers of polluted storm water, involving high concentrations of silt and turbidity, as well as oil and grease, trash, sewage, and other chemicals used in construction activities and equipment maintenance. Despite this well-known and well-documented problem, the DRSEIR fails to adequately describe construction activities and on-site and off-site drainage "improvements," both of which could impact the water quality of the area. See concerns raised above about the inadequate and incomplete description of the project drainage and water quality features.

The DRSEIR concludes that there will be no significant drainage impacts after mitigation because of a highly engineered system of storm drains, catch basins, inlet/outlet structures, energy dissipators and slope drains to "control project drainage." DRSEIR at page 4.3-7. A "riverine water quality filtration system" is proposed next to the road to "cleanse low flow urban runoff." DRSEIR at page 4.3-7. There is no evidence in the DRSEIR that confirms this combination of features will mitigate for the impacts associated with the introduction of impervious surfaces, the complete alteration of the on-site drainage system and redirection of the natural drainages. No examples of successful projects that are similar in features are provided in the DRSEIR.

Moreover, there is no discussion of what kind of long-term maintenance and monitoring will be needed to maintain this highly engineered system. The DRSEIR merely states that the "structural and non-structural BMPs would be owned, operated and maintained by the home owner's association (HOA) or community services district." DRSEIR at page 4.4-12. Specific information about the drainage and water quality features and how they will be maintained and monitored over the long-term (including information about the cost of maintenance and monitoring) is essential to determine: first, whether the extent of drainage alterations is an acceptable project feature; and second, whether the proposed system of drainage features will actually be a viable system over the long-term, and effectively mitigate significant impacts to the natural drainage system. Specific information about the Riverine system, and the fact that the northerly development area does not have sufficient room to continue this system, suggests that the proposed project features may fall short of ensuring water quality is not adversely impacted by the project. DRSEIR at page 4.4-11.

The revised document should include examples of projects that incorporated similar features and have been demonstrated to result in effectively addressing drainage and water quality impacts. Absent this information, the conclusion reached in the DRSEIR that "[u]pon implementation of the Project Design Features and compliance with the Standard County Conditions, water quality impacts would be mitigated to a less than significant level," is not supported by evidence.

Finally, the significance of project-related impacts requires that the analysis of cumulative impacts to drainage and water quality be extensive. The DRSEIR fails to complete any analysis of these admittedly significant cumulative impacts, yet concludes that as a result of "required mitigation," cumulative impacts would not be significant. DRSEIR at pages 4.3-7 and 4.4-13.

C. The DRSEIR Fails to Analyze Cumulative Impacts Adequately.

The DRSEIR utterly fails to analyze cumulative impacts in the manner or to the degree required by CEQA. The CEQA Guidelines define cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." CEQA Guidelines § 15355(a). "[I]ndividual effects may be changes resulting from a single project or a number of separate projects." Id.

A legally adequate cumulative impacts analysis views a particular project over time and must consider the impact of the project combined with other projects causing related impacts, including past, present, and probable future projects. CEQA Guidelines 15130(b)(1). Projects currently under environmental review unequivocally qualify as reasonably probable future projects to be considered in a cumulative impacts analysis. See San Franciscans for Reasonable Growth v. City and County of San Francisco, 151 Cal.App.3d 61, 74 & n. 13 (1984). In addition, projects anticipated beyond the near future should be analyzed for their cumulative effect if they are reasonably foreseeable. See Bozung v. Local Agency Formation Comm'n, 13 Cal.3d 263, 284 (1975). Alternatively, an EIR may utilize:

> A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or areawide conditions contributing to the cumulative impact.

CEQA Guidelines § 15130(b)(1)(B). Any such planning document shall be referenced and made available to the public at a location specified by the lead agency. Id.

The discussion of cumulative impacts must include a summary of the expected environmental effects to be produced by those projects, a reasonable analysis of the cumulative impacts, and full consideration of all feasible mitigation measures that could reduce or avoid any significant cumulative effects of a proposed project. See CEQA Guidelines §§ 15126.4(a)(1) and 15130(b)(3).

The cumulative impacts concept recognizes that "[t]he full environmental impact of a proposed . . . action cannot be gauged in a vacuum." Whitman v. Board of Supervisors, 88 Cal.App.3d 397, 408 (1097). The requirement of a cumulative impacts analysis of a project's regional impacts is considered a "vital provision" of CEQA. Bozung, 13 Cal.3d at 283. Moreover, an EIR must examine not only the anticipated cumulative impacts, but also reasonable options for mitigating or avoiding the project's contribution to significant cumulative impacts. CEQA Guidelines § 15130(b)(3). The DRSEIR does not come close to meeting these requirements for the reasons described below.

1. The DRSEIR's Cumulative Impacts Analysis' Geographic Study Area Is Too Small and Thus Inadequate Under CEQA.

The DRSEIR considers a geographic study area far to small to reveal the true nature of the proposed project's cumulative impacts and, thus, is deficient under CEQA. The analysis of cumulative impacts appears to be based on a short list of "related" projects in the immediate area of the project. See Table 3.1 and Figure 3.2.

Among the major projects that must be included in a revised cumulative analysis include but are not limited to the massive Mission Viejo project and other projects in the Southern Subregion NCCP area. In September of 2001, the Mission Viejo Company filed an application for development of its land. As such, the cumulative analyses of land use and planning, geology and soils, hydrology and water quality, air quality, traffic and transportation, biological resources, public services and utilities, aesthetics and growth inducement must consider this potentially massive foreseeable project.

Furthermore, the document does not provide even minimal information regarding other projects within the Southern Orange County NCCP Study area. Analysis of these additional projects is

particularly important given the project's location in the Southern Orange County Natural Community Conservation Program Study area.

Although the DRSEIR concludes that the project's cumulative impacts, with the exception of air quality, will not be significant, such a conclusion cannot be supported in light of the inadequacy of the geographic study area. The DRSEIR's failure to consider the 14,000 home Rancho Mission Viejo Project alone renders its scope inadequate. The DRSEIR must also acknowledge and analyze the project's significant cumulative impact on the existing severely "impacted" water quality in adjacent Aliso Creek. This failure to consider regional or area wide cumulative impacts is fatal under CEQA and, as such, the document must be revised.

2. The DRSEIR Fails to Analyze any of the Cumulative Impacts Adequately.

In addition to relying on a far too small geographic study area, the level of analysis in the DRSEIR's cumulative impacts analysis is far too cursory. An EIR must include objective measurements of a cumulative impact when such data are available or can be produced by further study and are necessary to ensure disclosure of the impact. See Kings County, 221 Cal.App.3d at 729. Despite this mandate, the DRSEIR fails to analyze adequately a number of cumulative impacts, including, but not limited to, impacts to biological resources, water quality and drainage, and aesthetics, among others.

For example, with regard to cumulative water quality impacts, the DRSEIR states that "Ultimate development planned in the watershed in conjunction with the proposed project would potentially impact both surface and groundwater quality. Without controls, both short-term construction-related and long-term impacts due to pollutants in urban runoff could substantially impact water quality." DRSEIR at page 4.4-13. Despite this finding and despite the project's location in the watershed streams, the DRSEIR concludes that: "...as with the proposed project, related projects would be required to mitigate impacts to water quality to less than significant levels." Id. The DRSEIR fails to adequately summarize any information that would support the conclusion, and offers no supporting analysis itself. A revised environmental document must include analysis of cumulative impacts in order to support the conclusions throughout the DRSEIR that cumulative impacts will be reduced to less than significant levels. Statements such as: "cumulative projects are required to mitigate their impacts, therefore they will," are insufficient to support findings that all cumulative impacts, except air quality, will be less than significant.

Moreover, none of the cumulative impact discussions provide quantified information concerning cumulative project impacts, including, but not limited to: acres of habitat types directly/indirectly impacted by development or total construction trips. This information must be provided in revised cumulative analyses in a revised environmental document. Without such information, there is insufficient evidence to support the DRSEIR's conclusion that cumulative impacts to biological resources, traffic and water quality, among other impacts, will be insignificant. A revised document must also specify mitigation measures for cumulative impacts. Currently, the

DRSEIR includes conclusory statements in each section concerning potentially significant cumulative impacts. In each case, "required mitigation" is assumed to reduce significant cumulative impacts to less than significant levels. For example, the biology section contains the following statement concerning cumulative impacts:

"However, as with the proposed project, all identified related projects within the region would have to mitigate biological project impacts to less than significant." DRSEIR at page 4.8-22.

This conclusory statement provides no evidence that cumulative impacts to biological impacts will or can in fact be mitigated, nor is there any legal requirement that "all proposed projects" mitigate biological project impacts to less than significant. CEQA requires only that such impacts be mitigated to the extent feasible, which may not be to a less than significant level. See also DRSEIR at pages 4.1-12 (cumulative loss of open space would be adverse, but not significant); 4.4-13 (ultimate development in the watershed would potentially impact both surface and groundwater quality, but such impacts would be required to be mitigated to less than significant levels); 4.12-4, and other cumulative sections throughout the DRSEIR.

Finally, as described above, the DRSEIR fails to explore the full range of mitigation measures that could potentially reduce cumulative impacts below a level of significance. An EIR must examine reasonable options for mitigating or avoiding the project's contribution to cumulative impacts. See CEQA Guidelines § 15130(b)(3).

D. The DRSEIR's Discussion of Growth-Inducing Impacts is Inadequate Under CEQA.

The DRSEIR must consider the growth-inducing potential of the project in this undeveloped area. CEQA requires that an EIR include a "detailed statement" setting forth the growth-inducing impacts of the proposed project. See Public Resources Code § 21100(b)(5); City of Antioch v. City Council of Pittsburg, 187 Cal.App.3d 1325, 1337 (1986). The statement must "[d]iscuss the ways in which the proposed project could foster economic growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment." CEQA Guidelines § 15126.2(d). It must also discuss how a project may "encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively" or "remove obstacles to population growth." Id.

The DRSEIR's brief growth-inducing section concludes that the project is consistent with growth management policies of SCAG's RCP and would not extend or serve beyond the project boundaries. There is no analysis of whether the extension of roads and services on-site, and the development of a water tank and access road off-site, would facilitate growth on adjacent properties. Nor does the discussion reach any conclusion as to whether the project is or is not growth inducing as required by CEQA. The DRSEIR fails to address the potential for the off-site water tank to support development on adjacent, currently undeveloped parcels. In addition, wastewater pipes would be extended on site. The DRSEIR fails to describe the potential for these

pipes to support development beyond the project site. A revised environmental document must include an adequate analysis of the project's potential for growth inducement.

Finally, the DRSEIR fails to consider the precedent set by approval of this project. Specifically, the project interprets the general plan and other County plan policies to allow this development. No information is provided on the status of "permitted" development under the applicable plans for the area including the site and beyond. Figure 4.1.3, Foothill/Trabuco Specific Plan Land Use Designations, indicates development potential on a number of presently undeveloped properties that are contiguous to the project site. No information is provided in the DRSEIR concerning the status of development within the Specific Plan (e.g. the current statistical summary). It is clear that the development of the project site could have a growth inducing effect on these adjacent properties. Overall, the DRSEIR provides little evidence that the improvements to infrastructure it will involve and the precedent it will set will not induce growth to adjacent undeveloped properties.

In addition, the DRSEIR must analyze the potentially eviscerating effect of all other undeveloped sites within the Foothill Trabuco Specific Plan area seeking to follow the precedent of spot-amending the Specific Plan to explicitly exempt proposed development from all of the regulations and guidelines of the Specific Plan.

A revised growth inducing analysis must be prepared and include the status of development permitted on adjacent properties under all applicable plan and policies. This analysis should inform a revised analysis of cumulative impacts, including, but not limited to the long-term sustainability of an adequate wildlife corridor system.

E. The DRSEIR Improperly Attempts to Defer Mitigation to a Later Date, Fails to Identify Feasible Mitigation Measures, and Relies on Inadequate Mitigation Measures.

CEQA requires that mitigation measures be identified and analyzed. "The purpose of an environmental impact report is . . . to list ways in which the significant effects of such a project might be minimized . . . ." Pub. Res. Code § 21061. The Supreme Court has described the mitigation and alternative sections of the EIR as the "core" of the document. Citizens of Goleta Valley v. Board of Supervisors, 52 Cal. 3d 553 (1990). As explained below, the DRSEIR's identification and analysis of mitigation measures, like its analysis throughout, is thoroughly inadequate. An EIR is inadequate if it fails to suggest mitigation measures, or if its suggested mitigation measures are so undefined that it is impossible to evaluate their effectiveness. See San Franciscans for Reasonable Growth v. City and County of San Francisco, 151 Cal.App.3d 61, 79 (1984). Moreover, an EIR may not use the inadequacy of its impacts review to avoid mitigation: "The agency should not be allowed to hide behind its own failure to collect data." Sundstrom v. County of Mendocino, 202 Cal.App.3d 296, 361 (1988). Nor may the agency use vague mitigation measures to avoid disclosing impacts. See Stanislaus Natural Heritage Project v. County of Stanislaus, 48 Cal.App.4th 182, 195 (1996). Lastly, the formulation of mitigation

measures may not properly be deferred until after Project approval; rather, "[m]itigation measures must be fully enforceable through permit conditions, agreements, or legally binding instruments." 14 CCR § 15126.4 (a). In the present case, the DRSEIR does not come close to satisfying these basic CEQA requirements regarding impact mitigation. Most egregiously, it attempts to defer discussion and development of suitable mitigation measures until after the certification of the environmental document and the conclusion of public review.

1. The DRSEIR Improperly Defers Mitigation.

The DRSEIR impermissibly concludes that all of the project's environmental impacts, with the exception of cumulative air quality, will be mitigated below a level of significance, while at the same time deferring necessary analysis of mitigation measures. DRSEIR at page 9-1. Under CEQA, an EIR may conclude that impacts are insignificant only if it provides an adequate analysis of the magnitude of the impacts and the degree to which they will be mitigated. See Sundstrom, 202 Cal.App.3d at 306-07. Thus, if an agency fails to investigate a potential impact, its finding of insignificance simply will not stand. Id. Further, CEQA generally requires that all mitigation measures be adopted simultaneously with, or prior to, project approval. An agency may defer preparation of a plan for mitigation only when the agency commits itself and/or the project proponent to satisfying specified performance standards that will ensure the avoidance of any significant effects. Id.

In the present case, the DRSEIR violates CEQA by deferring critical analyses of project impacts and necessary mitigation. The following is a non-exhaustive list of the project design features and mitigation measures that the DRSEIR improperly defers to a later date:

a. PDF 3-1. A master drainage concept has been incorporated into project design to mitigate hydrology impacts to existing OCFCDs requirements and standards...This Project Design Feature is being prepared in consultation with USACE.
b. M 4-1. The applicant shall have the option to research off-site water quality improvements to determine the technical and economic feasibility of implementing improvements that have regional water quality benefits and can also mitigate project-related impacts...
c. PDF 4-9. The storm drain system shall be designed to mimic natural drainage patterns as closely as possible. Emphasis added.
d. As part of final design, ponds and swales would be incorporated to the maximum extent feasible...DRSEIR at page 4.4-12.

The DRSEIR's failure to adequately analyze the potentially significant effects of the project, and to design proper mitigation measures prior to project approval, renders the document inadequate and vulnerable to legal challenge. With the DRSEIR in its current form, decision-makers, the

public and permitting agencies cannot evaluate the advisability of project approval. Too little is known, and too much is entirely unknown, about the project's environmental impacts.

2. The DRSEIR Fails to Identify Feasible Mitigation Measures.

The DRSEIR's consideration of mitigation is inadequate because it fails to identify several feasible measures that could reduce or eliminate identified significant impacts. Mitigation is defined by CEQA as including:

> (a) Avoiding the impact altogether by not taking a certain action or parts of an action.
> (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
> (c) Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.
> (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
> (e) Compensating for the impact by replacing or providing substitute resources or environments.

CEQA Guidelines § 15370. The DRSEIR fails to consider measures, which could mitigate in the fashion described above significant impacts in several resource categories, including, but not limited to, biology, geologic hazards, hydrology and water quality, among others.

Furthermore, the DRSEIR improperly concludes that all impacts except cumulative air quality, are mitigated to below a level of significance based either on deferred mitigation measures, as discussed above, incomplete and "future" project features, or on mitigation measures of unproven efficacy. These determinations are not supported by substantial evidence. A partial list of impacts that should be identified as significant and unavoidable in a revised environmental document include, but are not limited to the following:

Project impacts to biological resources: There is insufficient information in the DRSEIR to establish the efficacy of proposed mitigation measures including wildlife corridors and replacement ponds, and to support a finding that the impacts to biological resources will be less than significant with mitigation. Moreover, the applicant has not secured all of the necessary permits for the project and the agencies have not signed off on the adequacy of the proposed measures. Even with such agency approvals, significant impacts may remain. For these reasons, and because a feasible project alternative is proposed that would significantly reduce impacts to resources (Alt. 4), a revised environmental document should identify project related impacts to biological resources as significant and unavoidable.

Cumulative impacts to biological resources. In the USFWS biological opinion, the Service

states under cumulative impacts:

"At this time, we do not have adequate information to fully evaluate the potential impacts of the Saddlecreek/Saddlecrest Residential Development Project, Whispering Hills Development Project, and the Capistrano Valley Water District Pipeline Project on designated critical habitat for the gnatcatcher." Biological Opinion at page 23.

Another major project in the Southern NCCP area, the Mission Viejo Project, implicates some of the same species and habitats as the proposed project. Based on: 1) the significant amount of habitat loss involved with these development projects in combination with properties surrounding the project site "planned" for development; 2) the lack of information concerning the efficacy of proposed mitigation measures; and 3) the lack of information concerning mitigation measures for cumulative projects, a revised environmental document should identify cumulative impacts to biological resources as a cumulatively significant and unavoidable impact.

Project-related aesthetic impacts: The DRSEIR finds that impacts to aesthetic and visual resources would be less than significant. DRSEIR at page 4.9-23. In support of this finding, the text of the document states:

"The proposed project would not have a substantial negative aesthetic effect. As depicted in the visual simulations, Saddleback Meadows would be low-density and rural in character and would not conflict with the surrounding environment..." DRSEIR at page 4.9-23.

The project is not "rural in character." Figure 2.9, Conceptual Streetscape, clearly illustrates a project that is suburban in character. Lot sizes averaging 6,672 square feet clearly represent urban/suburban development densities. The protection of fragmented areas of the project site in open space does not "transform" this suburban development into "rural" character. Based on Appendix G of the CEQA Guidelines, the transformation of this site from undeveloped to suburban in the midst of wildlife habitat would constitute a substantial degradation of the existing visual character of the site and its surroundings. Therefore, this impact should be identified as significant and unavoidable as clearly demonstrated by the visual simulations (Compare figures 4.8.4 and 4.9.1, and see Figures 4.9.4, 4.9.5, and 4.9.9, among other exhibits in the DRSEIR, which demonstrate the significant change in character of the site and surrounding area with development as proposed.)

Cumulative Aesthetic Impacts. Figure 2.6 and 4.1.3 clearly indicate that other properties in the project area are designated for development. Cumulative development in the area should have been analyzed and mitigation measures proposed to ensure that the area's visual resources are not further degraded by planned development. Since no cumulative analysis was undertaken, and no cumulative mitigation measures are proposed, the potential for cumulatively significant and unavoidable aesthetic and visual impacts should be identified in a revised environmental document.

Other impacts that should be identified as significant and unavoidable in a revised environmental document include, but are not limited to: plan and policy inconsistencies; landform alteration; project-related and cumulative drainage and water quality impacts; cumulative traffic impacts; and cumulative impacts to public services and utilities. Growth inducement should also be identified as a significant adverse result of the project. The DRSEIR does not include sufficient evidence to identify these and other impacts as less than significant after mitigation.

F. The DRSEIR Does Not Adequately Discuss Alternatives to the Proposed Project.

Although the alternatives section of the DRSEIR describes a number of alternatives, this section continues to fall short of the standard set by CEQA. Under CEQA, an EIR must analyze a reasonable range of alternatives to the project, or to the location of the project, that would feasibly attain most of the basic objectives while avoiding or substantially lessening the project's significant impacts. See Pub. Res. Code § 21100(b)(4); CEQA Guidelines § 15126.6(a); Citizens for Quality Growth v. City of Mount Shasta, 198 Cal.App.3d 433, 443-45 (1988). As stated in Laurel Heights I, "Without meaningful analysis of alternatives in the EIR, neither the courts nor the public can fulfill their proper roles in the CEQA process . . . [Courts will not] countenance a result that would require blind trust by the public, especially in light of CEQA's fundamental goal that the public be fully informed as to the consequences of action by their public officials." 47 Cal.3d 376, 404 (1988). The DRSEIR's discussion of alternatives fails to meet these standards.

First, none of the development alternatives are "transparently" based on a comprehensive constraints map that identifies areas of high resource values and areas that should be avoided based on County plan policies. However, one of the alternatives, Alternative 4 – F/TSP EIR 531 Staff Alternative B, appears to avoid substantially more of the impacts than the proposed project and the other development alternatives. Alternative 7 – Acquisition Alternative, would protect key on-site resources because the site would be acquired rather than developed. Because of the resource values represented on the site, the site's sensitive location and its topography, all development alternatives, including Alternatives 4 and 6 would result in substantial grading of sensitive areas, impacts to water quality and biological resources and other significant impacts. A revised analysis should include an alternative based on a site constraints map, which represents current information about high value resources.

Second, the DRSEIR fails to describe an alternative location for the project housing. Therefore, no off-site alternative was evaluated. No information is contained in the DRSEIR concerning the potential for in-fill housing within the County, including on sites assembled by the applicant within incorporated and unincorporated areas to accommodate the units proposed by the project. Such sites should include "infill" sites with reuse, redevelopment and additional development potential (e.g. under performing shopping centers and other underutilized/vacant sites). The explanation in the DRSEIR concerning such sites is not supported by a methodology, analysis or facts. Moreover, the DRSEIR applied criteria to alternative sites that is unreasonably constrained. According to the DRSEIR:

"It is speculative, but unlikely that the project applicant could assemble other contiguous properties within the area to accommodate the number and type or[f] residences proposed for the project. Moreover, if such properties were identified and acquired by the applicant, the properties would likely have resources and environmental constraints similar to Saddleback Meadows. Development of the proposed project at an alternative location, therefore, is unlikely to be economically viable and would probably not reduce environmental impacts in comparison to the proposed project." DRSEIR at page 5-3.

Off-site alternatives to accommodate housing in the County should not be limited to contiguous properties. Recently, the Planning Center completed an analysis of where development could be accommodated in Orange County. See LA Times, June 17, 2001 article. The study concluded that there are sufficient underutilized shopping center sites to accommodate significant development demand. Based on this information and a reasonable methodology for off-site locations, a revised analysis must describe specifically the methodology used to determine that alternative sites do not exist.

Third, the DRSEIR fails to identify appropriate environmentally superior alternatives as required by CEQA. Specifically, the DRSEIR fails to identify Alternative 4 as the environmentally superior development alternative. See Table 5.7, which clearly indicates that Alternative 4 is the superior development alternative and meets the applicant's objectives. The DRSEIR improperly identifies Alternative 8 as the environmentally superior alternative of the "non-no project alternatives." DRSEIR at page 5-47. This section of the DRSEIR must be revised to report the appropriate environmentally superior alternative based on the facts contained in the DRSEIR. Moreover, because Alternative 4 has fewer impacts than the proposed project, and meets project objectives, facts must be presented that this alternative is infeasible if it is rejected in favor of another development alternative.

Finally, the DRSEIR fails to adequately analyze the feasibility of Alternative 7 – Acquisition Alternative. No information is provided concerning interest expressed by agencies and other conservation organizations to purchase the property and whether the applicant is a "willing seller." This information is critical to the County's consideration of the project and must be provided in a revised analysis. Moreover, this section should identify potential funding sources for purchase of the property, including Proposition 40 funding and the possibility of funding under the NCCP program if the site is upheld as important for inclusion in a reserve. The DRSEIR's statement that this alternative would not meet project objectives assumes that the County cannot develop an aggressive infill program as part of its housing element to provide for needed housing in the County. Information about the feasibility of meeting housing needs without relying on parcels that contain sensitive biological and environmental resources must be included in a revised analysis.

II. THE PROJECT MUST BE DISAPPROVED OR THE DRSEIR MUST AGAIN BE REVISED AND RECIRCULATED.

The serious inadequacies of the DRSEIR are symptomatic of fundamental deficiencies in the project itself. Only a project as deeply flawed as this would fail to result in an adequate revised DEIR after the extensive and highly detailed comments provided by the groups and many others on the first DEIR. The enormous mass grading and placement of fill on erosion-prone soils required for the project seriously call into question the suitability of the site for residential development. The project would wreak unnecessary havoc on the habitat and corridors of several sensitive and endangered species, including the gnatcatcher. For these reasons, the project application should be denied as inadequate and infeasible.

In the alternative and at a minimum, the County may not approve the project unless the DRSEIR is again revised and recirculated to fully disclose and analyze the project's impacts and a proper range of alternatives. Given the multiple inadequacies discussed above, this DRSEIR cannot properly form the basis of a final EIR. CEQA and the CEQA Guidelines require recirculation of a draft EIR where, as here, the document is so fundamentally inadequate in nature that meaningful public review and comment are precluded. See CEQA Guidelines § 15088.5.

CONCLUSION

As set forth above, the DRSEIR suffers from numerous deficiencies, many of which would independently render it inadequate under CEQA. Taken as a whole, the deficiencies of the DRSEIR are so pervasive as to necessitate further extensive revision of the document– and recirculated for public comment. National Audubon Society, Endangered Habitats League and Rural Canyons Conservation Fund respectfully request that the County deny the project at this time. The project should not be reconsidered until a legally adequate EIR is prepared.

Very truly yours,

RECENT PROJECTS

- Santa Clara County Parks and Recreation Department: Currently working with 2M Associates, Inc., to assist the Department to develop a Countywide Strategic Plan primarily directed at managing and improving existing parks and recreation facilities. Work effort includes: 1) working with the Advisory Committee to develop the Strategic Plan and draft action plans, including a resource management plan, and 2) facilitating public workshops related to Plan development. Reference: Lisa Killough, Assistant Director, (408) 355-2219.

- Santa Clara County Land Trust: Assisted the Land Trust to develop an agricultural conservation strategy for agricultural lands adjacent to Gilroy and Morgan Hill (a willing seller/agricultural easement program). Reference: Nancy Richardson, Executive Director, (408) 224-0114.

- David and Lucile Packard Foundation - Conserving California Landscapes Initiative Grant: Developed a Conservation Plan for the Central Coast of California, including Monterey, Santa Cruz and Santa Clara counties. The Plan identifies "no regrets" acquisition parcels based on habitat, agricultural and scenic values and identifies long-term conservation strategies. Reference: Bill Leahy, The Nature Conservancy, (415) 777-0487.

- Mid-Peninsula Regional Open Space District: Currently working with 2M Associates, Inc., to assist the District in its proposed boundary change to include San Mateo Coast within its jurisdiction. The work effort includes: 1) facilitating meetings of the Advisory Committee, and 2) development of a project description for the area including acquisition and management policies, preparation of the Local Agency Formation Commission annexation applications, and responsibility for the LAFCO process. Reference: Craig Britton, General Manager (650) 691-1200.

- City of Livermore Habitat Conservation Plan: Advised the City on the development of a Memorandum of Agreement with the USFWS and CDFG for the completion of a regional HCP. Obtained a Section 6 Grant for the City's effort. Reference: Marc Roberts, Community Development Director, (925) 373-5200.

- Bay Conservation and Development Commission (BCDC): Assisted in the development of a revised San Francisco Bay Plan that will result in (1) additional piers being removed to create new public open spaces and bay views, (2) new land uses in return for new public plazas in conjunction with development, and (3) public access within and around piers. Reference: Jeff Blanchfield, Director of Planning.

- Infill Working Group: Assisted Environment Now to launch an "Infill Working Group," including representatives of the development community, the State Department of Housing and Community Development and Caltrans to develop a model infill assessment methodology. The work efforts includes facilitation of the Infill Working Group monthly meetings. Funding provided by an Environmental Equity grant from Caltrans, and matching funding from Environment Now and the City and County of Los Angeles. Reference: Dave Myerson, Environment Now (310) 829-5568.

- Marin Local Agency Formation Commission: Assisted in the review of Sphere's of Influences (SOI's) in response to the Hertzberg amendments to the Cortese-Knox-Hertberg Local Government Reorganization Act. Currently working on the Southern Marin Sphere of Influence report, which includes a public agency and community outreach component. Reference: Peter Banning, Executive Officer (415) 446-4409.

- Monterey County Planning: Currently assisting local community groups in Monterey County to promote policies that are supportive of "smart growth" and resource conservation in the County General Plan update. The effort includes significant community outreach and agency coordination. Reference: Jean Driscoll, Resources Law Group.

- City of Livermore: Assisted the City in preparing general plan amendments, and a specific plan for the South Livermore Valley "winecountry." The plans were developed collaboratively with members of the community and landowners. The plan includes: (1) fees and dedication requirements in return for limited, clustered new development; (2) development of a model conservation easement; (3) transfer of development rights to protect open space; and (4) protection of up to 10,000 acres of agricultural lands beyond an urban growth boundary. The effort also resulted in the launching of a land trust and a voter approved urban growth boundary.

- Silicon Valley Conservation Council: Assisted in the passage of a local measure to raise funding for open space in the region. Headed up the campaign and public outreach effort, which will raise $8 million per year for open space acquisition and management. The Council includes representatives of the Silicon Valley Manufacturing Group, Cisco Systems, Greenbelt Alliance, the Santa Clara County Land Trust and Santa Clara County Open Space Authority, The Nature Conservancy, among other groups.

- The Nature Conservancy and Sierra Los Tulares Land Trust: Currently assisting these organizations to develop a conservation plan for Tulare County and to develop strategies for agricultural and habitat land conservation. Reference: Alex Mas, TNC (415) 777-0487.

- Endangered Habitats League: Provide ongoing assistance reviewing and commenting on general plan updates and environmental documents for Orange, San Bernadino, San Diego and Riverside counties. Assisting in the development of a transfer of development rights concept to address rural property rights issues in San Diego County. Reference: Dan Silver, Director (323-654-1456).

- Cambria Pine Forest Committee: Prepared a "white paper" on alternative organizational structures and funding sources for the management of the remaining stands of native Monterey Pine forest in San Luis Obispo County. Reference: Paul Cylinder, Jones and Stokes (916)373-7000.

Re: Comments on the Draft Revised Subsequent Environmental Impact Report for Saddleback Meadows (DEIR), State Clearinghouse No. 1996121072

Dear Sir or Madam:

My wife and I are members of The Saddleback Canyons Conservancy which is dedicated to protecting and enhancing the environment and quality of life in the Foothill/Trabuco Specific Plan (FTSP) area and surrounding areas of Orange County; however, we submit these comments as residents and members of the concerned general public.

Compliance with the FTSP:

The FTSP was chartered by the Orange County Board of Supervisors to assure the "rural character of the area and preserve, forever, open space." The current request for exemption to the FTSP is not in keeping with the spirit or letter of the plan. Furthermore, such exemptions only serve those who would gain financially by such exemptions and do not serve the intended constituents, area residents or the planned protection envisioned by the plan.

We find this request inappropriate, unfair and a blatant disregard for the development guidelines that all residents must comply with. It is no coincidence the new project cannot comply with FTSP guidelines; it is simply too destructive. Just because a project cannot comply does not warrant exemption; it is simply inappropriate planning, and that planning process must be revisited.

Cumulative impacts:

As you know this is not the only project currently being considered for this area. Unfortunately, each project is only evaluated with regard to itself and not for its cumulative impact on the environment. Water quality is a key component of this certain degradation and to ignore such cumulative impacts is not only a dereliction of duty and responsibility but an error in favor of an exception for a special interest project.

We encourage you to be diligent and objective in your analysis, not cursory and subjective.

Specific projects include the planned RPLA facility, SaddleCreek and SaddleCrest and the development at the Rancho Mission Viejo. All projects will increase overall pollutant loads and receiving waters should be properly analyzed. We ask that your agency require the applicant to comply with this request and address critical concerns of FTSP compliance and protection of precious water quality resources.

Sincerely,

Richard and Patti Gomez

RE: EIR 566
Saddleback Meadows

As a longtime resident of Orange County, my wife and I are strongly opposed to further residential growth in South County and cannot support a Zone Change to the Foothill/Trabuco Specific Plan. Mission Viejo has done enough already with the enormous amount of homes and apartments being developed off of El Toro road between Live Oak and Marguerite.

Sincerely,

Mr. & Mrs. Michael Hodges

RE: Comments on Draft Revised Subsequent EIR 566 (State Clearinghouse No. 1996121072) for Saddleback Meadows.

Dear Mr. Grieman:

My name is Kathleen Stockwell and I reside in Mission Viejo. **Please include my entire comment in the official record of proceedings for this project.**

Of major concern are the sensitive biological resources that are present at Saddleback Meadows, and in particular the proposed mitigation and related hydrological/water quality issues closely related to the preservation of these resources. The Riverside fairy shrimp (Streptocephalus woottoni), present at Saddleback Meadows, is a Federal endangered species with a USFWS recovery priority of 5C, indicating "that it is a species facing a high degree of threat and having a low potential for recovery" (USFWS Recovery Plan for Vernal Pools of Southern California, Sept. 1998, pg. 19). This extremely rare, beautiful, and wonderful species has very limited geographic distribution, existing only in southern California. Another Branchiopod that exists in one of the Saddleback Meadows ephemeral pools, Cyzicus californicus (a "clam"shrimp) is equally fascinating and beautiful, and is related to fossil clam shrimps that date back in the fossil record ca. 350 million years!

DRSEIR566 implies that the "pilot" mitigation proposed to artificially create "ephemeral ponds/vernal pools" will bring the direct and significant impact to the existing ephemeral pools and the Riverside fairy shrimp to a less than significant level. This assumption is based on insufficient scientific evidence, since **this type of mitigation is "experimental in nature with many uncertainties"** (USFWS Biological Opinion for Saddleback Meadows, pg.19). The Riverside fairy shrimp, as a highly endangered species having a low potential for recovery, deserves the highest level of protection where it exists, and it is not being afforded this protection by allowing experimental mitigation that has a high potential for failure.

The "Implementation Plan/Rationale for Expecting Implementation Success" (Appendix 1.2, section VI. pg.9) cites as justification for this mitigation a "recent review of vernal pool rehabilitation and creation projects" which mentions:

*Ephemeral ponds created in San Diego County where **one obligate vernal pool plant** (Pogogyne abramsii) was sustained 5-10 years adjacent to existing habitat.

*A Del Sol Reserve vernal pool project in Santa Barbara County that demonstrated "pools created and restored in 1986 are self-sustaining and **support native vernal pool plant species".**

***One vernal pool construction project in Folsom, California** where density and composition of macroinvertebrate populations, including "several" species of fairy shrimp, were similar to adjacent reference pools. (Rogers 1998).

What justification do these few and poorly explained examples provide? The first two give vernal pool **plant** restoration as examples. Furthermore, upon examination of the Folsom project in Sacramento County, California (Aquatic Macroinvertebrate Occurrences and Population Trends in Constructed and Natural Vernal Pools in Folsom, California, D. Christopher Rogers, 1996) :

*This project is geographically far removed from southern California, and cannot represent unique ecological parameters that exist here.

*The two kinds of fairy shrimp occurring in the pools at the Folsom project are different species with requirements that vary from the southern California Riverside Fairy Shrimp. For example, both of these species, the Vernal Pool Fairy Shrimp (Branchinecta lynchi) and the California Fairy Shrimp Linderiella packardi), develop to maturity in less time than the Riverside Fairy Shrimp. The Riverside Fairy Shrimp needs 1-2 weeks to hatch and another 7-8 weeks to reach maturity. The span in which the right conditions can occur must cover several months, not just two. This strongly suggests that created pools that are **only required to hold rainwater for a minimum of 60 days** at depths required for the Riverside Fairy Shrimp will not be adequate for long term survival of the Riverside Fairy Shrimp. Ephemeral pools in which large numbers of Riverside Fairy Shrimp can successfully breed in Orange County are deep pools that persist for four to five months, or even longer. The paper presented by D. Christopher Rogers on the Folsom project states that, **"Because these constructed pools are mitigation for impacted vernal pools, they need to demonstrate that they are functioning ecologically like naturally occurring vernal pools to be considered adequate compensation".** This takes time, a minimum of 10 years according to the USFWS, and should not be allowed as an experiment unless the original ephemeral pools and their watersheds are left entirely intact until success is proven.

Why is it that only a five year monitoring program is mentioned in the EIR, when 10 years is required? Why is deferral of mitigation allowed in case of failure? This is not acceptable.

* The Folsom project that is quoted in the EIR only presented results of the first two years in a nine year monitoring program, which began in 1994. **What is the current status of its results, and how does this relate to such projects in Orange County?**

*The Folsom project site contains 273 natural vernal pools on 246.9 hectares, where 37 pools were constructed. The high number of natural vernal pools alone points to a higher chance for success of the created pools, in my opinion. This project, although admirable, does not seem to be in itself adequate justification for experimental mitigation for an entirely different species of endangered fairy shrimp and a different set of ecological circumstances in Orange County, where such high numbers of natural vernal pools never occur in one complex.

The USFWS Biological Opinion for Saddleback Meadows, pg. 13 and 18, state: "**The 9 ponds at Saddleback Meadows represent 53 percent of the 17 remaining occupied pools/ponds, making it the largest fairy shrimp habitat complex found in Unit 2**" (L.A. Basin-Orange Management Area). "Implementation of the proposed project ...represents a 56 percent loss of fairy shrimp ponds, and a 68 percent loss of the pond basin area, onsite." **Why is it deemed acceptable to gamble with perhaps the most valuable habitat complex for the Riverside Fairy Shrimp in Orange County?** Page 19 of this same Biological Opinion states that "..construction of an artificial impervious layer to retain water [in sandy soils] for a minimum of 60 days..**has never been done successfully**. It is obvious to me that there should be a more concentrated effort to acquire the Saddleback Meadows property and preserve it as it now is. It is a real treasure for Orange County, and very important for the NCCP process as well, since it **"represents the only low elevation wildlife corridor /linkage between the Central and Southern Subregionsof the Orange County NCCP planning areas."** (pg. 18) Much effort has gone into the NCCP, but it seems the endangered fairy shrimp species and their ephemeral/vernal pool habitats of Orange County were never an integral part of the NCCP planning as they should have been. **The proposed wildlife corridor as presented in DSEIR566 is also inadequate**, being much too narrow and poorly designed. Other sensitive species certainly exist at Saddleback Meadows, such as the Catalina and Intermediate Mariposa Lily populations, which have not been adequately considered either. Two well known host plants for the endangered Quino checkerspot butterfly also exist on this site, and should be in the preservation plan since existence of the Quino in Orange County is still possible.

DSEIR566 fails to adequately define, analyze, and show mitigation for the hydrological aspects of the project, my concern is especially related to the proposed ephemeral pool

mitigation. Nuisance water and non-point source pollution appear to be directed into the natural drainage courses, and may seriously alter any chance for a successful mitigation. It seems obvious that such a drastic change in the watershed caused by grading, etc.will alter the natural regime of the ephemeral ponds no matter what "mitigation" takes place, further placing them in jeopardy.

Will you please explain in specific detail how Basins 1,3,4,5,and 6 (shown directly below houses and slopes on Fig.4 of Appendix I.2) will be unaffected by changes in hydrology and water quality? I have observed the "mitigation" carried out at the Santiago Canyon Estates/Beazer project for the Riverside Fairy Shrimp, and it appears to be sadly inadequate for long term survival of this endangered species. It is directly below homes and slopes similar to the illustration in Fig. 4 mentioned above, has multiple rows of PVC irrigation pipe (made of a very toxic material that may leach into the rainwater?) in and around it (for what purpose?), and cement drainage structures of some kind that look very foreign to a so-called "ephemeral pond". The slopes directly above it are landscaped with non-native plants that may require chemicals. **Will you please tell me where the "inoculent" of Riverside fairy shrimp/cysts originated that were put there? Is this questionable mitigation being used as a model for Saddleback Meadows? Please explain the status of the Santiago Canyon Estates "mitigation", and how it relates to Saddleback Meadows.**

My last questions/comments are these:

Page 5 of the USFWS Biological Opinion states that the created ponds must demonstrate the ability to hold **"water"** for a minimum of 60 days. As I have stated above in more detail, a 60 day minimum is not long enough. **Does the term "water" mean natural rainwater only?** Professor Emeritus Clyde Ericksen has stated, "Attempts to maintain these pools, and thus their fairy shrimp populations, by keeping them full with tap water has proven useless. Tap water contains chloramines which kills living shrimps."

Why does the first sentence of point C (Schedule) under section VI of Appendix I.2, pg.9, state that, "Grading is to be completed no later than December 31, 2000". Please explain?

The following should be incorporated into the project proposal as mitigation measures :

1) **A 10 year monitoring program for the ephemeral pool mitigation plan should be in place,** not 5 years. **No** development impacts should be allowed to proceed in any of the nine existing occupied ephemeral pools or their watersheds until this 10 year period has proven that successful mitigation can occur.

2) The **60 day minimum requirement** for created mitigation pools to hold rainwater at depths required for the Riverside Fairy Shrimp (Streptocephalus woottoni) **should be increased to a period appropriate to the life cycle of this particular species.**

Thank you for including and responding to my comments.

Sincerely,

K. Stockwell

The question which occurs to me, having experienced weekly for several years severe eye irritation with each trip to Saddleback Valley, continually seen the great brown haze of smog, and read that the area ranks among the top as most polluted in the country, how ANY development of the area can be contemplated?

Anything more than "open space, habitat preservation, recreation", and agriculture should not be permitted because it will further exacerbate the already horrendous existing problems, including traffic.

APPENDIX B

STREAMBED ALTERATION ALTERATION AGREEMENT

STATE OF CALIFORNIA - THE RESOURCES AGENCY GRAY DAVIS, Governor

DEPARTMENT OF FISH AND GAME
South Coast Region (Region 5)
Habitat Conservation Planning
4949 Viewridge Avenue
San Diego, California 92123
Tel. No. (858) 467-4201/02
(858) 467-4299

December 4, 2001

California Quartet
c/o TPG Management, Inc.
ATTN: Pike Oliver
3341 Norris Avenue
Sacramento, CA 95821

Dear: Mr. Oliver

Enclosed is your copy of Streambed Alteration Agreement **5-178-99**. If you agree with the conditions/measures set forth in the agreement, please make a copy, then sign and return both copies to our office for signature. Send the copies to Brad Henderson; Department of Fish and Game; Post Office Box 1879; Redondo Beach, CA 90278. Written notice of your intent to commence project activities needs to be provided to the Department at least five days in advance of commencing project activities.

The California Fish and Game Code requires that you notify the Department in writing within 14 days of receipt of this Proposal as to its acceptability. If you do not respond within this time period you will lose your right to request binding arbitration. For minor changes we suggest you contact the person responsible for writing your agreement prior to sending the written response.

Please be advised the Department cannot execute (sign) your Streambed Alteration Agreement without your:

- CEQA (California Environmental Quality Act) document,
- certified Notice of Determination (NOD),
- CEQA Findings (if applicable), and
- proof of payment of CEQA document filing fee, or filing of De Minimis Fee Exemption

If these documents were not included with the Streambed Alteration notification package, please provide copies of these documents when you return the Agreement to the Department for the Department's signature. If the lead agency determined that the project is exempt from CEQA analysis and public comment, please provide a copy of the Notice of Exemption or other appropriate documentation. Also, be advised that this Agreement is subject to change upon receipt and review of your CEQA documents.

If you have any questions regarding the proposed conditions please contact me at (310) 214-9950.

Thank you for your cooperation in this matter.

Brad Henderson
Environmental Scientist
Habitat Conservation Planning, Region 5

Notification No. 5-178-99
Page 1 of 9

December 4, 2001

AGREEMENT REGARDING PROPOSED STREAM OR LAKE ALTERATION

THIS AGREEMENT, entered into between the State of California, Department of Fish and Game, hereinafter called the Department, and Pike Oliver, 3341 Norris Avenue Sacramento, CA 95821, hereinafter called the Operator, is as follows:

WHEREAS, pursuant to Section 1603 of California Fish and Game Code, the Operator, on the 15th day of June, 1999, notified the Department that they intend to divert or obstruct the natural flow of, or change the bed, channel, or bank of, or use material from the streambeds of, the following waters: Aliso Creek, unnamed tributaries and impoundment (Pond A); unnamed tributary drainages to Oso Creek, unincorporated Orange County, California, Section 4, Township 6 South; Range 7 West, SBBM.

WHEREAS, the Department (represented by Brad Henderson during a site visit on the eighth day of March, 2001) has determined that such operations may substantially adversely affect those existing fish and wildlife resources within the Aliso Creek and Oso Creek and tributaries thereto within the project site and the vicinity of the site, specifically identified as follows: invertebrates: Riverside fairy shrimp (*Streptocephalus woottoni*); amphibians: western spadefoot toad (*Scaphiopus hammondii*), California treefrog (*Hyla cadaverina*), western toad (*Bufo boreas*), California slender salamander (*Batrachoseps attenuatus*); reptiles: orange-throated whiptail (*Cnemidophorus hyperythrus beldingi*), western fence lizard (*Sceloporus occidentalis*), southern alligator lizard (*Gerrhonotus multicarinatus*), western skink (*Eumeces skiltonianus*), gopher snake (*Pituophis melanoleucus*) ; birds: yellow-breasted chat (*Icteria virens*), western yellow warbler (*Dendroica petechia brewsteri*), song sparrow (*Melospiza melopdia*), Cooper's hawk (*Accipiter cooperii*), Nuttall's woodpecker (*Picoides nuttallii*), bushtit (*Psaltriparus minimus*), spotted towhee (*Pipilo maculatus*); mammals: desert cottontail (*Sylvilagus audubonii*), California ground squirrel (*Spermophilus beecheyi*), bobcat (*Lynx rufus*), mule deer (*Odocoileus hemionus*), and coyote (*Canis latrans*) ; riparian vegetation which provides habitat for those species: western sycamore (*Platanus racemosa*) willows (*Salix* spp.), mule fat (*Baccharis salicifolia*), mugwort (*Artimesia douglasiana*), laurel sumac (*Malosma laurina*), coast live oak (*Quercus agrifolia*), Mexican elderberry (*Sambucus mexicana*), and all other aquatic and riparian wildlife resources in the area.

THEREFORE, the Department hereby proposes measures to protect fish and wildlife resources during the Operator's work. The Operator hereby agrees to accept the following measures/conditions as part of the proposed work.

If the Operator's work changes from that stated in the notification specified above, this Agreement is no longer valid and a new notification shall be submitted to the Department of Fish and Game. Failure to comply with the provisions of this Agreement and with other pertinent code sections, including but not limited to Fish and Game Code Sections 5650, 5652, 5937, and 5948, may result in prosecution.

Nothing in this Agreement authorizes the Operator to trespass on any land or property, nor does it relieve the Operator of responsibility for compliance with applicable federal, state,

or local laws or ordinances. A consummated Agreement does not constitute Department of Fish and Game endorsement of the proposed operation, or assure the Department's concurrence with permits required from other agencies.

This Agreement becomes effective on the date of Department's signature and terminates December 31, 2004 for project construction only. This Agreement shall remain in effect for that time necessary to satisfy the terms/conditions of this Agreement.

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

1. The following provisions constitute the limit of activities agreed to and resolved by this Agreement. The signing of this Agreement does not imply that the Operator is precluded from doing other activities at the site. However, activities not specifically agreed to and resolved by this Agreement shall be subject to separate notification pursuant to Fish and Game Code Sections 1600 et seq.

Project Description

2. Saddleback Meadows is a 222-acre site located in an unincorporated area of southeastern Orange County approximately 16 miles inland from the Pacific Ocean within the foothills of the Santa Ana Mountains. The parcel is situated on the northeastern side of Santiago Canyon Road, approximately 1,000 feet south of its intersection with Live Oak Canyon Road (S-19) in the Foothill-Trabuco area. Aliso Creek runs north and south along the western boundary of the site, and drains the central and western portion of the site. Streams in the southeastern portion of the site are tributary to Oso Creek. Residential communities are located to the south and west, pasture land is located to the east, and Saint Michael's Abbey is located to the north. The project site supports 8.47 acres of Department jurisdictional streams, including 0.34 acre of impounded intermittent ponds, 4.32 acres of wetland/riparian vegetation, and 3.58 acres of streambeds. The proposed project would impact approximately 3.78 acres of Department jurisdiction, including 0.11 acre of intermittent Pond A, 2.22 acres of wetland vegetation (1.51 acres of mule fat scrub, 0.61 acre of oak woodland, and 0.10 acre of sycamore woodland), and 1.45 acres of ephemeral streambeds traversing upland habitats.

The Operator proposes to alter the streambeds and impoundments to develop 283 single-family residential lots, roads, and recreational trails on approximately 121.8 acres of the property. An additional 28.2 acres will be impacted by remedial grading and shall be revegetated with coastal sage scrub vegetation. The Operator will avoid portions of Drainages (i.e., jurisdictional streams) 5, 10, 14, 15, and 16 and associated oak woodlands near the center of the property as identified in Figure 3 of the *Jurisdictional Delineation of the Saddleback Meadows Property in Orange County* dated March 2000 prepared by Chambers Group, Inc. The remedial grading areas occurring within proposed open space will be recontoured to preconstruction elevations, revegetated and preserved as open space. The remaining remedial grading areas will be landscaped for fuel management purposes. A total of approximately 159 acres of the property's 222 acres will be dedicated in permanent open space, including 90 acres dedicated to the County of Orange as an extension of O'Neill Regional Park. Manufactured slopes extending outside of the fuel modification zones will be revegetated with native vegetation and dedicated as open space.

3. The agreed work includes activities associated with No. 2 above. Specific work areas are described in the documents submitted by the Operator, including the Notification of Lake or

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

Streambed Alteration dated June 15, 1999, the revised Conceptual Mitigation and Monitoring Plan for CDFG Jurisdictional Areas dated May 21, 2001 prepared by Helix Environmental Planning, Inc., the Draft Biological Resources Technical Report dated June 1999 prepared by Chambers Group, Inc., the Biological Assessment dated July 6, 2000 prepared by Helix Environmental Planning, Inc., the Jurisdictional Delineation dated March 2000 prepared by Chambers Group, Inc., and the Addendum to Certified Final Subsequent Environmental Impact Report 566 dated August 1998. The project shall be implemented as proposed in the aforementioned documents unless directed differently by this agreement.

4. The Operator shall not impact more than 3.78 acres of jurisdictional streams. Disturbance to streambeds or removal of vegetation beyond the 3.78-acre jurisdictional area to be impacted, as described in the documents referenced in Condition Number 3, will require additional mitigation at an acreage ratio of 5:1. The form of additional mitigation, if necessary, shall be determined by the Department and may include on- or off-site riparian/wetland habitat creation, enhancement, or preservation.

Mitigation

5. Mitigation for project impacts has been proposed in the Saddleback Meadows Conceptual Mitigation and Monitoring Plan for CDFG Jurisdictional Areas dated May 21, 2001 prepared by Helix Environmental Planning, Inc. (Mitigation Plan). The Operator shall submit a revised Saddleback Meadows Conceptual Mitigation and Monitoring Plan reflecting recent project changes (reduction of impacts) to the proposed project and mitigation measures within 60 days of executing this agreement. Specific locations for the off-site creation and/or protection of riparian habitat and ephemeral streams shall be described in the revised Mitigation and Monitoring Plan.

6. The Operator shall mitigate for the loss of 0.11 acre of intermittent ponds at a 3:1 ratio, or a total of 0.33 acre. A total of 0.82acres of intermittent ponds will be created, 0.49 acre in excess of the 3:1 ratio. The excess intermittent pond mitigation totaling 0.49 acre shall apply toward mitigation for impacts to mule fat scrub. Impacts to 2.22 acres of wetland vegetation (1.51 acres of mule fat scrub, 0.61 acre of oak woodland, and 0.10 acre of sycamore woodland) will be mitigated at a 3:1 ratio with the on-site creation of 2.74 acres of wetlands, the off-site creation of 2.25 acres of riparian habitat, the off-site preservation and enhancement of 1.18 acres of riparian habitat, and the aforementioned 0.49-acre credit from the creation of intermittent ponds.

Creation of ponds and streambeds and the surrounding wetland vegetation on site requires the excavation, grading, and contouring in disturbed upland areas or areas disturbed by remedial grading to form basins or streambeds, and revegetating the margin of these areas with riparian cuttings, container stock, and seeds of native understory species. The depth and shape of the constructed basins will be based on the contours of the existing ponds. In addition, soils from the bottom of the existing ponds will be collected prior to impacts and the collected soils will be used to innoculate the created ponds. Approximately 0.86 acre of mule fat scrub will be created around the pond margins. Additional mitigation measures include relocation and monitoring of western spadefoot toad, and the installation of fencing to deter vandalism and other disturbance of the mitigation sites. The fencing around the ponds will be maintained until mitigation success criteria have been met and will be of a 5-strand rounded wire design.

Creation and enhancement of riparian and oak woodland habitat off site is proposed on the Hidden Ranch property. If the Hidden Ranch mitigation bank is not available for use, the

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

Operator may propose alternate locations subject to approval by the Department. The final location(s) and site-specific mitigation measures shall be described in the revised Mitigation Plan.

Impacts to 1.45 acres of CDFG-jurisdictional streambeds will be mitigated on site by the creation of streambeds within areas proposed for remedial grading previously supporting streambeds (0.44 acre), and off site by purchase of 1.01 acre of existing streambeds at the Hidden Ranch Mitigation Bank or other location acceptable to the Department. Impacts will be mitigated at a 1:1 ratio for a total of 1.45 acres to be purchased.

7. All mitigation areas shall be protected in perpetuity under a conservation easement prior to initiation of project-related streambed impacts. The format of the conservation easement shall be approved by the Department's legal advisor prior to the conveyance of the easement. The 1.01-acre streambed(s) shall also be purchased and protected in perpetuity under an approved conservation easement prior to project-related streambed impacts.

8. The Operator will be responsible for financing pre-grading plan hydrological testing, installation, maintenance, and monitoring of the habitat creation and enhancement areas. In order to ensure the success of mitigation, the Operator will enter into a five-year, secured agreement to cover the projected cost to install, monitor, and report on the mitigation. The Operator shall submit a draft of the bond and/or letter of credit with an itemized cost list to the Department for approval at least 60 days prior to impacting jurisdictional streams. The operator shall submit the final bond and/or letter of credit for the amount approved by the Department within 20 days of receiving approval of the draft bond/and or letter of credit. Either of the following options would satisfy the security requirement:

(Option A) The agreement shall be in the form of a 120 percent letter of credit in favor of the Department for mitigation costs within the entire 8.44-acre area to be created or enhanced.

(Option B) The agreement shall be in the form of: (1) a 120 percent bond or letter of credit in favor of the Corps and/or Service for mitigation costs associated with Corps jurisdiction; and (2) a 120 percent letter of credit in favor of the Department for mitigation costs associated with the remaining acreage (i.e., Department jurisdiction) such that the entire 8.44-acre area to be created or enhanced is covered by both secured agreements.

9. Grading of the mitigation areas is to be completed no later than December 31, 2004. Planting and then seeding shall occur between November 15 and February 15 to take advantage of winter rains. Since irrigation will be provided for the container stock, planting (but not seeding) may occur into early spring. Container stock will be installed no later than April 30; cuttings will be installed no later than February 1, and seed will be planted no later than December 31.

10. Grading associated with providing adequate hydrology for habitat creation or riparian revegetation on the project site and at the Hidden Ranch site shall not impact nesting birds. Therefore, grading shall not take place in vegetated areas from March 1 to September 15 to avoid impacts to nesting birds. Alternately, an independent qualified biologist may perform a nesting bird survey no more than three days prior to grading. The results of the nesting bird survey, including site conditions and a list of all vertebrate species observed, shall be provided to the Department for concurrence prior to grading. If active nests are observed, the operator shall provide a buffer zone of at least 100 feet (300 feet for raptors) until the young have fledged, are no longer being fed by the parents, have left the nest, and will no longer be impacted by the project.

11. Grading associated with providing adequate hydrology for riparian revegetation on the project

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

site or at the Hidden Ranch mitigation site shall not impact any California Species of Special Concern. The day before grading, an independent qualified biologist shall perform a survey for Coast Range California newt (*Taricha torosa torosa*) in reaches of the Creek and adjacent areas to be disturbed by excavation, deposition of overburden, or staging of vehicles to ensure that the grading or other activities do not impact individuals. Any individuals encountered shall be relocated at least 1/4 mile upstream from the disturbance in areas of suitable habitat. Relocated individuals shall be dispersed and not released in a single area.

12. Mitigation site preparation shall be carried out pursuant to condition nos. 22-26; 28-31; and 33-39 below.

13. Plant material (seeds, container plants and cuttings) to be used for the revegetation effort will be derived from on-site material at each site. On-site material is anticipated to be adapted to the site conditions and exhibit local genotypes.

14. Pond basins 1, 2, 5 and 8, as identified in Figure 4 of the *revised Conceptual Mitigation and Monitoring Plan for CDFG Jurisdictional Areas* dated May 21, 2001 prepared by Helix Environmental Planning, Inc., shall be constructed concurrently with grading. A grading plan will be developed for all the new ponds based on their position in the watershed, and the contours of the existing ponds. The new ponds will mimic as closely as possible the depths and areas of the existing ponds. Soils at the proposed sites shall be tested for permeability characteristics prior to initiation of pond construction. Rough grading contours will be deep enough to allow for the application of a surface soil layer removed from the existing ponds. Only non-vegetative erosion control measures may be used in areas with native vegetation. Such erosion control measures may include sandbags, soil binders, waterbars, trenches, or dissipators. These measures preclude the introduction of non-native weedy species into the seed bank of areas with native vegetation. Drainage and sedimentation control devices shall be routinely cleaned, maintained, and repaired prior to and during the rainy season for three years following completion of project grading. All repairs to these systems will be immediately executed to minimize erosion problems. Garbage and debris will be removed from all areas of the mitigation site. Dead or downed wood will not be removed.

15. After finish grading of the relocation ponds, the upper 24 inches of soils from existing ponds proposed to be impacted will be collected and spread over the bottom of the relocation ponds in two layers. The top layer shall be 1" deeper than the cracks in the soil and the second layer will be the remaining depth to 24". Initial grading of the mitigation site must include over excavation to allow for placement of the salvaged soil. Relocation ponds must also support a sufficient prey base population. If ponds do not support sufficient algal populations they will be inoculated with resources from the original ponds.

16. Western spadefoot toad individuals to be impacted shall be relocated and dispersed within all of the created ponds.

17. The operator shall retain an independent qualified biologist to survey all of the pond basins on site to be impacted to identify western spadefoot toad activity. Surveys to identify tadpoles shall begin the first week of January or following the first one-inch or greater rain event, and will be repeated as necessary to monitor their development. An estimate of the total larval population for each pond and total density for all of the impacted ponds shall be recorded and provided to the Department in monitoring reports. The biologist shall attempt to capture approximately 25% of the western spadefoot tadpoles present in each impacted pond prior to metamorphosis. The tadpoles shall be relocated by netting the individuals, placing them in containers with pond water, and quickly moving the containers to each designated translocation pond. Once the water in the containers has equilibrated to the same temperature as the translocation pond, the tadpoles shall

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

be carefully released into the pond. An estimate of the number of tadpoles captured and released into each translocation pond shall be recorded and provided to the Department in monitoring reports. Because western spadefoot toad are episodic breeders, larvae may not be present for collection during the first year. If spadefoot toad larvae are not present during the first year, spadefoot toadlets shall be collected from the preserved ponds as described in Condition 18 below.

18. The juvenile western spadefoot toad relocation shall occur at each impacted pond during the peak day of metamorphosis and the day immediately following. Spadefoot toadlets (recently metamorphosed juveniles) will be relocated from all impacted ponds supporting spadefoot toad into the ponds created in advance of construction. The toadlets shall be relocated prior to leaving the ponds by netting the individuals, placing them in containers with pond water, and moving the containers to the translocation pond. Once the water in the containers has equilibrated to the same temperature as the translocation pond, the toadlets shall be carefully released into the pond. An effort shall be made to remove all the toadlets from the ponds to be impacted. An estimate of the number of toadlets captured from each impacted pond and released into each created pond shall be recorded and provided to the Department in monitoring reports. If toadlets are unavailable for collection during the first year due to low precipitation, the Operator shall collect and relocate approximately 25% of the toadlets from the site's preserved ponds during at least one subsequent year.

19. Maintenance/ monitoring methods and performance criteria for revegetation are provided on pages 18-23 of the Mitigation Plan. A mule fat scrub reference site shall be designated with the concurrence of the Department. Mule fat scrub shall achieve a native cover of 80% by the third year after planting, 90% by the fourth year after planting, and 100% by the fifth year after planting. Native species diversity of the planted mule fat scrub will be 60%, 70%, and 80% of the designated reference site in years three, four, and five, respectively. In planted oak and sycamore woodland habitats, the mitigation sites shall achieve a native cover of 40% by the third year after planting, 55% by the fourth year after planting, and 65% by the fifth year after planting. The planted oaks shall achieve at least 50% survivorship by the end of the fifth year. Replacement plants shall be monitored with the same survival and growth requirements for 5 years after planting.

20. Monitoring of the spadefoot toad relocation sites shall include annual bimonthly surveys for tadpoles in the translocation ponds between January 1 and June 1. An estimate of the number of tadpoles in each translocation pond shall be recorded, along with an estimate of tadpole density for all of the translocation ponds. Because the spadefoot toad is reported to become reproductively mature within two to three years, the identification of tadpoles at the relocation sites during years three through five following the initial relocation may indicate the successful breeding of the relocated individuals. The success criteria will be the natural reproduction of spadefoot toad at the relocation sites, indicated by the presence of tadpoles in the relocation ponds. If spadefoot toad tadpoles are observed in each of the relocation ponds (i.e., Ponds 1, 2, 5, and 8) at any time during the monitoring period beginning the second year after the ponds have been created, filled with water, and stocked with spadefoot tadpoles, the translocation effort shall be deemed successful.

21. An annual report shall be submitted to the Department by January 1 of each year for five years after planting. This report shall include: (1) a list of names, titles, and companies of all persons who prepared the content of the annual report and participated in monitoring activities for that year; (2) a copy of the agreement and any attachments including Special Conditions and subsequent Letters of Modification; (2) an analysis of all qualitative and quantitative monitoring data including spadefoot toad monitoring results; (3) copies of all monitoring photographs; and (4) maps identifying monitoring areas, transects, planting zones, and so forth as appropriate. Remedial recommendations, if necessary, shall be made in the annual reports as well as a

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

summary of whether or not the mitigation is meeting the success criteria for the appropriate year. Monitoring and performance criteria will be tied to implementation. The first annual monitoring event will occur in June after the first full growing season. Annual technical monitoring reports shall be submitted to the Department by the end of August of each year to ensure that there is adequate time remaining in the dry season to implement any necessary contingency measures.

Specific Work Conditions to Protect Fish and Wildlife Resources

22. Riparian/wetland habitat and ponds to be retained in open space shall be protected from construction disturbance through construction fencing and silt fencing or other erosion protection devices around the construction limits to prevent the flow of sediment into the ponds.

23. The removal of vegetation within any streams from March 1 to September 15 must avoid impacts to nesting birds. If vegetation must be cleared within this period, an independent qualified biologist may perform a nesting bird survey no more than three days prior to grading. The results of the nesting bird survey, including site conditions and a list of all vertebrate species observed, shall be provided to the Department for concurrence prior to grading. If active nests are observed, the operator shall provide a buffer zone of at least 100 feet (300 feet for raptors) until the young have fledged, are no longer being fed by the parents, have left the nest, and will no longer be impacted by the project.

24. In areas outside of the mass grading footprint, access to the work site shall be via existing roads, access ramps and previously disturbed areas. Vehicles shall not cross streams at any time to gain access to the work site.

25. No equipment shall be operated in ponded or flowing areas.

26. Disturbance or removal of vegetation shall not exceed the limits approved by the Department.

27. Installation of bridges, culverts, or other structures shall be such that water flow is not impaired. Bottoms of temporary culverts shall be placed at stream channel grade; bottoms of permanent culverts shall be placed at or below stream channel grade.

28. Preparation shall be made so that runoff from steep, erodible surfaces will be diverted into stable areas with little erosion potential. Frequent water checks shall be placed on dirt roads, cat tracks, or other work trails to control erosion.

29. Water containing mud, silt or other pollutants from aggregate washing or other activities shall not be allowed to enter a lake or flowing stream or placed in locations that may be subjected to high storm flows.

30. Structures and associated materials not designed to withstand high seasonal flows shall be removed to areas above the high water mark before such flows occur.

31. Staging/storage areas for equipment and materials shall be located outside of the stream.

32. If a stream's low flow channel, bed or banks/lake bed or banks have been altered, these shall be returned as nearly as possible to their original configuration and width, without creating future erosion problems.

33. Spoil sites shall not be located within a stream/lake, where spoil shall be washed back into a stream/lake, or where it will cover aquatic or riparian vegetation.

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

34. Materials associated with project related activities shall be prevented from contaminating the soil and/or entering the waters of the state. These materials include (but are not limited to) the following: raw cement/concrete or washings thereof; asphalt; paint or other coating material; oil or other petroleum products; or any other substances which could be hazardous to aquatic life. These materials, placed within or where they may enter any stream, by the Operator or any party working under contract, or with the permission of the Operator, shall be removed immediately.

35. No debris, soil, silt, sand, bark, slash, sawdust, rubbish, cement or concrete or washings thereof, oil or petroleum products or other organic or earthen material from any construction, or associated activity of whatever nature shall be allowed to enter into or placed where it may be washed by rainfall or runoff into, waters of the State. When operations are completed, any excess materials or debris shall be removed from the work area. No rubbish shall be deposited within 150 feet of the high water mark of any stream or lake.

36. The Operator shall comply with all litter and pollution laws. All contractors, subcontractors and employees shall also obey these laws and it shall be the responsibility of the operator to ensure compliance.

37. No equipment maintenance shall be done within or near any stream channel where petroleum products or other pollutants from the equipment may enter these areas under any flow.

38. The Operator will submit final grading plans to the Department for approval prior to initiating impacts. Avoidance areas will be clearly delineated on the grading plans.

39. The Operator shall request an extension of this agreement prior to its termination. Extensions may be granted for up to 12 months prior to the date of termination of the agreement and are subject to Departmental approval. The extension request and fees shall be submitted to the Department's South Coast Regional Office at the above address. If the Operator fails to request the extension prior to the agreement's termination then the Operator shall submit a new notification with fees and required information to the Department. Any activities conducted under an expired agreement is a violation of Fish and Game Code Section 1600 et. seq. The Operator may request up to a maximum of one extension of this agreement.

40. The Operator shall **provide a copy of this** Agreement **to all contractors, subcontractors, and the Operator's project supervisors. Copies of the** Agreement **shall be readily available at work sites at all times during periods of active work** and must be presented to any Department personnel, or personnel from another agency upon demand.

41. The Department reserves the right to enter the project site and mitigation areas at any time to ensure compliance with terms/conditions of this Agreement.

42. The Operator **shall** notify the Department, **in writing, at least five (5) days prior to initiation of construction (project) activities and at least five (5) days prior to completion of construction (project) activities.**

43. It is understood the Department has entered into this Streambed Alteration Agreement for purposes of establishing protective features for fish and wildlife. The decision to proceed with the project is the sole responsibility of the Operator, and is not required by this agreement. **It is further agreed all liability and/or incurred cost related to or arising out of the Operator's project and the fish and wildlife protective conditions of this agreement, remain the sole responsibility of the Operator.** The Operator agrees to hold harmless the State of California and the Department of Fish and Game against any related claim made by any party or parties for

STREAMBED ALTERATION CONDITIONS FOR NOTIFICATION NUMBER: 5-178-99

personal injury or any other damages.

44. The Department reserves the right to suspend or cancel this Agreement for other reasons, including but not limited to the following

a. The Department determines that the information provided by the Operator in support of the Notification/Agreement is incomplete or inaccurate;
b. The Department obtains new information that was not known to it in preparing the terms and conditions of the Agreement;
c. The project or project activities as described in the Notification/Agreement have changed;
d. The conditions affecting fish and wildlife resources change or the Department determines that project activities will result in a substantial adverse effect on the environment.

45. Before any suspension or cancellation of the Agreement, the Department will notify the Operator in writing of the circumstances which the Department believes warrant suspension or cancellation. The Operator will have seven (7) working days from the date of receipt of this notification to respond in writing to the circumstances described in the Department's notification. During the seven (7) day response period, the Operator shall immediately cease any project activities which the Department specified in its notification. The Operator shall not continue the specified activities until that time when the Department notifies the Operator in writing that adequate methods and/or measures have been identified and agreed upon to mitigate or eliminate the significant adverse effect.

5 July 2002

Mr. Thomas Mathews
Planning and Environmental Services
County of Orange
P.O. Box 4048
Santa Ana, CA 92702

Dear Tom,

It's been almost a decade since we last crossed paths, and it's hardly a surprise that again we touch bases regarding an issue related to NCCP. Developers of the Saddleback Meadows property adjacent to El Toro Road asked me to visit their property and to convey to you my observations in reference to a letter jointly signed by staff of the U. S. Fish and Wildlife Service and California Department of Fish and Game (to Tim Neely, dated 26 June 2002). The landowner's concern involves the contention by the agencies that the proposed project will sever landscape linkages between reserved lands in "lower elevation Santa Ana Mountain foothills," thereby compromising the persistence of key (but not state or federal listed) species, and in turn compromising the goals of NCCP. The immediate concern is attenuated by a long history of negotiations over this property, previously agreed upon mitigations, and (apparently) full resolution of listed species issues.

As chief architect of the original guidelines for NCCP, I must admit to being heartened by the wildlife agencies' general approach to multiple species planning, which calls not just for reserve designs to meet the habitat needs of imperiled species, but goes further to add landscape connectivity that can be necessary to sustain certain more abundant and wide ranging species, which can play important roles in ecosystem function. Ultimately, conservation of species at risk requires protection of all of the constituent elements of their habitats, including species not equally so imperiled. Unfortunately for this developer, the regulatory approach of providing connectivity to more common species is being applied on the Saddleback Meadows property without any clear benefit to species of concern, either common or imperiled.

Any extant wildlife corridor through Saddleback Meadows currently must be funneling dispersing animals from the extensive open spaces of O'Neill Regional Park and the Cleveland National Forest toward busy El Toro Road and the small (and degraded) low elevation coastal sage scrub patches beyond, or to O'Neill Park from the National Forest, a route that is redundant with available reserve lands. While those sage patches north and east of the Foothill Transportation Corridor have habitat value for California Gnatcatcher, which can fly between them, they have little value and make no sense in planning for larger mammals -- deer have access to much superior open spaces to the north and east, mountain lions should hardly be encouraged into small natural spaces in already suburbanized Orange County, and coyotes, they will find their ways to those patches with or without the proposed development. The fates of gnatcatcher and other coastal sage-dependent species in this lower elevation corner of Orange County's two NCCP's are already sealed. The proposed project will make no difference. The local fates of large mammals are not going to be dependent on engineered habitat stringers and pathways within suburban development, but on the wildlands of O'Neill Regional Park, Whiting Ranch Wilderness Park, and National Forest lands beyond.

This observation begs the biological rationale for the corridors map presented in the draft EIR (figure 4.8.4) referenced on page 3 of the agency letter. A more nonsensical map would be hard to conjure up. Two of four named "corridors," central and southern, show connections between open space reserves (to the east) west through a transportation gauntlet to essentially dead-ended habitat remnants. The other two "corridors," northern and eastern, are not corridors in any application of the term. They are open space habitat; in fact reserves, not corridors.

The purpose of a wildlife corridor is to facilitate the dispersal or movement of organisms between reserve land units that otherwise would be isolated. In 1993, my colleagues and I on the scientific review panel to NCCP called on land planners to include such corridors where necessary to connect reserves. This is not, however, such a circumstance.

At lower elevations northeast of the foothill Transportation the gnatcatcher will fly between remnant patches of coastal sage scrub without corridors and despite extant land barriers. Reserved lands are continuous at higher elevations; animal dispersal will not require corridors. In between and around currently proposed Saddleback Meadows development, anticipated open space set asides should contribute to local and regional species conservation, facilitate dispersal of many species known to successfully inhabit mosaics of developed land, and provide important ecosystem services, such as controlling local hydrodynamics and stabilizing soils. What Saddleback Meadows developers cannot

offer the Orange County NCCPs is a wildlife corridor where one simply does not and cannot exist.

It is my best professional judgement that the agencies's call for a low elevation wildlife corridor across the Saddleback Meadows property is not warranted and should be rejected. If I can be of any further assistance please feel free to contact me at (775) 784-1303.

Sincerely,

Dennis D. Murphy, PhD.
Professor and Program Director

V. Summary

EXHIBITS

1. Riverine exhibit (cross section)

I. PURPOSE

The goal of the Saddleback Meadows Water Quality Management Plan (WQMP) is to reduce pollutants and/or specific sources of pollution which affect or may affect the project property as well as the downstream properties in its development. Such reductions should result in cleaner water in onsite runoff, storm water and incidental flows, including those flows emptying towards offsite facilities and features downstream.

When implemented, the pollution control measures proposed by the WQMP will create cleaner water runoff associated with development in compliance with all applicable water quality ordinances and laws. These laws include, but are not limited to, San Diego Region, California State Regional Water Quality Control Board directives; the County of Orange's NPDES Drainage Area Management Plan (DAMP); and the Clean Water Act of the United States of America.

II. EXISTING CONDITIONS

A. Saddleback Meadows

Saddleback Meadows is located primarily within the Aliso Creek Watershed area. Its hillside topography is incised with drainage courses that mainly drain west to Aliso Creek. Aliso Creek is located just west of the project's western flank. Some remaining courses drain south to Oso Creek. Oso Creek is located south of the project's southeast boundary.

The vacant, 222.2 acre project site comprises hillside topography covered with native grasses and dirt trails. Remnants related to agricultural and ranching uses employed since the 1930's include an abandoned, worn out wooden house, corrals, an overgrown olive orchard and eight stock ponds. The remainder of the site is covered by coastal sage scrub, chapparel and oak woodland. The property has been heavily grazed for the past several decades. This is evident as the native vegetation has been replaced by grasslands on over 50% of the property. Significant portions of the property are also covered by artichoke thistle, another indicator of overgrazing. Accordingly, evidence on the property indicates poor hydrologic conditions with high stormwater runoff and highly erosive overland flow. Over the past several years, numerous highly incised drainage courses have been cut into the natural rolling topography. During low flow conditions, for example a 2-year storm event, peak discharges are 30% higher than in its pre-grazing natural state.

An east-west running ridgeline located in the southern portion of the property rises up from the west (elevation 1,200') and extends east approximately 3,000 LF. This ridge spans two thirds of the east-west width of Saddleback Meadows. The ridgeline then turns north-northeast, continuing to rise and extending 2,200 LF towards the northeast property corner. Existing site elevations exceeding 1,600' are typical at the northern portion of the east property line.

In general, storm water runoff flows drain to the west across the property, eventually emptying into Aliso Creek. In the project's area, Aliso Creek flows parallel to and at the **west side** of existing El Toro Road. Existing El Toro Road, in this same area, forms the western boundary of Saddleback Meadows.

Existing storm drain facilities on the **east side** of El Toro Road picks up water runoff from the project site and conveys it westerly under El Toro Road, to outlets discharging into Aliso Creek. These existing storm drain facilities are maintained by the County of Orange. They are:

- The J01 facility per the J01-701-15 storm drain improvements approved by the County of Orange located north of the project's spine road intersection with El Toro Road.
- The Line "B", 24" RCP storm drain line per J01-701-15 plans (described directly above) located south of the project's spine road intersection with El Toro Road.
- Lines "A", "B" and "C", 24" RCP storm drain lines per the improvement plans for Tract 12724, County of Orange, located at the southern most entry street (existing Valley Vista Street) intersection with El Toro Road.

However, some stormwater runoff flows at the eastern two thirds of the southern portion of the property surface drain to the south property line, then southerly across natural vegetation of the adjacent property and empties into Oso Creek. Oso Creek runs as close as 200 LF from Saddleback Meadow's southern boundary.

B. Regional

Down stream to this project there is drainage from the newer projects which are tributary to the Aliso Creek which is a natural water course. Recently, the Regional Water Quality Board has issued a new directive to clean the high bacteria count (Coliform) from the Creek. The Board's goal is to make Aliso Creek Beach safe for swimming.

III. DEVELOPED CONDITIONS

A. Saddleback Meadows

Residential development for up to 299 single-family homes is proposed in two project areas. 173 residential lots are proposed in the southwest quadrant of the project, 70 residential lots are proposed for the southeasterly quadrant and the remaining 56 residential lots are located in the northeasterly quadrant. While stabilization of the existing land slides and conventional mass grading will disturb approximately 71% of the entire project site, approximately 69% of the property will be placed into permanent open space.

Table 1

Summary of Proposed Land Uses

Land Use	Area (acres)	Portion of Site
Single-Family Residential Lots (299)	47.9	21.5%
Streets (private)	19.0	8.5%
Regional Park *	83.25	37.6%
Biological Open Space Easement**	11.65	5.2%
Restricted Scenic Preservation Easement***	60.2	27.2%
Total	**222.0**	**100%**

*Regional Park, as required by the County of Orange, excludes manufactured slopes and fuel modification areas. Regional Park may include areas subject to remedial grading and biological enhancement.

** Biological Open Space Easement includes biologically restored manufactured slopes outside fuel modification areas.

*** Restricted Scenic Preservation Easement included fuel modification areas owned and maintained by homeowner's association/community management district.

Table 2

Summary of Grading Disturbance

Land Use	Area (acres)	Portion of Site
Single-Family Residential Lots (299)+ Roads	66.9	30%
Manufactured Slopes	63.2	28%
Remedial Grading*	27.9	13%
Undisturbed Areas **	64.0	29%
Total	**222.0**	**100%**

* Landfill stabilization beyond the limits of the conventional mass grading

** Undisturbed areas may include Fuel Modification Zones and may be subject to biological enhancement; i..e., annual grasslands replaced with Coastal Sage Scrub or Oak Woodlands as discussed in the Biological Technical Report

Open space areas are proposed for both the project's northwest quadrant and significant areas along the project's eastern and southern flanks. The permanent open space will be dedicated to the County of Orange as a regional park and will be maintained by the County or a third-party conservation group. Maintenance of the permanent open space will be funded by a permanent endowment created by the developer.

Saddleback Meadows will be served by urban type drainage systems. Drainage systems will conform to County of Orange Flood Control District standards, and basically comprised of paved street gutters, catch basins, and underground concrete pipes.

Storm drain improvements for the southwest development area will drain westerly into existing Orange County maintained storm drains at the west-southwest project boundary where the main storm drain and low-flow channel will cross. Only Lots 1 through 37 connect directly to an existing storm drain facility in El Toro Road. Storm drain improvements for the northeastern development area, in general, will drain easterly and outlet into the project's open space area located in the north central portion of the project. Drainage flows through the open space and collects in a tributary which drains westerly about 2,000 feet before draining into Aliso Creek. Aliso Creek continues another 600 feet before emptying into the existing J01 storm drain facility inlet located north of the El Toro Road/Spine road intersection.

The Storm drain outlets have been carefully located so that they discharge into natural channels in order to replicate natural flow patterns as closely as possible. In some cases, this has resulted in multiple outlets; for example, the drainage system in the northwest development area.

B. Regional

The project is located within the boundaries of two primary watershed areas:

Aliso Creek Approximately 75% of the site *is within the Aliso Creek Watershed.* Aliso Creek is located west of the project site. The natural creek is located along the eastside of El Toro Road but crosses under the roadway near the project's entrance, continuing southwesterly along the west side of El Toro Road. The creek flows through natural open space and urban development and outlets at the ocean at Aliso Creek Beach. Aliso Creek's watershed encompasses 23,000 acres, and includes natural open space, rural and urban development, agriculture and ranching, regional parks and other recreational facilities. There are a number of street crossings over Aliso Creek which have been built as the result of newer or existing developments downstream. Saddleback Meadows represents less than 1% of the Aliso Creek watershed.

Oso Creek The remaining 25% of the site located on the southeasterly portion of the project is part of the Oso Creek watershed. Flows from the project

drain offsite through natural drainages. The natural drainages converge and flow into a concrete storm drain system that runs in a southwesterly direction though Tract 12724 (Hidden Ridge residential development). The system outlets onto a concrete energy dissipator and then into the natural drainage course of Oso Creek. The creek drains into the Upper Oso Reservoir. Overflows from the reservoir continue westerly eventually draining into San Juan Creek which outlets into the Pacific Ocean at Doheney State Beach.

A small area at the extreme eastern portion of the site drains into the Trabuco Creek watershed.

IV. BEST MANAGEMENT PRACTICES (BMP'S)

A. Introduction

In order to reduce, control, prevent, remove or eliminate pollution, BMPs will be proposed, implemented and followed for development of Saddleback Meadows. BMPs are construction devices, procedures, rules or methods that will be used to control predictable pollutant runoff associated with the development of Saddleback Meadows.

B. BMP Highlights for Saddleback Meadows

The Saddleback Meadows BMP's have been chosen based on local industry standards and the existing constraints on the property. The site plan for Saddleback Meadows has been carefully designed to minimize the impact to the natural topography and vegetation. The proposed development area is the minimum area possible which accommodates the project's 299 Single Family Residential lots. This reduces the opportunity to use structural BMPs that require larger areas (created wetlands, basins) within the development area. Sensitive biological habitat also prevents locating such facilities within the open space areas. The structural BMP's therefore have been designed to take advantage of excess space for created wetlands and basins and in-line solutions where space is not available.

Saddleback Meadows BMP's will include the following.

1. **Restore Natural Watershed** – The portion of the property that will not be disturbed by grading, approximately 30%, will be restored by cessation of cattle grazing. Furthermore, the annual grasslands and artichoke thistle will be replaced with coastal sage scrub and oak woodlands. Existing disturbed coastal sage scrub will be enhanced. All of these actions will reduce stormwater runoff by up to 30%. This will also significantly reduce erosion potential and should eliminate the erosion that is currently plaguing the property. The remaining 40% of the property that will be placed into permanent open space will be revegetated with coastal sage scrub and oak woodlands ensuring that these disturbed areas are stabilized.

2. **Minimize Impervious Areas** – The project has been designed to minimize impervious areas through the use of larger lots (5,000 square foot minimum, nearly 6,700 square foot average) and narrower private streets. This will limit impervious areas to less than 17% of the property.

3. **Storm Drain System** – The storm drain system has been designed to mimic natural drainage patterns as closely as possible. Storm drain outlets will be provided to return runoff into each natural drainage that intersects the development area. This serves the dual purpose of ensuring that the natural drainages are receiving no more runoff than they can accommodate and ensuring that natural riparian habitat continue to receive an adequate supply of water. Appropriate energy dissipaters will be installed at each outlet to reduce flows to non-erosive velocities.

4. **Riverine System** – The southwest and southeast quadrants of development, approximately 80% of the residential lots and streets, will be served by a riverine system designed to provide a natural cleansing of the urban run-off. Incidental and low flows produced by the completed project will be filtered by the riverine system. The riverine system will collect low flows at strategically located catch basins. Underground pipes will then convey the low flows to a vegetated swale. This swale is located parallel to and along the north side of the project's spine road attached exhibit provides the detail and cross section of the proposed Riverine system. The swale design will filter pollutants from low flows. It will also allow dissipation of a portion of the flows through percolation and evaporation. The downstream terminus of the riverine system is a 1200' long by 60' wide earthen and vegetated detention basin) located just north of the spine road and 700' east of the El Toro Road/spine road intersection. The effectiveness of the Riverines generally depend on the length and the amount of vegetation within the Riverines along the path. The typical vegetation within the Riverine system include PlatanusRacemosa, Schinus Molle, Baccharis Sacfolia, Juncus Mexicanus, Scripus Californicus.

5. **Stormceptors** – Stormceptors are in-line storm drain devices designed to separate sediment and oil from low-flow runoff flowing through underground storm drain pipes. The trapped sediment and oil is then removed during routine maintenance and disposed of at an approved landfill. All storm drain pipe flows within the northeastern quadrant, the remaining 20% of the development, will pass through strategically located Stormceptors prior to discharging into project open space areas. The Stormceptors will be able to remove up to 80% of the total sediment load (TDS). The Stormceptors will also remove free oil from stormwater during normal flow conditions. It should be noted that the stormceptor will retain trapped pollutants during peak stormflows.

6. **Erosion and Sedimentation Control** – The Saddleback Meadows erosion and sedimentation control plan will be prepared and implemented in order to achieve the following two primary goals:

a. Soil erosion shall be minimized by keeping soil stabilized as long as possible.

b. Runoff from remaining disturbed areas shall be directed to locations where sediments will be removed prior to discharge into water courses.

Installation of temporary sediment basins, sand bag debris dams and temporary sand bag sediment catchment areas at catch basins during construction, are examples of ways the goal outlined in paragraph (b) directly above will be achieved by implementation of project BMP's.

7. **Monitoring, Inspection and Maintenance** – Structural BMPs will be monitored periodically and maintained sufficiently for their effectiveness. BMPs, such as the Stormceptors and the riverine system, will be privately maintained by the homeowner's association. A detailed plan for maintenance, inspection and for assessing the effectiveness of the BMPs including testing, will be included in the project's final WQMP and SWPPP. The final plans will be submitted to the applicable County departments and regional jurisdictions for their review and approval prior to issuance of the project grading permit. It is anticipated that the maintenance responsibilities will entail the following:

a. **Homeowners/Tenant Education**

California Quartet or its' assigns will insure that all homeowners will be given a copy of the recorded CC&R's which will contain a section outlining the environmental awareness education materials. The Master HOA will establish requirements for the implementation of a community awareness program that informs home buyers of the impacts of dumping oil, paints, solvents or other potentially harmful chemicals into the storm drain; the proper use and management of fertilizers, pesticides and herbicides in home landscaping and gardening practices; the impacts of littering and improper watering. Environmental awareness education materials, shall be provided to all members of the Master HOA periodically thereafter.

b. **Activity Restrictions**

Within the Master CC&R's prepared by California Quartet or its assigns, language will be included to identify surface water quality protection required by the Master HOA. Surface water quality activities shall also be conducted in conformance with the Water Quality Management Plan as it relates to the handling and disposal of contaminants. The following language provides additional direction for controlling activities that may affect the environment of the project and/or surrounding areas.

PROPOSED LANGUAGE

POLLUTANT RUNOFF
The Master HOA and its members shall comply with plans for the regulation and control of pollutant run-off by using "Best Management Practices" in accordance with the residential provisions of the California and Orange County Storm Water Best Management Practices Handbook, which include the following:

The Master HOA shall periodically provide to their members environmental awareness education materials made available by the local municipalities. These materials will describe the use of chemicals (including household types) that should be limited to the Covered Property with no discharge of specified wastes via hosing or other direct discharge to gutter, catch basins, settling basins and storm drains. The materials shall also provide a description of fertilizer and pesticide usage guidelines consistent with County Management Guidelines for Use of Fertilizers and Pesticides.

The Master HOA shall establish trash management and litter control procedures aimed at reducing pollution of drainage water.

The Master HOA shall have any drainage systems, streets and catch basins on property they maintain inspected and cleaned, and any streets and parking areas they maintain swept prior to the storm season (no later than October 15th of each year).

The Master HOA shall implement irrigation and landscaping practices which will include provision of water sensors, programmable irrigation times, grouping of plants with similar water requirements in order to reduce excess irrigation runoff and to promote surface filtration. The Master HOA shall maintain erosion control devices on the property they maintain until adequate vegetation coverage has been achieved following establishment of the landscape plantings.

c. **Common Area Landscape Management**

Management programs will be designed and established by the Master HOA, who will own and maintain all common areas within the project site. These programs will include how to mitigate the potential dangers of fertilizer and pesticide usage. Ongoing maintenance will be consistent with the County Water Conservation Resolution (Ordinance. No. 3802) and the State of California Model Water-Efficient Landscape Ordinance. Fertilizer and Pesticide usage

shall be consistent with County Management Guidelines for use of Fertilizers and Pesticides.

d. **BMP Maintenance**

As indicated above, the CC&R's identify the Master HOA as being responsible for implementation of each applicable non-structural BMP as well as scheduling cleaning of all applicable structural BMP facilities and will be responsible for inspection and maintenance activities in landscape areas. Debris and other water pollutants will be controlled, contained and disposed of in a proper manner by the Master HOA. California Quartet or its' assigns will be responsible for maintenance during construction.

e. **Common Area Litter Control**

The Master HOA will be required to implement trash management and litter control procedures in the common areas aimed at reducing pollution of drainage water. The Master HOA may contract with their landscape maintenance firm to provide this service during regularly scheduled maintenance, which should consist of litter patrol, emptying of trash receptacles in common areas, and noting trash disposal violations by homeowners and reporting the violations to the Master HOA for investigation.

f. **Employee Training**

An employee training/education program will be established as it would apply to future employees, contractors of the Master HOA, and volunteers to inform and train employees engaged in maintenance activities regarding the impact of dumping oil, paints, solvents or other potentially harmful chemicals into storm drain; the proper use of fertilizers and pesticides in landscaping maintenance practices; and the impacts of littering and improper water disposal. In addition, California Quartet or its' assigns will make available training and education materials to their contractors and subcontractors and their employees during construction.

g. **Common Area Catch Basin Inspection**

The proposed storm drain mainline along with its catch basins and the stormceptor shall be constructed by California Quartet or its' assigns and maintained and cleaned by the Maintenance Landscape Company hired by the Master HOA. This will be done on a regular basis and prior to the storm season, no later than October 15th of each year. The Master HOA will maintain all catch basins on-site.

California Quartet or its' assigns will be responsible for on-site inspection and maintenance during construction.

The proposed stormceptor will have the following maintenance performed by the HOA:

- Annual inspection and power wash of the screen.
- Inspection of the unit after the first major seasonal storm.
- Removal of captured pollutants by a vac truck when the sump becomes 2/3 to ¾ full.
- Remove and replace oil and grease sorbents when fully discolored/coated with oil.

h. **Street Sweeping Private Streets and Parking Lots**

The Master HOA shall have all private streets and parking lots vacuum swept on a weekly basis. This procedure will be intensified around October 15th of each year prior to the "first flush" storm.

8. **Routine Structural BMP's** – Structural BMP's shall be installed initially by California Quartet or its' assigns, the developer, through the construction and development of the project, for instance; slope planting and irrigation systems shall be designed by licensed landscape architects and installed by qualified contractors to specifications and standards of the County of Orange.

a. **Filtration**

This BMP is considered a "routine" BMP and will be implemented through the provisions of a grassy swale. This grassy swale will be located on the north side of the project spine road. Low flow, dry weather, nuisance flows will be directed to the grassy swale areas for "polishing" prior to being discharged downstream.

The proposed riverine system/grassy swale will have the following maintenance performed by the HOA.

- Vegetation within the grassy swale shall be monitored monthly to identify and remove any dead or dying material. Vegetation removed shall be replaced in a timely manner to ensure the continued effectiveness of the grassy swale.

- The grassy swale shall be inspected monthly for trash and debris. Any trash and debris shall be removed and disposed of properly. The density of the vegetation shall be monitored monthly to ensure that the grassy swale contains adequate material to "polish" the runoff flows. Any areas found to be deficient shall be planted with the appropriate material.

- The vegetation shall be monitored twice yearly to ensure that the growth and condition of the plant materials are consistent with the approved fuel modification program.

- The grasses shall be mowed or weed whipped (depending on the type of grass) on a monthly basis during the dry weather months. All grass clippings shall be disposed of properly.

b. **Common Area Efficient Irrigation**

As a part of the design of all common area landscape irrigation, implementation of the County Water Conservation Resolution including, but not limited to, such provisions as water sensors, programmable irrigation times (for short cycles), etc., will be used. Such common areas will be maintained by the Master HOA.

c. **Common Area Runoff - Minimizing Landscape Design**

As a part of the design of all common area landscape areas, similar planting material with similar water requirements will be used in order to reduce excess irrigation runoff and promote surface filtration. Such common areas will be maintained by the Master HOA.

d. **Energy Disapators**

Energy disapators will be installed per the approved storm drain plans and maintained by the Master HOA.

e. **Catch Basin Stenciling**

As a part of the final civil engineering drawings, it will be required by California Quartet or its' assigns to stencil on all catch basins, where applicable in paved areas, the words, "No Dumping - Drains to Ocean." This will be done in a location that can be clearly seen by all and will be routinely inspected and restenciled as required.

9. **BMP Selection Criteria** – BMP selection for Saddleback Meadows will be refined during the preparation of the project's grading and drainage plans. Final selection will be made in accordance with two major objectives of the WQMP. These two WQMP objectives are:

   a. To identify the sources of pollution that affects the quality of storm water discharges from the project construction sites.

   b. To identify, assign and implement control measures and management practices to reduce pollutants in the storm water discharges before and after the completion of construction activities.

   The final analysis and design of the BMP's will meet or exceed the minimum standard BMPs set forth by County of Orange and State of California Water Quality Regulations, Permits and Guidelines.

10. **Standard Conditions** – In addition to this Conceptual Plan, implementation of the project will be controlled by the County of Orange through compliance with the conditions of approval for the Tentative Tract Map. The following will be part of those conditions:

   a. Potential for the proposed project to impact the site's hydrology shall be reduced to a level of insignificance through engineering and construction techniques incorporated into the project in a manner meeting the approval of the Manager, PDS/subdivision and Grading Services Division, County of Orange.

   b. Prior to issuance of a grading permit, a Water Quality Management Plan specially identifying Best Management Practices that will be used onsite to control predictable pollutant runoff shall be prepared and approved by the County of Orange.

   c. Prior to issuance of any grading permits, the applicant shall submit evidence to the Manager, PDS/Subdivision and Grading Services Division, County of Orange, that the applicant has obtained coverage under the NPDES statewide General Stormwater Permit from the State Water Resources Control Board.

IV. SUMMARY

Saddleback Meadows WQMP, when implemented, will achieve the primary objectives of applicable governmental storm water permits and water quality management for construction activities in that it will:

A. Reduce excessive erosion potential

B. Minimize excessive sedimentation.

C. Prevent materials used at construction sites from causing on-site or offsite contamination.

D. Prevent non-storm water discharges from the project's construction activities.

E. Install appropriate measures to reduce impacts on downstream waterways from the completed project, and provide a commitment that these measures will be maintained.

F. Establish maintenance commitments on post-construction sites.

There are standard conditions of approval and Mitigation Measures that this project will have to comply with during the development process. These conditions are part of the Tentative Tract Map conditions and below are a few of these measures. Overall, these Mitigation Measures will ensure that all the above goals will be achieved.

Following are the standard County of Orange Mitigation Measures:

A. Potential for the proposed project to impact the site's hydrology shall be reduced to a level of insignificance through engineering and construction techniques incorporated into the project in a manner meeting the approval of the Manager, PDS/subdivision and Grading Services Division.

B. Prior to issuance of a grading permit, a Water Quality Management Plan specially identifying Best Management Practices that will be used onsite to control predictable pollutant runoff shall be prepared and approved by the County of Orange.

C. Prior to issuance of any grading permits, the applicant shall submit evidence to the Manager, PDS/Subdivision and Grading Services Division, that the applicant has obtained coverage under the NPDES statewide General Stormwater Permit from the State Water Resources Control Board.

During the planning phase of this project, the following items have been incorporated into the project plans to minimize the impact from the development:

A. Preservation of natural topography, existing drainage and existing vegetation to the extent possible.

B. Reduction of the paved area by means of narrower streets to the extent allowed by the local jurisdiction.

C. Use of existing vegetation and creation of new standards vegetated area to promote infiltration.

D. The street lay out and storm drain systems have been designed for easy maintenance and cleaning.

EXHIBITS

1. Riverine exhibit (cross section)

I. PURPOSE

The goal of the Saddleback Meadows Water Quality Management Plan (WQMP) is to reduce pollutants and/or specific sources of pollution which affect or may affect the project property as well as the downstream properties in its development. Such reductions should result in cleaner water in onsite runoff, storm water and incidental flows, including those flows emptying towards offsite facilities and features downstream.

When implemented, the pollution control measures proposed by the WQMP will create cleaner water runoff associated with development in compliance with all applicable water quality ordinances and laws. These laws include, but are not limited to, San Diego Region, California State Regional Water Quality Control Board directives; the County of Orange's NPDES Drainage Area Management Plan (DAMP); and the Clean Water Act of the United States of America.

II. EXISTING CONDITIONS

A. Saddleback Meadows

Saddleback Meadows is located primarily within the Aliso Creek Watershed area. Its hillside topography is incised with drainage courses that mainly drain west to Aliso Creek. Aliso Creek is located just west of the project's western flank. Some remaining courses drain south to Oso Creek. Oso Creek is located south of the project's southeast boundary.

The vacant, 222.2 acre project site comprises hillside topography covered with native grasses and dirt trails. Remnants related to agricultural and ranching uses employed since the 1930's include an abandoned, worn out wooden house, corrals, an overgrown olive orchard and eight stock ponds. The remainder of the site is covered by coastal sage scrub, chapparel and oak woodland. The property has been heavily grazed for the past several decades. This is evident as the native vegetation has been replaced by grasslands on over 50% of the property. Significant portions of the property are also covered by artichoke thistle, another indicator of overgrazing. Accordingly, evidence on the property indicates poor hydrologic conditions with high stormwater runoff and highly erosive overland flow. Over the past several years, numerous highly incised drainage courses have been cut into the natural rolling topography. During low flow conditions, for example a 2-year storm event, peak discharges are 30% higher than in its pre-grazing natural state.

An east-west running ridgeline located in the southern portion of the property rises up from the west (elevation 1,200') and extends east approximately 3,000 LF. This ridge spans two thirds of the east-west width of Saddleback Meadows. The ridgeline then turns north-northeast, continuing to rise and extending 2,200 LF towards the northeast property corner. Existing site elevations exceeding 1,600' are typical at the northern portion of the east property line.

In general, storm water runoff flows drain to the west across the property, eventually emptying into Aliso Creek. In the project's area, Aliso Creek flows parallel to and at the **west side** of existing El Toro Road. Existing El Toro Road, in this same area, forms the western boundary of Saddleback Meadows.

Existing storm drain facilities on the **east side** of El Toro Road picks up water runoff from the project site and conveys it westerly under El Toro Road, to outlets discharging into Aliso Creek. These existing storm drain facilities are maintained by the County of Orange. They are:

- The J01 facility per the J01-701-15 storm drain improvements approved by the County of Orange located north of the project's spine road intersection with El Toro Road.
- The Line "B", 24" RCP storm drain line per J01-701-15 plans (described directly above) located south of the project's spine road intersection with El Toro Road.
- Lines "A", "B" and "C", 24" RCP storm drain lines per the improvement plans for Tract 12724, County of Orange, located at the southern most entry street (existing Valley Vista Street) intersection with El Toro Road.

However, some stormwater runoff flows at the eastern two thirds of the southern portion of the property surface drain to the south property line, then southerly across natural vegetation of the adjacent property and empties into Oso Creek. Oso Creek runs as close as 200 LF from Saddleback Meadow's southern boundary.

B. Regional

Down stream to this project there is drainage from the newer projects which are tributary to the Aliso Creek which is a natural water course. Recently, the Regional Water Quality Board has issued a new directive to clean the high bacteria count (Coliform) from the Creek. The Board's goal is to make Aliso Creek Beach safe for swimming.

III. DEVELOPED CONDITIONS

A. Saddleback Meadows

Residential development for up to 283 single-family homes is proposed in two project areas. 163 residential lots are proposed in the southwest quadrant of the project, 68 residential lots are proposed for the southeasterly quadrant and the remaining 52 residential lots are located in the northeasterly quadrant. While stabilization of the existing land slides and conventional mass grading will disturb approximately 70% of the entire project site, approximately 71% of the property will be placed into permanent open space.

Table 1

Summary of Proposed Land Uses

Land Use	Area (acres)	Portion of Site
Single-Family Residential Lots (283)	46.2	21%
Streets (private)	18.4	8%
Regional Park *	88.2	40%
Biological Open Space Easement**	9.2	4%
Restricted Scenic Preservation Easement***	60.2	27%
Total	**222.0**	100%

*Regional Park, as required by the County of Orange, excludes manufactured slopes and fuel modification areas. Regional Park may include areas subject to remedial grading and biological enhancement.

** Biological Open Space Easement includes biologically restored manufactured slopes outside fuel modification areas.

*** Restricted Scenic Preservation Easement included fuel modification areas owned and maintained by homeowner's association/community management district.

Table 2

Summary of Grading Disturbance

Land Use	Area (acres)	Portion of Site
Single-Family Residential Lots (283)+ Roads	64.6	29%
Manufactured Slopes	57.2	26%
Remedial Grading*	28.2	13%
Undisturbed Areas **	72.0	32%
Total	222.0	100%

* Landfill stabilization beyond the limits of the conventional mass grading

** Undisturbed areas may include Fuel Modification Zones and may be subject to biological enhancement; i..e., annual grasslands replaced with Coastal Sage Scrub or Oak Woodlands as discussed in the Biological Technical Report

Open space areas are proposed for both the project's northwest quadrant and significant areas along the project's eastern and southern flanks. The permanent open space will be dedicated to the County of Orange as a regional park and will be maintained by the County or a third-party conservation group. Maintenance of the permanent open space will be funded by a permanent endowment created by the developer.

Saddleback Meadows will be served by urban type drainage systems. Drainage systems will conform to County of Orange Flood Control District standards, and basically comprised of paved street gutters, catch basins, and underground concrete pipes.

Storm drain improvements for the southwest development area will drain westerly into existing Orange County maintained storm drains at the west-southwest project boundary The main storm drain and low-flow channel will crossing. Only Lots 1 through 37 connect directly to an existing storm drain facility in El Toro Road. Storm drain improvements for the northeastern development area, in general, will drain easterly and outlet into the project's open space area located in the north central portion of the project. Surface flows through the open space and collects in a tributary which drains westerly about 2,000 feet before draining into Aliso outlet into Aliso Creek after reaching the main El Toro under creek. Aliso Creek continues another 600 feet before emptying into the existing J01 storm drain facility inlet located north of the El Toro Road/Spine road intersection.

The Storm drain outlets have been carefully located so that they discharge into natural channels in order to replicate natural flow patterns as closely as possible. In some cases, this has resulted in multiple outlets; for example, the drainage system in the northwest development area.

B. Regional

The project is located within the boundaries of two primary watershed areas:

Aliso Creek Approximately 75% of the site *is within the Aliso Creek Watershed.* Aliso Creek is located west of the project site. The natural creek is located along the eastside of El Toro Road but crosses under the roadway near the project's entrance, continuing southwesterly along the west side of El Toro Road. The creek flows through natural open space and urban development and outlets at the ocean at Aliso Creek Beach. Aliso Creek's watershed encompasses 23,000 acres, and includes natural open space, rural and urban development, agriculture and ranching, regional parks and other recreational facilities. There are a number of street crossings over Aliso Creek which have been built as the result of newer or existing developments downstream. Saddleback Meadows represents less than 1% of the Aliso Creek watershed.

Oso Creek The remaining 25% of the site located on the southeasterly portion of the project is part of the Oso Creek watershed. Flows from the project drain offsite through natural drainages. The natural drainages converge and flow into a concrete storm drain system that runs in a southwesterly direction though Tract 12724 (Hidden Ridge residential development). The system outlets onto a concrete energy dissipator and then into the natural drainage course of Oso Creek. The creek drains into the Upper Oso Reservoir. Overflows from the reservoir continue westerly eventually draining into San Juan Creek which outlets into the Pacific Ocean at Doheney State Beach.

A small area at the extreme eastern portion of the site drains into the Trabuco Creek watershed.

IV. BEST MANAGEMENT PRACTICES (BMP'S)

A. Introduction

In order to reduce, control, prevent, remove or eliminate pollution, BMPs will be proposed, implemented and followed for development of Saddleback Meadows. BMPs are construction devices, procedures, rules or methods that will be used to control predictable pollutant runoff associated with the development of Saddleback Meadows.

B. BMP Highlights for Saddleback Meadows

The Saddleback Meadows BMP's have been chosen based on local industry standards and the existing constraints on the property. The site plan for Saddleback Meadows has been carefully designed to minimize the impact to the natural topography and vegetation. The proposed development area is the minimum area possible which accommodates the project's 283 Single Family Residential lots. This reduces the opportunity to use structural BMPs that require larger areas (created wetlands, basins) within the development area. Sensitive biological habitat also prevents locating such facilities within the open space areas. The structural BMP's therefore have been designed to take advantage of excess space for created wetlands and basins and in-line solutions where space is not available.

Saddleback Meadows BMP's will include the following.

1. **Restore Natural Watershed** – The portion of the property that will not be disturbed by grading, approximately 30%, will be restored by cessation of cattle grazing. Furthermore, the annual grasslands and artichoke thistle will be replaced with coastal sage scrub and oak woodlands. Existing disturbed coastal sage scrub will be enhanced. All of these actions will reduce stormwater runoff by up to 30%. This will also significantly reduce erosion potential and should eliminate the erosion that is currently plaguing the property. The remaining 40% of the property that will be placed into

permanent open space will be revegetated with coastal sage scrub and oak woodlands ensuring that these disturbed areas are stabilized.

2. **Minimize Impervious Areas** – The project has been designed to minimize impervious areas through the use of larger lots (5,000 square foot minimum, nearly 6,700 square foot average) and narrower private streets. This will limit impervious areas to less than 17% of the property.

3. **Storm Drain System** – The storm drain system has been designed to mimic natural drainage patterns as closely as possible. Storm drain outlets will be provided to return runoff into each natural drainage that intersects the development area. This serves the dual purpose of ensuring that the natural drainages are receiving no more runoff than they can accommodate and ensuring that natural riparian habitat continue to receive an adequate supply of water. Appropriate energy dissipaters will be installed at each outlet to reduce flows to non-erosive velocities.

4. **Riverine System** – The southwest and southeast quadrants of development, approximately 80% of the residential lots and streets, will be served by a riverine system designed to provide a natural cleansing of the urban run-off. Incidental and low flows produced by the completed project will be filtered by the riverine system. The riverine system will collect low flows at strategically located catch basins. Underground pipes will then convey the low flows to a vegetated swale. This swale is located parallel to and along the north side of the project's spine road attached exhibit provides the detail and cross section of the proposed Riverine system. The swale design will filter pollutants from low flows. It will also allow dissipation of a portion of the flows through percolation and evaporation. The downstream terminus of the riverine system is a 1200' long by 60' wide earthen and vegetated detention basin) located just north of the spine road and 700' east of the El Toro Road/spine road intersection. The effectiveness of the Riverines generally depend on the length and the amount of vegetation within the Riverines along the path. The typical vegetation within the Riverine system include PlatanusRacemosa, Schinus Molle, Baccharis Sacfolia, Juncus Mexicanus, Scripus Californicus.

5. **Stormceptors** – Stormceptors are in-line storm drain devices designed to separate sediment and oil from low-flow runoff flowing through underground storm drain pipes. The trapped sediment and oil is then removed during routine maintenance and disposed of at an approved landfill. All storm drain pipe flows within the northeastern quadrant, the remaining 20% of the development, will pass through strategically located Stormceptors prior to discharging into project open space areas. The Stormceptors will be able to remove up to 80% of the total sediment load (TDS). The Stormceptors will also remove free oil from stormwater during normal flow conditions. It should be noted that the stormceptor will retain trapped pollutants during peak stormflows.

6. **Erosion and Sedimentation Control** – The Saddleback Meadows erosion and sedimentation control plan will be prepared and implemented in order to achieve the following two primary goals:

   a. Soil erosion shall be minimized by keeping soil stabilized as long as possible.

   b. Runoff from remaining disturbed areas shall be directed to locations where sediments will be removed prior to discharge into water courses.

   Installation of temporary sediment basins, sand bag debris dams and temporary sand bag sediment catchment areas at catch basins during construction, are examples of ways the goal outlined in paragraph (b) directly above will be achieved by implementation of project BMP's.

7. **Monitoring, Inspection and Maintenance** – Structural BMPs will be monitored periodically and maintained sufficiently for their effectiveness. BMPs, such as the Stormceptors and the riverine system, will be privately maintained by the homeowner's association. A detailed plan for maintenance, inspection and for assessing the effectiveness of the BMPs including testing, will be included in the project's final WQMP and SWPPP. The final plans will be submitted to the applicable County departments and regional jurisdictions for their review and approval prior to issuance of the project grading permit. It is anticipated that the maintenance responsibilities will entail the following:

   a. **Homeowners/Tenant Education**

   California Quartet or its' assigns will insure that all homeowners will be given a copy of the recorded CC&R's which will contain a section outlining the environmental awareness education materials. The Master HOA will establish requirements for the implementation of a community awareness program that informs home buyers of the impacts of dumping oil, paints, solvents or other potentially harmful chemicals into the storm drain; the proper use and management of fertilizers, pesticides and herbicides in home landscaping and gardening practices; the impacts of littering and improper watering. Environmental awareness education materials, shall be provided to all members of the Master HOA periodically thereafter.

   b. **Activity Restrictions**

   Within the Master CC&R's prepared by California Quartet or its assigns, language will be included to identify surface water quality protection required by the Master HOA. Surface water quality activities shall also be conducted in conformance with the Water

Quality Management Plan as it relates to the handling and disposal of contaminants. The following language provides additional direction for controlling activities that may affect the environment of the project and/or surrounding areas.

PROPOSED LANGUAGE

POLLUTANT RUNOFF
The Master HOA and its members shall comply with plans for the regulation and control of pollutant run-off by using "Best Management Practices" in accordance with the residential provisions of the California and Orange County Storm Water Best Management Practices Handbook, which include the following:

The Master HOA shall periodically provide to their members environmental awareness education materials made available by the local municipalities. These materials will describe the use of chemicals (including household types) that should be limited to the Covered Property with no discharge of specified wastes via hosing or other direct discharge to gutter, catch basins, settling basins and storm drains. The materials shall also provide a description of fertilizer and pesticide usage guidelines consistent with County Management Guidelines for Use of Fertilizers and Pesticides.

The Master HOA shall establish trash management and litter control procedures aimed at reducing pollution of drainage water.

The Master HOA shall have any drainage systems, streets and catch basins on property they maintain inspected and cleaned, and any streets and parking areas they maintain swept prior to the storm season (no later than October 15th of each year).

The Master HOA shall implement irrigation and landscaping practices which will include provision of water sensors, programmable irrigation times, grouping of plants with similar water requirements in order to reduce excess irrigation runoff and to promote surface filtration. The Master HOA shall maintain erosion control devices on the property they maintain until adequate vegetation coverage has been achieved following establishment of the landscape plantings.

c. **Common Area Landscape Management**

Management programs will be designed and established by the Master HOA, who will own and maintain all common areas within the project site. These programs will include how to mitigate the potential dangers of fertilizer and pesticide usage. Ongoing

maintenance will be consistent with the County Water Conservation Resolution (Ordinance. No. 3802) and the State of California Model Water-Efficient Landscape Ordinance. Fertilizer and Pesticide usage shall be consistent with County Management Guidelines for use of Fertilizers and Pesticides.

d. **BMP Maintenance**

As indicated above, the CC&R's identify the Master HOA as being responsible for implementation of each applicable non-structural BMP as well as scheduling cleaning of all applicable structural BMP facilities and will be responsible for inspection and maintenance activities in landscape areas. Debris and other water pollutants will be controlled, contained and disposed of in a proper manner by the Master HOA. California Quartet or its' assigns will be responsible for maintenance during construction.

e. **Common Area Litter Control**

The Master HOA will be required to implement trash management and litter control procedures in the common areas aimed at reducing pollution of drainage water. The Master HOA may contract with their landscape maintenance firm to provide this service during regularly scheduled maintenance, which should consist of litter patrol, emptying of trash receptacles in common areas, and noting trash disposal violations by homeowners and reporting the violations to the Master HOA for investigation.

f. **Employee Training**

An employee training/education program will be established as it would apply to future employees, contractors of the Master HOA, and volunteers to inform and train employees engaged in maintenance activities regarding the impact of dumping oil, paints, solvents or other potentially harmful chemicals into storm drain; the proper use of fertilizers and pesticides in landscaping maintenance practices; and the impacts of littering and improper water disposal. In addition, California Quartet or its' assigns will make available training and education materials to their contractors and subcontractors and their employees during construction.

g. **Common Area Catch Basin Inspection**

The proposed storm drain mainline along with its catch basins and the stormceptor shall be constructed by California Quartet or its' assigns and maintained and cleaned by the Maintenance Landscape Company hired by the Master HOA. This will be done on a regular

basis and prior to the storm season, no later than October 15th of each year. The Master HOA will maintain all catch basins on-site. California Quartet or its' assigns will be responsible for on-site inspection and maintenance during construction.

The proposed stormceptor will have the following maintenance performed by the HOA:

- Annual inspection and power wash of the screen.
- Inspection of the unit after the first major seasonal storm.
- Removal of captured pollutants by a vac truck when the sump becomes 2/3 to ¾ full.
- Remove and replace oil and grease sorbents when fully discolored/coated with oil.

h. **Street Sweeping Private Streets and Parking Lots**

The Master HOA shall have all private streets and parking lots vacuum swept on a weekly basis. This procedure will be intensified around October 15th of each year prior to the "first flush" storm.

8. **Routine Structural BMP's** – Structural BMP's shall be installed initially by California Quartet or its' assigns, the developer, through the construction and development of the project, for instance; slope planting and irrigation systems shall be designed by licensed landscape architects and installed by qualified contractors to specifications and standards of the County of Orange.

a. **Filtration**

This BMP is considered a "routine" BMP and will be implemented through the provisions of a grassy swale. This grassy swale will be located on the north side of the project spine road. Low flow, dry weather, nuisance flows will be directed to the grassy swale areas for "polishing" prior to being discharged downstream.

The proposed riverine system/grassy swale will have the following maintenance performed by the HOA.

- Vegetation within the grassy swale shall be monitored monthly to identify and remove any dead or dying material. Vegetation removed shall be replaced in a timely manner to ensure the continued effectiveness of the grassy swale.

- The grassy swale shall be inspected monthly for trash and debris. Any trash and debris shall be removed and disposed of properly. The density of the vegetation shall be monitored monthly to ensure that the grassy swale contains adequate material to "polish" the runoff flows. Any areas found to be deficient shall be planted with the appropriate material.

- The vegetation shall be monitored twice yearly to ensure that the growth and condition of the plant materials are consistent with the approved fuel modification program.

- The grasses shall be mowed or weed whipped (depending on the type of grass) on a monthly basis during the dry weather months. All grass clippings shall be disposed of properly.

b. **Common Area Efficient Irrigation**

As a part of the design of all common area landscape irrigation, implementation of the County Water Conservation Resolution including, but not limited to, such provisions as water sensors, programmable irrigation times (for short cycles), etc., will be used. Such common areas will be maintained by the Master HOA.

c. **Common Area Runoff - Minimizing Landscape Design**

As a part of the design of all common area landscape areas, similar planting material with similar water requirements will be used in order to reduce excess irrigation runoff and promote surface filtration. Such common areas will be maintained by the Master HOA.

d. **Energy Disapators**

Energy disapators will be installed per the approved storm drain plans and maintained by the Master HOA.

e. **Catch Basin Stenciling**

As a part of the final civil engineering drawings, it will be required by California Quartet or its' assigns to stencil on all catch basins, where applicable in paved areas, the words, "No Dumping - Drains to Ocean." This will be done in a location that can be clearly seen by all and will be routinely inspected and restenciled as required.

9. **BMP Selection Criteria** – BMP selection for Saddleback Meadows will be refined during the preparation of the project's grading and drainage plans. Final selection will be made in accordance with two major objectives of the WQMP. These two WQMP objectives are:

   a. To identify the sources of pollution that affects the quality of storm water discharges from the project construction sites.

   b. To identify, assign and implement control measures and management practices to reduce pollutants in the storm water discharges before and after the completion of construction activities.

   The final analysis and design of the BMP's will meet or exceed the minimum standard BMPs set forth by County of Orange and State of California Water Quality Regulations, Permits and Guidelines.

10. **Standard Conditions** – In addition to this Conceptual Plan, implementation of the project will be controlled by the County of Orange through compliance with the conditions of approval for the Tentative Tract Map. The following will be part of those conditions:

    a. Potential for the proposed project to impact the site's hydrology shall be reduced to a level of insignificance through engineering and construction techniques incorporated into the project in a manner meeting the approval of the Manager, PDS/subdivision and Grading Services Division, County of Orange.

    b. Prior to issuance of a grading permit, a Water Quality Management Plan specially identifying Best Management Practices that will be used onsite to control predictable pollutant runoff shall be prepared and approved by the County of Orange.

    c. Prior to issuance of any grading permits, the applicant shall submit evidence to the Manager, PDS/Subdivision and Grading Services Division, County of Orange, that the applicant has obtained coverage under the NPDES statewide General Stormwater Permit from the State Water Resources Control Board.

IV. SUMMARY

Saddleback Meadows WQMP, when implemented, will achieve the primary objectives of applicable governmental storm water permits and water quality management for construction activities in that it will:

A. Reduce excessive erosion potential

B. Minimize excessive sedimentation.

C. Prevent materials used at construction sites from causing on-site or offsite contamination.

D. Prevent non-storm water discharges from the project's construction activities.

E. Install appropriate measures to reduce impacts on downstream waterways from the completed project, and provide a commitment that these measures will be maintained.

F. Establish maintenance commitments on post-construction sites.

There are standard conditions of approval and Mitigation Measures that this project will have to comply with during the development process. These conditions are part of the Tentative Tract Map conditions and below are a few of these measures. Overall, these Mitigation Measures will ensure that all the above goals will be achieved.

Following are the standard County of Orange Mitigation Measures:

A. Potential for the proposed project to impact the site's hydrology shall be reduced to a level of insignificance through engineering and construction techniques incorporated into the project in a manner meeting the approval of the Manager, PDS/subdivision and Grading Services Division.

B. Prior to issuance of a grading permit, a Water Quality Management Plan specially identifying Best Management Practices that will be used onsite to control predictable pollutant runoff shall be prepared and approved by the County of Orange.

C. Prior to issuance of any grading permits, the applicant shall submit evidence to the Manager, PDS/Subdivision and Grading Services Division, that the applicant has obtained coverage under the NPDES statewide General Stormwater Permit from the State Water Resources Control Board.

During the planning phase of this project, the following items have been incorporated into the project plans to minimize the impact from the development:

A. Preservation of natural topography, existing drainage and existing vegetation to the extent possible.

B. Reduction of the paved area by means of narrower streets to the extent allowed by the local jurisdiction.

C. Use of existing vegetation and creation of new standards vegetated area to promote infiltration.

D. The street lay out and storm drain systems have been designed for easy maintenance and cleaning.

SADDLEBACK MEADOWS
GROWTH MANAGEMENT/CMP TRAFFIC ANALYSIS (REVISED)
ORANGE COUNTY, CALIFORNIA

1.0 INTRODUCTION AND SUMMARY

A. Purpose of Report and Study Objectives

The purpose of this revised traffic study is to evaluate the development of the Saddleback Meadows from a traffic circulation standpoint. The proposed development is included within the unincorporated portion of Orange County.

Study objectives include (1) documentation of existing traffic conditions in the vicinity of the site; (2) calculation of existing plus project traffic conditions; (3) evaluation of traffic conditions for the Year 2005; (4) analysis of traffic conditions for Year 2025; and (5) determination of off-site improvements and system management actions needed to achieve County of Orange level of service requirements.

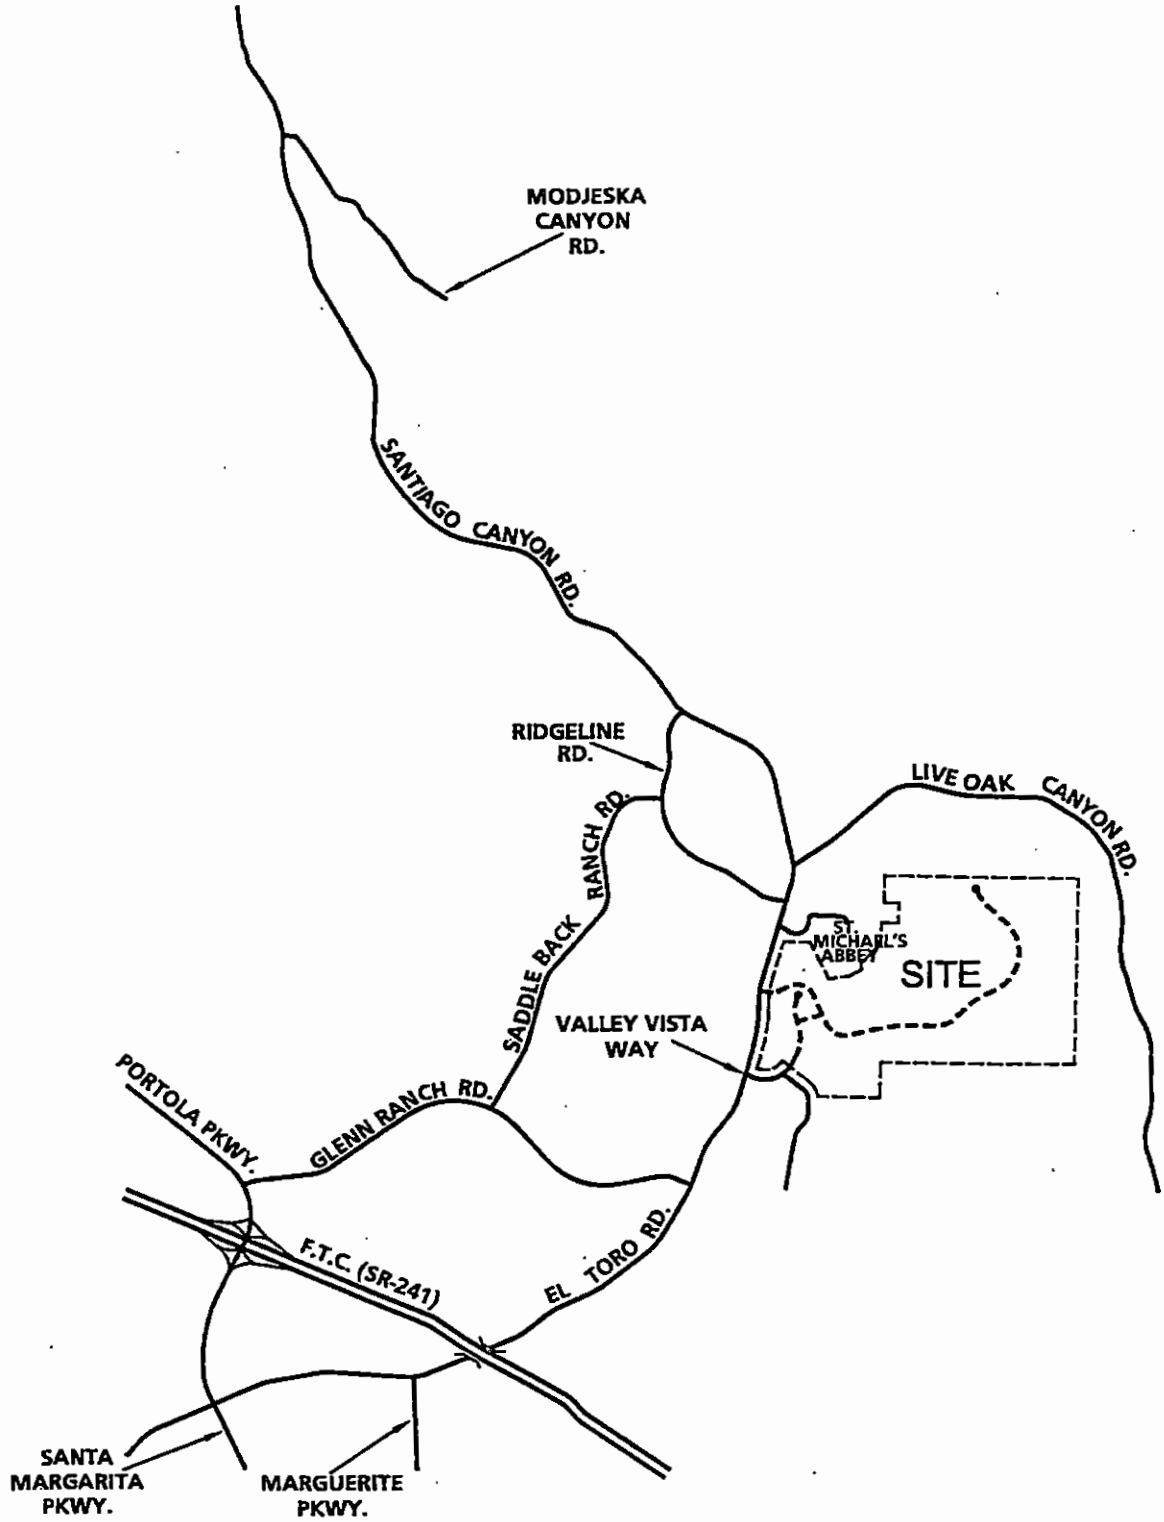
B. Executive Summary

1. Site Location and Study Area

The project site is located east of El Toro Road and south of Live Oak Canyon Road in the County of Orange. Exhibit 1-A illustrates the traffic analysis study area.

EXHIBIT 1-A

LOCATION MAP



The study area includes the following intersections:

Santiago Canyon Road (NS) at:

- Modjeska Canyon Road (EW)
- Ridgeline Road (EW)

El Toro Road (NS) at:

- Live Oak Canyon Road (EW)
- Ridgeline Road (EW)
- Valley Vista Way (EW)
- Glenn Ranch Road (EW)

Saddleback Ranch Road (NS) at:

- Glenn Ranch Road (EW)

Marguerite Parkway (NS) at:

- El Toro Road (EW)

Portola Parkway (NS) at:

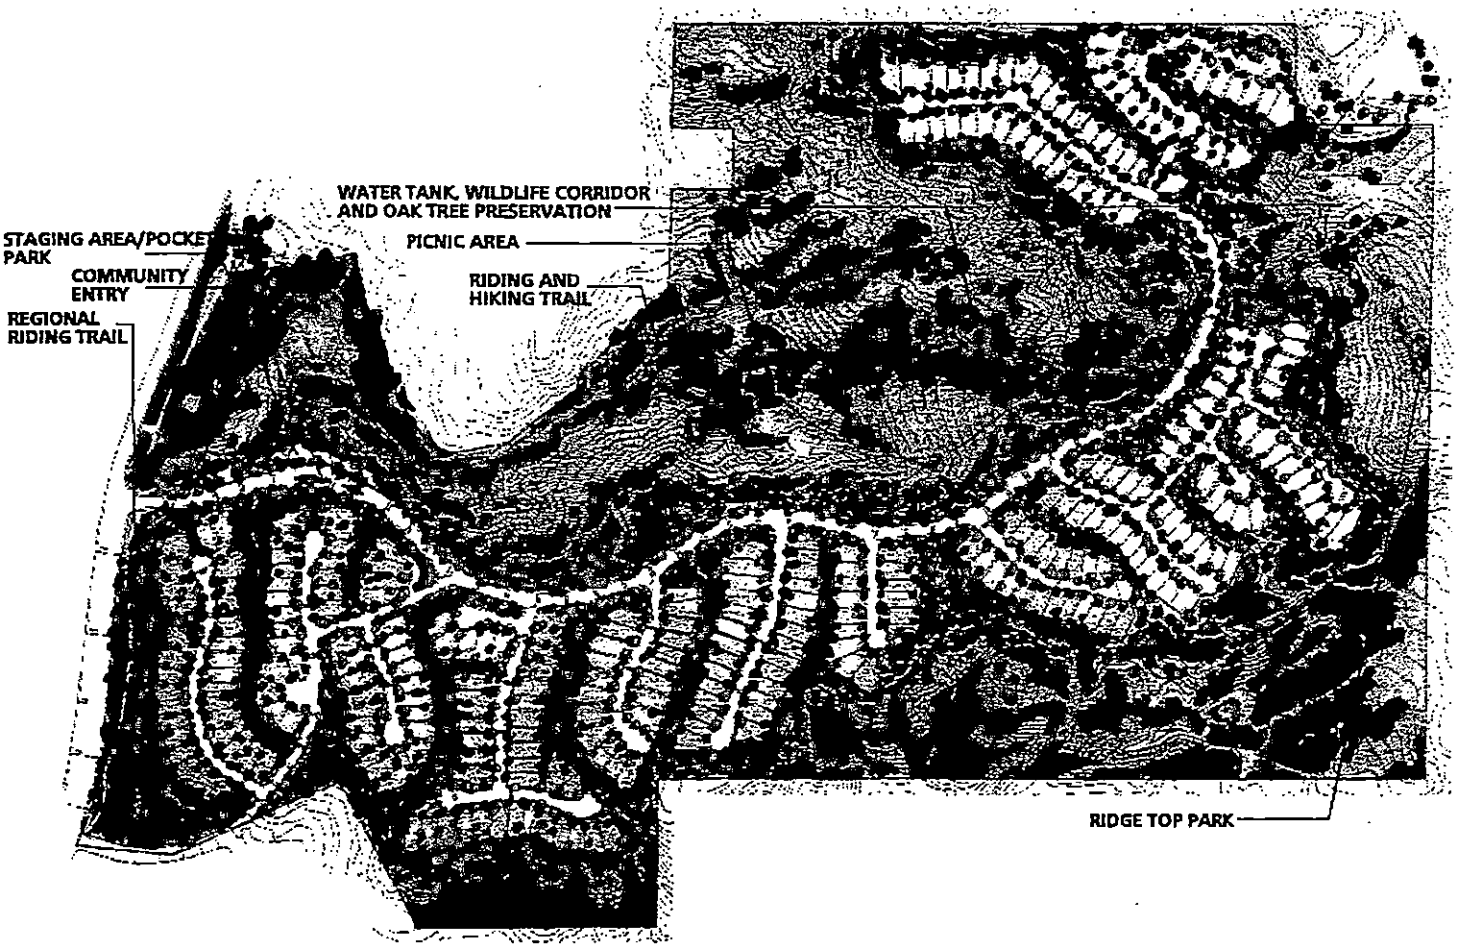
- Glenn Ranch Road (EW)
- Foothill Transportation Corridor (EW)
- El Toro Road (EW)

2. Development Description

The 223 acre project site is currently undeveloped and does not generate any significant traffic. Proposed uses for the project site include 299 single-family detached dwelling units. The site plan for the project is shown on Exhibit 1-B.

EXHIBIT 1-B

SITE PLAN



3. Principal Findings

The proposed development is projected to generate a total of approximately 3,590 trip-ends per day with 265 vehicles per hour during the AM peak hour and 355 vehicles per hour during the PM peak hour.

For existing traffic conditions, the intersections in the vicinity of the site are operating at Level of Service "D" or better during the peak hours, as shown in Table 2-2. A traffic signal appears to presently be warranted at the following intersection (see Appendix "J"):

El Toro Road (NS) at:

- Live Oak Canyon Road (EW)

For existing plus project traffic conditions, the intersections in the vicinity of the site are projected to continue to operate at Level of Service "D" or better during the peak hours, as shown in Table 4-1. A traffic signal is projected to be warranted at the intersection of El Toro Road/Project Entrance for existing plus project traffic conditions (see Appendix "J").

For Year 2005 traffic conditions, the intersections in the vicinity of the site are projected to operate at Level of Service "D" or better during the peak hours with improvements, as shown in Table 4-4.

For Year 2025 traffic conditions, the intersections in the vicinity of the site are projected to operate at Level of Service "D" or better during the peak hours with improvements that include the ultimate widening of El Toro Road and Santiago Canyon Road to four through travel lanes (two in each direction), as shown in Table 4-7.

Pursuant to the County of Orange Growth Management Plan (GMP), segments of Santiago Canyon Road are required to function at a Level of Service "C". Capacity improvements along Santiago Canyon Road will be required in conjunction with future growth to achieve Level of Service "C". The Santiago Canyon Road Major Thoroughfare and Bridge Fee Program has been designed to provide up to $34 million in improvements to Santiago Canyon Road from Chapman Avenue to Live Oak Canyon Road. However, the March, 1994 Project Report for improvements to Santiago Canyon Road indicates that the total cost of improvements is approximately $52.3 million for a "limited project" scenario.

4. Project Recommendations

The proposed project will have primary access to El Toro Road. The El Toro Road turn-lane improvements needed at the Project Entrance to serve Year 2005 conditions should be completed in conjunction with development. Secondary access will be provided via an access to Valley Vista Way.

For Year 2005 and Year 2025 traffic conditions with the project and with off-site improvements, study area intersections that are impacted by the proposed development are projected to operate at Level of Service "D" or better during the peak hours. Significant off-site improvements will be needed at study area intersections to accommodate Year 2025 traffic conditions. Improvements are programmed to be implemented through existing funding programs (i.e., Measure "M", existing road fee programs, etc.) and pro-rata participation by individual developments based upon

vesting tentative map conditions and existing development agreements. Potential roadway fees for the Saddleback Meadows development are shown in Table 5-1.

North of the Foothill Transportation Corridor, El Toro Road can accommodate cumulative Year 2025 traffic volumes with the proposed project on four travel lanes divided by a raised or striped median. Exhibit 5-A illustrates the alternative cross-sections for El Toro Road in the vicinity of the project. Implementation of a full Major arterial cross-section (six lanes divided) is not needed to serve future traffic volumes.

Exhibit 5-A depicts an alternative section which would provide four travel lanes along El Toro Road divided by a striped median. This alternative section represents a modification of the typical cross-section for a Primary arterial. Appropriate transitions would be required between this cross-section and other modified cross-sections along El Toro Road south of Glenn Ranch Road.

It is anticipated that the main project access point to El Toro Road will require a traffic signal in conjunction with the project. The project should provide this improvement as well as a southbound left turn lane and northbound right turn lane on El Toro Road at the project entry.

In order to accommodate the anticipated traffic and the potential traffic signal, it is recommended that the entry street to Saddleback Meadows be designed as a Collector roadway with a curb-to-curb width of 58 feet at its intersection with El Toro Road. This provides for two 12 foot exiting lanes and two 12 foot entering lanes with a 10 foot median. The Collector cross-section should be maintained for approximately 160 feet where it could then

be transitioned to a standard 40 foot wide curb-to-curb width Collector roadway, as shown on Exhibit 5-B.

Traffic signing/striping should be implemented in conjunction with detailed construction plans for the project. Verification of adequate parking should be analyzed for the project site in conjunction with approval of the site plan.

The project should participate in existing road fee programs, including the Foothill/Eastern Transportation Corridor Fee Program, Foothill Circulation Phasing Program (FCPP), El Toro Road Fee Program and the Santiago Road Fee Program.

Sight distance at each of the project access intersections should be reviewed with respect to Standard Plan Number 1117 (see Appendix "K") in conjunction with the preparation of precise grading and landscape plans.

2.0 AREA CONDITIONS

A. Study Area

1. Area of Significant Traffic Impact

Existing roadways in the study area include the Foothill Transportation Corridor (SR-241), Santiago Canyon Road, El Toro Road, Marguerite Parkway, Portola Parkway, Santa Margarita Parkway, Live Oak Canyon Road, Ridgeline Road, Saddleback Ranch Road and Glenn Ranch Road.

Foothill Transportation Corridor (SR-241) extends south to Oso Parkway and north to the Eastern Transportation Corridor. The construction of corridors has resulted in a significant reduction in traffic on El Toro Road and Santiago Canyon Road near the project study area.

Santiago Canyon Road is classified as a Primary (four-lane divided) Arterial highway on the Orange County Master Plan of Arterial Highways (MPAH). It is currently two lanes in the vicinity of the site. Santiago Canyon Road currently accommodates approximately 5,300 to 5,700 ADT in the study area.

El Toro Road is classified as a Major (six-lane divided) Arterial highway south of Live Oak Canyon Road on the Orange County MPAH. It is partially constructed to its Master Plan classification near Santa Margarita Parkway and has not yet been fully improved in the vicinity of the project site. El Toro Road currently accommodates approximately 6,000 to 9,300 ADT in the study area.

Marguerite Parkway is classified as a Primary (four-lane divided) Arterial highway south of El Toro Road on the Orange County MPAH. Marguerite Parkway in the study area has been fully constructed and currently carries approximately 9,800 ADT in the study area.

Portola Parkway is classified as a Major (six-lane divided) Arterial highway north of El Toro Road to Alton Parkway on the Orange County MPAH. It is fully improved and currently accommodates approximately 24,900 ADT in the study area.

Santa Margarita Parkway is classified as a Major (six-lane divided) Arterial highway on the Orange County MPAH. It has been fully improved to its Master Plan of Arterial Highways classification in the study area. Traffic volumes on Santa Margarita Parkway are approximately 30,400 ADT in the study area.

Live Oak Canyon Road is currently two lanes east of El Toro Road. It currently carries approximately 3,000 ADT in the study area.

Ridgeline Road is currently two lanes west of El Toro Road.

Saddleback Ranch Road is currently two to four lanes in the study area.

Glenn Ranch Road provides a direct connection between El Toro Road south of the project site and Portola Parkway north of the Foothill Transportation Corridor (SR-241). Glenn Ranch Road is classified as a Primary (four-lane divided) Arterial highway on the Orange County MPAH. It is fully constructed and currently carries approximately 11,300 ADT in the study area.

B. Site Accessibility

1. Area Roadway System

Exhibit 2-A identifies the existing roadway conditions for study area roadways. The number of through travel lanes for existing roadways and the existing intersection controls are identified.

2. Existing Master Plan of Arterial Highways

Existing and future roadways are included in the latest Orange County Master Plan of Arterial Highways (MPAH) and are illustrated on Exhibit 2-B. This exhibit shows the nature and extent of arterial highways that are needed to adequately serve the ultimate development depicted by the Land Use Element of the General Plan and serves to coordinate future arterial highways between local jurisdictions. Exhibit 2-C illustrates the typical Orange County cross-sections and design capacity values for various roadway classifications.

3. Traffic Volumes and Conditions

Existing average daily traffic (ADT) on arterial highways throughout the study area are shown on Exhibit 2-D. Existing ADT volumes are based upon the traffic data collected by the County of Orange and counts made for Urban Crossroads, Inc. in February, 2001 (see Appendix "B"). Additional existing ADT volumes were derived from the existing AM and PM peak hour counts. ADT volumes at these locations were calculated by adding the AM and PM counts and applying a factor of 5.56. This factor has been calculated based upon an analysis of over 200 24-hour traffic counts collected in South Orange County. Typical daily capacity values for arterial highways are shown in Table 2-1.

EXHIBIT 2-A

SECONDARY
4 Lane Undivided Roadway
Accommodates 10,000 to 20,000 ADT

COMMUTER
2 Lane Undivided Roadway
Accommodates 7,500 to 10,000 ADT

EXHIBIT 2-D

EXISTING AVERAGE DAILY TRAFFIC (ADT)

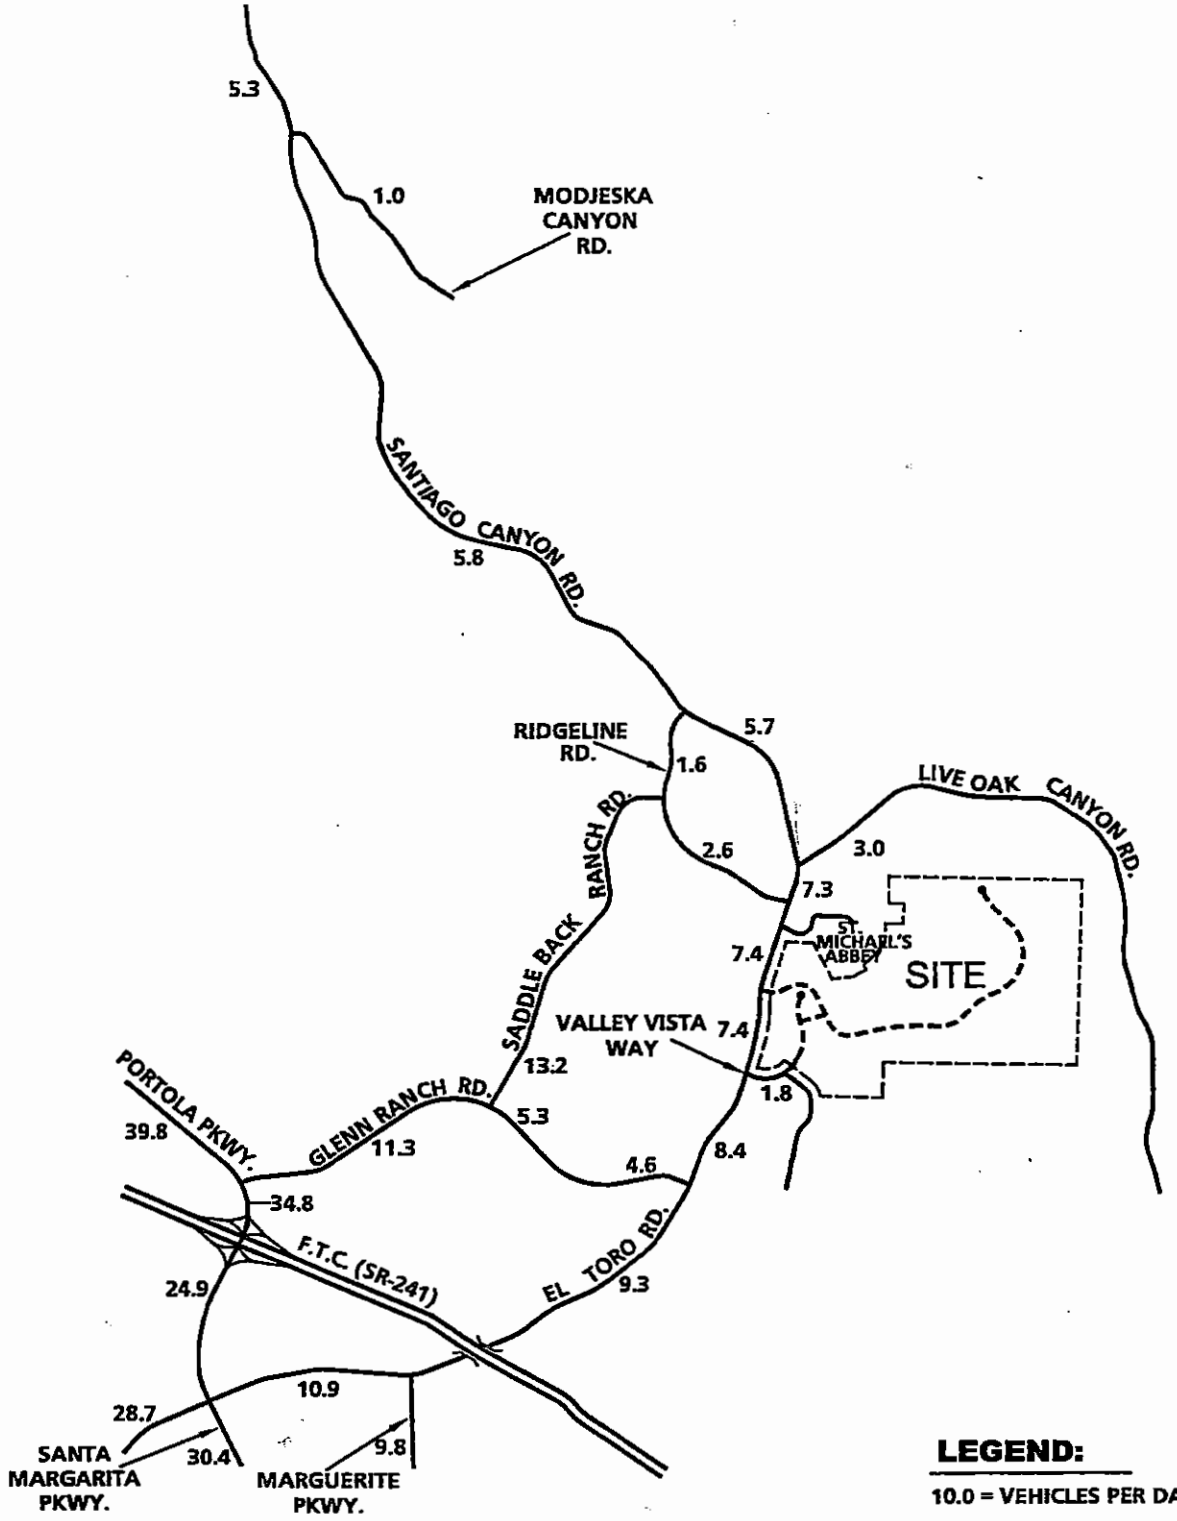

TABLE 2-1

ROADWAY CAPACITY VALUES[1]

FREEWAY SIZES	AT ULTIMATE CAPACITY (LOS "E")
4 lanes	96,000
6 lanes	144,000
8 lanes	192,000
10 lanes	240,000
12 lanes	288,000
14 lanes	336,000

TYPE OF ARTERIAL	LEVEL OF SERVICE				
	A	B	C	D	E
8 lanes divided	45,000	52,500	60,000	67,500	75,000
6 lanes divided	33,900	39,400	45,000	50,600	56,300
4 lanes divided	22,500	26,300	30,000	33,800	37,500
4 lanes undivided	15,000	17,500	20,000	22,500	25,000
2 lanes divided	11,300	13,200	15,000	17,000	18,800
2 lanes undivided	7,500	8,800	10,000	11,300	12,500

1 These roadway capacities are approximate figures only, and are used at the General Plan level. They are affected by such factors as intersections (numbers & configuration), degree of access control, roadway grades, design geometrics (horizontal & vertical alignment standards), sight distance, level of truck and bus traffic, and level of pedestrian and bicycle traffic. Average daily traffic (ADT) is used by the County as long range planning tool to assist in determining arterial highway classification (number of through lanes) needed to meet traffic demand.

U:\UcJobs\00146\Excel\[00146-08.xls]T 2-1

The technique used to assess the operation of an intersection is known as Intersection Capacity Utilization (ICU). To calculate an ICU the volume of traffic using the intersection is compared with the capacity of the intersection. ICU is usually expressed as a percent. The percent represents that portion of the hour required to provide sufficient capacity to accommodate all intersection traffic if all approaches operate at capacity. An explanation of Level of Service is included in Appendix "A".

Calculation Method:

a. Intersection Capacity Utilization (ICU) for study area intersections;

b. Saturation Flow Rate:

Saturation flow value of 1,700 vehicles per lane per hour for intersections; no adjustments are used for protected movements with dedicated lanes (including both right and left turns).

c. Lost Time:

A lost time factor of 5% (.05) is applied to the ICU calculations.

d. Level of Service Ranges:

The following thresholds are used in assigning a letter value to the resulting LOS:

LOS	CRITICAL VOLUME TO CAPACITY
A	0.00 - 0.60
B	0.61 - 0.70
C	0.71 - 0.80
D	0.81 - 0.90

E	0.91 - 1.00
F	>1.00

e. Peak-Periods:

Weekday peak-hour analysis periods are defined as follows:

7:00 to 9:00 AM
4:00 to 6:00 PM

f. Peak-Hour:

The highest one-hour period in both the AM and PM peak periods, as determined by four consecutive 15-minute count periods are used in the ICU calculations. Both AM and PM peak hours are studied.

g. Peak-Hour Data Consistency:

Variations in peak-hour volumes can affect LOS calculations because they vary from day-to-day. To minimize these variations, no counts are taken on Mondays, Fridays, holidays or weekends.

h. Right Turn Movements:

If the distance from the edge of the outside through lane is at least 19 feet and parking is prohibited during the peak period, right turning vehicles may be assumed to utilize this "unofficial" right turn lane. Otherwise, all right turn traffic is assigned to the through lane. If a right turn lane exists, right turn activity is checked for conflicts with other critical movements. It is assumed that right turn movements are accommodated during non-conflicting left turn phases (e.g., northbound right turns during westbound left turn phase), as well as

non-conflicting through flows (e.g., northbound right turn movements and north/south through flows. Right turn movements become critical when conflicting movements (e.g., northbound right turns, southbound left turns, and eastbound through flows) represent a sum of V/C ratios which are greater than the normal through/left turn critical movements. Right turn volumes have been reduced by 15% to account for right turns on red.

If a free right turn lane exists (right turns do not have to stop for the signal), a flow rate of 1,700 vehicles per hour per lane is assumed. The V/C ratio of the right turn lane is reported but not included in the sum of the critical V/C ratios.

The ICU's for the intersections in the vicinity of the site are shown in Table 2-2. Existing ICU's are based upon manual AM and PM peak hour turning movement counts made for Urban Crossroads, Inc. in February, 2001 (see Exhibits 2-E and 2-F). The existing intersection lanes for the study area intersections are depicted on Exhibit 2-G.

Traffic count worksheets are included in Appendix "B". The intersections in the vicinity of the site are currently operating at Level of Service "D" or better during the peak hours. ICU calculation worksheets are provided in Appendix "C".

Traffic signals appear to presently be warranted at the following intersections (see Appendix "I"):

El Toro Road (NS) at:

- Live Oak Canyon Road (EW)

3.0 PROJECTED TRAFFIC

A. Site Traffic

1. Trip Generation

Trip generation represents the amount of traffic which is attracted and produced by a development. The proposed project includes 299 single-family detached dwelling units.

Trip generation rates for this project are shown in Table 3-1. The daily trip generation rates used in this analysis were provided by the County of Orange. These rates are consistent with the recently approved Saddle Creek/Saddle Crest traffic study prepared by Austin-Foust Associates, Inc. in March of 2000.

Both daily and peak-hour trip generation for the proposed project are shown in Table 3-2. The Saddleback Meadows development is projected to generate a total of approximately 3,590 trip-ends per day with 265 vehicles per hour during the AM peak hour and 355 vehicles per hour during the PM peak hour.

Compared to the recorded map, this represents a decrease of 275 and 470 vehicles per hour during the AM and PM peak hours, respectively. Table 3-3 presents a comparison of the currently proposed 299 single-family unit project with the previously recorded Tract Map (TT 10692).

TABLE 3-1

TRIP GENERATION RATES

2. Trip Distribution

Trip distribution represents the directional orientation of traffic to and from the project site. Trip distribution is heavily influenced by the geographical location of the site, the proximity to the regional freeway system, existing/future residential development, other commercial and community facilities. The directional orientation of traffic was determined by evaluating existing and proposed land uses within the community and the Master Plan of Arterial Highways (MPAH).

Trip distribution patterns for this study are consistent with previous traffic studies and were reviewed by County staff prior to completion of this traffic analysis. The trip distribution patterns for the project are graphically depicted on Exhibit 3-A.

3. Modal Split

The traffic reducing potential of public transit has not been considered in this report. Essentially the traffic projections are "conservative" in that public transit might be able to reduce the traffic volumes.

4. Trip Assignment

The assignment of traffic from the site to the adjoining roadway system has been based upon the site's trip generation, trip distributions, proposed arterial highway and local street systems. Based on the identified project traffic generation and distributions, the project related daily traffic volumes are shown on Exhibit 3-B The project AM and PM peak hour intersection turning movement volumes are shown on Exhibits 3-C and 3-D, respectively.

B. Other Development Traffic

1. Method of Projection

To develop background traffic projections, Urban Crossroads, Inc. worked with the County of Orange regarding the Year 2005 and Year 2025 traffic projections in the study area. To assess Year 2005 traffic conditions, project traffic, other development and areawide growth were combined. Based on feedback from County staff, an annual growth rate of 3% per year was assumed over a four-year time period (2001 and 2005).

The modeling sources for Year 2025 traffic projections in the study area includes the Orange County Transportation Analysis Model, Version 3.1 (OCTAM 3.1) and the Irvine Transportation Analysis Model ITAM 3.01. The ITAM 3.01 volume forecasts (Run ID 2029) were projected to include the residential portion of the project, therefore, Year 2025 traffic conditions without the project involved subtracting the residential project volumes from the (ITAM 3.01) model. The Year 2025 peak hour forecasts along Santiago Canyon Road were developed using the OCTAM 3.1 daily forecasts, along with peak hour traffic count data collected at each analysis location.

2. Forecast Refinement/Post-Processing

The goal of the future traffic volume forecast refinement or post-processing is to utilize all available data to prepare the best possible estimate of future traffic conditions. The recommended procedure incorporates 2001 traffic count data, 2000 model validation data (Run ID EV42 traffic estimates), and future (raw) model forecasts (Run ID 2029

estimates) as inputs. Development of refined future daily traffic volume forecasts is discussed first. The refined daily traffic volumes are then input to a separate peak hour data refinement and turn movement estimation procedure. Appendix "D" includes the Year 2025 post processing report for the study area intersections.

The future daily volume refinement process is described by the following steps:

1. Determine whether the existing counted volume is greater than the existing modeled volume (Option A) or the existing counted volume is less than the existing modeled volume (Option B).

2A. Use the growth increment (additive) refinement process. Growth is equal to the future model volume minus the existing model volume. The refined future forecast is equal to the existing traffic count plus the growth.

EXAMPLE:

Existing traffic count = 17,000 vehicles per day (vpd)
Existing traffic model estimate = 15,000 vpd
Future traffic model raw forecasts = 24,000 vpd
Calculated growth = 24,000 – 15,000 = 9,000 vpd
Refined future daily traffic volume forecast = 17,000 + 9,000 = 26,000 vpd

2B. Use the growth ratio (multiplicative) refinement process. The forecast refinement ratio is equal to the existing counted traffic volume divided by the existing modeled traffic volume. The forecast refinement ratio is then multiplied by the future model forecast to calculate the refined future daily traffic volume forecast.

EXAMPLE:

Existing traffic count = 25,000 vehicles per day (vpd)
Existing traffic model estimate = 28,000 vpd
Future traffic model raw forecasts = 34,000 vpd
Forecast refinement ratio = 25,000 / 28,000 = 0.893
Ratio refined future forecast = 34,000 * 0.893 = 30,400 vpd
Calculated (refined) growth = 30,400 – 25,000 = 5,400 vpd

There are two minimum growth checks included in the ADT refinement process. The first check is based on a user input segment specific allowable minimum growth percentage. During input, the software provides for a user specified global default that can be modified for each individual segment. For instance, this allows the use to prohibit negative growth throughout the study area, then specify less stringent minimum growth requirements for segments where new parallel capacity is being provided.

The second minimum growth check is only allowed at the global level. It is intended to "smooth" small negative growth (typically less than 10%) that may be caused by the modeling process and is not reasonable (e.g., no new parallel facilities) and no decreases in surrounding development travel activity.

The resulting daily traffic volumes are suitable for reporting, analysis, and input to the future peak hour data refinement process. At new link locations or existing locations where existing counts are very low relative to future projections, raw model assignments are utilized.

The recommended peak hour procedure incorporates existing peak hour intersection counts, existing model validation peak hour link directional data, and future (raw) model peak hour link directional data. The procedure uses model peak hour inbound and outbound traffic flows by intersection leg. Model directional flows are generally considered more reliable than the individual modeled turning movements.

Once the raw model peak period data has been converted to raw model peak hour volumes for each intersection leg approach and departure, the link directional peak hour refinement procedure can be performed. The first two steps of the process are identical to the calculation of refined daily traffic volume forecasts. The result of these first two steps for the peak hour data refinement process is referred to as the initial model derived peak hour growth for purposes of this discussion.

Subsequent steps (3 and on) are:

3. The initial model derived peak hour growth is compared to the daily traffic volume growth at this point in the process. Future peak hour volumes that are less than the existing volume are only allowed if the future daily traffic volume is less than the existing daily traffic volume. Such "negative growth" may be reasonable when a new transportation facility is provided which parallels the route being analyzed. In such instances, negative growth is allowed, consistent with the change in daily volume (e.g., if the future daily traffic volume

is 15% less than the existing daily traffic volume, up to 15% negative growth in the final refined peak hour directional volume is allowed as well). Otherwise, the final refined future peak hour directional volume is adjusted to match the existing peak hour directional volume, eliminating the negative growth that would otherwise occur.

4. The final future refined peak hour directional segment traffic volumes are then used as inputs to the turning movement estimation algorithm. The starting point turn proportion estimates must also be determined. Either existing peak hour intersection turning movement counts (Option A), or weighted exiting (leaving the intersection) volumes on intersection legs (Option B) are used as the basis for determining the starting point turn proportion estimates. Existing traffic counts are used if the counts are representative of future conditions (e.g., no new intersection legs or legs that are underutilized under existing conditions, which render existing turn proportions inappropriate for use under future conditions). Otherwise, starting point turn proportions are determined as described under Step 5B.

If Existing Peak Hour Data Is Available For All Intersection Legs:

5A. Use existing turn movement counts as the starting point for the turning movement algorithm. Apply the NCHRP-255 algorithm. This algorithm was obtained from the report Highway Traffic Data for Urbanized Area Project Planning and Design (National Cooperative Highway Research Program Report 255, Transportation Research Board, 1982, pp. 105-109), commonly referred to as NCHRP-255. The resulting turning movement estimates will sum to the outbound volume which was input for each leg of the intersection.

If Reliable Existing Turning Movement Is Not Available:

5B. Use refined model intersection leg outbound volumes to calculate the starting point turn proportions for the turning movement estimation algorithm. The potential through movement volume is weighted more heavily (Factor of 3.0) to more accurately reflect actual observed traffic volume patterns. Apply the NCHRP-255 algorithm. The resulting turning movement estimates will again sum to the outbound volume which was input for each leg of the intersection.

3. Non-Site Traffic for Study Area

Table 3-4 presents other development planned within the project study area as identified by County of Orange. Other development reviewed in this analysis includes the Live Oak Plaza Traffic Analysis prepared by Kunzman Associates (January 7, 1997) and the Saddle Creek/Saddle Crest Traffic Analysis prepared by Austin-Foust Associates, Inc. in March of 2000.

Table 3-4 presents the daily and peak hour vehicle trips generated by the other development in the study area. Exhibit 3-E illustrates the directional distribution and assignment of Live Oak Plaza. Exhibit 3-F presents the Saddle Creek/Saddle Creek project trip distribution. Based on the identified trip distribution for other development on arterial highways throughout the study area, other development average daily traffic (ADT) are shown on Exhibit 3-G. Other development AM and PM peak hour intersection turning movement volumes are shown on Exhibits 3-H and 3-I, respectively.

C. Total Traffic

Once the project related traffic is assigned to the street network (see Exhibit 3-B) and added to existing volumes in the study area, existing plus project ADT volumes can be assessed (see Exhibit 3-J).

Exhibit 3-K shows the ADT volumes which can be expected for Year 2005 traffic conditions without the project. Exhibit 3-L shows the ADT volumes which can be expected for Year 2005 traffic conditions with the project.

Exhibit 3-M shows the ADT volumes which can be expected for Year 2025 traffic conditions without the project. Exhibit 3-N shows the ADT volumes which can be expected for Year 2025 traffic conditions with the project.

Table 3-5 presents a summary of the average daily traffic volumes on Santiago Canyon Road. The revised traffic forecasts for Santiago Canyon Road have been updated to reflect the latest OCTAM 3.1 model forecast volumes. The results of this analysis indicate the future year forecasts for Santiago Canyon Road will range from 16,100 vehicles on El Toro Road between Ridgeline Road and Live Oak Canyon Road to 21,300 vehicles on Santiago Canyon Road between the Eastern Transportation Corridor (ETC) and Modjeska Canyon Road. In light of the recent Irvine company open space dedication, these future traffic volumes may be conservatively high.

4.0 TRAFFIC ANALYSIS

A. Capacity and Level of Service and Improvement Analysis, Existing Plus Project

1. Level of Service at Existing Plus Project

Intersection Capacity Utilization (ICU) for existing plus project traffic conditions have been calculated and are shown in Table 4-1. Table 4-1 shows ICU calculations at the study area intersections without improvements. Existing plus project AM and PM peak hour turning movement volumes are shown on Exhibits 4-A and 4-B, respectively.

As shown in Table 4-1, intersections in the vicinity of the site are projected to continue to operate at Level of Service "D" or better during the peak hours. ICU calculation worksheets are included in Appendix "E". A traffic signal is projected to be warranted at the intersection of El Toro Road/Project Entrance for existing plus project traffic conditions (see Appendix "I").

B. Capacity and Level of Service and Improvement Analysis, Year 2005

1. Level of Service at Year 2005 Without Project

Intersection Capacity Utilization (ICU) for Year 2005 traffic conditions without the project have been calculated and are shown in Table 4-2. Table 4-2 shows ICU calculations at the study area intersections without the project, without improvements. Year 2005 AM and PM peak hour turning movement volumes without the project are shown on Exhibits 4-C and 4-D, respectively.

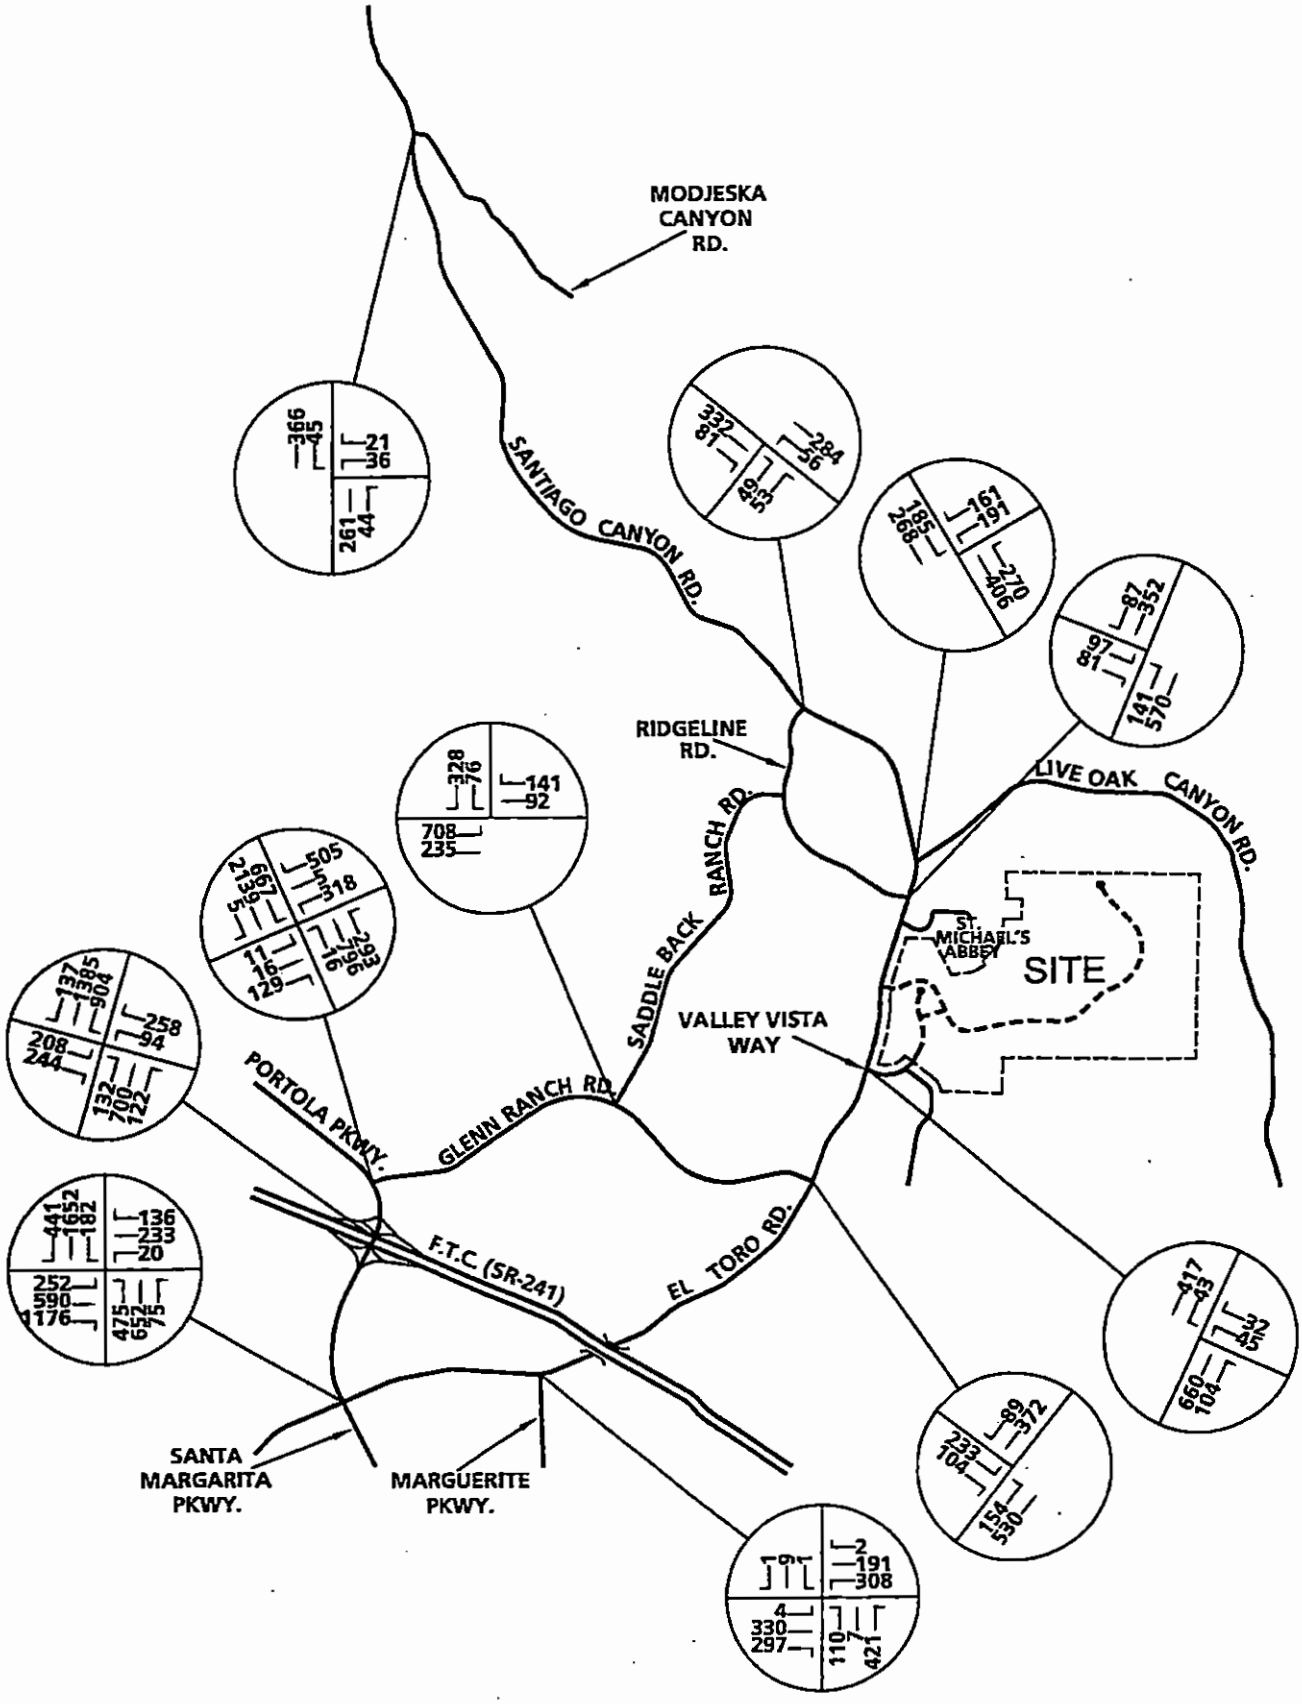
YEAR 2005 PM PEAK HOUR INTERSECTION VOLUMES WITHOUT PROJECT



As shown in Table 4-2, the intersection of Portola Parkway (NS) at the Foothill Transportation Corridor (EW) is projected to operate at Level of Service "E" or better during the peak hours without the proposed project, without improvements. All other study area intersections are projected to operate at Level of Service "D" or better. ICU calculation worksheets are included in Appendix "F".

2. Level of Service at Year 2005 With Project

Intersection Capacity Utilization (ICU) for Year 2005 traffic conditions with the project have been calculated and are shown in Table 4-3 and 4-4. Table 4-3 shows ICU calculations at the study area intersections with the project, without improvements. ICU calculations with the project and with improvements are shown in Table 4-4. Year 2005 AM and PM peak hour turning movement volumes with the project are shown on Exhibits 4-E and 4-F, respectively.

As shown in Table 4-4, intersections in the vicinity of the site are projected to operate at Level of Service "D" or better during the peak hours with the proposed project, and with improvements. ICU calculation worksheets are included in Appendix "G". The following intersection improvements is required for Year 2005 conditions:

Portola Parkway (NS) at:

- Foothill Transportation Corridor (EW)
  - Add Southbound Left Turn Lane

C. Capacity and Level of Service and Improvement Analysis, Year 2025

1. Level of Service at Year 2025 Without Project

Intersection Capacity Utilization (ICU) for Year 2025 traffic conditions without the project have been calculated and are shown in Table 4-5. Table 4-5 shows ICU calculations at the study area intersections without the project, without improvements. Year 2025 AM and PM peak hour turning movement volumes without the project are shown on Exhibits 4-G and 4-H, respectively. The following intersections are projected to operate at an LOS of "E" or below:

El Toro Road (NS) at:

- Ridgeline Road (EW)
- Valley Vista Way (EW)
- Glenn Ranch Road (EW)

Portola Parkway (NS) at:

- Glenn Ranch Road (EW)
- Foothill Transportation Corridor (EW)
- El Toro Road (EW)

2. Level of Service at Year 2025 With Project

Intersection Capacity Utilization (ICU) for Year 2025 traffic conditions with the project have been calculated and are shown in Tables 4-6 and 4-7. Table 4-6 shows ICU calculations at the study area intersections with the project, without improvements. ICU calculations with the project and with improvements are shown in Table 4-7. Year 2025 AM and PM peak hour

[2] Intersection Capacity Utilization (ICU)

U:\UcJobs\00146\Excel\[00146-08.xls]T 4-7

turning movement volumes with the project are shown on Exhibits 4-I and 4-J, respectively.

As shown in Table 4-7, intersections in the vicinity of the site are projected to operate at Level of Service "D" or better during the peak hours with the proposed project, with improvements that include the ultimate widening of El Toro Road and Santiago Canyon Road to four through travel lanes (two in each direction) in the vicinity at the project. Improvements are also required at each of the Portola Parkway intersections analyzed. Year 2025 with project ICU calculation worksheets are included in Appendix "I".

D. Santiago Canyon Road Analysis

Pursuant to the County of Orange Growth Management Plan (GMP), segments of Santiago Canyon Road are required to function at a Level of Service "C". Capacity improvements along Santiago Canyon Road will be required in conjunction with future growth to achieve Level of Service "C". The Santiago Canyon Road Major Thoroughfare and Bridge Fee Program has been designed to provide up to $34 million in improvements to Santiago Canyon Road from Chapman Avenue to Live Oak Canyon Road. However, the March, 1994 Project Report for improvements to Santiago Canyon Road indicates that the total cost of improvements is approximately $52.3 million for a "limited project" scenario.

The project should be conditioned to pay fees in accordance with the Santiago Canyon Road Major Thoroughfare and Bridge Fee Program. A funding shortfall has been identified for the currently adopted fee program. Any additional funding should be included as part of a revised fee program, and the project should be conditioned to participate in the revised fee program, as appropriate.

5.0 RECOMMENDATIONS

A. Site Access

The proposed project will have primary access to El Toro Road. The El Toro Road turn-lane improvements needed at the Project Entrance to serve Year 2000 conditions should be completed in conjunction with development. Secondary access will be provided via an access to Valley Vista Way.

It is anticipated that the main project access point to El Toro Road will require a traffic signal. The project should provide this improvement as well as a southbound left turn lane and northbound right turn lane on El Toro Road at the project entry.

Traffic signing/striping should be implemented in conjunction with detailed construction plans for the project. Verification of adequate parking should be analyzed for the project site in conjunction with approval of the site plan.

B. Roadway Improvements

1. Off-Site

The project should participate in existing road fee programs, including the Foothill/Eastern Transportation Corridor Fee Programs, Foothill Circulation Phasing Program (FCPP), El Toro Road Fee Program and the Santiago Road Fee Program. Potential roadway fees for the Saddleback Meadows development are shown in Table 5-1.

TABLE 5-1

POTENTIAL ROADWAY FEES

EXISTING ROAD FEE PROGRAMS	ROADWAYS TO BE CONSTRUCTED	ADOPTION DATE	RATES (EFFECTIVE JULY 1, 2000)	APPROXIMATE PROJECT FEES (299 DU'S)
1. Eastern/Foothill Transportation Corridor Road Fee Program (Zone A)	Portion of the cost of the future Eastern/ Foothill Transportation Corridor from the Southern Orange county line at Interstate Route 5 to the Riverside Freeway (State Route 91).	Oct., 1984	$3,916/DU	$1,170,884.00
2. Santiago Canyon Road Major Thouroughfare and Bridge Fee Program	Improvements of Santiago Canyon Road from Chapman Avenue to Live Oak Canyon Road to its Master Plan of Arterial Highways designation as a primary arterial highway.	Aug., 1990	$617/DU	$184,483.00
3. El Toro Road Fee Program	Widen El Toro Road from a two lane to four lane highway from Live Oak Canyon Road to Trabuco Road.	Oct., 1983	$1,240/DU	$370,760.00
4. Foothill Circulation Phasing Program (FCPP), Including Special FTC Fees (Zone 4).	Provides for a Backbone Systems of arterial highways and intersection improvements in the northern El Toro area. Roadways to be constructed include the extension of Portola Pkwy/ Santa Margarita Pkwy. (with the FTC), Bake Pkwy., OSO Pkwy., Alicia Pkwy., Sand Canyon, Jeffrey, Irvine Blvd./ Trabuco Road and various intersection upgrades.	Oct., 1987	$2,300/DU	$687,700.00
TOTAL	--	--	--	$2,413,827.00

5-2

U:\UcJobs\00146\Excel\[00146-08.xls]T 5-1

North of the Foothill Transportation Corridor, El Toro Road can accommodate cumulative Year 2025 traffic volumes with the proposed project on four travel lanes divided by a raised or striped median. Exhibit 5-A illustrates the alternative cross-sections for El Toro Road in the vicinity of the project. Implementation of a full Major arterial cross-section (six lanes divided) is not needed to serve future traffic volumes. Exhibit 5-A depicts an alternative section which would provide four travel lanes along El Toro Road divided by a striped median. This alternative section represents a modification of the typical cross-section for a Primary arterial. Appropriate transitions would be required between this cross-section and other modified cross-sections along El Toro Road south of Glenn Ranch Road.

2. On-Site

In order to accommodate the anticipated traffic and the potential traffic signal, it is recommended that the entry street to Saddleback Meadows be designed as an augmented Collector roadway with a curb-to-curb width of 58 feet at its intersection with El Toro Road. This provides for two 12 foot exiting lanes and two 12 foot entering lanes with a 10 foot median. The Collector cross-section should be maintained for approximately 160 feet where it could then be transitioned to a standard 40 foot wide curb-to-curb width Collector roadway, as shown on Exhibit 5-B.

Traffic signing/striping should be implemented in conjunction with detailed construction plans for the project. Verification of adequate parking should be analyzed for the project site in conjunction with approval of the site plan.

Sight distance at each of the project access intersections should be reviewed with respect to Standard Plan Number 1117 (see Appendix "K") in conjunction with the preparation of precise grading and landscape plans.

THIS PAGE INTENTIONALLY LEFT BLANK

APPENDIX A

LEVEL OF SERVICE DESCRIPTION

LEVEL OF SERVICE - DEFINITIONS*

Service Level	General Definition	Freeways Criteria for measurement: Density (cars per lane-mile)	Arterials Criteria for measurement: Average travel speed (mph)
A	Free flow. Individual users are virtually unaffected by the presence of others in the traffic stream. Freedom to select desired speeds and to maneuver within the traffic stream is extremely high. The general level of comfort and convenience provided to the motorist, passenger, or pedestrian is excellent.	Free flow operations. Average travel speeds near 60 mph generally prevail on 70-mph freeway elements. Vehicles are almost completely unimpeded in their ability to maneuver within the traffic stream. The average spacing between vehicles is about 440 ft, or 22 car-lengths, with a maximum density of 12 cars/mi/ln. The effects of minor incidents or breakdowns are easily absorbed at this level. Although they may cause a deterioration in LOS in the vicinity of the incident, standing queues will not form, and traffic quickly returns to LOS A on passing the disruption.	Primarily free flow-operations at average travel speeds usually within 90 percent of the free flow speed. Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Stopped delay at signalized intersections is minimal.
B	Stable flow, but the presence of other users in the traffic stream begins to be noticeable. Freedom to select desired speeds is relatively unaffected, but there is a slight decline in the freedom to maneuver within the traffic stream from LOS A. The level of comfort and convenience provided is somewhat less than at LOS A, because the presence of others in the traffic stream begins to affect individual behavior.	Reasonably free-flow conditions, and speeds of over 57 mph are maintained on 70-mph freeway elements. The average spacing between vehicles is about 260 ft, or 13 car-lengths, with a maximum density of 20 cars/mi/ln. The ability to maneuver within the traffic stream is only slightly restricted. The effects of minor incidents and breakdowns are still easily absorbed, though local deterioration in service would be more severe than for LOS A.	Unimpeded operations at average travel speeds usually within 70 percent of the free flow speed. The ability to maneuver within the traffic stream is slightly restricted and stopped delays are not bothersome.
C	Stable flow, but marks the beginning of the range of flow in which the operation of individual users becomes significantly affected by interactions with others in the traffic stream. The selection of speed is affected by the presence of others, and maneuvering within the traffic stream requires substantial vigilance on the part of the user. The general level of comfort and convenience declines noticeably at this level.	Stable operations, but flows approach the range in which small increases in flow will cause substantial deterioration in service. Average travel speeds are still over 54 mph. Freedom to maneuver within the traffic stream is noticeably restricted at LOS C, and lane changes require additional care and vigilance by the driver. Average spacings are in the range of 175 ft, or 9 car-lengths, with a maximum density of 30/cars/mi/ln. Minor incidents may still be absorbed, but the local deterioration in service will be substantial. Queues may be expected to form behind any significant blockage. Additional vigilance by driver required for safe operation.	Stable operations. Ability to maneuver and change lanes in midblock locations may be more restricted than in LOS B, and longer queues and/or adverse signal coordination may contribute to lower average travel speeds of about 50 percent of the average free flow speed.

D	High-density, but stable, flow. Speed and freedom to maneuver are severely restricted, and the driver or pedestrian experiences a generally poor level of comfort and convenience. Small increases in traffic flow will generally cause operational problems at this level.	Borders on unstable flow. In this range, small increases in flow cause substantial deterioration in service. Average travel speeds of 48 mph or more can still be maintained on 70-mph freeway elements. Freedom to maneuver within the traffic stream is severely limited. Even minor incidents can be expected to create substantial queuing, because the traffic stream has little space to absorb disruptions. Average spacings are about 125 ft, or 6 car-lengths, with a maximum density of 42 cars/mi/ln.	Borders on a range on which small increases in flow may cause substantial increases in approach delay and, hence, decreases in arterial speed. This may be due to adverse signal progression, inappropriate signal timing, high volumes, or some combination of these. Average travel speeds are about 40 percent of free flow speed.
E	Operating conditions at or near the capacity level. All speeds are reduced to a low but relatively uniform value. Freedom to maneuver within the traffic stream is extremely difficult, and it is generally accomplished by forcing a vehicle or pedestrian to "give way" to accommodate such maneuvers. Comfort and convenience levels are extremely poor, and driver or pedestrian frustration is generally high. Operations at this level are usually unstable, because small increases in flow or minor perturbations within the traffic stream will cause breakdowns.	The boundary between LOS D and LOS E describes operation at capacity. Operations in this level are extremely unstable, because there are virtually no usable gaps in the traffic stream. Vehicles are spaced at approximately 80 ft, or 4 car-lengths, at relatively uniform headways. This, however, represents the minimum spacing at which stable flow can be accommodated. Any disruption to the traffic stream, such as a vehicle entering from a ramp, or a vehicle changing lanes, causes following vehicles to give way to admit the vehicle. At capacity, the traffic stream has no ability to dissipate even the most minor disruptions. Any incident can be expected to produce a serious breakdown with extensive queuing. The range of flows encompassed by LOS E is relatively small compared to other levels, but reflects a substantial deterioration in service. Maneuverability within the traffic stream is extremely limited. Average travel speeds at capacity are approximately 30 mph.	Significant approach delays and average travel speeds of one-third the free flow speed or lower. Such operations are caused by some combination or adverse progression, high signal density, extensive queuing at critical intersections, and inappropriate signal timing.
F	Level-of-service F. Forced or breakdown flow. This condition exists wherever the amount of traffic approaching a point exceeds the amount which can traverse the point. Queues form behind such locations. Arrival flow exceeds discharge flow.	Level F describes forced or breakdown flow. Such conditions generally exist within queues forming behind breakdown points. Breakdown occurs when the ratio of actual arrival flow rate to actual capacity or the forecasted flow rate to estimated capacity exceeds 1.00. Operations at such a point will generally be at or near capacity, and downstream operations may be better as vehicles pass the bottleneck (assuming that there are no additional downstream problems). The LOS F operations observed within a queue are the result of a breakdown or bottleneck at a downstream point.	Arterial flow at extremely low speeds below one-third to one-quarter of the free flow speed. Intersection congestion is likely at critical signalized locations, with high approach delays resulting. Adverse progression is frequently a contributor to this condition.

APPENDIX D

ITAM 3.01 POST-PROCESSING REPORT

ITAM 3.0.1 Post Processing Report

The goal of the future traffic volume forecast refinement or post-processing is to utilize all available data to prepare the best possible estimate of future traffic conditions. The recommended procedure incorporates 1999/2000 traffic count data, 1999 model validation data (traffic estimates), and future (raw) model forecasts (estimates) as inputs to develop future refined daily traffic volume forecasts.

INTERSECTION LIST (Chosen for Reporting)

402 Santiago Cyn. Rd. (NS) at Modjeska Cyn. Rd. (EW)

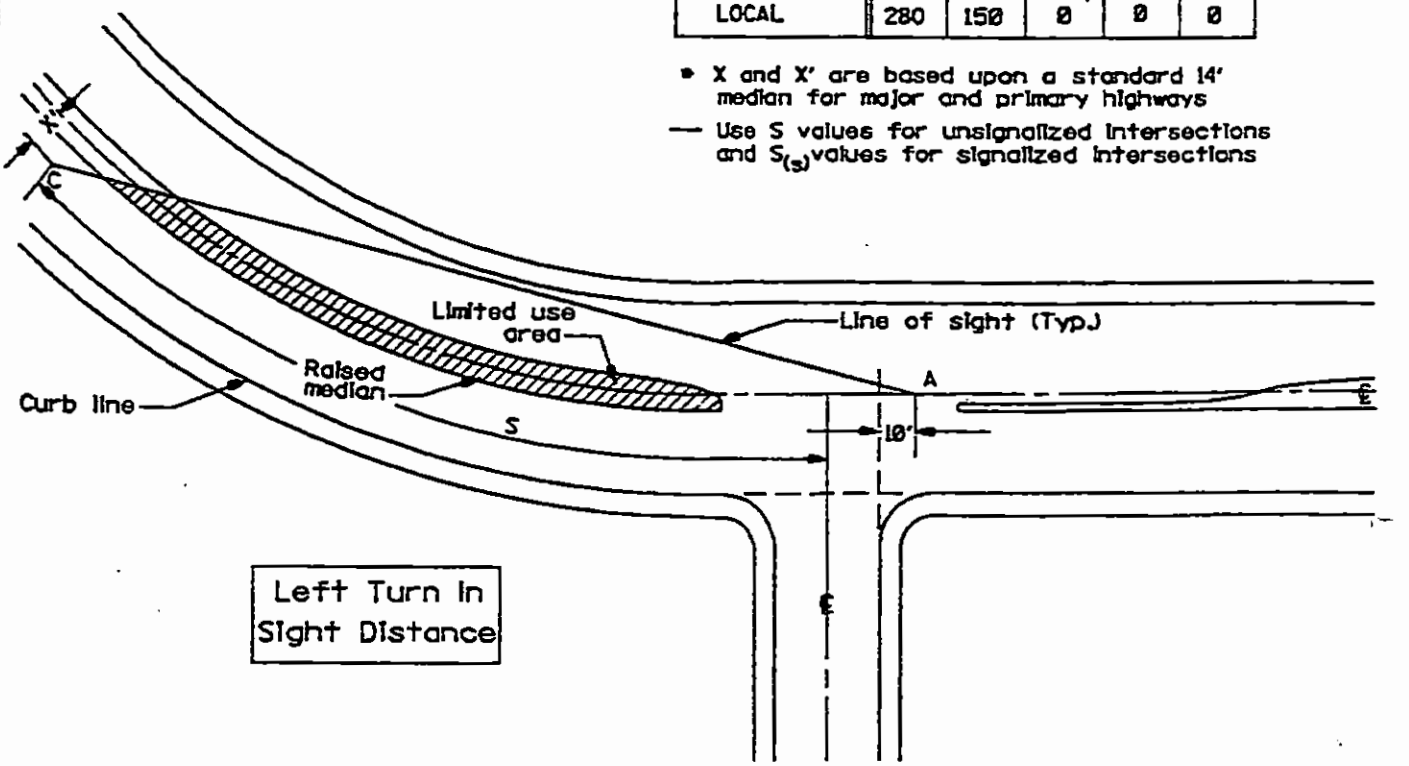
— Use S values for unsignalized intersections and $S_{(s)}$ values for signalized intersections



Left Turn In Sight Distance

ORANGE COUNTY ENVIRONMENTAL MANAGEMENT AGENCY

Approved W.L. Zoon 11-15-91
W.L. Zoon, Director of Public Works

Adopted: Res. 77-92 Revised: Res. 82-718; 86-1141; 88-1341; 91-1481

INTERSECTION SIGHT DISTANCE

STD. PLAN 1117

SHT. 1 OF 3

NOTES:

1. The distance S represents the corner sight distance measured along the centerline of the road. The corner sight distance is the distance required to allow 7 1/2 seconds for the driver on the cross road (or left turn pocket) to safely cross the main roadway or turn left while the approach vehicle travels at the assumed design speed of the main roadway.

2. The distance S should be increased by 20% from the amount shown on the table on sustained downgrades steeper than 3% and longer than one mile.

3. Points A and A' are the locations of a driver's line of sight (3.5 foot eye height) to oncoming vehicles (4.25 foot object height) located at Points C and C' while in a vehicle at an intersection 10 feet back from the projection of the curb line. In no case shall Points A or A' be less than fifteen feet from the edge of the traveled way.

4. The distance Y' is the distance measured from the centerline of the main road to the far right through travel lane. The distance Y' is equal to zero for T-intersections. The distance X is the distance measured from the centerline of the main road to the center of the far right through travel lane. The distance X' is the distance measured from the centerline of the main road to the center of the travel lane nearest the centerline of the road.

5. The Limited Use Area is determined by the graphical method using the appropriate distances given in the above table. It shall be used for the purpose of prohibiting or clearing obstructions in order to maintain adequate sight distance at intersections.

6. The Line of Sight line shall be shown at intersections on all landscaping plans, grading plans and tentative tract plans where safe sight distance is questionable. In cases where an intersection is located on a vertical curve, a profile of the line of sight may be required.

7. Obstructions such as bus shelters, walls or landscaping within the Limited Use Area which could restrict the line of sight shall not be permitted.
   a. Plants and shrubs within the Limited Use Area shall be of the type that will grow no higher than 12 inches above the ground and shall be maintained at a maximum height of 12 inches above the ground. Maintenance at a lower height may be required on crest vertical curves per Note 6 above.
   b. A profile of the line of sight may be required to verify 12" minimum vertical clearance above variable height obstructions such as slope landscaping, plants and shrubs.
   c. The toe of slope may encroach into the Limited Use Area provided that the requirements of (b) above are satisfied.
   d. In lieu of providing a profile of the line of sight, the toe of slope shall not encroach into the Limited Use Area, and the Limited Use Area shall slope at 2% maximum to the roadway.

ORANGE COUNTY ENVIRONMENTAL MANAGEMENT AGENCY

Approved W.L. Zaun 11-15-91
W.L. Zaun, Director of Public Works

Adopted: Res. 77-92 Revised: Res. 82-718; 86-1141; 88-1341; 91-1481

STD. PLAN 1117

INTERSECTION SIGHT DISTANCE

SHT. 2 OF 3

8. Trees shall not be permitted within any portion of the Limited Use Area.

9. Median areas less than six (6) feet in width shall be paved with concrete per Standard Plan 1114.

10. Residential driveways serving four or more units and comercial driveways shall be treated as a local street intersection.

Subject: Saddleback Meadows Alternative Development Scenarios

Dear Mr. Oliver:

INTRODUCTION

The purpose of this letter is to provide a trip generation comparison of alternative land uses for the proposed Saddleback Meadows Development. This trip generation comparison supplements the Saddleback Meadows Growth Management/CMP Traffic Impact Analysis prepared by Urban Crossroads, Inc. on March 29, 2001. The project site is located south of Live Oak Canyon Road in the County of Orange.

TRIP GENERATION ESTIMATES

Trip generation represents the amount of traffic which is attracted and produced by a development. The traffic generation for the project is based upon the specific land use which has been planned for the development. For the purpose of this trip generation analysis, a total of eight land use alternatives are compared. A detailed summary for each of the land use alternatives is provided in Appendix "A".

Trip generation rates for the alternative uses are shown in Table 1. The trip generation rates are based upon data collected by the Institute of Transportation Engineers (ITE) and previously published rates.

Both daily and peak hour trip generation for each of the project alternative uses are shown on Table 2. Table 3 provides a comparison of trip generation for all eight project land use alternatives.

SUMMARY

The results of the trip generation comparison indicate that the previously recorded Tract map 10692 (Alternative No. 2 - No Development) produces the greatest trip generation. Table 2 shows that Alternative No. 2 - No Development will produce approximately 7,530 trip-ends per day with 517 vehicles per hour during the AM peak hour and 750 vehicles per hour during the PM peak hour. The alternative light industrial use is projected to generate 5,500 trip ends per day with 726 during the AM peak hour and 774 during the PM peak hour.

The remaining alternatives will produce daily trips ranging from 0 for Alternatives1 and 7 to 3,384 vehicle trips for the 299 single-family detached residential home planned for Alternative No. 8 – Reduced Alternative. Compared to the recorded map, this represents a decrease of 284 vehicles per hour during the AM peak hour and 482 vehicles per hour during the AM and PM peak hours, respectively.

If you have any questions regarding this comparison, please do not hesitate to call at (949) 660-1994.

Sincerely,

URBAN CROSSROADS, INC.

Bill Lawson, AICP

APPENDIX A

LAND USE ALTERNATIVE DESCRIPTIONS

ALTERNATIVE DESCRIPTIONS

ALTERNATIVE NO. 1 - NO DEVELOPMENT ALTERNATIVE

Under Alternative No. 1, the proposed project would not be developed and the recorded map would not be implemented. There would be no further development within the project site would occur. The project site would remain as undeveloped for the foreseeable future, with cattle grazing operations continuing.

ALTERNATIVE NO. 2 - NO PROJECT ALTERNATIVE

The project site has a recorded final tract map permitting the development of 705 single-family manufactured housing units (Tract 10692 recorded December 16, 1988). Under Alternative No. 2, the project site would not change from the existing entitlement for 705 manufactured units. As shown in Table 1, approximately 86 percent of the project site would be impacted, with approximately 14 percent of the site as natural open space.

Table 1
Alternative No. 2 Land Use Summary

Land Use	Area (acres)	Percent of Site
Residential Lots	69.1	31%
Commercial Lot	1.4	1%
Streets/ROW	23.5	11%
Recreation Areas (park/trails)	4.6	2%
Manufactured Slope	92.1	41%
Natural Open Space	31.3	14%
Total	222.0	100%

Under Alternative No. 2, the minimum lot size would be 2,630 square feet. Site access would be provided via El Toro Road, and secondary access, for emergency purposes, would be via Valley Vista Way. In addition to the residential component, this alternative also includes commercial uses. Grading for this alternative would be approximately 11.5 million cubic yards. Infrastructure improvements would be similar to those described for the proposed project, including the proposed 1.4 million gallon water tank and associated access road located off-site, adjacent to the northeast corner of the project site.

ALTERNATIVE NO. 3 - F/TSP EIR 531 STAFF ALTERNATIVE A

Alternative No. 3 would include the construction of 150 single-family residential lots, with minimum lot sizes of 20,000 square feet. As shown in Table 2, approximately 40 percent (88.5 acres) of the project site would be used for the residential lots, with approximately 38 percent of the site as natural open space.

Table 2
Alternative No. 3 Land Use Summary

Land Use	Area (acres)	Percent of Site
Single-family Lots	88.5	40%
Streets	17.8	8%
Manufactured Slope	31.6	14%
Natural Open Space	84.1	38%
Total	222.0	100%

Site access would be from El Toro Road via a double loaded roadway traversing the main ridgeline looping back through the oak woodland canyon connecting with the access road near the middle of the site. Secondary access, for emergency purposes, would be provided via El Toro Road, through St. Michael's Abbey property. Residential lot access would be provided either directly off the main road or from short cul-de-sac streets spaced throughout the site.

Grading for this alternative would be approximately 12.5 million cubic yards. Infrastructure improvements would be similar to those described for the proposed project.

ALTERNATIVE NO. 4 - F/TSP EIR 531 STAFF ALTERNATIVE B

Implementation of Alternative No. 4 would result in site development occurring only on the western third of the project site. Single-family residential units would be reduced from 299 to 100. Lot sizes would be a minimum of 4,000 square feet. As shown in Table 3 below, approximately five percent (11.3 acres) of the project site would be used for residential lots, with 85 percent (190.5 acres) of the site left as natural open space.

Table 3
Alternative No. 4 Land Use Summary

Land Use	Area (acres)	Percent of Site
Single-family Lots	11.2	5%
Streets	5.6	3%
Manufactured Slope	14.8	7%
Natural Open Space	190.4	85%
Total	222.0	100%

Primary access for Alternative No. 4 from El Toro Road would be provided by a two lane 60-foot roadway, terminating in a traffic circle which surrounds an overview park. Residential lot access would be provided off secondary cul-de-sac streets located on the south side of the primary tract road. Secondary access, for emergency use, would be provided at Valley Vista Way near the southwest corner of the project site. Grading for Alternative No. 4 would be approximately one million cubic yards.

ALTERNATIVE NO. 5 - CLUSTER/SINGLE FAMILY/MULTI FAMILY RESIDENTIAL ALTERNATIVE

Alternative No. 5 would include 318 detached and attached dwelling units, within a reduce development impact area of approximately 110.5 acres. Specifically this alternative would result in the construction of 178 attached condominium units located on the western half of the project site and 140 single-family units located along the eastern ridgeline. As shown in Table 4, approximately eight percent of the site would be used for residential lots, with 50 percent of the site left as natural open space.

Table 4
Alternative No. 5 Land Use Summary

Land Use	Area (acres)	Percent of Site
Single-family Lots	16.9	8%
Multi-family Lots	39.0	18%
Streets	11.1	5%
Manufactured Slope	43.5	19%
Natural Open Space	111.5	50%
Total	222.0	100%

Primary access for this alternative would be provided from El Toro Road via a single main road traversing the project site and ending in a cul-de-sac near the northeast project boundary. Secondary access would be provided from Valley Vista Way through Hidden Ridge near the southwest corner

of the project site. Grading for Alternative No. 5 would include approximately 6.5 million cubic yards.

ALTERNATIVE NO. 6 - 44/178 ALTERNATIVE

Under Alternative No. 6, the project site would be divided into two parcels, a "Development Parcel" and a "Conservation Parcel." The Conservation Parcel would be purchased by an interested party for the purposes of open space conservation. No development would occur in the Conservation Parcel. The Development Parcel would be developed with 127 single-family residential units on approximately 44-acres. The homes would be located in the extreme southwest corner of the property and continue along the southerly ridge easterly to the base of the easterly ridge. Land uses for this alternative are shown on Table 5 below.

Table 5
Alternative No. 6 Land Use Summary

Land Use	Area (acres)	Percent of Site
127 Single-family Lots	22.0	10%
Streets	8.3	4%
Manufactured Slope	51.3	23%
Natural Open Space	140.4	63%
Total	222.0	100%

Primary access for this alternative would be provided from El Toro Road via Valley Vista Way, which would continue along the project sites southerly flank terminating at a cul-de-sac about three-quarters of the way into the property. There would be no secondary access. This alternative would still include the off-site water tank and a 20-foot access road would be built across the Conservation Parcel from the cul-de-sac to the project site's northeast corner. A small amount of remedial grading would be required to stabilize the water tank site. Grading for Alternative No. 6 would include approximately __ million cubic yards.

ALTERNATIVE NO. 7 - ACQUISITION ALTERNATIVE

Under Alternative No. 7, the proposed project site would be acquired by another interested party in order to preserve the project site in its current condition. Under this alternative it is assumed that the proposed project site would not be developed and no further development within the project site would occur. The project site would remain in natural open space for the foreseeable future, without the current cattle grazing operations.

ALTERNATIVE NO. 8 - REDUCED ALTERNATIVE (282 SINGLE-FAMILY UNITS)

Under Alternative No. 8, approximately 282 single-family residential units would be developed on the project site. This alternative was developed to further reduce the biological impacts associated with the proposed project. Under Alternative No. 8, approximately half of the ephemeral ponds on the project site would remain, as compared to the proposed project in which approximately one fourth of the on-site ponds would remain.

As shown in Table 6, approximately 21 percent of the site would be used for residential lots, with the majority of the site left as open space.

Table 6
Alternative No. 8 Land Use Summary

Land Use	Area (acres)	Percent of Site
282 Single-family Lots	46.2	21%
Streets	18.4	8%
Regional Park	88.2	40%
Biological Open Space	9.2	4%
Restricted Scenic Easement	60.0	27%
Total	222.0	100%

This alternative would require essentially the same access and circulation, and infrastructure systems as the prospered project. Access would be provided via a controlled access private street off El Toro Road. Secondary access would be via Valley Vista Way. Open space areas would slightly increase by approximately 2.3 acres. Grading for this alternative would be similar to the proposed project and would include approximately 2.45 million cubic yards for conventional grading and 6.8 million cubic yards for remedial grading.

METEOROLOGY/CLIMATE

The project site's climate, as with all of Southern California, is dominated by the strength and position of the semi-permanent high pressure center over the Pacific Ocean near Hawaii. It creates cool summers, mild winters, infrequent rainfall, it drives the cool daytime sea breeze, and it maintains comfortable humidities and ample sunshine. Unfortunately, the same atmospheric processes that create the desirable living climate combine to restrict the ability of the atmosphere to disperse the air pollution generated by the large population attracted in part by the comfortable climate. Portions of the Los Angeles Basin therefore experience some of the worst air quality in the nation for certain pollutants.

Temperatures in El Toro average 62°F annually. Daily and seasonal oscillations of temperature are small because of the moderating effects of the nearby oceanic heat reservoir. In contrast to the steady temperature regime, rainfall is highly variable, and confined almost exclusively to the "rainy" period from early November to mid-April. Rainfall in the project area averages around 12 inches annually with January typically the wettest month of the year.

Winds near the project site, based on long-term monitoring from nearby MCAS El Toro, display several characteristic regimes. During the day, especially in summer, winds are from the west at 7-9 miles per hour. At night, especially in winter, the land becomes cooler than the ocean and an offshore wind of 3-5 miles per hour develops. After sunrise, the wind direction rotates through the southeast and south at 5-7 miles per hour until the west wind again becomes dominant in the early afternoon. One other important wind regime occurs when a high pressure center forms over the western United States and creates strong, hot, dry, gusty, Santa Ana winds from the northeast and east across El Toro.

The net effect of the area wind pattern is that any locally generated air pollutant emissions will be carried from east to west at night, and then reverse from west to east by day. Although the daytime windspeeds are generally stronger and therefore better ventilate the project area, the offshore flow, once well-organized late in the evening and during the night, is also strong enough to minimize any significant localized air stagnation. The least ventilated period is typically during the morning and evening directional transition when winds become near calm until the new flow component becomes fully established.

In addition to winds that govern the horizontal rate and trajectory of any air pollutants, Southern California experiences several

characteristic temperature inversions that control the vertical depth through which pollutants can be mixed. The daytime onshore flow of marine air is capped by a massive dome of warm air that acts like a giant lid over the basin. As the clean ocean air moves inland, pollutants are continually added from below without any dilution from above. As this layer slows down in inland valleys of the basin and undergoes photochemical transformations under abundant sunlight, it creates very unhealthful levels of smog (mainly ozone).

A second inversion forms at night as cool air pools in low elevations while the air aloft remains warm. Shallow radiation inversions are formed (especially in winter) that trap pollutants near intensive traffic sources such as freeways, shopping centers, etc., and from localized violations of clean air standards called "hot spots." Although inversions are found during all seasons of the year, the regional capping inversion is far more prevalent in summer while the localized radiation inversions are strongest in winter. The strong seasonal split in inversion intensity thus contributes significantly to the completely different air quality climate found in summer in the project vicinity than in winter. Because traffic concentrations in the project area are low, and because individual cars are becoming progressively "cleaner," air quality concerns in the El Toro area are more centered on the regional, summertime intrusion of photochemical smog (ozone) than on any winter microscale stagnation conditions.

AIR QUALITY SETTING

Ambient Air Quality Standards (AAQS): In order to assess the air quality impact of any proposed new development such as Saddleback Meadows, that impact, together with baseline air quality levels, must be compared to the applicable ambient air quality standards. These standards are the levels of air quality considered adequate to protect the public health and welfare. They are designed to protect that segment of the public most susceptible to respiratory distress or infection, such as asthmatics, the elderly, the very young, people weak from other disease or illness, and persons engaged in heavy work or exercise, called "sensitive receptors". Healthy adults can tolerate periodic exposure to air pollution levels well above these standards before adverse health effects are observed. Recent research has shown, however, that adverse health effects may occur from life-long chronic exposure to ozone concentrations that just meet the hourly standard. Barely meeting clean air standards may, therefore, not be enough to insure public health protection until some additional margin of safety is established to overcome chronic exposure health effects.

The Clean Air Act Amendments of 1970 established national AAQS with states retaining the option to adopt more stringent standards or to include other pollution species. Because California already had standards in existence before federal AAQS were established, and because of unique meteorological problems in California, there is considerable diversity between state and federal standards currently in effect in California as shown in Table 1.

The federal Clean Air Act Amendments (CAAA) of 1990 required that the U.S. Environmental Protection Agency (EPA) review all national AAQS in light of all current health data. EPA was charged with modifying existing standards or promulgating new ones where appropriate. EPA subsequently developed standards for chronic ozone exposure (8+ hours per day) and for very small diameter particulate matter (called "PM-2.5"). New national AAQS were adopted on July 17, 1997. California standards for PM-10, which includes PM-2.5, are more stringent than the federal PM-2.5 standard.

Planning and enforcement of the new federal standards for PM-2.5 and for ozone (8-hour) were put on hold through a decision by the U.S. Court of Appeals. The Appeals Court ruled that EPA did not have discretionary authority to adopt national clean air standards without specific congressional approval. An appeal filed on behalf of EPA by the Department of Justice was heard by the U.S. Supreme Court in early November, 2000. In a unanimous decision published at the end of February 2001, the Court ruled the EPA did have authority to promulgate standards without specific congressional authority, and that a cost:benefit analysis was not required for

TABLE 1

Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards		Federal Standards		
		Concentration	Method	Primary	Secondary	Method
Ozone (O_3)	1 Hour	0.09 ppm (180 µg/m³)	Ultraviolet Photometry	0.12 ppm (235 µg/m³)	Same as Primary Standard	Ethylene Chemiluminescence

Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m³)	Cadmium Hydroxide STRactan			

health-based standards. The Court also ruled, however, that there was an attainment schedule inconsistency between "old" and "new" standards. This inconsistency must be resolved before the new standards are considered fully implemented. Data collection for these standards is on-going, but no additional attainment action can be taken until all legal issues are resolved.

Baseline Air Quality: Existing and probable future levels of air quality in the project area can be best inferred from ambient air quality measurements conducted by the South Coast Air Quality Management District (AQMD) at its El Toro monitoring station. Monitoring at this station include both regional pollutants such as dust and smog, as well as primary vehicular pollution levels such as carbon monoxide. Table 2 summarizes the last seven years of published data from this monitoring station. Although the entire spectrum of air pollutants is not monitored at the El Toro station, the following conclusions can be drawn from this data:

a. Photochemical smog (ozone) levels continue to exceed standards by a small margin. However, the frequency of first-stage smog episodes has dropped by 90% the last 10-15 years. There have been no first-stage smog alerts from 1992 to the present in the El Toro area.

b. Annual maximum ozone levels rose in the early '80s to close to the second stage alert level of 0.35 ppm for 1 hour, but they since dropped sharply to the sub-0.20 ppm level. For several years, El Toro had the worst smog of any station in Orange County. In the last several years, however, El Toro, and by inference all of the South County, had some of the lowest smog readings on record.

c. Measurements of carbon monoxide have shown relatively low baseline levels for a monitoring station located near two busy arterials (El Toro Road and Jeronimo Road). With lower traffic volumes and more complex terrain reducing stagnation potential, CO levels near Saddleback Meadows are probably even lower than the AQMD readings at the El Toro monitoring station.

d. Respirable dust (PM-10) levels periodically exceed the state standard, but the less stringent federal PM-10 standard has never been violated since PM-10 measurements began at El Toro.

e. One violation of the federal ultra-fine particulate (PM-2.5) standard has been recorded since measurements were initiated in 1999.

Despite substantial South County growth in the last two decades, area air quality, as inferred from the El Toro SCAQMD data, continues to improve. The following air pollution "bests" have been recorded in the last three years:

Fewest 24-hour State PM-10 violations	(2)	-	2000

Although complete attainment of every clean air standard is not yet imminent, extrapolation of the steady improvement trend suggests that such attainment will occur within the reasonably near future.

Air Quality Management Planning: The Federal Clean Air Act (1977 Amendments) required that designated agencies in any area of the nation not meeting national clean air standards must prepare a plan demonstrating the steps that would bring the area into compliance with all national standards by December 31, 1987. The South Coast Air Basin (SCAB) could not meet the deadline for ozone, nitrogen dioxide, carbon monoxide, or PM-10. In the SCAB, the agencies designated by the Governor to develop regional air quality plans are the SCAQMD and the Southern California Association of Governments (SCAG). The two agencies first adopted an Air Quality Management Plan (AQMP) in 1979 and revised it several times subsequently as earlier attainment forecasts were shown to be overly optimistic.

In 1988, because of uncertainty in federal Clean Air Act reauthorization, the California Legislature enacted the California Clean Air Act (CCAA). The CCAA requires that regional emissions be reduced by 5 percent per year, averaged over 3-year periods, until attainment can be demonstrated. Each area that did not meet a national or state ambient air quality standard was required to prepare a plan which demonstrated how the 5 percent reductions were to be achieved. In July 1991, the SCAQMD adopted a revised AQMP which was designed to meet the CCAA requirements. The 1991 AQMP deferred the attainment date to 2010, consistent with the 1990 federal Clean Air Act.

The 1990 federal Clean Air Act Amendments (CAAA) required that all states with airsheds with "serious" or worse ozone problems submit a revision to the State Implementation Plan (SIP). The 1991 AQMP was modified/adapted and submitted as the South Coast Air Basin (SCAB) portion of the SIP. The 1991 SIP submittal estimated that an 85% basinwide reduction in volatile organic compound (VOC) emissions and a 59% reduction in oxides of nitrogen (NO_x) between 1990 to 2010 was needed to meet federal clean air standards. About 40% of these reductions were to come from existing pollution control programs. The rest would come from new rules, technologies, or other reduction programs.

In 1996, EPA approved the 1994 submittal of the SCAB portion of the SIP. The plan was finally approved after considerable debate on the contingency measures that should be implemented if progress is not as rapid as anticipated in the 1994 SIP. The federal Clean Air Act required that an updated plan be submitted by February 8, 1997, which included attainment plans for all pollutants exceeding federal standards. The CCAA requires an update of the State-mandated clean air plan every three years. The last update was completed on December 31, 2000.

An updated 1997 AQMP was locally adopted. The California Air Resources Board (ARB) forwarded this plan on to EPA for its consideration and recommended approval. The 1997 AQMP was designed to meet both federal (EPA) and State (ARB) air quality planning guidelines. Components of the 1997 plan update included:

- Demonstration of attainment for ozone, CO, and PM-10
- Updated emissions inventories (1993 base year) of VOC, NO_x, CO, SO_x and PM-10
- Emissions budgets for future years of the inventoried compounds.
- An updated pollution control strategy
- Contingency measures if the plan as presently proposed fails to meet stated timetables.

Additional research and photochemical computer modeling, as well as improved emissions estimates, now suggest that formerly predicted emissions reductions required to meet standards need not be quite as severe as thought earlier. Table 3 summarizes the currently proposed regional attainment planning for ozone (VOC and NO_x) and for carbon monoxide (CO). Emissions reductions of around 66 percent for VOC, 56 percent for NO_x and 66 percent for CO are

** - winter CO "hot spot" precursors

anticipated from the currently proposed AQMP update. Within the plan, some measures considered "long-term reductions" require additional technological development whose development schedule is uncertain. There is therefore no clear scientific consensus that the 1997 AQMP update will be able to achieve its mandatory clean air objectives by the end of 2010.

The Draft 1997 AQMP was challenged by several environmental organizations as not being consistent with the 1990 federal CAAA on rates of progress toward attaining the ozone standard. The Ninth Circuit Court found for these organizations. A 1999 Amendment to the proposed SIP Revisions was developed that accelerates the schedule for a number of new SCAQMD rules and regulations. The 1999 SIP Amendment meets the court-ordered acceleration of the rate of progress. The 1999 Amendments were approved by the California ARB on January 27, 2000. EPA staff has proposed approval of the amendments with additional minor changes. Formal EPA approval of the 1999 SIP Amendment came in April, 2000.

A residential development such as Saddleback Meadows relates to the AQMP through the land use and growth assumptions used to forecast automotive air pollution emissions. The basinwide AQMP is based on the designated land use for the project site contained in the Orange County General Plan. The "approved" land use for the project site, presumably incorporated into the AQMP/SIP, is for a 705-unit manufactured housing subdivision. To the extent that the proposed project represents a lower intensity of development than anticipated in the General Plan, it is, by inference, consistent with the AQMP. Implementation of planned growth will not delay the timely attainment of regional clean air standards. However, SCAQMD's position is that consistency with the AQMP alone is not a sufficient basis for a finding of an insignificant air quality impact. Impact significance is therefore determined by a direct project analysis.

AIR QUALITY IMPACTS

Methodology

The analysis methodology utilized procedures outlined in the SCAQMD 1993 "CEQA Air Quality Handbook" where appropriate. In areas where more site-specific information was available beyond the default values recommended in the handbook, they were used to supplement the AQMD-suggested input parameters. Where more current technical information is available than contained in the 1993 Handbook, such data was used where appropriate.

Vehicular emissions were therefore calculated using the California Air Resources Board (CARB) URBEMIS computer model because the SCAQMD no longer supports use of its "MAAQI" model for environmental impact analysis. Microscale emissions impacts were calculated using one generic run of the CALINE4 computer model which was then adjusted for site-specific traffic volumes, travel speeds and emission data for intersections near Saddleback Meadows potentially affected by project-related traffic.

Standards of Significance

Many air quality impacts from dispersed mobile sources, i.e., the dominant pollution generators in the basin, often occur hours later and miles away after photochemical processes have converted primary exhaust pollutants into secondary contaminants such as ozone. The incremental regional air quality impact of an individual source is generally immeasurably small. The SCAQMD has therefore developed suggested significance thresholds based on the volume of pollution emitted rather than on actual ambient air quality because the direct air quality impact of a project is not quantifiable on a regional scale. The 1993 SCAQMD Handbook states that any projects in the SCAB with daily emissions that exceed any of the following thresholds should be considered as having an individually and cumulatively significant air quality impact:

55 lbs per day of ROC*
55 lbs per day of NO_x**
550 lbs per day of CO
150 lbs per day of PM-10
150 lbs per day of SO_x

* - 75 lbs/day during construction

** - 100 lbs/day during construction

These thresholds do not take into account several important considerations, namely:

1. Emission levels from one large project may exceed thresholds while those from numerous smaller projects with identical emissions might not, even though the regional impact is the same.

2. Large developments have a greater opportunity to effectively implement TCMs because of a greater potential participant pool in trip/VMT diversion programs.

3. Project-related emissions and their regional impact may already have been incorporated into regional growth projections.

4. Emissions generated in or near El Toro have essentially the same regional air quality impact if they were released in a nearby community. If the anticipated demand for residential use is not met at Saddleback Meadows but in some other community, the no-project alternative will have basically the same regional air quality impact.

These considerations can be used by the Lead Agency as a basis for supporting a finding of a less than significant impact, even if the SCAQMD advisory thresholds are exceeded. Alternately, the Lead Agency may make a finding of a significant impact for projects exceeding the SCAQMD thresholds, but use as many of the above criteria in a statement of overriding considerations as are applicable.

Additional indicators should be used as screening criteria to evaluate the need for further analysis with respect to air quality. Whenever possible, the project should be evaluated in a quantitative analysis; otherwise a qualitative analysis is appropriate. The additional indicators are as follows:

- Project could interfere with the attainment of the federal or state ambient air quality standards by either violating or contributing to an existing or projected air quality violation;

- Project could result in population increases within the regional statistical area which would be in excess of that projected in the AQMP;

- Project could generate vehicle trips that cause a CO hot spot;

- Project might have the potential to create or be subjected to objectionable odors;

- Project could have hazardous materials on site and could result in an accidental release of air toxic emissions;
- Project could emit an air toxic contaminant regulated by District rules or that is on a federal or state air toxic list;
- Project could involve disposal of hazardous waste;
- Project could be occupied by sensitive receptors near a facility that emits air toxics or near CO hot spots;
- Project could emit carcinogenic air contaminants that could pose a cancer risk.

Residential development on former ranch property would usually not have any secondary impacts, particularly any related to hazardous or toxic materials. The project is consistent with the level of development anticipated in the AQMP. The potential for CO "hot spots," and hazardous emissions associated with diesel exhaust from grading equipment, are the only secondary impact issues evaluated in this study.

Project-Related Sources of Potential Impact

Intensification of land uses in Orange County potentially impacts ambient air quality on two scales of motion. As cars drive throughout Southern California, the small incremental contribution to the basin air pollution burden from any single vehicle is added to that from several million other vehicles. The impact from this project, even if it generates a significant number of new vehicle trips, is very small on a regional scale. Basinwide air quality impacts are, therefore, addressed in terms of project compatibility with regional air quality plans. If any given project or plan has been properly incorporated into basinwide growth projections which are the basis for regional air quality/transportation planning, then the basinwide impact of any proposed development is presumed, by definition, to be less than significant.

Locally, changes in the location of any collection of automotive sources, or changes in the number of vehicles or travel speeds may impact the microscale air quality around any given development site. Traffic increases not only contribute air pollutants in direct proportion to their cumulative percentage of traffic volume growth, but they may slow all existing traffic to slower, more inefficient travel speeds. The development traffic/air quality impact is thus potentially compounded.

Temporary construction activity emissions will occur during project buildout. Such emissions include on-site generation of dust and equipment exhaust, and off-site emissions from construction employee commuting and/or trucks delivering building materials. Because of their temporary nature, air quality impacts from construction have often been considered as individually less than significant. Also, construction activity emissions are difficult to quantify, since the exact type and amount of equipment that will be used or the acreage that may be disturbed on any given day in the future is not known with any reasonable certainty. The emphasis in environmental documents relative to construction activity emission impacts has therefore been to minimize the emissions as fully as possible through comprehensive mitigation even if the precise amount of emissions can not be precisely quantified.

Construction Activity Impacts

Dust is normally the primary concern during construction of new buildings and infrastructure. Because such emissions are not amenable to collection and discharge through a controlled source, they are called "fugitive emissions". Emission rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). Because of such variations, regulatory agencies use one universal factor based on the area disturbed assuming that all other input parameters into emission rate prediction fall into mid-range average values.

The PM-10 fraction of fugitive dust emissions are predicted to be around 55 pounds per day per acre disturbed in the absence of any dust control measures being applied (AQMD CEQA Handbook, Table 9-2). Mandatory measures required by South Coast AQMD Rule 403 (Fugitive Dust) are generally assumed to reduce this rate by 50%. Average daily PM-10 emissions during site grading and other disturbance are stated in the SCAQMD Handbook to be 26.4 pounds/acre. Best available control measures (BACMs) such as continual soil wetting, use of supplemental binders, early paving, etc. can achieve a substantially higher PM-10 control efficiency. Use of BACMs in dust control from construction is an important component of the 1997 PM-10 regional attainment plan.

The Saddleback Meadows project site totals 223 acres. Some steep slopes will be left in open space, but a very substantial part of the site would be graded to accommodate 299 single-family homes. Rough grading over a large part of the site would likely occur initially with finish grading completed in response to market demand. The area of simultaneous disturbance on any given day

could be 10-20 acres. Use of the SCAQMD "default" PM-10 emission factor of 26.4 pounds per acre per day would predict daily PM-10 emissions during rough grading of 264-528 pounds per day. Such emissions would exceed the daily PM-10 significance threshold of 150 pounds per day by a wide margin.

Recent studies of dust control with BACMs have demonstrated, however, that emissions rates of 10.2 pounds per acre per day are attainable when such measures are applied. A 10-20 acre disturbance area with use of all BACMs would contribute 102-204 pounds per day of PM-10. Use of BACMs, plus limiting the daily grading area to approximately 14 acres or less, could be used in tandem to keep PM-10 emissions at less than significant levels.

It is possible that impact significance in terms of PM-10 emissions may not be wholly relevant in light of current understanding of health effects from airborne dust exposure. Recent research indicates that only the very tiniest particulates of 2.5 micron in diameter or smaller (called "PM-2.5") dominate health response to particulate inhalation. Mechanical soil abrasion creates very little PM-2.5. Measurements in Orange County have shown that one-third of PM-10 is made up of "crustal material", i.e., dirt. Among the PM-2.5 fraction, less than two percent is soil material. The lack of any substantial PM-2.5 generation from grading activities would further support the finding of a less-than-significant dust impact relative to any potentially adverse health effects.

In addition to the fine particulates that remain suspended in the air semi-indefinitely, soil disturbance during construction may release considerable amounts of larger particles that have short atmospheric residence times. These larger particulates are generally inert silicates that are readily filtered out in the upper respiratory tract. They therefore have no adverse health effects. They may, however, create a soiling nuisance as they settle out on parked cars, landscaping foliage or other horizontal surfaces. Clouds of such dust may also locally impair visibility. Soiling nuisance at St. Michael's Abbey during daytime on-shore flow or in Hidden Hills during early morning drainage winds is therefore a possible concern that further prompts the use of efficient dust control.

It is through these larger particulates that the public is aware of a dust problem in a construction area rather than through PM-10. Under "normal" wind conditions, EPA documents suggest that the zone of large particle dust deposition is very close to the source (<100 feet impact radius). Off-site large particle transport is mainly a strong wind phenomenon. Because such large particles are more readily lofted by turbulence during strong winds, extra dust control or cessation of soil disturbance activities is recommended when wind speeds exceed a heavy particulate lofting threshold of around 25 mph.

Construction also entails use of internal combustion engines to power on-road trucks and off-road mobile, semi-mobile and semi-stationary equipment. Such sources are mainly diesel-powered and are poorly regulated in terms of allowable emission levels. Off-road sources are sometimes not well maintained because there is no regulatory mechanism to enforce efficient combustion as there is for on-road sources. The SCAQMD has calculated the total area under construction that would cause the significance thresholds to be exceeded from construction-related equipment combustion emissions. For single family residences, the threshold is 1.3 million sq. feet of gross floor area (SCAQMD Handbook, Table 6-2). For 299 units of single-family housing, even at 3,000 square feet per unit, total improved footage from simultaneous construction of the entire project will be less than the stated threshold. With the use of a comprehensive dust control program, construction activity air quality impacts in the project vicinity can be maintained at less than significant levels.

Diesel-powered construction equipment releases exhaust particulates (soot) that have been identified as carcinogenic in a number of health effects studies. Health risk is calculated based upon a lifetime (70 year) exposure for 365 days per year, 24 hours per day, outside one's residence or place of employment. These are not conditions that occur around a grading project. The equipment exhaust will be released for a limited time during daytime hours of moderate winds and turbulence by mobile sources that will not expose any individual receptor for any extended period. Receptors will not be outside their residences for the duration of the grading activity. Impacts from grading equipment diesel exhaust will therefore be minimal.

Construction activities are concentrated at the construction site, but they also spill over into the adjacent community. Spill-over may be physical spillage, or it may be from off-site congestion effects. Vehicles may track dirt off-site, lane closures may create congestion on public roadways and construction worker vehicles and supply trucks may compete with the general public for sometimes inadequate roadway capacity. Trucks may be left idling near off-site sensitive receptors while waiting to load or unload. Each of these small impacts nevertheless may be cumulatively significant when spread over several years of project area buildout. As with the on-site impacts, a heightened level of impact mitigation will need to be utilized to maintain an overall tolerable level of impact from site activity construction. Housekeeping and construction activity management procedures are identified in the impact mitigation discussion relative to "spill-over" minimization.

Mobile Source Impacts

The bulk of the proposed project's impact will derive from the approximately 3,588 "new" daily trips that will be generated at full site buildout. At a typical trip length of slightly under 9 miles per trip, project implementation would add around 30,000 vehicle miles traveled (VMT) to the basinwide mobile source emissions burden of around 300,000,000 VMT/day (0.01 percent).

The emissions associated with project buildout can be readily calculated using the California Air Resources Board (ARB) URBEMIS7G computer model. Emissions from project-related travel were calculated for a buildout year of 2003 as the earliest likely project completion year. The results of these calculations are summarized in Table 4. The computer output from the emissions model is attached as an appendix to this report. Mobile source emissions for all vehicular exhaust pollutants will not exceed their respective SCAQMD significance thresholds.

The emissions burden in Table 4 also includes the stationary source contribution from consumer products and on-site natural gas combustion. The inclusion of the stationary source contribution does not change any conclusions about the lack of impact significance.

Relative to a finding of (in)significance for the mobile source emissions, traffic from all future growth will contribute significantly to the sub-regional and regional air pollution burden, and, therefore, creates a cumulatively significant air quality impact, regardless of project size. This is a function of growth and the dependence upon the single occupant fossil-fueled vehicle as the primary means of transportation. All growth delays the ultimate attainment of regional clean air standards. This project, within a loose definition of "cumulative projects", would contribute to that impediment to clean air. Regardless of any finding of individual impact insignificance, the proposed Saddleback Meadows development should be identified as having a cumulatively significant air quality impact.

Because vehicular sources from all combined growth will contribute so substantially to regional emissions total, it correspondingly represents a significant opportunity to reduce that contribution.

A reasonable reduction percentage through the implementation of an aggressive transportation system management (TSM) will achieve a measurable reduction when applied to such a large baseline emissions level. If the air quality impact from mobile source emissions is to be maintained at an acceptable level, a viable TSM program is an imperative strategy toward achieving that end.

TABLE 4

Source: URBEMIS7G for Windows Computer Model (output in Appendix)

* - Assuming a 2003 buildout.

Orange County has been extensively involved in trip/VMT reduction programs through the trip reduction ordinances (TRO) and various geographically focused transportation management programs. Several countywide programs that monitor city and county response to AQMP TCMs have shown that the county collectively has exceeded its trip reduction targets of the AQMP when the county is allocated its fair share of the basinwide reduction target. While progress toward reducing the dependence on the single occupant vehicle (SOV) is slow, continued progress toward higher average vehicle ridership (AVR) is to be expected during the Saddleback Meadows buildout timeframe.

While regional mobile source emissions do not have a very direct impact on local El Toro air quality, the incremental addition of growth-related traffic over a wide area may change microscale air quality distributions. To determine whether future traffic changes will create an adverse air quality impact, a microscale air quality analysis was performed for the traffic analysis grid around the project site. A screening procedure based on the California line source roadway dispersion model CALINE4 was run for a number of traffic scenarios to evaluate any changes due to changes in patterns of growth anticipated as part of the Saddleback Meadows development.

The model combines the results of the traffic analysis with very restrictive dispersion conditions in order to generate a worst-case impact assessment. Carbon monoxide (CO) was used as an indicator of any "hot spot" potential because CO, unlike regional pollutants such as ozone, is directly related to source activity immediately adjacent to the receptor (a primary, unreacted pollutant impact). Calculations were made for an hourly exposure in the immediate vicinity of 10 roadway intersections where baseline traffic volumes were calculated in the traffic analysis.

The results of the microscale impact analysis are summarized in Table 5. The values in Table 5 must be added to any non-local background CO distribution. If one assumes that the maximum level measured near the El Toro and Jeronimo Roads intersection is the regional background, and that the worst-case, one-hour level of 4 ppm observed in 1999 or 2000 occurs at the exact same hour as any worst-case project impact, then it would take a local contribution of 16 ppm to threaten the one-hour California CO standard of 20 ppm.

Source: Screening procedure based upon CALINE4 Model; Caltrans Air Quality Technical Notes (AQTAN), 1988.

Microscale hourly CO levels, both without and with the proposed project are forecast to be well below the 16 ppm threshold. Combined CO concentrations will thus remain below the California 1-hour CO standard of 20 ppm, and far below the federal standard of 35 ppm.

In comparing "plus project" versus "existing" conditions, project-related CO contributions are seen in Table 5 to range from 0.0 to 1.5 ppm. The only increase exceeding 1 ppm would occur within 25 feet of the Portola Parkway/Foothill Transportation Corridor. There are pollution-sensitive receptors this close to the roadways at this location. The maximum CO increase at any location near residential development is much less than one (1) ppm compared to the most stringent standard of 20 ppm (less than 5.0 percent average change). There are not now, nor will there be with the project, any microscale air pollution "hot spots" at any project area intersections.

Increased areawide traffic and associated congestion is offset by continued improvements in vehicular CO emissions per average vehicle. Future (2025) CO levels with the proposed project and with anticipated intersection improvements are generally similar to those in 2002. Maximum localized CO levels would increase from 4.7 ppm in 2002 to 6.8 ppm in 2025. However, hourly background levels of 4 ppm will drop if the trend from the last decade continues. Combined hourly local plus regional background levels will continue to remain well below 20 ppm. The findings of the microscale impact assessment are therefore that CO levels under theoretical worst-case conditions do not exceed clean air standards and the Saddleback Meadows traffic will add an insignificant amount to the total CO exposure. Microscale impacts are less than significant.

MITIGATION

Potentially significant impacts were identified during construction from dust (PM-10) generated by surface disturbance and from construction equipment operations. Operational emissions will not be in excess of thresholds of significance for regionally significant pollutants as identified by the South Coast AQMD. However, vehicular emissions from project-related traffic should be identified as having a cumulatively significant air quality impact. A number of mitigations, as related to the project, are already incorporated into rules, regulations or ordinances. They are included in the following list of mitigation measures in that compliance mitigates a potentially adverse impact. They are not discretionary measures, however, which a developer can implement or the County of Orange can additionally require since compliance is already assumed in the impact analysis.

In particular, dust control during construction requires compliance with SCAQMD Rule 403 (rev. 1997). Rule 403 requires the use of best available control measures, requires that visible dirt track-out at construction access be promptly removed, and prohibits visible dust clouds beyond the property boundary. Any discretionary actions would be those measures that go beyond the already established Rule 403 minimum requirements.

The SCAQMD in its CEQA Handbook (1993) has developed a menu of mitigation options for consideration into project planning where applicable or appropriate. Some measures are not considered feasible for the proposed project. Many transportation control measures (TCMs) are already incorporated into actions required by the County of Orange. Mitigation potential, beyond what is already required, is therefore somewhat limited. The following measures are recommended:

Construction Dust

- Contractors will comply with SCAQMD Rule 403. In addition to meeting minimum compliance requirements, the contractor will utilize any additional reasonable and feasible methods of dust control from the measures shown in the list in the SCAQMD Rule 403 Implementation Handbook.

  Responsible Party: Construction Contractor

  Supervising Agency: County of Orange
  South Coast AQMD

- Contractors will implement a high wind dust control program when wind gusts exceed 25 mph as measured by an on-site wind monitor. High wind dust control will entail:

  - Termination of operation of scrapers, graders or dozers on unpaved surfaces until winds subside.

  - Application of water hourly to any unpaved surface with vehicle or equipment operations.

  - Application of water or other dust control material to any previously graded surface if dust emanation is visible from such surface.

- Contractors will utilize measures to prevent dirt from being tracked, washed, blown or otherwise conveyed onto paved roadways, and will wash or sweep the construction access points at El Toro Road on a routine basis on a frequency specified by the County of Orange as well as whenever dirt is visible more than 50 feet from the access point independent of the routine clean-up schedule.

  Responsible Party: Construction Contractor

  Supervising Agency: County of Orange

- Trucks hauling dirt on public roads to and from the site will be covered or will maintain a six inch differential between the maximum height of any hauled material and the top of the haul trailer. Haul truck drivers will water the load prior to leaving the site to prevent soil loss during transport.

  Responsible Party: Construction Contractor

  Supervising Agency: California Highway Patrol

- Construction management procedures required by the County of Orange and other jurisdictions shall be implemented. Contractor personnel responsible for supervision and the appropriate actions to be taken for the following measures shall be identified:

  - Cessation of activities during a Stage-2 smog episode. Call 1-800-242-4022 for the daily forecast.

- Truck routes and schedules for receipt of materials shall be coordinated with County of Orange staff.

- Where feasible, on-road vehicles and off-road equipment shall be turned off and subsequently restarted if the anticipated duration of idling is expected to exceed five (5) minutes.

Responsible Party: Construction Contractor

Supervising Agency: County of Orange

- Graded surfaces used for off-road parking, materials laydown or awaiting future construction shall be stabilized for dust control as needed. Frequently accessed unpaved areas shall be paved as early as possible to minimize dirt track-out to public rights of way.

Responsible Party: Construction Contractor

Supervising Agency: County of Orange

- Equipment will be maintained in proper tune to prevent visible soot from reducing light transmission through the exhaust stack exit by more than 20 percent for more than three (3) minutes per hour and use low-sulfur fuel as required by SCAQMD regulation.

Responsible Party: Construction Contractor

Supervising Agency: South Coast AQMD

- Lane closures or detour will require coordination with the County of Orange. Flagpersons and appropriate traffic control devices will be used as needed to minimize construction activity interference with off-site traffic.

Responsible Party: Construction Contractor

Supervising Agency: County of Orange EMA
Orange County Sheriff Department

Implementation of the above measures is expected to maintain construction activity air quality impacts at less than significant levels.

Operational Activities:

Impact mitigation is not required because the project-related impact is less than significant. However, cumulative impact significance and the overall non-attainment status of the airshed requires that reasonable mitigation be applied, where feasible. The following measures are recommended:

- Traffic flow at the project access will be maintained at acceptable levels of service through mitigation measures identified in the project traffic study.

  Responsible Party: Project Developer

  Supervising Agency: County of Orange Transportation Planning

- 220 Volt electric power for future use to charge electric-powered vehicles will be made available in homeowner garages.

  Responsible Party: Site Developer

  Supervising Agency: County of Orange EMA

Emissions Reduction Quantification

Emissions calculations and the corresponding ambient air quality impact assessment for project-related construction and Saddleback Meadows operations presumed compliance with SCAQMD rules regarding dust control. The potential for additional emissions reduction beyond the mandatory requirements of existing rules and regulations was evaluated based on Appendix 11 of the SCAQMD Air Quality Handbook which quantifies reduction potential of a variety of project construction and operation emissions control measures.

Table 6 shows the emission reduction estimate for the menu of recommended measures for the proposed project. Dust emissions can be controlled from their 50 percent control assumed for Rule 403 compliance by an additional 50-80 percent of the uncontrolled fraction. The net effective dust control level is therefore 75-90 percent, seen as follows.

$$\text{Control} = 0.50 + (0.50 - 0.80) \times (0.50)$$

$$= \text{Rule 403} + \text{Add'l. Control X Not Contr.}$$

$$= 0.50 + (0.25 - 0.40)$$

$$= 0.75 - 0.90$$

TABLE 6

MITIGATION EFFECTIVENESS ESTIMATE

	Pollutant Control	
Construction Measures	Particulates	Gaseous
Rule 403 Additional Measures	25-40%	---
High Wind Response Plan	NQ	NQ
Off-Site Dirt Deposition Control	5-10%	---
Covered Trucks or Watered Loads	5%	---
Construction Mgmt. Procedures	---	10%
Surface Stabilization	10-20%	---
Equipment Tune-ups	5%	10%
Traffic Interference Minimization	---	5%
Composite:	50-80%	25%
Operational Measures:		
Congestion Management	5%	5%
Electric Vehicle Access	NQ	NQ
Composite:	5%	5%

--- = minimal reduction

NQ = not quantified. Compliance with regulations already presumed in the impact analysis and generates no new reduction.

For purposes of analysis, an 80 percent control was assumed, and the size of the simultaneous grading area was presumed to not exceed 14 acres. Unless the entire project site is under simultaneous massive grading, attaining the optimum level of dust control will maintain dust impacts at less than significant levels.

Alternatives

Lesser intensity alternatives have been considered for the project site. Air quality impacts from the proposed project at 299 dwelling units were not found significant except for construction dust emissions. Adoption of a lesser intensity development would therefore not reduce any significant impacts to less than significant.

Air quality occurs mainly within a regional context. The air quality impact from lesser intensity alternatives may therefore not necessarily be environmentally preferred for the following reasons:

a. The same level of growth is likely to occur at some other Orange County location with similar impacts.

b. Transportation corridor access for goods and services may be less adequate at another location.

c. Development of this site is a natural expansion of already completed developments at Hidden Hills, Portola Hills or Foothill Ranch.

NOISE SETTING

Sound is mechanical energy transmitted by pressure waves in a compressible medium such as air. Noise is generally described as unwanted sound. Sound is technically described in terms of the loudness (amplitude) of the sound and frequency (pitch) of the sound. The standard unit of measurement of the loudness of sound is the decibel (dB). Since the human ear is not equally sensitive to sound at all frequencies, a special frequency dependent rating scale has been devised to relate noise to human sensitivity. The A-weighted decibel scale (dBA) performs this compensation by discriminating against frequencies in a manner approximating the sensitivity of the human ear.

Several rating scales have been developed for the analysis of adverse effects of community noise on human beings. Based on these effects, the observation has been made that the potential for a noise to impact people is dependent on the total acoustical energy content of the noise. Upon this premise, a number of noise scales have been developed including the Equivalent Noise Level (LEQ) and the Community Noise Equivalent Level (CNEL).

LEQ is the sound level corresponding to a steady-state sound level containing the same total energy as a time varying signal over a given sample period. LEQ is the "energy" average noise level. CNEL is similar to LEQ but is based on a 24 hour period, and applies a time-weighting factor that places greater significance on noise events occurring during the evening and night hours (when sleep disturbance is a concern). "Time-weighted" refers to the fact that noise occurring during certain sensitive time periods is penalized for occurring at these times. The evening period (7 p.m. to 10 p.m.) penalizes noises by 5 dB, while nighttime (10 p.m. to 7 a.m.) noises are penalized by 10 dB. The CNEL scale is specified by the County of Orange for community noise analysis.

An interior CNEL of 45 dB(A) has been required by the State noise insulation standards (Title 24 of the California Code of Regulations) for all multiple family dwelling units and hotel/motel rooms since 1974. In 1988, the State Building Standards Commission expanded that standard to include all habitable rooms, including single family or low density residential uses. All development in close proximity to automotive traffic, rail, or industrial noise sources with baseline levels exceeding 60 dB CNEL must undergo an analysis to verify that the 45 dB interior standard is attainable.

Exterior to interior noise attenuation is typically 20 dB for all windows closed. A 65 dB CNEL exterior noise exposure thus generally allows the 45 dB CNEL interior standard to be met as long as windows can normally be closed to shut out the noise. A level of 65 dB is also the threshold where noise begins to intrude

significantly into normal activities such as having a conversation. Although people may express annoyance if traffic noise levels in usable exterior space such as yards, patios, porches, etc. are below 65 dB, the percentage of "highly annoyed" people increases dramatically when noise exceeds 65 dB.

Noise/land use compatibility standards for various classes of land uses are generally expressed in the Noise Element of the General Plan to insure that noise exposure is considered in any development decisions. Local noise suitability criteria are based on State model guidelines shown in Figure 1.

Figure 1 contains four classes of acceptability and has a number of overlapping compatibility noise levels within several criteria. In order to reduce the potential ambiguity of various conditional acceptabilities, Orange County developed a more clear-cut matrix of acceptable noise levels shown in Table 1 and explained in Table 2.

Noise standards for residential projects such as Saddleback Meadows are as follows:

Exterior Level	Requirement
<60 dB CNEL	None
60-65 dB CNEL	Indoor Level <45 dB CNEL
>65 dB CNEL	Outdoor Level Mitigated to <65 dB CNEL Indoor Level <45 dB CNEL

Baseline Noise Levels

Existing noise levels on the project site are normally low except in close proximity to El Toro Road. Prior to the closing of the El Toro Marine Corps Air Station, periods of quiet had been interspersed with occasionally noisy periods of aircraft overflights. Currently, the former air base sits idle, while concerns for its re-use are debated by the public, the politicians, and the courts.

The project site is located near one of the former primary landing/ takeoff routes from El Toro MCAS. Aircraft above the site, however, had flown sufficiently high such that the noise exposure had been only marginally degraded. The site is traversed by the 60 CNEL contour in the El Toro noise footprint shown in the Orange County Noise Element as determined in the 1981 El Toro MCAS Air Installation Compatible Use Zone (AICUZ) study. The 60 dB

TABLE 2

EXPLANATION AND DEFINITIONS ON TABLE 1

Action Required to Ensure Compatibility Between Land Use and Noise from External Sources

1. Allowed if interior and exterior community noise levels can be mitigated.

2. Allowed if interior levels can be mitigated.

3. New residential uses are prohibited in areas within the 65-decibel CNEL contour from any airport or air station; allowed in other areas if interior and exterior community noise levels can be mitigated. The prohibition against new residential development excludes limited "in-fill" development within an established neighborhood.

Standards Required for Compatibility of Land Use and Noise

a. Interior Standard: CNEL of less than 45-decibels (habitable rooms only)

b. Exterior Standard: CNEL of less than 65-decibels in outdoor living areas

c. Interior Standard: LEQ(h) = 45 to 65 decibels interior noise level, depending on interior use

TYPICAL USE	LEQ(h)
Private Office, Church Sanctuary, College, Preschool, Schools (Grade K-12), Board Room, Conference Room, etc.	45
General office, Reception, Clerical, etc.	50
Schools (Grades K-12)	52
Bank Lobby, Retail Store, Restaurant, Typing Pool, etc.	55
Manufacturing, Kitchen, Warehousing, etc.	65

d. Exterior standard: LEQ(h) of less than 65 decibels in outdoor living areas.

e. Interior Standard: As approved by the Board of Supervisors for sound events of short duration such as aircraft fly-overs or individual passing railroad trains.

contour just touches a few lots in the southwestern corner of the project site. Almost all developed lots are outside the 60 dB CNEL contour. However, County policy relative to aircraft noise exposure is to use the highest exposure anywhere on the property as the noise reference level. At the property line adjacent to Valley Vista Way in an area of proposed commercial development, the maximum EL Toro MCAS noise exposure had been 62 dB CNEL. To be consistent with County policy, this level was thus used as an impact evaluation/mitigation criterion with the understanding that its use is overpredictive to varying degrees across the project site. A preliminary noise impact analysis for the proposed conversion of MCAS El Toro to a civilian airport predicted a noise contour pattern across the project site almost identical to the former military aviation pattern.

If it is determined that the former Marine air station eventually be developed as a commercial airport, the constraints imposed by the existing adopted noise footprint would remain unchanged. However, even if there is a commercial airport developed on the base site, there is no guarantee at this time that the previous runways and flight patterns would be used. It is also possible that the base could see development as an educational facility, an urban park, a commercial development, or a multitude of mixed uses. Nothing has been proposed that would exceed the noise level of an airport. Therefore, noise assumptions for a nearby airport could be considered as a worst-case scenario for this site.

In order to characterize existing project site noise levels, a brief noise measurement program was undertaken on February 11, 2002. Noise levels were measured for 30-minute periods near El Toro Road, and again near the caretaker's trailer by the cattle corral.

Noise measurements were somewhat affected by strong winds, but they show that there has been a steady increase in noise levels since previous measurements were made along El Toro Road in 1995 during earlier project environmental analyses. The most current noise levels, compared to those measured in 1995, are as follows:

	50' TO EL TORO RD.		CATTLE CORRAL	
Parameter	1995	2002	1995	2002
LEQ	67.8	70.4	62.4	62.8
Lmax	86.5	87.5	86.5	82.5
Lmin	38.0	42.0	39.0	38.0
L10	71.0	72.5	55.5	56.0
L50	59.5	69.5*	46.0	48.5*
L90	43.5	65.0*	42.5	47.0*

* = probable wind noise contamination.

Whereas the on-site noise has not changed measurably in seven years, the average roadway noise has increased by 2-3 dB. An increase of +1.5 dB is the margin of detectability under laboratory conditions. Increases of +3 dB are considered clearly perceptible even under ambient conditions. Noise levels near El Toro Road have therefore increased by an amount that is detectable/perceptible, but not at a significant amount.

The above data are short-term measurements while the Orange County noise/land use standard is based upon a weighted 24-hour average (CNEL). Measurement experience has shown, however, that mid-afternoon LEQ and 24-hour CNEL are relatively equal. The above data show that existing noise levels close to El Toro Road exceed the 65 dB CNEL level considered acceptable for noise-sensitive land uses unless mitigation is used to protect habitable outdoor space. Noise levels are not so high, however, such that the combination of increased setback and/or perimeter barriers (noise walls) would not achieve an acceptable noise environment with a substantial margin of safety.

NOISE IMPACTS

Three noise concerns are typically identified with land use intensification such as that proposed for the project area. Construction activities, especially heavy equipment, will create short-term noise increases near the project site. Upon completion, project-related traffic will cause an incremental increase in areawide noise levels throughout the El Toro area. Since, however, the number of trips generated by the proposed project is limited, the impact of ambient noise on the project site, rather than project traffic noise impacts on the rest of the community, is likely the important noise environment concern.

Residential activity generally creates minimal noise that is considered unacceptable unless the activity is unlawful (loud late-night parties, music practice or high volume speakers, excessive dog barking, etc.). Off-site religious facility uses are very noise sensitive, but if "normal" residential activity noise does not excessively disturb the next-door neighbor, it will not disturb religious contemplative activities a much farther distance away.

Standards of Significance

CEQA Guidelines identify significant impacts as those that cause standards to be exceeded where they are currently met. An impact is also considered significant if it "substantially" worsens an existing unacceptable noise environment.

"Substantially" is not defined in any guidelines. The accuracy of sound level meters and of sound propagation computer models is no better than ± 1 dB. This is also the human loudness difference discrimination level under ideal laboratory conditions. Most people cannot distinguish a change in the noise environment that differs by less than 3 dB between the pre- and post-project exposure if the change occurs under ambient conditions. For the purposes of this analysis, an increase of 3 dB which creates or worsens an area of noise/land use incompatibility would be considered a significant degradation of noise quality.

Construction Noise Impacts

Temporary construction noise impacts will vary markedly because the noise strength of construction equipment ranges widely as a function of the equipment used and its activity level. Short-term construction noise impacts tend to occur in discrete phases dominated initially by site clearing and grading, then by foundation construction, and finally for finish construction. The

earth-moving (grading) activities are seen in Figure 2 to be the noisiest sources during construction with equipment noise ranging from 75 to 90 dB(A) at 50 feet from the source. The range of noise levels shown in Figure 2 is meant to indicate that long-term (hourly or more) noise levels are at the lower end of the range, while short-term peaks are at the upper end.

Spherically radiating point sources of noise emissions are atmospherically attenuated by a factor of 6 dB per doubling of distance. The quieter construction noise sources will, therefore, drop below 60 dB by about 300 feet from the source, while the loudest sources might still be detectable above the local background beyond 1,000' from the construction area. With hilly topography in the project vicinity, the terrain shielding effects will limit the "noise envelope" around each construction site to considerably less than its theoretical maximum.

Construction noise sources are not strictly relatable to a noise standard because they occur only during selected times and the source strength varies sharply with time. The penalty associated with noise disturbance during quiet hours and the nuisance factor accompanying such disturbance usually leads to time limits on grading activities imposed as conditions on grading permits. The weekday (including Saturday) hours from 7 a.m. to 8 p.m. are the times allowed in the Orange County Noise Ordinance for construction or grading. Division 6 (Sec. 4-6-1, et seq.) of the County Code also contains standard requirements related to the distance separation between construction activities and any occupied dwellings. EMA's "Standard Condition for Approval" N10 requires:

1. All powered equipment operating within 1,000 feet of a dwelling must have a properly operating and maintained muffler.

2. Stockpiling and staging activities must be located as far as practicable from dwellings.

Construction activities in areas of noise-sensitive biotic habitats such as coastal sage scrub containing gnatcatchers may affect bird behavior. Little actual evidence of noise effects on gnatcatchers has been documented, but many wildlife management agencies believe such effects exist. In San Diego County, a standard of 60 dB Leq (one hour average) derived from studies on least Bell's vireo has been applied to gnatcatchers. Use of this standard ignores the fact that a large number of successful breeding pairs have been found directly under the take-off end of major airport runways or next to freeways where peak hourly noise levels reach almost 80 dB. Many grading projects have nevertheless been conditioned to avoid the breeding season for possibly noise-sensitive birds, or to erect temporary berms or other buffers to reduce avian noise exposure if

TYPICAL CONSTRUCTION EQUIPMENT
NOISE GENERATION LEVELS

FIGURE
2

seasonal avoidance is not practical. Wildlife agencies require construction activity noise monitoring during nesting/breeding seasons to verify the efficacy of noise mitigation to maintain levels at 60 dB Leq or less.

Contemplative off-site religious facilities would similarly be potentially affected by construction equipment noise. However, the maximum single-event equipment noise will be lower in magnitude than the single-event aircraft noise experienced for many years during the operational history of the airbase. Any noise impacts due to construction equipment would thus be considered adverse, but less than significant, to adjacent religious retreat facilities.

Development-Related Vehicular Noise Impacts

Off-Site Noise Levels

Long term noise concerns from the increased urbanization of the project area center primarily on mobile source emissions surrounding the project site. These concerns were addressed using the California specific vehicle noise curves (CALVENO) in the federal highway noise prediction model (FHWA-RD-77-108) in a computerized version of the model developed by Caltrans. The model calculates the Leq noise level for a particular reference set of input conditions, and then makes a series of adjustments for site-specific traffic volumes, distances, speeds, or noise barriers.

Project-related traffic may incrementally contribute to the noise exposure of off-site receiver locations. Of the 3590 daily project-generated trips, 75% will travel south on El Toro Road, while the other 25% will travel inland. At each subsequent turning opportunity, fractions of each traffic stream will split into different directions and thus dilute any off-site project traffic noise impact. The CNEL at 100 feet from area roadways for various scenarios is shown in Table 3.

In areas of greater concentration of site-related traffic, high non-project traffic levels will substantially mask any small project noise contribution. Any detectable project-related noise increases would only occur in areas of low baseline traffic volumes. The maximum project-related traffic noise impact (difference between existing-with project versus existing-no project) of 1.3 dB will occur along El Toro Road at the Site Entrance. This is not a perceptible noise increase. By the year 2005, the project-related traffic noise increase will be less than one decibel because of the increase of noise generated by predicted growth in the area. This increase of <1 dB will not be perceptible even for sensitive receivers. By 2025, the project contribution to the El Toro Road traffic noise environment will be 0.6 dB or less.

N/A = no data available Source: FHWA-RD-77-108 (Calveno mod.)

Maximum off-site traffic noise impacts in areas of already elevated non-project traffic noise are 1 dB or less. Noise level differences of less than 1 dB are not distinguishable even in a laboratory setting -- much less in an ambient environment. Maximum expansion of the 65 dB CNEL contour is seen in Table 4 to occur along El Toro Road directly adjacent to the project site. An increase of 15 feet in contour distance occurs for "plus project versus existing" scenarios. Away from the project site with dilution of project-related traffic, the project-related increment drops steadily to 10-foot, then a 5-foot, and quickly to an immeasurably small increase. A maximum +10-foot increment in the 65 dB CNEL contour distance is seen in future years as the project increment is masked by a rising background level. The project is too limited in scope to create a discernible change in off-site traffic noise levels. The noise impact of the project on the ambient acoustic environment is judged to be less than significant.

On-Site Noise Exposure

The roadway that could affect project on-site noise exposure is El Toro Road. At the maximally exposed lot at around 300 feet from El Toro Road, the traffic noise level will be 61.5 dB CNEL at area buildout for an acoustically "hard" underlying surface. The presumed aircraft noise contribution at this location is 60 dB CNEL for a worst-case assumption of a civilian airport. Their combined exposure is 64 dB CNEL. This meets the Orange County exterior noise standard for residential use and requires no exterior noise mitigation. This calculation is a theoretical worst-case condition that assumes:

1. The maximally exposed residence in the year 2025 has a 180 degree field of view of El Toro Road without terrain irregularities or any vegetative noise absorption, and,

2. Possible future aircraft noise in 2025 is characterized by El Toro MCAS aircraft mixes and operational conditions that existed almost twenty (20) years before today.

Both assumptions probably somewhat overstate horizon year noise exposures. There is likely an extra margin of safety relative to meeting the 65 dB CNEL exterior standard without any supplemental noise mitigation.

Mitigation in the form of exterior to interior noise attenuation will be required to meet the 45 dB CNEL interior standard for all units within the development since a maximum 60 dB CNEL aircraft noise contour will cover the project site if a commercial airport is eventually developed at the MCAS site. With open windows, exterior to interior noise reduction is approximately 12 dB. Any

N/A = no data available Source: FHWA-RD-77-108 (Calveno mod.)

project site exposure exceeding 57 dB CNEL can not meet the 45 dB CNEL interior standard. Meeting the interior standard thus requires the option to close the window. Such ability, in turn, requires that there is supplemental mechanical ventilation to replace the natural draft eliminated by such closure. For new homes in inland valleys of Orange County, air conditioning is normally a standard feature meeting this requirement.

Noise reduction of 20 dB is normally attainable with closed single-paned windows. That would reduce any aircraft-related CNEL from 60 to 40 dB. As previously noted, however, CNEL is not the best predictor of noise annoyance due to single event phenomena such as individual overflights. Peak noise levels from aircraft takeoffs would be 85 dB within the project site. A 20 dB attenuation would create a 65+ dB single event level that may be annoying to occupants even with windows closed. Most new developments within the fringes of an aircraft noise impact envelope have been built with acoustically enhanced windows. Such windows reduce single event noise, reduce vibration response (rattle) to aircraft noise often found in single-pane windows and are more energy efficient. Use of windows rated with a sound transmission class (STC) of 25 or better is therefore recommended to reduce noise annoyance potential from single events.

Residential activities may affect adjacent noise-sensitive land uses such as contemplative religious facilities. In the past, these facilities had been exposed to single event aircraft noise that was much louder than a distant barking dog, lawnmower, or auto horn associated with project residential use. The combination of irregular terrain, distance buffering and normally quiet residential activities are not expected to create a significant noise impact on any adjacent abbey or monastery uses.

NOISE IMPACT MITIGATION

The project noise impact study indicates a less than significant noise impact from project-related traffic on project vicinity receptors. Ambient noise levels were also shown to present no development constraint as the project site has more than adequate setback from El Toro Road to meet Orange County standards.

Construction activities may create a temporary adverse impact if new construction occurs adjacent to already completed residences. This potential will be minimized by completion of all mass grading before any homes are constructed. Construction noise could adversely affect any sensitive biotic species such as gnatcatchers if such species are present in the project vicinity. Although monitoring in high noise environments has shown gnatcatchers to be less noise-sensitive than sometimes believed, noise protection during construction has been required in some projects. Construction activity mitigation measures recommended for this project thus only include standard County requirements as follows:

- All construction and general maintenance activities, except in an emergency, shall be limited to the hours of 7 a.m. to 8 p.m. Monday through Saturday and should utilize the quietest equipment available.

- All on-site construction equipment should have properly operating mufflers.

- All construction staging areas should be as far away as possible from any surrounding completed development.

If wildlife management agencies require noise protection for noise-sensitive bird species, the following hierarchy of measures would be implemented:

1. Avoidance of noise generation during noise-sensitive nesting/breeding seasons.

2. If avoidance is not possible, maintain an adequate distance buffer and erect temporary barriers (berms, wall, etc.) between the equipment and the habitat.

3. If distance buffers are not feasible, use the quietest possible equipment, monitor daily noise levels, and provide habitat mitigation for any incidental "takes" due to excessive noise.

Single event noise from aircraft would be intrusive in homes with "standard" construction if a civilian airport is developed at El

Toro. Aircraft noise at this time has subsided with the elimination of military aviation in Orange County. Given, however, that a commercial airport could eventually replace the departed military operations, enhanced acoustical window treatment is recommended as follows:

- All operable windows exceeding 6 square feet of total glazing should be rated STC = 25 or greater.

EXECUTIVE SUMMARY

The 222-acre Saddleback Meadows property is proposed to be developed as a residential community and is located in southeastern Orange County. The project consists of 299 single-family residential lots, access roads, recreational trails, and a 1.4 million gallon water tank on approximately 163.5 acres. This project will include a fire fuel modification zone and the remedial grading needed to correct historic landslides. Development will be concentrated in the north and south sections of the property, avoiding a steep ravine and associated oak woodlands near the center of the property. Following restoration efforts, 94.9 acres will be designated as biological open space. This area will contain coastal sage scrub, coast live oak woodland, mule fat/riparian scrub habitats as well as several ephemeral ponds.

Ten vegetation communities occur on site. Six of the vegetation communities are sensitive: Venturan-Diegan coastal sage scrub (including that which is disturbed), southern mixed chaparral, coast live oak woodland, southern sycamore riparian woodland, mule fat scrub, ephemeral ponds and non-native grassland. The proposed project would significantly impact all of these sensitive vegetation community types.

Three sensitive plant species were observed during the sensitive plant surveys: (1) the intermediate mariposa lily (*Calochortus weedii Hallii*), a Federal Species of Concern (FSOC); (2) Catalina mariposa lily (*Calochortus catalinae*), a California Native Plant Society (CNPS) 4 (watch list) species; and (3) small-flowered microseris (*Microseris douglasii* ssp. *platycarpha*) a CNPS 4 (watch list) species. None of these species is state or federally listed as threatened or endangered.

One federally listed endangered animal species occurs on site: the Riverside fairy shrimp (*Streptocephalus woottoni*). Additionally, four sensitive animal species were observed on site: (1) the western spadefoot toad (*Scaphiopus hammondii*) a FSOC; (2) the orange-throated whiptail (*Cnemidophorus hyperythrus*), a California Species of Concern (CSC); (3) the coastal cactus wren (*Campylorhynchus brunneicapillus couesi*), a CSC; and (4) the Cooper's hawk (*Accipiter cooperii*), a CSC.

A total of 5.28 acres on site fall under the jurisdiction of the U.S. Army Corps of Engineers (ACOE). ACOE jurisdictional areas include approximately 1.67 acres of wetlands 3.61 acres of Waters of the United States. The 1.67 acres of wetlands are composed of 0.48 acre of open water and 1.19 acre of mule fat scrub associated with eight ephemeral ponds and 0.12 acres associated with three drainages (#1-0.01 acre, #14-0.09 acre and #15-0.02 acre) on the property. The 3.61 acres of Other Waters are associated with the ephemeral drainages. California Department of Fish and Game (CDFG) jurisdictional areas total 8.47 acres. Of these areas, approximately 0.34 acres are associated with the ephemeral ponds, 4.32 acres are CDFG wetlands, and 3.58 acres are unvegetated streambeds associated with the drainages. Any alteration to or filling in of ACOE jurisdictional areas would be subject to regulation by the ACOE in the form of a permit pursuant to Section 404 of the Federal Clean Water Act. Section 401 certification from the California Regional Water Quality Control Board is also required. Impacts to CDFG jurisdictional areas would require a Section 1603 Streambed Alteration Agreement.

Impacts to 4.09 acres of CDFG jurisdictional areas (also includes ACOE jurisdictional areas) will be mitigated for by both on and off site mitigation totaling 8.67 acres. This will consist of construction of ephemeral ponds, drainages and mule fat scrub habitat associated with both ponds and drainages. Additionally, the feasibility of on-site mitigation for the ephemeral ponds will be tested prior to project initiation.

Upland habitat mitigation includes both on-site habitat enhancement and restoration and off site habitat acquisition. Impacts to 43.7 acres of coastal sage scrub will be mitigated for by conservation of 23.2 acres onsite, creation and enhancement of 41.7 acres of coastal sage scrub on-site and acquisition of 14.8 acres off-site. Coast live oak woodland will be mitigated for at a ratio of 3:1 for both acreage and trees. A total

of 16.5 acres will be created and 543 coast live oaks (*Quercus agrifolia*) will be planted (13.5 on-site and 3.0 acres off site).

Monitoring during construction adjacent to all habitats that will remain is recommended to avoid indirect impacts. The monitoring would include flagging of sensitive areas, a pre-construction meeting involving the monitor and the construction contractor, and monitoring during construction as necessary to ensure that impacts to sensitive areas are minimized and that corrective measures are taken if necessary.

1.0 INTRODUCTION

This report describes existing biological conditions on the Saddleback Meadows Project (Project) site to provide the project applicant, U.S. Fish and Wildlife Service (USFWS), U.S. Army Corps of Engineers (ACOE), the California Department of Fish and Game (CDFG), County of Orange (County) and the public with current biological data to satisfy the review of the project under the California Environmental Quality Act (CEQA) and other potential regulatory requirements. This report describes the vegetation communities, jurisdictional areas, and wildlife observed, and identifies sensitive and/or significant biological resources on the site and in the off-site grading areas located along the northern and southern boundaries. Project impacts are assessed, and mitigation is proposed to offset the potential significant impacts that would result from the proposed project. Eight project alternatives are also analyzed.

The proposed project consists of 299 single-family residential lots, access roads, recreational trails, and a 1.4 million gallon water tank that will impact approximately 155.5 acres of the 222-acre property on site and an additional 8 acres off site. Development will be concentrated in the north and south sections of the property, avoiding a steep ravine and associated oak woodlands near the center of the property. Following restoration efforts, 94.9 acres will be designated as open space. This area will contain coastal sage scrub, coast live oak woodland, mule fat/riparian scrub habitats as well as several ephemeral ponds. Additionally, open space design will provide for a wildlife corridor through the property that connects off-site open space to the east and west.

The project site is located in an unincorporated area of southeastern Orange County approximately 16 miles inland from the Pacific Ocean within the foothills of the Santa Ana Mountains (Figure 1). The parcel is situated on the northeastern side of Santiago Canyon Road, approximately 1,000 feet south of its intersection with Live Oak Canyon Road (S-19) in the Foothill-Trabuco area (Figure 2). The site is located on the U.S. Geological Survey Santiago Peak and El Toro 7.5-minute quadrangles.

2.0 PHYSICAL DESCRIPTION AND LAND USE

The project site is mostly undeveloped and supports native and non-native habitats. The Project site is situated amid the lower, southwestern foothills of the Santa Ana Mountains (Figure 2). The topography on site is hilly with several steep slopes and ravines. Aliso Creek generally follows El Toro Road near the western site boundary. Drainage is to the west into Aliso Creek and to the south into O'Neill Regional Park. The site is currently being used for horse and cattle grazing. Development on site is limited to a small corral in the western portion of the site, remnants of several houses, and a few un-maintained access roads. Surrounding land uses include residential development to the south and west, undeveloped lands to the east and northeast, and Saint Michael's Abbey to the north.

Three large blocks of designated open space occur within the site's vicinity. O'Neill Regional Park abuts the site on the south while the Cleveland National Forest occurs off site to the north and east. Another large block of open space, Whiting Ranch Regional Park, occurs to the west. Part of Whiting Ranch Regional Park lies directly across El Toro Road from the Project site, while the remaining larger block of open space in Whiting Ranch Regional Park is to the west on the opposite side of intervening residential development. Site elevation ranges from 1,000 feet to 1,544 feet above mean sea level.

3.0 METHODS

Biological resource information presented in this report includes results from surveys by Chambers Group in 1998 and 1999 as well as observations from recent field reconnaissance performed by HELIX. Sweetwater Environmental Biologists conducted biological assessments for the property in March 1997 and December 1995, and focused surveys for the coastal California gnatcatcher (*Polioptila californica californica*) in 2001. (Most of the biologists who worked on this project through SEB now work at HELIX.) Additional biological assessments were done in 1989, 1993, and 1994 by Pacific Southwest Biological Surveys (PSBS).

Vegetation mapping and sensitive plant surveys were conducted by Chambers Group in April and June of 1998. Vegetation was mapped on a 1"=100' topographic map. Acreages were calculated using a Geographic Information System (GIS). The list of plants observed by Chambers Group is included as Appendix A. Additionally, an oak inventory was completed in 1994 by PSBS and then updated by SEB in 1995 to assess specific impacts under this revised Project.

Chambers Group conducted wildlife surveys in April and June 1998. Wildlife and wildlife sign, including tracks, fecal material, carcasses, nests, excavations, and vocalizations, were recorded on standardized data sheets. A list of wildlife species detected on the property is included in Appendix B.

Chambers Group conducted focus surveys for the coastal California gnatcatcher and Quino checkerspot butterfly (*Euphydryas editha quino*), and western spadefoot toad (*Scaphiopus hammondii*). Focused surveys for gnatcatchers were conducted on April 15, May 22, 29, June 5, 16, and June 23, 1998 by Mari Schroeder, Christine Mukai, and Michelle Dohrn. These biologists are listed on Chambers Group's Federal Fish and Wildlife Permit (PRT-78127) to conduct coastal California gnatcatcher surveys and USFW survey protocol was followed. Focused surveys for the Quino checkerspot butterfly were conducted in May 1998 and from April through May 1999 by Chrisitne Mukai and assistant Michelle Dohrn of Chambers Group. Both biologists are listed on Chambers Group's Federal Fish and Wildlife Permit (PRT-781217) to conduct Quino checkerspot surveys according to USFWS guidelines (1997). HELIX conducted an additional survey for the coastal California gnatcatcher during June 2001 under their Federal Fish and Wildlife Permit (PRT-TE778195-5). Riverside fairy shrimp (*Streptocephalus woottoni*) were observed in a majority of the ponds by Dr. Marie Simovich. For purposes of this assessment, it is assumed that all of the ponds support Riverside fairy shrimp.

Chambers Group biologists performed a wetland delineation on March 12 and 18, 1999 and October 19, 1999 in accordance with the 1987 U.S. Army Corps of Engineers (ACOE) Wetlands Delineation Manual (Environmental Laboratory 1987). This delineation took place within the development portion of the site including the remedial grading zone. This delineation was updated in 2001 based on input from the ACOE.

Vegetation community classification follows the County of Orange categories (1994). Latin names of plants follow *The Jepson Manual, Higher Plants of California* (Hickman 1993). Sensitive plant status follows Skinner and Pavlik (1994), CDFG (1994), and USFWS (1990). Animal nomenclature used in this report is taken from Collins (1997) and Stebbins (1985) for reptiles/amphibians; American Ornithologists' Union (1998) for birds; and Jones et. al. (1997) for mammals.

SADDLEBACK MEADOWS

Figure 2

4.0 RESULTS

4.1 VEGETATION/HABITAT TYPES

Saddleback Meadows supports a variety of vegetation communities (Figure 3), and portions of the site have been previously grazed, cleared, or disturbed. The intensive grazing combined with the presence of highly erodable soils has resulted in degradation of both upland and wetland habitat over the years. On-site vegetation communities include annual grassland, Venturan-Diegan transitional coastal sage scrub, coast live oak woodland, and southern mixed chaparral (Chambers, 1999). In addition to these upland habitats, several wetland habitats are also present on site. Southern sycamore riparian woodland is located along Aliso Creek at the western site boundary. Nine ephemeral ponds, originally created to hold water for cattle (Urban Vision 1997), are located along several drainages scattered throughout the site. Two of the ponds no longer retain water; however, the remaining seven ponds create open water habitat. Mule fat scrub has established along the perimeters of most of the ponds. The ponds on site are not vernal ponds because of their morphology and plant associates (see following text).

Table 1
SUMMARY OF VEGETATION COMMUNITIES ON SADDLEBACK MEADOWS

VEGETATION COMMUNITY	ACREAGE*
Venturan-Diegan transitional coastal sage scrub	56.3
Disturbed Venturan-Diegan transitional coastal sage scrub	14.4
Coast live oak woodland	13.2
Southern sycamore riparian woodland	0.3
Mule fat scrub	3.0
Southern mixed chaparral	6.4
Annual grassland	122.02
Agriculture	5.4
Ephemeral ponds	0.48
Ornamental	0.5
TOTAL	222.0

*Acreage is approximate.

4.1.1 Riparian/Wetland/Open Water

4.1.1.1 Southern Sycamore Riparian Woodlands

Southern sycamore riparian woodland is composed of tall, open, broad-leaved, winter-deciduous trees that require water near the soil surface. Western sycamore (Platanus racemosa) is the dominant species forming an open, medium height woodland. Associated understory species include mule fat (Baccharis salicifolia), Mexican elderberry (Sambucus mexicana), and poison oak (Toxicodendron diversilobum). This habitat occurs along very rocky streambeds subject to seasonally high-intensity flooding (Holland 1986) and occurs along large intermittent streams in Orange County. An estimated 0.3 acre of this habitat occurs along Aliso Creek near El Toro Road on the western boundary of the site.

4.1.1.2 Mule Fat Scrub

Mule fat scrub is a depauperate, tall, herbaceous, riparian scrub community that often occurs along intermittent stream channels but is also found around ponds or other wet areas. This early seral community thrives in areas that are subject to disturbances (for instance, by flooding); the absence of which could lead to a riparian woodland or forest (Holland 1986). On the site it occurs on fringes of the manmade stock ponds and in areas where there is not enough water to support riparian tree species. Approximately 3.0 acres of mule fat scrub occur on site.

4.1.1.3 Ephemeral Ponds

Seven existing and two former ponds occur on site. The seven existing ponds total 0.48 acre in size. The smaller of the two former ponds lacks significant vegetation in the bottom of the pond, but it is still rimmed with mule fat scrub. The larger pond still supports mule fat scrub. All of the ponds, with the possible exception of Pond E, appear to have been artificially created with earthen dams a number of years ago to provide water for cattle. The earthen dams of two of the ponds have breached, and as a result, no longer retain water. Existing use of the ponds by cattle severely impacts vegetation and water quality.

None of the plant species observed in the ponds are primarily or typically found in vernal ponds in southern California. Several species observed on site can occur in vernal ponds but typically occur elsewhere. These species include salt-grass (*Distichlis spicata*) and curly dock (*Rumex crispus*). Salt-grass is a species typically found in salt marshes, and moist, alkaline areas. Curly dock is a species typically found in disturbed places. The typical habitats of the plant species observed in or near the ponds include fresh or saltwater marsh, riparian, moist places, and disturbed areas.

The physical setting of these ponds also differs from most other southern California vernal ponds (Zedler 1987). Vernal ponds typically occur on relatively flat mesas, situated in low lying areas between small mounds. This contrasts sharply with the lay of the land on site where few areas are flat. Furthermore, the ponds do not occur in the few flat areas. They occur primarily in dammed drainages that support a low species diversity and a high percentage of weed species. Based on vegetation, species composition, and physical setting, these ponds are not vernal pools. However, six of the existing ponds and two former ponds contained Riverside fairy shrimp (*Streptocephalus woottoni*). Although recently the USFWS recorded the Riverside fairy shrimp near El Toro, the occurrence of these shrimp on the site may be an anomaly because the ponds appear to have been artificially created.

4.1.2 Upland Habitats

4.1.2.1 Venturan-Diegan Transition Coastal Sage Scrub (including disturbed)

Coastal sage scrub is found in coastal areas of California from the San Francisco Bay Area to the Mexican border, and beyond. The coastal sage scrub plant community is composed of low statured, drought-deciduous shrubs. Four floristic associations are recognized in distinct geographical areas along the California coast with the Diegan association occupying an area from Orange County to northwestern coastal Baja California, Mexico (O'Leary 1990). The Venturan association occupies an area from San Luis Obispo County to Orange County. Venturan-Diegan transitional coastal sage scrub is found throughout Orange County and is a transitional scrub community between two floristic associations of coastal sage scrub: Venturan and Diegan. Approximately 70.7 acres of this plant community occur on site, 14.4 acres of which is disturbed.

Some of the typical plants found within the Venturan-Diegan transitional coastal sage scrub on site include California sage brush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), laurel

Figure 3

sumac (Malosma laurina), black sage (Salvia mellifera), and coastal prickly-pear (Opuntia littoralis). Disturbed portions of Venturan-Diegan transitional coastal sage scrub (14.4 acres) have a higher component of annual grasses and noticeably less shrub cover than undisturbed Venturan-Diegan transitional coastal sage scrub areas. Much of the Venturan-Diegan transitional coastal sage scrub on site is unconnected and subject to continued degradation because of previous and continued cattle grazing.

4.1.2.2 Coast Live Oak Woodlands

Coast live oak woodlands occur in the outer portion of the central California coastal mountain ranges and extend south into Baja California, Mexico occurring between 500 and 4,500 feet in elevation. The dominant plant in this oak woodland are coast live oaks (Quercus agrifolia), which typically reach a height of 12 to 70 feet, forming an incompletely closed canopy, with an understory herbaceous layer approaching 80 percent cover.

On Saddleback Meadows, coast live oak woodland is found mainly along moderate, north-facing slopes and in ravines. Areas within small drainages or swales (central portion of the site) have the most dense canopy. The understory is, for the most part, dominated by annual grassland and has been heavily grazed, making the woodland of an overall moderate quality. The ongoing grazing is precluding natural recruitment of new seedlings in the oak woodlands. Approximately 13.2 acres of coast live oak woodland occur on site.

4.1.2.3 Southern Mixed Chaparral

Southern mixed chaparral is composed of deep-rooted shrubs that are usually not deciduous and grow to about 6 to 10 feet tall forming dense, often nearly impenetrable, stands. The plants of this association typically include lemonadeberry (Rhus integrifolia), toyon (Heteromeles arbutifolia), chamise (Adenostoma fasciculatum), and mission manzanita (Xylococcus bicolor). Southern mixed chaparral occurs on canyon slopes in the extreme northeast and southeast quadrants of the site. Approximately 6.4 acres of southern mixed chaparral occur on site.

4.1.3 Other Upland Areas

4.1.3.1 Annual Grassland

Annual grassland is a dense to sparse cover of mostly non-native grasses, often associated with numerous species of showy-flowered, annual forbs. This association occurs on gradual slopes with deep, fine-textured soils. Characteristic species include oats (Avena sp.), red brome (Bromus madritensis ssp. rubens), ripgut (B. diandrus), and mustard (Brassica spp.). Cardoon (Cynara cardunculus) is dominant in some areas on site while virtually lacking in others. In conjunction with agriculture and grazing in California, many of these plants were imported. Annual grassland is in every quadrant of the site, but the most dense coverage is on the less steeply sloped portions of the western half of the site. Approximately 122.02 acres of annual grassland occur throughout the site.

4.1.3.2 Agricultural

Agriculture in the form of olive trees (Olea europaea) is found in the central portion of the site. Approximately 5.4 acres of agriculture occur on site.

4.1.3.3 Ornamental

Ornamental eucalyptus (Eucalyptus sp.) trees are the dominant species in two small areas (totaling 0.5 acre) near the west end of a large ravine in the center of the site. Eucalyptus is an introduced species that

produces a large amount of leaf and bark litter. The chemical and physical characteristics of this litter inhibits the growth of other species in the understory, causing floristic diversity to decrease. In most instances, eucalyptus are planted for a variety of cultural reasons. If sufficient moisture is available, eucalyptus become naturalized and are able to reproduce and expand their range.

4.2 PLANT SPECIES OBSERVED ON SITE

A total of 187 plant species, 130 (69 percent) of which are native, were observed during surveys by PSBS (1993; 1994) and SEB. The presence of 58 non-native plant species on the Project site reiterates the disturbed nature of most of the site. A common plant species over much of the site is the invasive non-native cardoon, an artichoke-like plant that grows in areas where soils, especially clay soils, have been highly disturbed and compacted. This aggressive plant species often dominates areas that have been heavily grazed. Undisturbed native vegetation communities on steeper slopes of the site support a typical diversity of plant species common to central Orange County. Overall the plant diversity on site, however, appears to be somewhat limited. Appendix A provides a complete list of all plant species observed.

4.3 ANIMAL SPECIES OBSERVED ON SITE

A total of 85 animal species were observed during the surveys by PSBS (1993;1994), SEB HELIX. The animal species observed represent a somewhat lower diversity than is usually observed in the western foothill region of the Santa Ana Mountains, probably due to the disturbed nature of the site and the presence of both cattle and humans. For a complete listing of animal species observed see Appendix B.

4.3.1 Invertebrates

Both the native and non-native plant communities on site probably play host to a wide variety of invertebrate species, especially insects. Invertebrates are important features of an ecosystem because of their role in food chains and as decomposers. Specific surveys for invertebrates focused on the presence of Riverside fairy shrimp, which were known to occur on site. Hundreds of additional invertebrates are expected to use the site.

4.3.2 Vertebrates

4.3.2.1 Amphibians

Three amphibians were heard during site surveys: Western spadefoot toad (*Scaphiopus hammondii*), western toad (*Bufo boreas*), and California chorus frog (*Pseudacris cadaverina*). At least two additional species, the black-bellied salamander (*Batrachoseps nigriventris*) and California slender salamander (*Batrachoseps attenuatus*), are expected to occur. The disturbed conditions that exist throughout most of the site have likely restricted these species to the steeper slopes where vegetative coverage is most dense.

4.3.2.2 Reptiles

Five reptiles were observed on-site: the western fence lizard (*Sceloporus occidentalis*), western skink (*Eumeces skiltonianus*), orange throated whiptail (*Cnemidophorus hyperythrus beldingi*), southern alligator lizard (*Gerrhonotus multicarinatus*), and the gopher snake (*Pituophis melanoleucus*). Two additional species were observed in earlier surveys by SEB: the coastal whiptail (*Cnemidophorus tigris multiscutatus*) and the side-blotched lizard (*Uta stansburiana*). Although the site has many disturbed areas, reptile habitat still occurs throughout the site. Additional lizards and snakes would be expected, especially in the undisturbed portions of Venturan-Diegan transitional coastal sage scrub on the steeper slopes.

4.3.2.3 Birds

Birds were most abundant and conspicuous (50 species) during the surveys, and undoubtedly exhibit the highest vertebrate diversity. Most of the birds were observed within the Venturan-Diegan transitional coastal sage scrub, southern mixed chaparral, and coast live oak woodland habitats on site. A few of the resident birds which were most abundant on site include California quail (*Callipepla californica*), Anna's hummingbird (*Calypte anna*), mourning dove (*Zenaida macroura*), California towhee (*Pipilo crissalis*), house finch (*Carpodacus mexicanus*), and lesser goldfinch (*Carduelis psaltria*). Other bird species were observed foraging on the site but probably reside elsewhere including cliff swallows (*Hirundo pyrrhonota*), northern rough-winged swallows (*Stelgidopteryx serripennis*), red-tailed hawks (*Buteo jamaicensis*), and American kestrels (*Falco sparverius*).

4.3.2.4 Mammals

Nine native mammals were detected on site including the Virginia opossum (*Didelphis virginiana*) California ground squirrel (*Spermophilus beecheyi*), desert cottontail (*Sylvilagus audubonii*), Botta's pocket gopher (*Thomomys bottae*), California mouse (*Peromyscous californicus*), woodrat (*Neotoma* spp.), coyote (*Canis latrans*), raccoon (*Procyon lotor*), skunk (*Mephitis* spp.), and mule deer (*Odocoileus hemionus*), and domestic cattle. Additional species that may occur were not observed during the diurnal surveys because they are nocturnal.

5.0 SENSITIVE RESOURCES

The following is a description of sensitive biological resources found on Saddleback Meadows. Where impacts to these resources occur, mitigation may be required as discussed in the Mitigation Section of this report.

5.1 SENSITIVE VEGETATION COMMUNITIES/HABITATS

Sensitive habitats are those that have been depleted, are naturally uncommon, or support sensitive species. Venturan-Diegan coastal sage scrub (including that which is disturbed), coast live oak woodland, southern sycamore riparian woodland, mule fat scrub, ephemeral ponds and non-native grassland are all considered sensitive by resource agencies and groups. Eucalyptus woodland, although not considered sensitive, may potentially support raptor nests, which are protected under the auspices of the federal Migratory Bird Treaty Act (MBTA). In addition, any impacts to wetland habitat or Waters of the U.S. must be reviewed in the context of a ACOE 404 Permit and/or a CDFG Code Section 1603 Streambed Alteration Agreement applications.

5.2 SENSITIVE PLANT SPECIES OBSERVED ON SITE

Sensitive species are those considered unusual or limited in that the species are (1) only found in restricted region; (2) a local representative of a species or association of species not otherwise found in the region; or (3) severely depleted within their ranges or within the region. High-interest plants include those listed by the USFWS (1990), CDFG (1994), and California Native Plant Society (CNPS) (Skinner and Pavlik 1994). Three sensitive plant species were observed on the site: (1) the intermediate mariposa lily; (2) Catalina mariposa lily; and (3) small-flowered microseris. None of these species is state or federally listed as threatened or endangered. See Appendix C for an explanation of sensitivity codes.

Catalina mariposa lily (*Calochortus catalinae*)
Status: USFWS: None; CDFG: None; CNPS List 4; R-E-D 1-2-3
Distribution: This species is distributed in all coastal counties from Santa Cruz County to San Diego County, except Monterey County.
Habitat(s): The Catalina mariposa lily grows on heavy soils, usually in chaparral, coastal sage scrub, and grassland habitats.
Status on site: Eight stands were detected by SEB (435 individuals), six of which (428 individuals) were in Venturan-Diegan transitional coastal sage scrub along the southern boundary of the site. The two additional stands (seven individuals) were in Venturan-Diegan transitional coastal sage scrub patches in the northeastern quadrant of the site.

Intermediate flowered mariposa lily (*Calochortus weedii* **var.** *intermedius*)
Listing: USFWS: Regionally sensitive; CDFG: None; CNPS: List 1B, R-E-D 2-2-3
Distribution: This mariposa lily has only been recorded from Los Angeles, Orange, and Riverside counties.
Habitat(s): Dry, rocky slopes are the habitat of this species.
Status On Site: Three stands were detected by SEB totaling 18 individuals. Two stands are in the southwest quadrant, while the remaining stand is in the southeast quadrant.

Small-flowered microseris (*Microseris douglasii* var. *platycarpha*)
Status: USFWS: None; CDFG: None; CNPS List 4
Distribution: West of the Sierran crest from Southern California to southern Oregon.
Habitat(s): Occurs in coastal grassy areas.
Status on site: Several individuals were found in the annual grasslands in the western portion of the property.

5.3 SENSITIVE PLANT SPECIES WITH THE POTENTIAL TO OCCUR ON SITE

Table 2 provides a list of sensitive plant species that occur or have the potential to occur on the property. This list includes federal and state listed species endangered or threatened species, FSOC, and CSC species, and CNPS listed species.

5.4 SENSITIVE ANIMAL SPECIES OBSERVED ON SITE

Five sensitive animals were observed during the surveys by Chambers Group: Riverside fairy shrimp, western spadefoot toad, orangethroat whiptail, cactus wren, Cooper's hawk. No coastal California gnatcatchers occur on site.

Riverside fairy shrimp (*Streptocephalus woottoni*)
Listing: USFWS Endangered
Distribution: Extremely limited distribution in Riverside, Orange, and San Diego counties; and northern Baja California, Mexico. In Orange County, known from two locations, in Riverside County, known only from five vernal ponds, in San Diego County, known only from two vernal pond complexes.
Habitat(s): Vernal and ephemeral pond habitats that are relatively deep and have low values for alkalinity and chloride presence. The Riverside fairy shrimp is a warm water species of fairy shrimp, and it hatches at water temperatures of 15 to 17 °C.
Status On Site: Six of the ponds and two recently dried ponds (their dams have been breached) have evidence of Riverside fairy shrimp. These locations represent a significant expansion of the shrimp's typical habitat range.

Table 2
LISTED OR SENSITIVE PLANT SPECIES WITH THE POTENTIAL FOR OCCURRENCE WITHIN THE SADDLEBACK MEADOWS SITE

SPECIES	LISTING OR SENSITIVITY*	POTENTIAL TO OCCUR
Catalina mariposa lily (*Calochortus catalinae*)	CNPS: 4	Present; occurs in dry, rocky, open slopes in chaparral, coastal sage scrub, and grassland habitats. A Spring blooming (Feb-May) perennial herb. This species was found scattered throughout the coastal sage scrub along the east and south boundaries of the property.
Intermediate mariposa lily (*Calochortus weedii var. intermedius*)	USFWS: FSOC CNPS: 4 1B	Present; occurs in dry, rocky, open slopes in chaparral, coastal sage scrub, and grassland habitats. A Spring to early Summer blooming (May-July) perennial herb. A population was found in the coastal sage scrub near the south boundary of the property.
Lewis's evening-primrose (*Camissonia lewisii*)	CNPS: 3	Low, occurs in open grassland, sandy places. A spring blooming (April-May) annual. No suitable habitat was present onsite.
Slender-horned Spineflower (*Dodecahema leptoceras*)	USFWS: FE CDFG:CE CNPS: 1B	Low, occurs in alluvial sand in coastal sage scrub and chaparral communities. A Spring blooming (April-June) annual. No suitable habitat is present and this species was not found onsite.
Santa Monica Mountains dudleya (*Dudleya cymosa ssp. ovatifolia*)	USFWS: FE CNPS: 1B	Low, occurs on volcanic cliff faces, rocky outcrops, and rocky slopes in chaparral and coastal sage scrub. . No suitable habitat is present and this species was not found onsite.
Many-stemmed dudleya (*Dudleya multicaulis*)	USFWS: FSOC CNPS: 1B	Moderate; occurs on heavy, clay soil or grassy slopes in a variety of habitats. No suitable habitat is present and this species was not found onsite.
Small-flowered microseris (*Microseris douglasii* var.*platycarpha*)	CNPS: 4	Present; occurs in coastal grassy areas. Species present in annual grasslands onsite.
Hall's monardella (*Monardella macrantha ssp. hallii*)	CNPS: 1B	Moderate; occurs on dry slopes and ridges in openings within chaparral, valley, and foothill grasslands from 2,000 – 6,500 feet elevation. Suitable habitat is present, but this species was not found onsite.
Heart-leaved pitcher sage (*Lepechinia cardiophylla*)	USFWS: FSOC CNPS: 1B	Occurs in dry areas and slopes in chaparral, closed coniferous forest, and cismontane woodland. The elevation range is 2,000-4,000 feet. Suitable habitat is present, but this species was not found onsite.

Table 2 (cont.)		
SPECIES	LISTING OR SENSITIVITY*	POTENTIAL TO OCCUR
Felt-leaved monardella (*Monardella hypolueca ssp. lanata*)	CNPS: 1B	Occurs in sandy soils, chaparral and cismontane woodland. No suitable habitat is present and this species was not found onsite.
Palmer's grapplinghook (*Harpagonella palmeri*)	USFWS: FSOC CNPS 2 R-E-D 1-2-1	Moderate; occurs in clay soils, dry slopes, and mesas with chaparral, coastal sage scrub, and valley and foothill grassland. Suitable habitat is present onsite, but this species was not found onsite.

*See Appendix C for an explanation of sensitivity codes.
**Table taken from Chambers 1999.

Western spadefoot toad (*Scaphiopus hammondii*)
Status: USFWS Regionally sensitive
Distribution: California's Central Valley and San Francisco Bay area south along the coast to northwestern Baja California, Mexico.
Habitat: Mesa tops, valleys, low hills, floodplains, and washes. Southern California habitats include coastal sage scrub, chaparral, and grassland. Important habitat components include temporary ponds (which form during winter and spring rains) for breeding and friable soils for burrowing.
Status On Site: During focused surveys, western spadefoot tadpoles were observed in two of the ephemeral ponds on site.

Orange-throated whiptail (*Cnemidophorous hyperthrus*)
Status: USFWS: Regionally sensitive; CDFG CSC
Distribution: Southern Orange County and southern San Bernardino County (Colton), south to the cape of Baja California, Mexico.
Habitat: Venturan-Diegan transitional coastal sage scrub, chaparral, edges of riparian woodlands, and washes. Also found in weedy, disturbed areas adjacent to these habitats. Important habitat requirements include a mosaic of open, sunny areas and shade for thermoregulation, and an abundant invertebrate prey base, particularly termites.
Status On Site: Two individuals were observed by SEB on a slope in the southeast quadrant adjacent to O'Neill Regional Park.

Cooper's hawk (*Accipiter cooperii*)
Status: Nesting—CDFG CSC
Distribution: Throughout the continental U.S. excluding Alaska, parts of Montana, and parts of the Dakotas. Winters south to Mexico and Honduras.
Habitat: In San Diego County tends to inhabit lowland riparian areas and oak woodlands in proximity to suitable foraging areas such as scrublands or fields.
Status On Site: One individual was observed by PSBS hunting in grassland on the northern half of the site.

Coast Cactus wren (*Campylorhynchus brunneicapillus couesi*)
Status: USFWS Regionally sensitive/CDFG CSC
Distribution: Southern Orange County (San Juan Creek) south through San Diego County into northwestern Baja California, Mexico.
Habitat: Restricted to clumps of prickly-pear (*Opuntia littoralis and O. oricola*) or cholla (*O. prolifera*) growing in Venturan-Diegan transitional coastal sage scrub or along washes.
Status On Site: Ten individuals were observed by PSBS in the southern half of site, with most (seven) occurring on the slopes contiguous with habitat in O'Neill Regional Park.

Several additional animal species may occur on site (see Table 2). The majority of these species have a low to moderate potential for occurring on site. None of the species warrant further surveys because of their low potential for occurrence, they are of a generally low level of sensitivity, and/or adequate mitigation can be accomplished by mitigating for their habitats.

5.5 SENSITIVE ANIMAL SPECIES WITH THE POTENTIAL TO OCCUR ON SITE

In addition to sensitive animal species observed on site, 24 sensitive animal species have the potential to occur on site, including four that are federally-listed as endangered (Table 3). Of those species that have the potential to occur on site, focused surveys for the federally-listed Quino checkerspot butterfly and coastal California gnatcatcher were conducted. Neither species was observed on site. Focused surveys for the other potentially-occurring species are not recommended due to the low probability of each of these species to inhabit the site and the species' low levels of sensitivity.

Table 3
SENSITIVE ANIMAL SPECIES WITH THE POTENTIAL FOR OCCURRENCE WITHIN THE SADDLEBACK MEADOWS SITE

SPECIES	LISTING OR SENSITIVITY*	POTENTIAL TO OCCUR
INVERTEBRATES		
Quino checkerspot butterfly (*Euphydryas editha quino*)	USFWS FE[1]	Low; larval host plants *Plantago erecta and Castilleja sp.* were observed on site; however, the Quino checkerspot butterfly was not detected on site during focused surveys.
Riverside fairy shrimp (*Streptocephalus wootonii*)	USFWS FE	Presence confirmed in 6 of 7 ephemeral ponds on site.
VERTEBRATES		
Fish		
Arroyo chub (Gila orcutti)	USFWS: FE CDFG CSC	Found in shaded pools 1-5m in depth. No suitable habitat is present and this species was not found on site.
Reptiles/Amphibians		
Coastal rosy boa (*Lichanura trivirgata roseofusca*)	CDFG CSC	Low; commonly occurs in and around rocky areas in coastal sage scrub. No suitable habitat is present on site.
Coastal western whiptail (*Cnemidophorus tigris multiscutatus*)	CDFG CSC	High; preferred habitats (grassland, coastal sage scrub, and chaparral) occur on site.

Table 3(cont.)		
SPECIES	LISTING OR SENSITIVITY*	POTENTIAL TO OCCUR
VERTEBRATES		
Reptiles/Amphibians (cont.)		
San Diego horned lizard (*Phrynosoma coronatum blainvillei*)	CDFG CSC[2] MSCP Covered Species	High; chaparral, coastal sage scrub, food source (harvester ants [*Pogonomyrmex* sp.]) not seen but probably present. Focused surveys may be needed for detection but are not warranted. Expected but not seen during surveys.
San Diego ringneck snake *(Diadophus punctatus similes)*	USFWS Regionally sensitive CDFG CSC	Low; Prefers moist habitats including woodlands and forest. No suitable habitat is present and this species was not found onsite.
Orange –throated whiptail (*Cnemidophorus hyperthrus*)	CDFG CSC	Species observed on disturbed hillside with scrub vegetation. Also found in washes and vegetation.
Southwestern pond turtle	USFWS: FSOC	Found in various aquatic sites with good water quality. Suitable habitat is present onsite, but this species was not observed.
Birds		
Coastal California gnatcatcher (*Polioptila californica*)	USFWS: FE CDFG: CSC	Low; Typically found in coastal sage scrub. The habitat onsite is of low quality and in scattered patches. None observed during several focused surveys.
Prairie falcon *(Falco mexicanus)*	CDFG CSC	Low; an uncommon visitor to grasslands and scrublands of Orange County.
Northern harrier *(Circus cyaneus)*	CDFG CSC	Moderate; habitat includes open areas, such as grasslands, and adjacent habitats. Would likely have been observed if it consistently uses the site.
Burrowing owl *(Speotyto cunicularia)*	CDFG CSC	Low; often found in disturbed sites where ground squirrel burrows are present. Suitable habitat is present on site, but this species was not observed.
Cooper's hawk (*Accipiter cooperii*)	CDFG CSC MSCP Covered Species	Species observed in grassland next to riparian area and also observed in flight over site.
Least Bell's vireo (*Vireo bellii pusillus*)	USFWS FE CDFG: SE	Low; occurs in willow-riparian areas. Low potential habitat onsite. Limited area of marginal habitat located offsite. Not observed onsite.
Tricolored blackbird (*Agelaius tricolor*)	USFWS: FT CDFG CSC	Low; found in grasslands and wetlands. No suitable habitat is present and this species was not found on site.
Coastal cactus wren (*Campylorhyncus brunneicapillus couesi*)	CDFG: CSC	Found in coastal sage scrub with cacti. Species observed primarily at eastern portion of site.

Table 3 (cont.)		
SPECIES	LISTING OR SENSITIVITY*	POTENTIAL TO OCCUR
VERTEBRATES (cont.)		
Birds (cont.)		
Loggerhead shrike (*Lanius ludovicianus*)	CDFG: CSC	High; found in various habitats that support adequate prey species. Prey species in abundance throughout site, but no observations were made.
Rufous-crowned sparrow (*Aimophila ruficeps*)	CDFG: CSC	Moderate; occurs around rocky coastal sage scrub and chaparral. Suitable habitat is present onsite, but this species was not observed.
Yellow-breasted chat (*Icteria virens*)	CDFG: CSC	Low; occurs in willow-riparian areas. No suitable habitat is present and this species was not found onsite.
Mammals		
San Diego desert woodrat (*Neotoma lepida intermedia*)	USFWS Regionally sensitive CDFG CSC	Moderate; woodrat sign was found, but it could have been dusky-footed woodrat. Habitat is coastal sage scrub and other dry habitats. Trapping necessary for detection but not warranted.
Dulzura California pocket mouse *Chaetodipus californicus femoralis*	USFWS Regionally sensitive CDFG CSC	Low to moderate; dense chaparral, but occasionally other shrublands. Trapping necessary for detection but not warranted.
Pallid bat (*Antrozous pallidus pacificus*)	CDFG CSC	Moderate; habitat highly variable, could forage throughout the site, but roosting sites are likely elsewhere. Focused surveys needed for detection but not warranted.
Greater western mastiff bat (*Eumops perotis californicus*)	USFWS Regionally sensitive CDFG CSC	Moderate; could forage in any habitat on site, but roosting sites are likely elsewhere. Focused surveys needed for detection but not warranted.

6.0 REGIONAL AND REGULATORY CONTEXT

The Project site is currently undeveloped, and more than half of the acreage is now covered by annual grassland. The Project site is located between several large protected areas: Cleveland National Forest, Aliso Creek Greenbelt, and O'Neill Regional Park. Connectivity of these areas and maintenance of wildlife corridors are a high priority in this region. The project is one of several wildlife corridors identified in the project area, including areas to the east along Live Oak Canyon and to the south across El Toro Road.

The large drainage on site contains substantial acreage of wetland habitats. Additionally, there are ephemeral ponds on site which also contain wetland habitat and the federally endangered Riverside fairy shrimp.

6.1 HABITAT CONNECTIVITY AND CORRIDOR ISSUES

This section discusses on-site corridor design within the broader context of the region. The pace of urbanization in coastal, southern California has resulted in the rapid loss of habitat that supports a unique biota. Consequently the development of ecological reserves that preserve natural communities is an important planning goal.

Connectivity between reserves contributes to maintaining species diversity in a reserve system (Harris and Scheck 1991). Conversely, lack of connectivity creates isolated islands of habitat. These islands often fail to support the level of species diversity that existed prior to the isolation event. The most prominent threats to populations in fragmented and isolated habitats are increased vulnerability to local extinction and genetic isolation (inbreeding). Adequate landscape linkages between native habitat areas tend to mitigate these threats.

Orange County is developing its NCCP preserve system in accordance with CDFG enrollment. The primary goal of this preserve system is to maintain large blocks of habitat that support viable ecosystems, and to link these large blocks via wildlife corridors. The project has been designed to allow for a large corridor along the entire northeast side of the property (Figure 4). This will maintain connectivity of the Aliso Creek Greenway to Cleveland National Forest. The project also provides a large east-west corridor through the main central drainage to provide connectivity from the Aliso Creek Greenbelt to the open space east of the property. Additionally, it will provide coastal sage scrub and coast live oak woodland habitat along a riparian system. There will also be 6 ephemeral ponds located in this portion of the project. A second, smaller corridor will go from east to west across the property and will facilitate wildlife movement through the property.

Corridors typically serve to facilitate wildlife movement through an area, as opposed to habitat linkages that actually provide sufficient habitat to allow for a species to live and reproduce. The proposed corridor on site is of sufficient width to function as a secondary corridor for gnatcatchers, and movement will not be precluded through the property. Habitat immediately west of the site is primarily riparian or non-native vegetation. Venturan-Diegan transitional coastal sage scrub habitat is confined to a slope area on the western portion of the site near El Toro Road, along the slopes adjacent to the main corridor, and in the southern portion of the site. Therefore, although gnatcatchers at least have the potential to use this corridor, this area is most suitable for some birds and most small- to medium-sized mammals. Connectivity for the gnatcatcher is more likely to occur to the west, where existing bird populations occur on either side of El Toro Road and elevations in this area are several hundred feet lower than elevations on site.

Large mammal movement between the Cleveland National Forest and O'Neill Canyon Regional Park will be maintained along the southern portion of the project and offsite through Live Oak Canyon.

6.2 REGULATORY ISSUES

6.2.1 U.S. Army Corp of Engineers and California Department of Fish and Game Jurisdictional Areas

The network of drainages on site and the ephemeral ponds contain both wetland habitat and non-wetland waters of the U.S. and are protected by law and require special permitting through the ACOE, CDFG, and Regional Water Quality Control Board (RWQCB). The ACOE regulates impacts to

Proposed Regional Wildlife Movement Corridors

SADDLEBACK MEADOWS

HELIX

Figure 4

jurisdictional Waters of the U.S. including wetlands. Jurisdictonal wetlands are defined by areas that meet ACOE standards for hydrology, vegetation, and soils. Impacts to these areas would be subject to regulation by the ACOE in the form of a permit pursuant to section 404 of the federal Clean Water Act. An application has been filed with the ACOE and is currently in process. As part of the 404 permit process, certification by the RWQCB is required through Section 401, An application has been filled with RWQCB and is currently in process. Any impacts to CDFG jurisdictional area would require a Streambed/Lake Alteration Agreement regulated under Fish and Game Code Section 1603. An application has been filed with CDFG and is currently in process.

6.2.2 Endangered Species Act

The USFWS administers the federal Endangered Species Act (ESA) The ESA provides the legal framework for protection of species (and their habitats) which are identified as being in danger of extinction or which are threatened at a regional level. Impacts to protected species (those listed as endangered or threatened) are considered a take under the federal ESA. The Riverside Fairy Shrimp is listed as federally endangered. Therefore, a formal Section 7 consultation has been initiated by the USFWS, in conjunction with the ACOE 404 process, for impacts to the Riverside Fairy Shrimp. Additionally, the site is considered critical habitat for the coastal California gnatcatcher and Riverside fairy shrimp, although no gnatcatchers were observed during project surveys. Potential impacts to critical habitat for both species is being addressed through the Section 7 consultation process.

7.0 IMPACTS

Two types of impacts will be assessed: direct and indirect. All areas to be modified, including remedial slopes and fuel modification zones will be interpreted as direct impacts. Fuel management zones are also considered direct impacts because most native vegetation will be removed. Both on- and off-site impacts are considered in this analysis.

Indirect impacts are impacts to the biological resources that result from adjacent direct impacts. Though these impacts may not initially be evident, over time they may occur due to the relative proximity of development or disturbance. Examples of indirect impacts include habitat fragmentation, habitat insularization, edge effect, exotic species invasion, lighting, domestic pet intrusion/predation, and increased human intrusion.

7.1 DIRECT IMPACTS

Direct impacts are summarized in Table 4 and shown on Figure 5.

7.1.1 Sensitive Vegetation Communities/Habitats

7.1.1.1 Wetland Habitats

Ephemeral Ponds. Approximately 0.40 acre of ephemeral ponds will be directly and significantly impacted by the project.

Mule Fat Scrub. Approximately 1.82 acre of mule fat scrub habitat would be directly and significantly impacted on site and an additional 0.1 acre would be impacted off site by the Project.

Southern Sycamore Riparian Woodland. Approximately 0.1 acre of southern sycamore riparian woodland habitat would be directly and significantly impacted by the Project.

Streambed. Although not a habitat type, areas identified as streambed under CDFG jurisdiction also occur on site. Approximately 1.45 acres of streambed will be impacted by the project.

7.1.1.2 Upland Habitats

Venturan-Diegan Coastal Sage Scrub (including disturbed). Approximately 39.8 acres of Venturan-Diegan coastal sage scrub habitat would be directly and significantly impacted on site and an additional 2.9 acres would be impacted off site by the Project.

Coast Live Oak Woodland. Approximately 5.4 acres of coast live oak woodland habitat and 181 coast live oak trees would be directly and significantly impacted on site and an additional 0.1 acre would be impacted off site by the Project.

Southern Mixed Chaparral. Approximately 3.7 acres of southern mixed chaparral habitat would be directly and significantly impacted on site and an additional 1.5 acres would be impacted off site by the Project.

Annual Grassland. Approximately 100.3 acres of non-native grassland would be directly impacted by the Project grading on site and an additional 3.4 acres would be impacted off site. These impacts are not considered significant.

Agriculture. Approximately 3.0 acre of agricultural habitat will be impacted by the Project. These impacts are not considered significant.

Table 4
PROJECT IMPACTS

Vegetation and Sensitive Resources/Impacts

SADDLEBACK MEADOWS

HELIX

Figure 5

7.1.2 Sensitive Plant Species Observed On Site

Direct impacts would not occur to any federal- or state-listed endangered or threatened species of plants. Three sensitive plant species will be impacted by the project: the intermediate mariposa lily, the Catalina mariposa lily, and small-flowered microseris. Impacts to these species are not considered significant due to their low sensitivity status.

7.1.3 Sensitive Animal Species Observed On Site

The Riverside fairy shrimp would be directly and significantly impacted by the Project as a result of impacts to 0.40 acre of ephemeral pond. Significant impacts to the western spadefoot toad will also result from impacts to 0.40 acre of ephemeral pond. Impacts to orange-throated whiptail, cactus wren, and Cooper's hawk are not considered significant due to their low sensitivity status.

There is a potential for raptor species to nest in trees in the eucalyptus woodlands on site, the riparian areas, or, in some cases on the ground. These nests, if present and active, require protection under the federal MBTA.

7.2 INDIRECT IMPACTS

Indirect impacts are impacts to the biological resources that result from adjacent direct impacts. Though these impacts may not initially be evident, over time they may occur due to the relative proximity of development or disturbance. Examples of indirect impacts include habitat fragmentation, habitat insularization, edge effect, exotic species invasion, lighting, domestic pet intrusion/predation, and increased human intrusion. The Project has been designed to minimize many of these indirect effects by preserving a significant proportion of sensitive habitats on site in one contiguous area. This will minimize habitat fragmentation and edge effects while providing corridors for wildlife.

8.0 MITIGATION

The following mitigation measures have been formulated to satisfy the requirements of the County of Orange CEQA requirements. Table 5 summarizes proposed project mitigation.

Table 5
SADDLEBACK MEADOWS EXISTING VEGETATION AND PROJECT IMPACT

8.1 MITIGATION FOR DIRECT IMPACTS

8.1.1 Wetland/Riparian/Streambed/Open Water Habitats

8.1.1.1 Wetland Mitigation

Habitat on site affected by ACOE and CDFG jurisdiction include ephemeral ponds, mule fat scrub, southern sycamore riparian woodland. Additionally, impacts to ephemeral drainages (non-vegetated Waters of the U.S.) are covered under ACOE and CDFG jurisdiction and mitigation requirements for the Project have been determined as part of the ACOE 404, California RWQCB 401, and CDFG 1603 permitting processes. Mitigation for impacts to these areas will occur on-site and off-site. Detailed descriptions of mitigations for jurisdictional areas are described in the *Saddleback Meadows Conceptual Mitigation and Monitoring Plan for CDFG Jurisdictional Areas* (Helix 2001a).

This plan has been developed with five specific objectives:

1) On-site Wetland Preservation - Within open space on site, maximize the protection, to the extent practicable, of existing jurisdictional areas (i.e., ephemeral ponds and drainages, along with surrounding wetland vegetation);

2) On-site Wetland Creation - Maximize on-site creation of ephemeral ponds and wetlands;

3) On-site Streambed Creation - Stream courses will be reconstructed in their original location as part of the remedial grading (this will occur within areas of remedial grading that are outside of the conventional grading limits);

4) Off-site Wetland Creation, Enhancement, and Preservation – Preserve, create, and enhance as much wetland vegetation in suitable off-site areas as is hydrologically feasible; and

5) Off-site Streambed Preservation – Mitigate remaining impacts to streambeds through acquisition of streambeds at an off-site location.

On site, mitigation for the loss of 0.4 acre of ephemeral ponds will be mitigated at a 2.88:1 ratio, or a total of 1.15 acre. A total of 1.15 acres of ephemeral ponds will be created (Figure 6). Impacts to 2.63 acres of wetland vegetation (1.92 acres of mule fat scrub, 0.61 acre of oak woodland, and 0.1 acre of sycamore woodland) will be mitigated at a 3:1 ratio with the on-site preservation of 1.38 acres of mule fat scrub and sycamore woodland, creation of an additional 2.87 acres of wetlands, the on-site preservation of 1.18 acres of mule fat scrub, the off-site creation of 1.24 acres of riparian habitat at Hidden Ranch (Figures 7 and 8), and the off-site preservation and enhancement of 2.6 acres of riparian habitat.

Creation of ponds and streambeds and the surrounding wetland vegetation on site requires the excavation, grading, and contouring in disturbed upland areas or areas disturbed by remedial grading to form basins or streambeds, and revegetating the margin of these areas with riparian cuttings, plantings and seeds of native understory species. The depth and shape of the constructed basins will be based on the contours of the existing ponds. In addition, soils from the bottom of the existing ponds will be collected prior to impacts and the collected soils will be used to innoculate the created ponds. Approximately 0.86 acre of mule fat scrub will be created around the pond margins. Additional mitigation measures include the installation of fencing to deter vandalism and other disturbance of the mitigation site. The fencing around the ponds will be maintained until mitigation success criteria have been met and will be of a 5-strand rounded wire design. Creation and enhancement of riparian and oak woodland habitat off site is proposed on the Hidden Ranch property and will focus on areas previously disturbed by years of cattle grazing.

Impacts to 1.45 acres of CDFG-jurisdictional streambeds will be mitigated for on site by the creation of streambeds within areas proposed for remedial grading previously supporting streambeds (0.44 acre), and off site by purchase of 1.01 acre of existing streambeds at either the Viejo (Figure 9) or Hidden Ranch Mitigation Banks or other site acceptable to the County. Impacts will be mitigated at a 1:1 ratio for a total of 1.45 acres.

The Plan provides information on the construction, maintenance, and monitoring of the on-site mitigation area as well as a description of the project goals and final success criteria. The on- and off-site mitigation areas will be monitored for five years or until project specific success criteria outlined in this Plan are achieved.

8.1.1.2 Upland Mitigation

Impacts to coastal sage scrub and coast live oak woodland require mitigation. These communities will be mitigated for both on- and off- site. The following describes how mitigation is proposed to occur for each of these habitats.

Project impacts to coastal sage scrub habitats will be mitigated for by preservation of 29.9 acres on site, creation of 33.0 acres of additional habitat on site in areas currently supporting disturbed vegetation or areas proposed for remedial grading outside of brush management zones, enhancement of 6.7 acres of disturbed sage scrub on site (Figure 6), and purchasing 14.8 acres of coastal sage scrub at an off-site location. Details of mitigation for Venturan-Diegan transitional coastal sage scrub are presented in the *Coastal Sage Scrub Restoration Plan for Saddleback Meadows* (HELIX 2001b). The goal of the plan is to outline the procedure for creating sage scrub habitat and for enhancing the value of existing coastal sage scrub habitat within the project site. Together these measures are intended to serve as mitigation for impacts to sage scrub habitat that would result from the construction of the proposed Saddleback Meadows development project. This plan also provides criteria and recommendations for the maintenance and management of created and enhanced sage scrub habitat. The final goal of this plan is to create habitat that, after five years, is on its way to approaching the function and value of surrounding mature sage scrub habitat.

Project impacts to 5.5 acres of coast live oak woodland will be mitigated for by on-site preservation of 7.8 acres of coast live oak woodland, on-site creation of 13.5 acres of habitat, and off-site creation of an additional 3.0 acres (a ratio of 3:1). The impacted trees (*Quercus agrifolia*) will also be replaced at the same ratio and 543 individuals will be planted. Details of mitigation for coast live oak woodlands are presented in the *Coastal Sage Scrub Restoration Plan for Saddleback Meadows* (HELIX 2001b).

8.1.1.3 Sensitive Plants and Animals/Raptor Habitat

Riverside fairy shrimp were observed in the ephemeral ponds. Impacts to fairy shrimp on-site would be mitigated in conjunction with the ephemeral pond mitigation discussed in the restoration plan for wetland impacts (HELIX 2001a). Impacts to the spadefoot toad will also be mitigated through implementation of this restoration plan. Additionally, spadefoot toads, toadlets and tadpoles will relocated to existing and created ponds from impacted ponds prior to initiating grading. Mitigation is not required for the other sensitive plant and animal species impacted by the Project due to their low sensitivity status

Mitigation for cumulative impacts to raptor foraging habitat (coastal sage scrub and grassland habitats, primarily) will be met in conjunction with the coastal sage scrub habitat mitigation discussed above for each habitat.

A potential exists for raptor species to be nesting on site during the time when most raptors breed (December to June). A pre-construction survey for raptor species will be conducted if construction occurs during the breeding season. If raptors are present then construction crews must provide a noise buffer of 300 feet around active raptor nests or avoid construction in those areas until the nesting process is complete (young birds have left the nest). Potentially, other measures may be possible to attenuate noise and dust effects on the nest. If raptors are not nesting on site, construction may proceed without need for further measures.

8.2 MITIGATION FOR INDIRECT IMPACTS

To reduce edge effect impacts into the open space areas, the following additional measures would be included when applicable:

- Backyard and street lighting will be shielded to prevent light overspill.
- Areas adjacent to the open space would require fencing to limit access to the MHPA. Fencing would not be required where slopes are sufficiently steep enough to preclude access.
- Silt fences will be installed prior to grading around all construction areas on slopes within the watershed area of preserved and constructed ephemeral ponds.

APPENDIX A

PLANT SPECIES OBSERVED

Appendix A
PLANT SPECIES OBSERVED AT SADDLEBACK MEADOWS
(†= Sensitive species, * = Non-native species)

FAMILY SCIENTIFIC NAME	COMMON NAME
VASCULAR PLANTS	
FERNS AND FERN ALLIES	
Pteridaceae – Brake Family	
Pentagramma triangularis	Goldenback fern
GYMNOSPERMS	
Pinaceae – Pine Family	
*Pseudotsuga macrocarpa**	Bigcone Douglas-fir
ANGIOSPERMS (DICOTYLEDONS)	
Amaranthaceae – Amaranth Family	
Amaranthus albus	Tumbling pigweed
Anacardiaceae – Sumac or Cashew Family	
Malosma laurina	Laurel sumac
Rhus integrifolia	Lemonadeberry
*Schinus molle**	Peruvian pepper tree
Toxicodendron diversilobum	Poison oak
Apiaceae – Carrot Family	
Bowlesia incana	Bowlesia
*Conium maculatum**	Poison
Daucus pusillus	Rattlesnake weed
*Foeniculum vulgare**	Fennel
Sanicula crassicaulis	Pacific sanicle
Apocynaceae – Dogbane Family	
*Vinca major**	Greater periwinkle
Asteraceae – Sunflower Family	
Ambrosia acanthicarpa	Annual bur-sage
Ambrosia psilostachya	Western ragweed
*Anthemis cotula**	Mayweed
Artemisia californica	California sagebrush
Artemisia douglasiana	Mugwort
Baccharis pilularis	Coyote brush
Baccharis salicifolia	Mulefat
Brickellia californica	California brickellbush
*Carduus pycnocephalus**	Italian thistle

Appendix A
(cont.)

FAMILY SCIENTIFIC NAME	COMMON NAME
*Centaurea melitensis**	Tocalote
*Chamomilla suaveolens**	Pineapple weed
*Cirsium vulgare**	Bull thistle
*Conyza bonariensis**	Flax-leaved horseweed
Conyza canadensis	Horseweed
*Cotula australis**	Australian brass-buttons
*Cynara cardunculus**	cardoon
Encelia californica	California bush sunflower
Eriophyllum confertiflorum	golden yarrow
Filago californica	California fluffweed
Gnaphalium californicum	California everlasting
Grindelia camporum	gum-plant
Hazardia squarrosa	saw-toothed goldenbush
*Heydypnois cretica**	tarweed
Hemizonia sp.	fascicled tarweed
Hemizonia fasciculate	telegraph weed
Heterotheca grandiflora	smooth cat's-ear
Isocoma menziesii	coastal goldenbush
*Lactuca serriola**	prickly lettuce
Layia platyglossa	tidy-tips
Lessingia filaginifolia	cudweed aster
Microseris douglasii ssp. platycarpha	small-flowered microseris
Microseris heterocarpa	microseris
*Senecio vulgaris**	common groundsel
*Silybum marianum**	milk thistle
Solidage californica	California goldenrod
*Sonchus asper ssp. asper**	prickly sow thistle
*Sonchus oleraceus**	common sow thistle
Xanthium strumarium	cocklebur
Boraginaceae – Borage Family	
Amsinckia menziesii	common fiddleneck
Cryptantha sp.	Cryptantha
Brassicaceae – Mustard Family	
*Brassica nigra**	black mustard
*Capsella bursa-pastoris**	shepherd's-purse
Descurainia pinnata	western tansy-mustard
Lepidium nitidum	shining peppergrass
*Raphanus sativus**	radish
*Sisymbrium officinale**	hedge mustard
Cactaceae – Cactus Family	
Opuntia littoralis	coastal prickly pear
Opuntia oricola	pancake prickly pear

Appendix A
(cont.)

FAMILY SCIENTIFIC NAME	COMMON NAME
Caprifoliaceae – Honeysuckle Family	
Lonicera subspicata	southern honeysuckle
Sambucus mexicana	Mexican elderberry
Symphoricarpos mollis	creeping snowberry
Caryophyllaceae – Pink Family	
*Silene gallica**	common catchfly
*Stellaria media**	common chickweed
Chenopodiaceae – Goosefoot Family	
*Atriplex semibaccata**	Australian saltbush
Chenopodium californicum	California goosefoot
*Chenopodium murale**	nettle-leaved goosefoot
*Salsola tragus**	Russian thistle
Convolvulaceae – Morning-Glory Family	
Calystegia macrostegia	western bindweed
Crassulaceae – Stonecrop Family	
Crassula connata	pygmy-weed
Dudleya lanceolata	lance-leaved dudleya
Dudleya pulverulenta	chalk dudleya
Cucurbitaceae – Gourd Family	
Cucurbita foetidissima	calabazilla
Marah macrocarpus	wild cucumber
Cuscutaceae – Dodder Family	
Cuscuta californica	California dodder
Euphorbiaceae – Spurge Family	
Chamaesyce albomarginata	rattlesnake weed
Eremocarpus setigerus	dove weed
*Euphorbia peplus**	petty spurge
*Ricinus communis**	castor-bean
Fabaceae – Legume Family	
Astragalus gambelianus	Gambell's dwarf locoweed
Lotus purshianus	Spanish clover
Lotus salsuginosus	Alkali lotus
Lotus scoparius	deerweed
Lotus strigosus	strigose lotus
Lupinus bicolor	miniature lupine
Lupinus hirsutissimus	stinging lupine
Lupinus sparsiflorus	Coulter's lupine
Lupinus succulentus	arroyo lupine
*Medicago polymorpha**	bur clover
*Melilotus alba**	white sweetclover
*Melilotus indica**	sourclover

Appendix A
(cont.)

FAMILY SCIENTIFIC NAME	COMMON NAME
*Robinia pseudoacacia**	black locust
*Trifolium hirtum**	rose clover
Fagaceae – Oak Family	
Quercus agrifolia	coast live oak
Quercus berberidifolia	scrub oak
Geraniaceae – Geranium Family	
*Erodium brachycarpum**	long-beaked filaree
*Erodium cicutarium**	red-stemmed filaree
Erodium moschatum	white-stemmed filaree
Grossulariaceae – Gooseberry Family	
Ribes aureum	golden currant
Ribes speciosum	fuchsia-flowered gooseberry
Hydrophyllaceae – Waterleaf Family	
Phacelia minor	wild caterbury-bell
Lamiaceae – Mint Family	
*Marrubium vulgare**	horehound
Salvia apiana	white sage
Salvia columbariae	chia
Salvia mellifera	black sage
Stacys ajugoides	hedge-nettle
Malvaceae – Mallow Family	
*Malva parviflora**	cheeseweed
Myrtaceae – Myrtle Family	
Eucalyptus sp.	gum tree
Nyctaginaceae – Four O'Clock Family	
Mirabilis californica	California wishbone bush
Oleaceae – Olive Family	
*Olea europaea**	olive
Onagraceae – Evening Primrose Family	
Epilobium canum	California fuchsia
Oxalidaceae – Oxalis Family	
*Oxalis corniculata**	creeping wood-sorrel
*Oxalis pes-caprae**	Bermuda buttercup

Appendix A
(cont.)

FAMILY SCIENTIFIC NAME	COMMON NAME
Paeoniaceae – Peony Family	
Paeonia californica	California peony
Papaveraceae – Poppy Family	
Eschscholzia californica	California poppy
Plantaginaceae – Plantain Family	
Plantago erecta	western plantain
Platanceae – Sycamore Family	
Platanus racemosa	western sycamore
Polemoniaceae – Phlox Family	
Eriastrum sapphirinum	sapphire eriastrum
Gilia angelensis	angel gilia
Linanthus dianthiflorus	ground-pink
Polygonaceae – Buckwheat Family	
Eriogonum elongatum var. elongatum	long-stemmed buckwheat
Eriogonum fasciculatum	California buckwheat
*Rumex crispus**	curly dock
Portulacaceae – Purslane Family	
Calandrinia ciliata	red maids
Claytonia parviflora	miner's lettuce
Claytonia perfoliata	miner's lettuce
Primulaceae – Primrose Family	
*Anagallis arvensis**	scarlet pimpernel
Ranunculaceae – Buttercup Family	
Ranunculus californicus	California buttercup
Rhamnaceae – Buckthorn Family	
Ceanothus crassfiolius	hoary leaf ceanothus
Rhamnus ilicifolia	holly-leaf redberry
Rhamnus tomentella	hoary redberry
Rosaceae – Rose Family	
Adenostoma fasiciculatum	chamise
Heteromeles arbutifolia	toyon
Rubiaceae – Madder Family	
Galium angustifolium	narrow-leaved bedstraw
Galium aparine	goose grass
Galium nuttallii	San Diego bedstraw
Salicaceae – Willow Family	
Salix gooddingii	black willow

Appendix A
(cont.)

FAMILY SCIENTIFIC NAME	COMMON NAME
Salix laevigata	red willow
Salix lasiolepis	arroyo willow
Scrophulariaceae – Figwort Family	
Castilleja affinis	coast paintbrush
Castilleja exserta	purple owl's-clover
Collinsia heterophylla	Chinese houses
Cordylanthus rigidus	bird's-beak
Keckiella cordifolia	heart-leaved penstemon
Mimulus aurantiacus	orange bush monkey-flower
Solanaceae – Nightshade Family	
Datura wrightii	jimson weed
*Nicotiana glauca**	tree tabacco
Solanum douglasii	Douglas' nightshade
Tamaricaceae – Tamarisk Family	
*Tamarix sp.**	tamarisk
Urticaceae – Nettle Family	
*Urtica urens**	dwarf nettle
Verbenaceae – Mistletoe Family	
Phoradendron macrophyllum	big leaf mistletoe
Phoradendron villosum	oak mistletoe
ANGIOSPERMS (MONOCOTYLEDONS)	
Arecaceae – Palm Family	
*Washingtonia robusta**	Mexican fan palm
Cyperaceae – Sedge Family	
Eleocharis montevidensis	slender creeping spike-rush
Iridaceae – Iris Family	
Sisyrinchium bellum	blue-eyed-grass
Juncaceae – Rush Family	
Juncus bufonius	toad rush
Juncus mexicanus	Mexican rush
Liliaceae – Lily Family	
Calochortus catalinae†	Catalina mariposa lily
Calochortus splendens	lilac mariposa lily
Calochortus weedii var. intermedius†	intermediate flowered mariposa lily
Dichelostemma capitatum	blue dicks
Yucca whipplei	Our Lord's candle

Appendix A
(cont.)

FAMILY SCIENTIFIC NAME	COMMON NAME
Poaceae – Grass Family	
Achnatherum coronatum	giant needlegrass
*Agrostis viridis**	water bentgrass
*Arundo donax**	giant reed
*Avena barbata**	slender wild oat
*Avena fatua**	wild oat
*Bromus catharticus**	rescue grass
*Bromus diandrus**	ripgut grass
*Bromus hordeaceus**	soft chess
Bromus sterilis	poverty brome
Distichlis spicata	saltgrass
Hordeum murinum	glaucous foxtail barley
*Lamarckia aurea**	goldentop
Leymus condensatus	giant wild rye
Lolium perenne	perennial ryegrass
Melica imperfecta	coast range melic
Nassella lepida	small-flowered needlegrass
Nassella pulchra	purple needlegrass
Piptatherum miliaceum	smilo grass
*Poa annua**	annual bluegrass
Poa secunda	Malpais bluegrass
*Schismus barbatus**	Mediterranean schismus
*Vulpia myuros**	fescue
Typhaceae – Cattail Family	
Typha domingensis	slender cattail

APPENDIX B

ANIMAL SPECIES OBSERVED

Appendix B
WILDLIFE SPECIES OBSERVED AT SADDLEBACK MEADOWS

FAMILY SCIENTIFIC NAME	COMMON NAME
CLASS AMPHIBIA	AMPHIBIANS
Pelobatidae	Spadefoot Toads
Scaphiopus hammondii	western spadefoot
Bufondidae	True Toads
Bufo boreas	western toad
Hylidae	Treefrogs
Pseudacris cadaverina	California chorus frog
CLASS REPTILIA	REPTILES
Iguanidae	Iguanid Lizards
Sceloporus occidentalis	western fence lizard
Scincidae	Skinks
Eumeces skiltonianus	western skink
Teiidae	Whiptail Lizards
Cnemidophorus hyperythrus	orange-throated whiptail
Anguidae	Alligator Lizards
Gerrhonotus multicarinatus	southern alligator lizard
Columbridae	Columbrid Snakes
Pituophis	gopher snakes
CLASS AVES	BIRDS
Ardeidae	Herons
Bubulcus ibis	cattle egret
Anatidae	Waterfowl
Anas platyrhynchos	mallard
Cathartidae	New World Vultures
Cathartes aura	turkey vulture
Accipitridae	Hawks
Accipiter straitus	sharp-shinned hawk
Accipiter cooperii	Cooper's hawk
Buteo jamaicensis	red-tailed hawk
Buteo lineatus	red-shouldered hawk
Falconidae	Falcons
Falco sparverius	American kestrel

Appendix B
(cont.)

FAMILY SCIENTIFIC NAME	COMMON NAME
Phasianidae	Pheasants & Quails
Callipepla californica	California quail
Charadriidae	Plovers
Charadrius vociferous	killdeer
Columbidae	Pigeons & Doves
Columbia livia	rock dove
Zenaida macroura	mourning dove
Cuculidae	Cuckoos & Roadrunners
Geococcyx californianus	greater roadrunner
Strigidae	True Owls
Otus kennicottii	western screech-owl
Apodidae	Swifts
Aeronautes saxatails	white-throated swift
Trochilidae	Hummingbirds
Calypte anna	Anna's hummingbird
Archilochus alexandri	black-chinned hummingbird
Calypte costae	Costa's hummingbird
Picidae	Woodpeckers
Melanerpes formicivorus	acorn woodpecker
Picoides nuttallii	Nuttall's woodpecker
Colaptes auratus	northern flicker
Tyrannidae	Tyrant Flycatchers
Sayomis nigricans	black phoebe
Sayomis saya	Say's phoebe
Myiarchus cinerascens	ash-throated flycatcher
Tyrannus vociferans	Cassin's kingbird
Tyrannus verticalis	western kingbird
Hirundinidae	Swallows
Tachycineta thalassina	violet-green swallow
Stelgidopteryx serripennis	northern rough-winged swallow
Hirundo pyrrhonota	cliff swallow
Hirundo rustica	barn swallow
Corvidae	Jays & Crows
Aphelocoma coerulescens	scrub jay
Corvus brachyrhynchos	American crow
Corvus corax	common raven
Paridae	Titmice
Parus inornatus	plain titmouse

Appendix B
(cont.)

FAMILY SCIENTIFIC NAME	COMMON NAME
Aegithalidae	Bushtits
Psaltriparus minimus	bushtit
Troglodytidae	Wrens
Campylorhynchus brunneicapillus	cactus wren
Salpinctes obsoletus	rock wren
Thryomanes bewickii	Bewick's wren
Troglodytes aedon	house wren
Muscicapidae	Kinglest, Gnatcatchers, Babblers
Regulus calendula	ruby-crowned kinglet
Polioptila caerulea	blue-gray gnatcatcher
Sialia mexicana	western bluebird
Chamaea fasciata	wrentit
Mimidae	Thrashers
Mimus polyglottos	northern mockingbird
Toxostoma redivivum	California thrasher
Ptilogonatidae	Silky-Flycatchers
Phainopepla nitens	phainopepla
Sturnidae	Starlings
Sturnus vulgaris	European starling
Emberizidae	Wood Warblers, Tanagers
Vermivora celata	orange-crowned warbler
Dendroica coronata	yellow-rumped warbler
Dendroica petechia	yellow warbler
Geothlypis trichas	common yellowthroat
Guiraca caerulea	blue grosbeak
Passerina amoena	lazuli bunting
Pipilo erythrophthalmus	spotted towhee
Pipilo crissalis	California towhee
Chondestes grammacus	lark sparrow
Amphispiza belli	sage sparrow
Melospiza melodia	song sparrow
Zonotrichia atricapilla	golden-crowned sparrow
Zonotrichia leucophrys	white-crowned sparrow
Molothrus ater	brown-headed cowbird
Euphagus cyanocephalus	Brewer's blackbird
Icterus galbula	Bullock's oriole
Fringillidae	Finches
Carpodacus mexicanus	house finch
Carduelis psaltria	lesser goldfinch

Appendix B
(cont.)

FAMILY SCIENTIFIC NAME	COMMON NAME
CLASS MAMMALIA	
Didelphidae	New World Opossums
Didelphis virginiana	Virginia opossum
Leporidae	Hares & Rabbits
Sylvilagus audubonii	desert cottontail
Sciuridae	Squirrels
Spermophilus beecheyi	California ground squirrel
Geomyidae	Pocket Gophers
Thomomys bottae	Botta's pocket gopher
Muridae	Mice, Rats, and Voles
Peromyscus californicus	California mouse
Neotoma spp.	Woodrat
Canidae	Wolves & Foxes
Canis latrans	coyote
Procyonidae	Raccoons
Procyon lotor	raccoon
Mustelidae	Weasels, Skunks, & Otters
Mephitis spp. Or Spilogale spp.	skunk
Cervidae	Deer
Odocoileus hemionus	mule deer
Equidae	Horses & Burros
Equus caballus	domestic horse
Bovidae	Bison, Goats & Sheep
Bos bovis	domestic cattle

APPENDIX C

EXPLANATION OF STATUS CODES FOR PLANTS AND ANIMALS

Appendix C
EXPLANATION OF STATUS CODES FOR PLANTS AND ANIMALS

U.S. FISH AND WILDLIFE SERVICE (USFWS)

FE	Federally-listed endangered
FT	Federally-listed threatened
FPE	Federally-proposed endangered
FPT	Federally-proposed threatened
FPD	Federally-proposed for delisting
FC	Federal candidate species (former Category 1 candidates)
FSC	Federal special concern species (a "term of art" for former Category 2 candidates)
MBTA	Migratory Bird Treaty Act

CALIFORNIA DEPARTMENT OF FISH AND GAME (CDFG)

SE	State-listed endangered
SR	State-listed rare
ST	State-listed threatened
SCE	State candidate for listing as endangered
SCT	State candidate for listing as threatened
CSC	California special concern species
Fully Protected and Protected	Fully protected and Protected species may not be taken or possessed without a permit from the Fish and Game Commission and/or the Department of Fish and Game

WATCH LIST

The Watch List (compiled by the Audubon Society and partners in Flight) identifies species are those faced with population decline, limited geographic range, and/or threats such as habitat loss on their breeding and wintering grounds serving as an early warning system that focuses attention on at-risk bird species before they become endangered.

CALIFORNIA ENVIRONMENTAL QUALITY ACT

For plants with no current state or federal legal standing, "CEQA" refers to the fact that under the Act, impacts to species may be found significant under certain circumstances (e.g., uniqueness due to size, age, or regional sensitivity).

CALIFORNIA NATIVE PLANT SOCIETY (CNPS)

LISTS

1A = Presumed extinct.

1B = Rare, threatened, or endangered in California and elsewhere. Eligible for state listing.

2 = Rare, threatened, or endangered in California but more common elsewhere. Eligible for state listing.

3 = Distribution, endangerment, and/or taxonomic information needed.

4 = A watch list for species of limited distribution. Needs monitoring for changes in population status.

R-E-D CODE

R (Rarity)

1 = Rare but found in sufficient numbers and distributed widely enough that potential for extinction is low at this time.
2 = Occurrence confined to several populations or to one extended population.
3 = Occurrence limited to one or a few highly restricted populations, or present in such small numbers that it is seldom reported.

E (Endangerment)

1 = Not endangered
2 = Endangered in a portion of its range
3 = Endangered throughout its range

D (Distribution)

1 = More or less widespread outside California
2 = Rare outside California
3 = Endemic to California

EXECUTIVE SUMMARY

This Conceptual Mitigation and Monitoring Plan (Plan) provides project information, a conceptual mitigation plan, and a monitoring program for mitigation of impacted California Department of Fish and Game (CDFG) jurisdictional areas on the Saddleback Meadows property, located northeast of the City of Mission Viejo in Orange County. The impacts mitigated in this plan are based on delineations conducted in 1998 and 1999 by Chambers Group, Inc. and in 1995 by Sweetwater Environmental Biologists, Inc.

The 222-acre Saddleback Meadows project site contains approximately 8.24 acres, including 0.34 acre of ephemeral ponds, 4.32 acres of wetland vegetation and 3.58 acres of streambeds, subject to CDFG jurisdiction under Section 1600 et seq. of the California State Code. The proposed project would impact approximately 4.09 acres of CDFG jurisdictional areas, including 0.28 acre of ephemeral ponds, 2.37 acres of wetland vegetation, and 1.44 acres of streambeds. This plan has been developed with five specific objectives:

1) **On-site Wetland Preservation** - Within open space on site, maximize the protection, to the extent practicable, of existing jurisdictional areas (i.e., ephemeral ponds and drainages, along with surrounding wetland vegetation);

2) **On-site Wetland Creation** - Maximize on-site creation of ephemeral ponds and wetlands;

3) **On-site Streambed Creation** - Stream courses will be reconstructed in their original location as part of the remedial grading (this will occur within areas of remedial grading that are outside of the conventional grading limits);

4) **Off-site Wetland Creation, Enhancement, and Preservation** – Preserve, create, and enhance as much wetland vegetation in suitable off-site areas as is hydrologically feasible; and

5) **Off-site Streambed Preservation** – Mitigate remaining impacts to streambeds through acquisition of streambeds at an off-site location.

On site, mitigation for the loss of 0.28 acre of ephemeral ponds will be mitigated at a 3:1 ratio, or a total of 0.84 acre. A total of 1.01 acres of ephemeral ponds will be created. An additional 0.18 acre of vernal pools will be preserved, created, and/or enhanced on the Viejo Mitigation Bank site. The excess ephemeral pond mitigation totaling 0.35 acre (0.17 acre ephemeral pond and 0.18 acre of vernal pool) would be used to mitigate impacts to wetland vegetation. Impacts to 2.37 acres of wetland vegetation (1.54 acres of mule fat scrub, 0.73 acre of oak woodland, and 0.10 acre of sycamore woodland) will be mitigated at a 3:1 ratio with the on-site creation of an additional 2.78 acres of wetlands, the off-site creation of 2.25 acres of riparian habitat, the off-site preservation and enhancement of 1.73 acres of riparian habitat, and the aforementioned credit from the creation, preservation, and enhancement of vernal pools.

Creation of ponds and streambeds and the surrounding wetland vegetation on site requires the excavation, grading, and contouring in disturbed upland areas or areas disturbed by remedial grading to form basins or streambeds, and revegetating the margin of these areas with riparian cuttings, plantings and seeds of native understory species. The depth and shape of the constructed basins will be based on the contours of the existing ponds. In addition, soils from the bottom of the existing ponds will be collected prior to impacts and the collected soils will be used to innoculate the created ponds. Additional mitigation measures include the installation of fencing to deter vandalism and other disturbance of the mitigation site. Creation and enhancement of riparian and oak woodland habitat off site is proposed on the Hidden Ranch property and will focus on areas previously disturbed by years of cattle grazing.

Impacts to 1.44 acres of CDFG-jurisdictional streambeds will be mitigated for on site by the creation of streambeds within areas proposed for remedial grading previously supporting streambeds (0.44 acre), and off site by purchase of 1.0 acre of existing streambeds at either the Viejo or Hidden Ranch Mitigation Banks. Impacts will be mitigated at a 1:1 ratio for a total of 1.44 acres.

The Plan provides information on the construction, maintenance, and monitoring of the on-site mitigation area as well as a description of the project goals and final success criteria. The on- and off-site mitigation areas will be monitored for five years or until project specific success criteria outlined in this Plan are achieved.

I. INTRODUCTION

This Conceptual Mitigation and Monitoring Plan (Plan) provides project information, a conceptual mitigation plan, and a monitoring program for impacted California Department of Fish and Game (CDFG) jurisdictional areas on the Saddleback Meadows property, located northeast of the City of Mission Viejo in Orange County. Mitigation for these impacts is required under section 1600 et seq. of the California State Code. Impacts were determined based on site delineations conducted in 1998 and 1999 by Chambers Group, Inc. and in 1995 by Sweetwater Environmental Biologists, Inc. (SEB). Mitigation for impacts occurring to other sensitive habitats, plants, and wildlife present on the Saddleback Meadows property will be covered in separate documents.

The development of this Plan included the evaluation of several on-site alternatives, including:

1) Using flatter portions of the property with good hydrology for on-site drainage mitigation.

   This proposed alternative gives higher priority to using the flat portions of the site for the creation of ephemeral ponds.

2) Using uplands adjacent to existing drainages for on-site drainage mitigation.

   These uplands are occupied by southern sycamore woodland and coastal live oak woodland habitat. This proposed alternative gives higher priority to preserving these existing vegetation communities.

3) Reworking existing drainages in order to create new, larger drainages.

   The drainages not impacted by the project footprint are of the "higher quality" on-site drainages. In addition, due to the steep terrain, the opportunity to achieve a "net gain" would be minimal. This alternative would not provide measurable benefits for the level of disturbance it would require.

II. PROJECT DESCRIPTION

A. PROJECT LOCATION

Saddleback Meadows is a 222-acre site located in an unincorporated area of southeastern Orange County approximately 16 miles inland from the Pacific Ocean within the foothills of the Santa Ana Mountains (Figure 1). The parcel is situated on the northeastern side of Santiago Canyon Road, approximately 1,000 feet south of its intersection with Live Oak Canyon Road (S-19) in the Foothill-Trabuco area (Figure 2). The site is located on the U.S. Geological Survey Santiago Peak and El Toro 7.5 minute quadrangles.

An active creek (Aliso Creek) runs north and south along the western boundary of the site. Residential communities are located to the south and west, pasture land is located to the east, and Saint Michael's Abbey is located to the north. The property is actively used for horse and cattle grazing. The intensive grazing combined with the presence of highly erodable soils on site has, over the years, resulted in extensive habitat degradation in both upland and wetland habitats. Significant erosion has also occurred within the drainages on the site. The project site is mostly undeveloped except for a small corral in the central portion of the western half of the site, remnants of houses, and a few unmaintained roads.

B. PROJECT SUMMARY

The proposed project entails the development of 299 single-family residential lots, roads, and recreational trails on approximately 63 acres of the property. An additional 102 acres will be impacted by remedial grading. The development is concentrated in the north and south sections of the property, avoiding a steep ravine and its associated oak woodlands near the center of the property. The remedial grading areas will be recontoured to preconstruction elevations, revegetated and preserved as open space. A total of approximately 159 of the property's 222 acres will be dedicated in permanent open space, including 90 acres dedicated to the County of Orange as an extension of O'Neill Regional Park. Manufactured slopes extending outside of the fuel modification zones will be revegetated with native vegetation and dedicated as open space. The current project configuration has been designed to avoid as much of the wetlands on site as possible, and to provide for an east-west wildlife corridor through the property to off-site open space areas located to the east and west. This east-west corridor is a critical component of the County's Natural Community Conservation Program (NCCP).

C. EXISTING JURISDICTIONAL AREAS

Several delineations have been conducted of the Saddleback Meadows property to identify areas subject to CDFG jurisdiction (Figure 3). SEB biologists conducted a jurisdictional delineation of the site in August 1995, and Chambers Group biologists delineated the project site in April and May 1998, and March, August, and October 1999. The delineations covered riparian plant communities and ponds within the project boundaries. In addition, all drainages on the site were inspected for evidence of periodic surface flows. Additional information on the site delineations is available in the Jurisdictional Delineation of the Saddleback Meadows Property in Orange County (Chambers Group 2000).

CDFG Jurisdictional Areas

A total of 8.24 acres on the site was determined to fall under CDFG jurisdiction (Figure 3; Table 1). CDFG jurisdiction is comprised of seven ephemeral ponds ringed by mule fat scrub, and patches of oak woodland, sycamore woodland, and mule fat scrub.

Table 1
IMPACTS TO CDFG JURISDICTIONAL AREAS

HABITAT	EXISTING (acres)	IMPACTS (acres)		
		Project Footprint	On-Site Mitigation Area	TOTAL
Ephemeral Ponds	0.34	0.28	--	0.28
Mule Fat Scrub	2.76	1.54	--	1.54
Oak Woodland	1.25	0.73	--	0.73
Sycamore Woodland	0.31	0.10	--	0.10
Streambed	3.58	1.34	0.10	1.44
TOTAL	8.24	3.99	0.10	4.09

Ephemeral Ponds – The site contains a total of nine stock ponds, two of which have breached and no longer retain water. The ponds are not natural, but rather man-made stock ponds created for cattle and other farming and ranching activities that have been present at the site for years. Four of the ponds, which are impoundments in otherwise natural drainages, are considered CDFG jurisdictional. The ponds

CDFG Jurisdictional Areas

SADDLEBACK MEADOWS

HELIX

Figure 3

are heavily degraded by cattle. For purposes of this analysis, it was assumed that the pond surface area extended to the maximum pond size based on the upper elevational limit of the dam that creates the pond. The ponds themselves are devoid of vegetation. Approximately 0.34 acre of ephemeral pond (calculated based on the sizes of the ponded basins) occurs on site.

Mule Fat Scrub - The mule fat scrub communities on site are, for the most part, associated with the ephemeral ponds and are essentially riparian "islands" within the surrounding upland communities. Mule fat (*Baccharis salicifolia*), in conjunction with arroyo willow (*Salix lasiolepis*) and red willow (*Salix laevigata*), also occurs along drainages on the site. Approximately 1.46 acres of mule fat scrub occurs along the edges of the ephemeral ponds; approximately 1.3 acres of mule fat scrub occur along two of the on-site drainages.

Oak Woodland– Approximately 1.25 acres of oak woodland, in association with mule fat, which extend beyond the banks of the drainage in the center of the property are considered CDFG jurisdictional.

Sycamore Woodland – Approximately 0.31 acres of CDFG-jurisdictional sycamore woodland occurs on the upper bench of Aliso Creek on site.

Streambeds – Approximately 3.58 acres of CDFG jurisdictional streambeds, which do not contain jurisdictional vegetation, occur on site.

D. JURISDICTIONAL AREAS TO BE IMPACTED

Implementation of the proposed project will impact a total of 4.09 acres of CDFG jurisdictional areas, including 0.28 acre of ephemeral ponds, 1.54 acres of mule fat scrub, 0.73 acre of oak woodland, 0.10 acre of sycamore woodland, and 1.44 acres of streambed (Table 1).

III. GOALS OF MITIGATION

The development of this Plan involved an iterative process that first focused on on-site preservation. Remaining on-site impact mitigation then focused on use of the flatter portions of the open space for creation of ephemeral ponds, with the surrounding area used for wetland creation. Other areas of on-site open space were also assessed for their potential for use as additional mitigation areas, including existing drainages. Widening existing drainages on site would result in greater impacts to wetland and upland habitats and were, therefore, not selected.

Remaining mitigation requirements are being met off site at two locations: the Viejo Mitigation Bank and the Hidden Ranch Mitigation Bank. The focus of mitigation on the Viejo site was the preservation, enhancement and creation of vernal pools, and the potential preservation of streambed and mule fat scrub. Mitigation on Hidden Ranch includes preservation, enhancement and creation of mule fat scrub, southern willow scrub, and sycamore/oak woodland. On site, two distinct areas were identified for mitigation: the area within the existing ranch compound that has been the most heavily disturbed and an area along the creek immediately upstream of the ranch compound that has been disturbed by long-term cattle grazing.

The Mitigation Plan has been developed with five specific objectives:

1) **On-site Wetland Preservation** – Within open space on site, maximize the protection, to the extent practicable, of existing ephemeral ponds and drainages, along with surrounding wetland vegetation;

2) **On-site Wetland Creation** - Maximize on-site creation of ephemeral ponds and wetlands;

3) **On-site Streambed Creation** - Stream courses will be reconstructed in their original location as part of the remedial grading (This will occur within areas of remedial grading that are outside of the conventional grading limits);

4) **Off-site Wetland Creation, Enhancement, and Preservation** – Preserve, create, and enhance as much wetland vegetation along the fringe of existing ephemeral basins and drainages as is hydrologically feasible; and

5) **Off-site Streambed Preservation** – Mitigate remaining impacts to streambeds through acquisition of streambeds at an off-site location.

The intent of this wetland mitigation is to create and enhance riparian, ephemeral pond, and vernal pool habitats on and off site to ensure no net loss of habitat values. The Plan also provides criteria and recommendations for the protection, enhancement, maintenance, and management of the natural resources located within the mitigation areas.

A. TYPE(S) OF HABITAT TO BE PRESERVED, ENHANCED, OR CREATED

Both on-site and off-site habitat preservation, enhancement, and creation are proposed and are outlined below. Table 2 summarizes the acreage totals for the mitigation program.

1. On-site Preservation

On site, approximately 159 acres of habitat located outside of the fuel modification zone will be preserved as open space, including 90 acres dedicated to the County as an extension of O'Neill Regional Park. This open space will include the preservation of 4.25 acres of the site's 8.24 acres of CDFG jurisdictional areas, and is comprised of 0.06 acre of ephemeral pond, 1.95 acres of wetland habitats, and 2.24 acres of streambeds. Several measures will be taken to minimize impacts related to construction and protect the biological values of this open space. Impacts to remaining open space will be minimized through project scheduling and construction monitoring and the (pre-construction) installation of high visibility orange fencing and silt fencing at the construction limits (where applicable). A delayed start date for the construction will allow for the salvage/collection of native materials such as mule fat cuttings from the development site. Mitigation will be initiated prior to project construction to minimize the temporal loss of wetland habitat functions and values.

The preserved areas will be protected in perpetuity as part of the dedicated open space for the project. These areas will be permanently fenced along the development edge to preserve their functions and values. Signs will be posted labeling the areas as sensitive habitat. These measures are intended to decrease potential impacts from humans and domestic animals. Any future measures required to protect the functions and values of the two remaining ponds will be undertaken as part of the regular open space maintenance.

2. On-site Pond Creation

Mitigation for the loss of ephemeral ponds will include the creation of approximately 1.01 acre of ephemeral ponds on site, a greater than 3:1 mitigation ratio. The on-site mitigation will occur in areas currently containing disturbed upland habitat, including annual grassland, and in a small area of non-jurisdictional mule fat scrub.[1] Mitigation in excess of a 3:1 ratio will be used towards the mitigation requirement for mule fat scrub (Figure 4).

[1] Mule fat scrub will be impacted by the expansion of one pond.

1 P = habitat preservation, E = habitat enhancement, C = habitat creation.
2 Mitigation acreages are preliminary estimates.
3 Excess of 0.84 acre used to mitigate mule fat scrub.
4 Impacts occur to approximately 1.16 acre of mule fat scrub around the ephemeral ponds and 0.38 acre along two drainages.
5 Mitigation includes both preservation and enhancement.
6 Excess of 2.19 acres used to mitigate mule fat scrub.
7 Mitigation for 1.0 acre of streambed will occur through preservation of waters/wetlands on the Viejo and/or Hidden Ranch sites.

3. On-site Habitat Creation

Mitigation for the loss of jurisdictional habitats on the site will consist of 2.78 acres of habitat creation. Specifically, habitat creation on site would include 0.78 acre of mule fat scrub, 1.70 acres of oak woodland and 0.30 acre of sycamore woodland. This on-site mitigation will occur in areas currently containing disturbed upland habitat, including annual grassland and non-jurisdictional mule fat scrub.

4. On-site Streambed Creation

Mitigation for loss of CDFG-jurisdictional streambeds will be mitigated on site within areas of remedial grading that are outside of the conventional grading limits. In these areas, stream courses will be reconstructed in their original location as part of the remedial grading. This will result in approximately 0.44 acre of streambed mitigation.

5. Off-site Vernal Pool Enhancement, Creation, and Preservation

Preservation (0.02 acre), enhancement (0.04 acre), and creation (0.12 acre) of vernal pools (Table 2) is proposed off site within the Viejo Mitigation Bank (Figures 5 and 6). The focus of this portion of the mitigation will be to provide long-term preservation of existing vernal pools and their watersheds on the Viejo site, as well as provide for enhancement and expansion of some of the existing pools, and the creation of new pools where appropriate. At least one of the pools supports the federally listed as endangered Riverside fairy shrimp (*Streptocephalus woottoni*). Some of the created pools may be created deep enough to support this species. A final determination shall be made through the federal Section 7 Consultation process with the U.S. Fish and Wildlife Service (USFWS).

6. Off-site Wetland Enhancement, Creation, and Preservation

Additional mitigation requirements for impacts to wetlands will be met by the off-site creation of 1.24 acres of mule fat scrub, 1.01 acres of oak woodland, and the off-site preservation and enhancement of 1.73 acres of degraded mule fat scrub/riparian habitat within the Hidden Ranch Mitigation Bank (Figure 7). The remaining mitigation requirements for wetland impacts will be met through mitigation of ephemeral ponds in excess of a 3:1 ratio by the creation, enhancement, and preservation of vernal pools in the Viejo Mitigation Bank.

In the main drainage channel, the existing creek crossing will be expanded with additional pipes to allow a wider area of inundation upstream and downstream (Figure 8). Areas of the creek downstream of the existing crossing (Area 1) will be widened to the same grade as the existing channel. These areas will be considered U.S. Army Corps of Engineers (ACOE)/CDFG creation areas. The existing creek channel both downstream and upstream of the crossing (Area 2) will be enhanced and graded to within one foot of the existing creek channel to the east for use as a CDFG creation area. Another area (Area 3) will be graded down and restored along the smaller drainage to the east of the primary drainage. The area upstream of the crossing (Area 4) will be graded down to provide for ACOE and CDFG creation. Additional areas to the north of the compound (Area 5 and to the east), where the existing channel is of better quality but the channel has been degraded by cattle grazing, will also be used for ACOE and CDFG creation.

The existing channels will be enhanced by weeding and planting of mule fat and a limited number of willows. The areas in the ranch compound will need to be planted at similar densities to areas proposed for creation given the highly disturbed nature of the channel. CDFG creation areas will be planted based on Table 3 below. Temporary irrigation will be used for all but the existing stream channel areas.

Hidden Ranch Mitigation Bank Restoration Areas

SADDLEBACK MEADOWS

HELIX

Figure 8

Table 3 CALIFORNIA DEPARTMENT OF FISH AND GAME RESTORATION AREAS	
SPECIES	**PLANTS PER ACRE**
Mule fat (*Baccharis salicifolia*)	200
Mexican elderberry (*Sambucus mexicana*)	20
Western sycamore (*Platanus racemosa*)	40
Coast live oak (*Quercus agrifolia*)	20
California rose (*Rosa californica*)	50

It is anticipated that this restoration effort will be successful because the areas proposed for creation/enhancement occur within or adjacent to the existing channel, and the width of the proposed creation/enhancement areas is no wider than the existing vegetation within the channel upstream or downstream where cattle grazing has been eliminated.

7. Off-site Streambed Preservation

Remaining mitigation requirements for streambeds (1.00 acre) will be provided through acquisition of 1.00 acre of streambeds at either the Viejo or Hidden Ranch Mitigation Bank.

A summary of existing conditions, impacts, and mitigation for CDFG jurisdictional areas is provided in Table 3.

B. TIME FRAME

The wetland monitoring program for Saddleback Meadows will take place over a five-year period, after installation of the creation areas is complete. The success criteria described below for this project must be met by the end of this period (Section IV of this document).

IV. FINAL SUCCESS CRITERIA

This section provides standards to determine the successful completion of the habitat creation outlined above. Attainment of these standards indicates that the mitigation area is progressing toward the target functions and values specified for this Plan. The methods to be used to measure these success criteria are described is section VIII A of this document. If at any time functions in these areas do not appear to be meeting the performance standards set forth in this Plan, California Quartet will be responsible for taking timely remedial actions (as determined by the restoration specialists) to ensure compliance with the performance standards.

TARGET JURISDICTIONAL ACREAGE TO BE CREATED/ENHANCED

Implementation of this Plan will result in the creation of 1.01 acres of ephemeral ponds, 2.78 acres of wetland habitats and 0.44 acre of streambed on the project site. A total of 0.18 acre of ephemeral ponds will be preserved, created, and enhanced off-site. Additionally, 2.25 acres of wetland habitat will be created off-site, and 1.73 acres of existing off-site riparian habitat will be preserved and enhanced to improve its wetland function and value. Also, 1.00 acre of off-site streambed will be acquired.

V. PROPOSED MITIGATION SITE

A. LOCATION AND SIZE OF MITIGATION AREA

1. On-site Habitat Creation

The wetland creation area will be located on site in areas that are deemed suitable based on soils (i.e., soil texture, and structure), topography, location within the same watershed, and potential for wildlife use. Suitable on-site creation areas are limited; therefore, the creation of the ephemeral ponds is planned for these areas. Streambeds will be recreated within remedial grading areas previously supporting these channels.

Figure 4 shows the locations of the ponds, wetlands, and streambeds proposed to be created. The ponds will be modeled after those currently existing on the project site. The impoundment will be situated to collect surface flows from the surrounding native habitat to ensure that a self-sustaining, ephemeral pond is created. The sites selected for the proposed ponds are located within the same watershed as the present impoundments and in the open space preserve areas of the project.

2. Off-site Wetland and Ephemeral Pond Creation, Enhancement, and Preservation; and Streambed Preservation

Off-site creation, enhancement, and preservation areas will be located in the Viejo and Hidden Ranch Mitigation Banks within the County of Orange. The final location of wetland enhancement and preservation areas will be determined in consultation with the County of Orange and the CDFG.

B. OWNERSHIP STATUS

The project applicant California Quartet owns the proposed on-site mitigation area. Off-site mitigation areas are owned by Southern California Edison.

C. EXISTING HABITAT VALUES OF MITIGATION AREA

The pond and wetland mitigation areas currently do not have wetland habitat values. They consist primarily of disturbed upland habitats that have been degraded by many years of grazing. The streambed habitat values vary for the streambeds being impacted and restored within the remedial grading areas. A majority of these areas are unvegetated streambeds that have been degraded by the ongoing cattle grazing; a limited area supports vegetated streambeds.

D. PRESENT AND PROPOSED USES OF MITIGATION AREA

Currently, the on-site mitigation areas are undeveloped. All of the on-site mitigation areas are proposed for open space preservation.

E. PRESENT AND PROPOSED USES OF ALL ADJACENT AREAS

On site, areas immediately adjacent to the created wetlands will be preserved as open space, wherever possible. The remainder of the site will be developed into a residential complex.

VI. IMPLEMENTATION PLAN

A. RATIONALE FOR EXPECTING IMPLEMENTATION SUCCESS

Ephemeral ponds have been successfully restored or created at various locations in California. A recent review of vernal pool rehabilitation and creation projects in San Diego County determined that most of the pools created adjacent to existing habitat successfully sustained populations of *Pogogyne abramsii*, an obligate vernal pool plant, over a period of 5 to 10 years (Black and Zedler 1998). A review of the Del Sol Reserve vernal pool project in Santa Barbara County also demonstrated that pools created and restored in 1986 are self-sustaining and support native vernal pool plant species (Ferren et al. 1998). Surveys conducted in 1996 found that the density and composition of macroinvertebrate populations, including several species of fairy shrimp, in vernal pools constructed in Folsom, California in 1994 were similar to that of adjacent reference pools (Rogers 1998). Generally, created pools inoculated with propagules taken from adjacent or nearby vernal pool complexes were more successful in sustaining populations of vernal pool species. The ponds on the project site will be designed using the methods of past successful projects as guidelines.

Measures outlined in guidelines described by the USFWS (De Weese 1998) will be incorporated into the construction, maintenance, and monitoring of the created ponds to ensure their successful creation. These measures include:

- The mitigation site will be located in an area that currently supports ephemeral ponds and has appropriate soil types (same series). An adequate buffer (>100') will be created between the pond habitat and the preserve boundary.
- Excavation of side slopes and pond bottoms will mimic that of the existing ponds to duplicate hydrologic depth, surface area, and inundation periods.
- Two existing on-site ponds will be preserved and managed for use as reference ponds.
- Hydrology staff gauges will be installed within the constructed and preserved ponds to facilitate monitoring of inundation periods. The hydrology will be monitored weekly during the wet season.
- Riverside fairy shrimp and other invertebrate populations will be monitored in the created and reference ponds once a month while the ponds hold water.
- Water quality, including temperature, turbidity, and conductivity, will be monitored in the created and reference ponds.
- Regular maintenance inspections will be performed to monitor for uncontrolled human disturbance, trash, and unexpected conditions (erosion, water run-off pollution, etc.).

Overall, success of the Plan is expected based on the following rationale:

- Plant material (seeds, container plants and cuttings) to be used for the revegetation effort will be derived from on-site material, which is anticipated to be adapted to the site conditions. Cuttings collected from the development site will also preserve the genetic integrity of the willow, mule fat, oak and sycamore populations.
- The mitigation site is located within a system that supports coastal sage scrub, coast live oak woodlands, and riparian habitat. The existence of these habitats provides support for the conclusion that the wetlands can be sustained.

- Exotic species to be removed within the site will reduce competition with existing native species and plantings associated with the revegetation project and enhance the site's ecological value.

- Removal of cattle is also expected to reduce the level of disturbance to the site.

- The revegetation site will be planted with cuttings and container plants at a relatively high density and seeded with a native herbaceous seed mix, which would impede the recolonization of invasive non-native plant species.

B. RESPONSIBLE PARTIES

1. Project Proponent

California Quartet
c/o TPG Management
ATTN: Pike Oliver
777 Campus Commons Road, Suite 200
Sacramento, California 95825

The project proponent and owner will be responsible for financing pre-grading plan hydrological testing, installation, maintenance, and monitoring of the habitat creation. In order to ensure the success of mitigation, the project proponent will enter into a five-year, secured agreement with the CDFG to cover the projected cost to install, monitor, and report on the mitigation. This agreement should be in the form of a 120 percent bond. The bond should be structured so that portions of the bond may be released as interim milestones are met (subject to negotiation between the proponent and the CDFG).

2. Landscape Architect

A licensed landscape architect will be selected for this project. The landscape architect shall prepare the construction drawings to accompany this Plan. The construction drawings shall be reviewed and approved by the restoration specialist.

3. Restoration Specialist

Monitoring of mitigation site preparation and installation, as well as maintenance/technical monitoring after site installation shall be the responsibility of a biologist, landscape architect, horticulturist, or other person knowledgeable in native habitat restoration. After each visit, the restoration specialist shall provide the project proponent and installation/maintenance contractor with a written checklist of maintenance items in need of attention, if any. All requests for work that are in addition to a contractor's scope of work shall first be approved by the project proponent. The restoration specialist shall educate the installation and maintenance contractors with regard to mitigation goals and requirements and will be responsible for tracking and preparing all required reports for submittal to the CDFG.

4. Landscape Contractor

The landscape contractor must be educated as to the installation and maintenance of native plants. This contractor shall be responsible for completion of grading, pre-planting weed control, irrigation system installation, planting, seeding, and final as-built plans.

Once the restoration specialist has verified the completion of the previous list of items, a 120-day installation maintenance period will begin. The landscape contractor shall be required to maintain the entire mitigation area at least once a month during this period. The landscape contractor shall meet the

restoration specialist at the site, when requested, and shall perform all maintenance items in need of attention in a timely manner. Maintenance tasks include, but are not limited to, dead plant replacement, reseeding, irrigation system repair, and weed control. At the end of the installation maintenance period, the restoration specialist will certify completion of the installation contract, provided all installation and maintenance tasks have been completed. The project proponent may change contractors at its discretion.

After the installation contract is certified as complete, site maintenance will be conducted by the landscape contractor for the five-year monitoring period. The contractor is responsible for actual implementation of this Plan's specifications and shall maintain the entire mitigation area according to a specified schedule. Maintenance tasks include, but are not limited to, dead plant replacement, reseeding, irrigation system repair, and weed control. The landscape contractor shall meet the restoration specialist at the site, when requested, and shall perform all maintenance items in need of attention in a timely manner. The project proponent may change contractors at its discretion. The landscape contractor will coordinate closely with the restoration specialist to ensure that the specifications of the mitigation plan are properly implemented.

C. SCHEDULE

Grading is to be completed no later than December 31, 2000. Planting and then seeding shall occur between November 15 and February 15 to take advantage of winter rains. Since irrigation will be provided for the container stock, planting (but not seeding) could occur into spring, but extreme care would need to be taken not to trample the previously spread seed mix.

If for any reason the plant materials (seeds and container plants) are undeliverable or rejected by the restoration specialist, planting will be completed as soon as desirable materials are available and the planting season is appropriate. The preliminary schedule guidelines for mitigation activities are outlined in Table 4.

Table 4
PRELIMINARY SCHEDULE GUIDELINES FOR MITIGATION ACTIVITIES

Mitigation Site Contracts Schedule
• Contract with Restoration Specialist
• Contract for plant materials
• Contract with earthmovers, schedule pond grading
• Restoration specialist and construction contractors attend pre-construction meeting(s)
• Contract with landscape contractor
• Contract with landscape architect (if Restoration Specialist determines irrigation a necessity)
Mitigation Site Preparation (September through November)
• Surveyor identifies restoration areas (verified by Restoration Specialist)
• Grade grasslands and create pond/wetland contours (Restoration Specialist present during grading activities)
• Pretreat site for weeds, if necessary
• Remove non-organic debris and vegetation material under guidance of Restoration Specialist
• Transfer inoculum from impact area ponds to replacement ponds
Planting (November through February)
• Schedule plant materials delivery date and planting crew
• Verify planting scheme for landscape contractor
• Collect/salvage suitable plant material from development site
• Cuttings and container plants installed

Table 4 (cont.)
Planting (November through February) (cont.)
• Seed application
• Coordinate replacement plantings
• Install replacement plantings (monitored by Restoration Specialist)
• Install plant fencing (if herbivory is a problem)
Maintenance and Monitoring
• See guidelines outlined in Sections VII and VIII of this report
Documentation
• Revegetation specialist submits annual reports to the CDFG by January 1 each year following implementation

D. SITE PREPARATION

1. Wetlands and Open Space Remaining On Site

Recommendations are presented to protect biological and aesthetic values of the natural habitats within the project site that are not directly affected by the proposed project. Impacts will be minimized through project scheduling and construction monitoring. A delayed start date for the construction will allow for the salvage/collection of native materials from the development site such as mule fat cuttings. Ponds to be retained in open space will be protected from construction disturbance through construction fencing and silt fencing or other erosion protection devices around the construction limits to prevent the flow of sediment into the ponds. Mitigation will be started before project construction to minimize the temporal loss of wetland habitat function. Specific measures to protect sensitive resources are discussed below.

2. Pond Creation Areas

Fencing – Orange plastic snow fencing (or other similar device) will be used to define limits of grading. Where possible, fencing will be located no closer than 15 feet from the dripline of all trees identified for protection.

Grading – A grading plan will be developed for the new ponds based on their position in the watershed, and the contours of the existing ponds. The new ponds will mimic as closely as possible the depths and areas of the existing ponds. A study of the hydrogeomorphology and dynamics of the existing ponds is currently in process. The yearlong study will provide the detailed information needed to create the exact specifications for the proposed ponds. Variables included in the study are topography and bank contours of the existing ponds, periods of inundation over time, watershed, and water quality analyses. Soils at the proposed sites will also be tested for permeability characteristics. Rough grading contours will be deep enough to allow for the application of a surface soil layer removed from the existing ponds.

Erosion Control – Only non-vegetative erosion control measures may be used in areas with native vegetation. Such erosion control measures may include sandbags, soil binders, waterbars, trenches, or dissipators. These measures preclude the introduction of non-native weedy species into the seed bank of areas with native vegetation. Drainage and sedimentation control devices will be routinely cleaned, maintained, and repaired prior to and during the rainy season. All repairs to these systems will be immediately executed to minimize erosion problems.

Debris – Garbage and debris will be removed from all areas of the mitigation site. Dead or downed wood will not be removed except as required for safety reasons, flood control or fuel modification because they provide important microhabitats for small vertebrates and invertebrates.

Transplanting Inoculum– After finish grading of the relocation ponds, the upper 24 inches of soils from existing ponds will be collected and spread over the bottom of the relocation ponds in two layers. The top layer shall be 1" deeper than the cracks in the soil and the second layer will be the remaining depth to 24". It is essential that the top soil layer salvaged is placed on the surface of the created basins. Initial grading of the mitigation site must include over excavation to allow for placement of the salvaged soil. Relocation ponds must also support a sufficient prey base population. If ponds do not support sufficient algal populations they will be inoculated with resources from the original ponds.

Vegetation Replacement – If any vegetation is removed, it will be replaced through seeding, container plantings, or both.

3. Wetland Enhancement Area

Regular weeding of the preserved habitat at Hidden Ranch shall be conducted according to the Post Installation Schedule presented in Table 7.

E. PLANTING PLAN MATERIALS AND METHODS

The planting palette for mule fat scrub (Table 5a), oak woodland (Table 5b), and sycamore woodland (Table 5c) shall be based on the species composition of corresponding extant habitat. Plants selected for the wetland areas are based mainly on those species currently found around the perimeter of the existing ponds and streambeds. The pond basins are not currently vegetated; therefore, no vegetation will be placed in the basins of the created ponds.

Table 5a
MULE FAT SCRUB PLANT SPECIES PALETTE

COMMON NAME	SCIENTIFIC NAME	PLANTING OR APPLICATION RATE/ACRE	GROUPING SIZE
Upper Canopy-Lower Benches[1]			
Black willow	*Salix goodingii*	30	2-3
Lower Canopy[1]			
Mexican elderberry	*Sambucus mexicana*	40	2-4
Mule fat	*Baccharis salicifolia*	250	15-25
Shrub and Herbaceous Layer (Seed Mix)[2]			
Mugwort	*Artemisia douglasiana*	5 lbs	--
Meadow barley	*Hordeum brachyantherum*	12 lbs	--
Western ragweed	*Ambrosia psilostachya*	6 lbs	--
Beardless wild rye	*Elymus triticoides*	8 lbs	--
Spikerush	*Eleocharis macrostachya*	1 lb	--
Toad rush	*Juncus bufonius*	1 lb	--

[1]1 gallon container stock
[2]Pounds of pure live seed per acre

Nettle	*Urtica holosericea*	8 lbs/acre	--

[1] 5 gallon container stock
[2] 1 gallon container stock
[3] Pounds of pure live seed per acre

To ensure preservation of regional genotypes, cuttings will be collected from mule fat and willows in the existing ponds and drainages for the development of container stock. Optimally, vegetation will be collected during the fall months, when the weather is cooler and the vegetation is generally in a dormant or slow growth phase. After collection of seed and plant materials, planting will begin during the fall to take advantage of the rainy season.

Container stock will be as 1-gallon plants at elevations of approximately 4 to 12 feet above groundwater, and in natural groupings. In addition, the restoration specialist shall approve the final layout of all plant materials in the field prior to planting to ensure their correct ecological positioning (e.g., plants are not installed in rows).

All container stock shall be planted in a hole at least twice the diameter of the container and twice the depth. Backfill shall not be amended. The top of the root ball shall be set one inch above finish grade. A mulched zone shall then be established around each container plant, extending for at least 18 inches from the base of the plant. The mulch shall be two to four inches thick and must not come in contact with the collar of the plant. No fertilizers shall be applied.

Seeding will be done by hand, hydroseeding, or imprinting depending on the size of the area, slope, and surface topography. Mychorrizal inoculum will be applied with the seed mix.

Contract Growing and Plant Material Sources - Arrangements shall be made as soon as possible in advance of the expected planting date, either by the project proponent or the landscape contractor, to acquire container plant materials and seed required for habitat creation. An additional 10 percent of the total number of container plants and seed mix shall be procured in case replanting or reseeding is necessary. A copy of the plant material contract shall be submitted to the restoration specialist as verification of acquisition. Contract growing and seed collection shall be conducted by an experienced native plant nursery or seed company such as, but not limited to, Tree of Life Nursery, San Juan Capistrano, California; Mockingbird Nursery, Riverside, California; and/or S&S Seeds, Carpinteria, California.

It is preferred that the source of all plant material used at the site be from the drainages on site or as close to the site as possible. If necessary, the restoration specialist shall help the grower locate acceptable local sources for plant materials.

Substitutions - No species shall be substituted without approval from the restoration specialist. If the project proponent or installation contractor is unable to obtain the proper species (and sizes) specified by the time of planting, commencement of the 120-day installation maintenance period shall be delayed until all plants specified are in the ground. Substitution of plant material at the time of planting depends solely upon the discretion of the restoration specialist in consultation with the landscape architect. Any substitutions that are approved shall be documented by the installation contractor in the final set of as-built plans.

Plant Material Inspection - All plant materials shall be inspected by the restoration specialist and approved as healthy, disease free, and of proper size prior to planting. Overgrown, root-bound container stock will be rejected.

Container Plant Guarantees - All plants determined to be dead or terminally diseased shall be replaced by the installation contractor as soon as possible but no more than 90 days after installation. Plant replacement by the landscape contractor shall be completed as soon as possible but no more than 90 days following written direction by the restoration specialist. Unless substitutions are approved by the restoration specialist, the replacement plants shall be of the same species and at least the same size as

originally planted. All replacement plants shall be inspected by the restoration specialist and approved as healthy, disease free, and of proper size prior to planting.

Seed Guarantees - The installation contractor shall guarantee a 50 percent germination coverage rate for all seeded areas (based on visual assessment by the restoration specialist) at the end of the 120-day installation maintenance period. If there are particular bare areas, reseeding shall take place in those areas at the direction of the restoration specialist. The restoration specialist shall determine the timing and method for reseeding.

F. IRRIGATION PLAN

An irrigation system will be installed where necessary. The mule fat scrub will receive water from seasonal precipitation and should not need one. The oak and sycamore woodlands will require irrigation for plant establishment. Supplemental hand watering shall be applied if necessary to prevent the mortality of seedlings. Care will be taken to avoid water entering into the pond basins to avoid triggering of fairy shrimp hatching at an inappropriate time of year. Supplemental irrigation is only expected to be used for the first three years, or less, of the five-year monitoring period. During the final two years, the restoration specialist shall determine whether or not irrigation is necessary.

G. AS-BUILT CONDITIONS

At the end of the installation phase of the project, the installation contractor shall prepare as-built plans of the mitigation area. The as-built plans will document the conditions of the site as they exist at the completion of the installation. These plans will include an as-built topographic map and show areas of grading, planting, and seeding. The restoration specialist will review these plans for conformance with this Plan's technical design criteria, CDFG permit conditions, and project objectives. Any differences found between the original design and the as-built conditions will be fully assessed and documented by the restoration specialist through field maps, photographs, and descriptive text. It is expected that modifications of the original plan will have occurred due to post-mapping changes in project design as well as unforeseen changes resulting from site conditions. Any changes in the plan shall be justified to and accepted in writing by the restoration specialist and the California Quartet before the as-built conditions are approved.

A report of the "As-Built Conditions" shall be submitted by the restoration specialist to the CDFG within six weeks of completion of site preparation and planting. If grading, planting and erosion control measures are not completed within six weeks of each other, separate reports for each activity will be submitted.

VII. MAINTENANCE DURING MONITORING PERIOD

A. MAINTENANCE ACTIVITIES

1. General Maintenance

All contractors shall be informed of the specific mitigation goals and maintenance requirements of this project. Maintenance efforts will focus on ensuring that the created ponds retain water consistent with the conditions of the existing ponds.

Only construction equipment necessary to accomplish the mitigation installation shall be allowed on the mitigation site, and each piece of construction equipment shall be removed from the site as soon as its task is complete. No vehicular fluids shall be added or changed on site. Once plant installation and

seeding has begun, no vehicles shall be allowed on the mitigation site. Workers' personal vehicles shall be parked outside the mitigation area. The mitigation site shall be kept free of garbage.

No power tools shall be operated on the mitigation site from March 15 through July 15. Only activities that can be performed with non-power tools shall be allowed during this period. This time period coincides with the breeding season of many sensitive riparian bird species.

Damage to plants on the mitigation site as a result of unusual weather or vandalism shall be repaired as directed by the restoration specialist. Such repairs shall be paid for by the project proponent. Any damage caused by a contractor's inadequate maintenance, as determined by the restoration specialist, shall be repaired by the contractor at its expense.

2. Fencing

California Quartet will be responsible for the maintenance of the perimeter fence. Additional, protective measures such as tree tubes and placement of cages or screens around individual plants will be used in areas subject to trampling, herbivory, or other threats as determined by the restoration specialist. All protective devices shall be maintained through completion of the monitoring period or until removal is authorized by the restoration specialist.

3. Weed Control

Weed control shall be conducted monthly by the installation contractor and per the schedule outlined in this document for the maintenance contractor, or as necessary, to minimize competition that could prevent the establishment and growth of native species. Weeds shall be removed for a minimum of 4 years or until plantings are well established to prevent detrimental competition of invasive species with the mitigation plantings for water, nutrients, light, and space. Maintenance personnel shall be trained to distinguish weed species from desirable native vegetation. All weeds shall be removed mechanically. No herbicides shall be applied in the wetlands adjacent to the ponds.

A mulched area 18 inches from the base of each container plant shall be maintained to minimize competition from weeds, except within basins. This mulch will be maintained during the establishment period (120 days following certification of the installation contract), or until plants reach 2 to 3 feet in height. Table 6 lists examples of weeds that need to be controlled at the mitigation site.

4. Disease and Pests

Damage-causing insects, high levels of herbivory, and diseases shall be monitored by the installation and maintenance contractors during their maintenance periods. Generally speaking, a high threshold of tolerance will be permitted before chemical/lethal control measures are considered. All specific recommendations will only be made by a licensed pest control adviser as required by law. All applicable federal and state laws and regulations will be closely followed. The CDFG and restoration specialist will be consulted on any pest control matters.

5. Pruning

No pruning shall be done unless directed by the restoration specialist.

Table 6 WEED SPECIES LIST*	
SCIENTIFIC NAME	COMMON NAME
Arundo donax	giant reed
Brassica nigra	black mustard
Carpobrotus edulis	hottentot fig
Cortaderia selloana	pampas grass
Cynara cardunculus	artichoke thistle
Cynodon dactylon	Bermuda grass
Eucalyptus spp.	eucalyptus species
Foeniculum vulgare	sweet fennel
Myoporum laetum	myoporum
Rincinus communis	castor bean
Schinus terebenthifolius	Brazilian pepper tree
Silybum marianum	milk thistle
Tamarix spp.	tamarisk species
Washingtonia robusta	Mexican fan palm
Xanthium strumarium	cocklebur

*This species lists some common wetland weed species. Other weed species may occur at this mitigation site.

6. Trash Removal

Following rain events, trash and debris may enter the creek from storm drains. Trash shall be removed during regular maintenance events by the installation and maintenance contractors during their respective maintenance periods.

B. RESPONSIBLE PARTIES

The project proponent (California Quartet) will be responsible for financing the maintenance program. The landscape contractor will conduct maintenance efforts and will submit regular maintenance reports to the project proponent.

The project proponent may choose to legally transfer the property in fee title (subject to agency approval) to a public or private entity specializing in long-term management of open space. If such a transfer occurs, this entity would become the responsible party for implementing the maintenance program.

C. SCHEDULE

During the 120-day installation maintenance period, the installation contractor shall be required to maintain the entire mitigation area at least twice a month. Once the 120-day installation maintenance period is over, the area will be maintained by the maintenance contractor according to the schedule in Table 7. Specific items evaluated during maintenance events will include the presence of weeds, trash, vandalism, irrigation function and scheduling, and plant material condition.

Table 7 MAINTENANCE SCHEDULE	
PHASE	SCHEDULE
120-day Installation Maintenance Period	Bi-weekly
Post-Installation Maintenance Period	
February-May	Bi-weekly
June-January	Monthly

The restoration specialist shall begin monitoring during the grading/site preparation and installation phases and shall then continue monitoring through the post-installation phase according to the schedule outlined in Table 8. The restoration specialist shall file a written monitoring report with the project proponent and landscape contractor after completing each inspection. Each of these reports shall identify maintenance concerns including, but not limited to, plant mortality, vandalism, and weed-related issues, and shall provide recommendations to the maintenance contractor regarding any changes to the maintenance program. These monitoring reports will be included as part of the annual report to the CDFG.

Table 8 MAINTENANCE MONITORING SCHEDULE FOR THE RESTORATION SPECIALIST	
PHASE	SCHEDULE OF INSPECTIONS
Grading/Site Preparation	2 times per week
Installation	Daily
Post Installation	
Year 1	Monthly
Year 2	February, March, April, May, June, September, December
Years 3-5 (or until performance standards have been met)	Quarterly

VIII. MONITORING PLAN

A. PERFORMANCE CRITERIA

Performance criteria are specific standards by which to evaluate the progress and success of the mitigation during the five-year monitoring period. The standards are based on a reference site. Three categories of interim success criteria shall be analyzed: species diversity, cover by weeds, and cover by native species. The annual milestones for these parameters are presented in Table 9.

Table 9 ANNUAL SUCCESS CRITERIA MILESTONES[1]					
CRITERIA	YEAR				
	1	2	3	4	5
Species Diversity	40	50	60	70	80
Cover by Weeds[2]	140	130	120	110	100
Cover by Native Species[2]	60	70	80	90	100

[1]Values are percentages as compared with the reference site.
[2]Percent total cover.

B. MONITORING METHODS

Annual monitoring will be performed by the restoration specialist or by a qualified biologist with appropriate experience in site monitoring and transect measurements. This monitoring will include qualitative observations of overall plant survival, vigor, and recruitment, the status of irrigation, trash, and weeds, and the presence of wildlife species. In addition, monitoring will include quantitative measurements of native and non-native plant growth. Using the same techniques, a designated reference site will also be sampled so that comparisons can be made between the functions and values of the mitigation site and previously existing habitat. The reference site shall be located on site.

Vegetation monitoring will be conducted for the restored habitats created along riparian corridors and the margins of the created ponds. Observations of plant health and vigor will be made and compared to observations of plant health and vigor of the preserved habitats. All species that occur within the habitat, along with percent cover of native shrubs and annuals and non-native species, shall be noted separately for each area. In addition to the observations and measurements described above, several permanent stations for photo-documentation shall be established in each habitat type and annual photographs taken.

1. Species Diversity

Species diversity usually increases with recruitment of new native species from the surrounding native habitats. The effect of recruitment on diversity should allow the mitigation to approach the level of species diversity at the reference site. After five years, the mitigation site should reach 80 percent of the species diversity of the reference site.

2. Cover by Weeds

Many weeds have become naturalized, and therefore, the weed cover should reflect (or be less than) what is present at the reference site. Although weeds are expected, they should not be allowed to get out of control on site. Weeds should be controlled during site maintenance.

3. Cover by Native Species

Cover by native vegetation should increase over time and ultimately approach that of the reference site. With sufficient site maintenance, proper irrigation, and natural rainfall, native vegetation cover should approach 100 percent of the reference site in five years.

C. ANNUAL REPORTS

Annual reports on the status of the project mitigation shall include an assessment of the site's status relative to yearly target criteria as well as overall site progress toward final success criteria. These reports will also include the following:

- a list of names, titles, and companies of all persons who prepared the content of the annual report and participated in monitoring activities for that year;
- a copy of the CDFG permit and any attachments including Special Conditions and subsequent Letters of Modification;
- an analysis of all qualitative and quantitative monitoring data;
- copies of all monitoring photographs; and
- maps identifying monitoring areas, transects, planting zones, and so forth as appropriate.

Remedial recommendations, if necessary, shall be made in the annual reports as well as a summary of whether or not the mitigation is meeting the success criteria for the appropriate year.

D. SCHEDULE

Monitoring and performance criteria will be tied to implementation. The first annual monitoring event will occur in June after the first full growing season. Annual technical monitoring reports shall be submitted to the CDFG by the end of August of each year to ensure that there is adequate time remaining in the dry season to implement any necessary contingency measures.

IX. COMPLETION OF MITIGATION

The project proponent shall notify the CDFG upon completion of the mitigation effort through the submittal of the final annual technical monitoring report. The final report shall include a jurisdictional delineation of the mitigation areas. This delineation must show that the goals of the mitigation (as described in section III of this document) have been met.

Performance standards may be waived by the CDFG in any area if monitoring indicates that good growth and functional habitats are otherwise achieved. If performance standards cannot be met because of adverse soil or other unmanageable site conditions, an alternative or auxiliary mitigation plan may be submitted to the CDFG for approval.

I. EXECUTIVE SUMMARY

HELIX Environmental Planning, Inc. (HELIX) was retained by TPG Management, Inc. to prepare a revised conceptual management plan for the Saddleback Meadows site located in the City of El Toro in Orange County, California. This plan meets requirements identified in the project's certified Final Environmental Impact Report (County of Orange 1997) as mitigation for impacts to 38.6 acres of Venturan-Diegan transitional coastal sage scrub habitat. This mitigation plan is based on two draft mitigation plans previously prepared for the site (Sweetwater Environmental Biologists, Inc. 1995; Chambers Group, Inc. 1999), and a recent site visit conducted by W. Larry Sward to verify potential mitigation areas.

The purpose of this mitigation plan is to describe the proposed mitigation for impacts to sage scrub habitat located on the Saddleback Meadows project site. The goal of the plan is to outline the procedure for creating sage scrub habitat and for enhancing the value of existing Diegan coastal sage scrub habitat within the project site. Remaining sage scrub mitigation needs will be met through offsite acquisition of sage scrub at the Viejo Mitigation Bank. Together these measures are intended to serve as mitigation for impacts to sage scrub habitat that would result from the construction of the proposed Saddleback Meadows development project. This plan also provides criteria and recommendations for the maintenance and management of created and enhanced sage scrub habitat. The final goal of this plan is to create habitat that, after five years, is on its way to approaching the function and value of surrounding mature sage scrub habitat.

II. PROJECT SUMMARY

A. PROJECT LOCATION

Saddleback Meadows is a 225-acre site located in an unincorporated area of southeastern Orange County approximately 16 miles inland from the Pacific Ocean within the foothills of the Santa Ana Mountains (Figure 1). The parcel is situated on the northeastern side of Santiago Canyon Road, approximately 1,000 feet south of its intersection with Live Oak Canyon Road (S-19) in the Foothill-Trabuco area (Figure 2). The site is located on the U.S. Geological Survey Santiago Peak and El Toro 7.5 minute quadrangles. The Viejo Mitigation Bank parcel is located to the northwest of the project on the El Toro quadrangle (Figure 3).

B. PROJECT DESCRIPTION

The proposed project entails the development of 299 single family residential lots, access roads, and recreational trails on approximately 165 acres of the property. The development is concentrated in the north and south sections of the property, avoiding a steep ravine and associated oak woodlands near the center of the property. Approximately 60 acres of the site will be designated as open space. This area will contain coastal sage scrub, coast live oak woodland, and mule fat/riparian scrub habitats as well as several ephemeral ponds. Graded slopes extending outside of the fuel modification zones will be revegetated with native vegetation.

C. RESPONSIBLE PARTY

California Quartet Limited
Contact: H. Pike Oliver
777 Campus Commons Road, Suite 200
Sacramento, California 95825
(916) 482-7200

D. EXISTING RESOURCES

This property consists primarily of undeveloped land. Aliso Creek runs north and south along the western boundary of the site. The site is currently being used for horse and cattle grazing. Development on site is limited to a small corral in the western portion of the site, remnants of several houses, and a few unmaintained access roads. Surrounding land uses include residential development to the south and west, pasture land to the east, and Saint Michael's Abbey to the north.

The Saddleback project site supports a variety of vegetation communities, and portions of the site have been previously grazed, cleared, or disturbed (Figure 4). On-site vegetation communities include annual grassland, Venturan-Diegan transitional coastal sage scrub, coast live oak woodland, and southern mixed chaparral (Chambers, 1999). In addition to these upland habitats, several wetland habitats are also present on site. Southern sycamore riparian woodland is located along Aliso Creek at the western site boundary. Nine ephemeral ponds, originally created to hold water for cattle (Urban Vision 1997), are located along several drainages scattered throughout the site. Two of the ponds no loner retain water; however, the remaining seven ponds create open water habitat. Mule fat scrub has established along the perimeters of most of the ponds.

Venturan-Diegan coastal sage scrub vegetation consists primarily of low, drought-deciduous and evergreen shrubs that are adapted to prolonged summer drought conditions. This plant community is common in Orange County and is a transitional association between the Venturan and Diegan coastal sage scrubs. Shrub species which commonly occur on the site include California *buckwheat (Eriogonum fasciculatum)*, black sage (*Salvia mellifera*), California sagebrush (*Artemisia californica*), California encelia (*Encelia californica*), and white sage (*Salvia apiana*). Groundcover is comprised primarily of non-native grasses, although some native grasses such as melic (*Melica imperfecta*) and needlegrass (*Nassella* sp.) are also present. A variety of herbaceous species also occur as ground cover.

Table 1
VEGETATION COMMUNITIES WITHIN THE SADDLEBACK MEADOWS PROPERTY

Vegetation Community*	Acres
Venturan-Diegan Coastal Sage Scrub	57.8
Venturan-Diegan Coastal Sage Scrub - Disturbed	14.4
Southern Mixed Chaparral	7.6
Coast Live Oak Woodland	12.9
Southern Sycamore Woodland	0.3
Mule Fat Scrub	3.2
Ephemeral Pond	0.5
Annual Grassland	122.3
Ornamental	0.5
Agriculture	5.3
TOTAL	224.8

Vegetation and Sensitive Resources

SADDLEBACK MEADOWS

E. PROJECT IMPACTS

Proposed project development would impact 165 acres of currently undeveloped land (Figure 5). This would include impacts to approximately 38.6 acres (or 53 percent) of the sage scrub habitat present on site. Brush management impacts to 4.6 acres of sage scrub are considered impact neutral (They are not counted as impacted acres but cannot be used for mitigation purposes).

F. AGENCY JURISDICTION AND REQUIREMENTS

The proposed project is located within an unincorporated portion of Orange County in an area designated as critical habitat for the coastal California gnatcatcher (*Polioptila californica californica*). Protocol surveys for this species have not located the gnatcatcher onsite however. The sage scrub mitigation program outlined in this plan will mitigate for any potential critical habitat impacts under the Federal Endangered Species Act, and also fully mitigates for sage scrub impacts under the California Environmental Quality Act (CEQA).

III. GOALS OF MITIGATION

A. TYPES OF HABITAT TO BE CREATED AND/OR ENHANCED

This plan outlines the procedure for creating and purchasing 54.1 acres (1.5:1 mitigation ratio for undisturbed css and 1:1 mitigation ratio for disturbed css) of Venturan-Diegan transitional coastal sage scrub habitat within the project site and at an offsite location. Onsite, a total of 33.4 acres of sage scrub will be created and an additional 7.3 acres of disturbed sage scrub will be enhanced (Figure 6). An additional 13.4 acres will be preserved at the Viejo Conservation Bank site (Figure 3).

B. FUNCTIONS AND VALUES OF HABITAT TO BE CREATED AND/OR ENHANCED

The goal of the mitigation is to create, restore, and enhance Venturan-Diegan transitional coastal sage scrub habitat of similar or higher quality than the adjacent existing Venturan-Diegan transitional coastal sage scrub habitat thereby increasing the habitat functions and values of upland habitats as well as adjacent oak woodland and wetland habitats.

C. LONG-TERM GOALS

The long-term goal of the plan is to create self-sustaining habitat that requires minimal maintenance and is resistant to invasion by non-native plant species. The sage scrub community will provide habitat for a variety of micro- and macro-organisms.

IV. ESSENTIAL PARTICIPANTS

A. PROJECT PROPONENT

The project proponent, California Quartet Limited, will be responsible for financing the installation and monitoring of the mitigation sites. The contact at this company is Mr. H. Pike Oliver. He can be reached by telephone at (916)482-7200, or at the address given in Section II.A. of this document.

B. LANDSCAPE ARCHITECT

A licensed landscape architect will prepare the construction plans necessary to implement this plan. The construction documents will be reviewed and approved by the restoration specialist and the County of Orange. A landscape architect will also be responsible for inspecting certain parts of the installation, and for participating in the final installation inspection.

C. RESTORATION SPECIALIST

Overall supervision of the installation and maintenance contractors and monitoring in the mitigation area will be the responsibility of a restoration specialist or a biologist familiar with native habitat restoration. The restoration specialist will educate all contractors with regard to mitigation goals and requirements. This education will be initiated at a pre-construction meeting. After each monitoring event, the restoration specialist will provide the project proponent and installation contractors with a monitoring memo outlining the items in need of attention. All requests for work which go beyond the contractor's scope of work will first be approved by the project proponent.

D. INSTALLATION CONTRACTOR

The installation contractor is responsible for pre-planting weed control, planting, and seeding. Once the restoration specialist has verified the completion of the landscape installation, a 180-day establishment period will begin. At the end of this period, the restoration specialist will certify completion of the installation contract, provided all installation and maintenance tasks have been finished. These items include, but are not limited to, weed control, dead plant replacement, and reseeding. The installation contractor will be educated as to the installation and maintenance of native plants.

E. MAINTENANCE CONTRACTOR

After the installation contract is completed, a maintenance contractor will be hired by the project proponent for the duration of the five-year monitoring period. The project proponent may change contractors at its discretion. The maintenance contractor will service the entire restoration area at least once a month. The maintenance contractor will meet the restoration specialist at the site when requested, and will perform all checklist items in a timely manner. The maintenance contractor will be experienced in the maintenance of native plant habitats and know the difference between native plants and weeds.

V. RESTORATION DESIGN

Sage scrub mitigation is designed to meet the requirements of the project under the CEQA. Project mitigation requirements call for a 1.5:1 mitigation ratio for Venturan-Diegan transitional coastal sage scrub and a 1:1 mitigation ratio for disturbed Venturan-Diegan transitional coastal sage scrub. The objective will be to provide self-sustaining sage scrub vegetation at the completion of the restoration effort.

Sage scrub mitigation will occur in areas that are best suited for this habitat and where they do not conflict with other landscape needs. The locations selected for sage scrub planting were based on several considerations, including depth of soils, slope aspect, and potential for future native wildlife use. Sage scrub vegetation currently exists on at least portions of the areas proposed for habitat restoration. In some cases, this includes existing agricultural areas and non-native grassland that would not otherwise be impacted by the project. The remaining areas proposed for restoration are remedial grading slope areas, many of which currently support sage scrub vegetation prior to project impacts. Fuel modification zones will not be planted with sage scrub for mitigation credit.

Oak Woodland Restoration Plan Planting Detail

SADDLEBACK MEADOWS

Figure 6

HELIX

In addition to creating sage scrub habitat, approximately 29.6 acres of sage scrub (including 7.3 acres of disturbed sage scrub habitat to be enhanced), excluding brush management zones, will be preserved on site.

VI. RESTORATION PLAN DETAILS

Individual plan elements are described below.

A. TEMPORARY PROTECTION OF EXISTING HABITAT

Native habitats are sensitive to environmental changes that alter the availability of water and nutrients. Coast live oak (*Quercus agrifolia*) trees, in particular, can easily be damaged during construction by sustaining injuries from soil cuts, fills, compaction, trenching, and excessive branch removal. To protect existing habitats onsite, all areas designated for preservation will be protected with the following measures:

- All remaining habitat will be marked with stakes and flagging by the restoration specialist. Prior to any grading, orange construction fencing will be installed and inspected by the restoration specialist to ensure that the fencing has been properly installed. The contractor will be responsible for repairing all damage to protective fencing within on week of such damage.
- Construction crews will be advised to avoid impacts to preserved habitat.
- Best management practices for erosion control will be implemented to contain sediment within the construction site.
- No heavy equipment will be allowed to operate within the dripline of any oak tree that is designated for preservation.

Unanticipated impacts to preserved habitat must be fully mitigated as recommended by the restoration specialist at the expense of the company or persons responsible.

B. VEGETATION AND TOPSOIL SALVAGE AND REUSE

Salvage of vegetation (track-walked shrubs and surface leaf litter) and topsoil from existing sage scrub areas proposed to be impacted has numerous benefits for the restoration process. Both the vegetation and the topsoil contain a seedbank that is genetically indigenous to the site. Providing a larger and locally native seed source will likely increase the rate of natural recruitment. In addition, collecting both vegetation and topsoil will ensure that plant litter, naturally-occurring understory plant species, mosses, fungi, and nutrients will also be transported to the restoration site. Finally, native topsoil covered with a layer of mulched vegetation will provide a better substrate for restoration, both for the planted and seeded species.

Vegetation and topsoil collection will be conducted in the following manner:

1) All collection areas will be identified and flagged by the restoration specialist. Disturbed/weedy areas will be avoided to decrease the amount of weed seed introduced to the restoration site.

2) Prior to collecting topsoil, the contractor will drive over specified collection sites to crush the vegetation.

3) The sage scrub vegetation will be collected, mulched, and stockpiled.

4) After vegetation has been collected, the top layer of soil (typically 4-6 inches, to be determined by the restoration specialist) will be removed and stockpiled separate from the mulched vegetation. In any collection areas dominated by grasses, vegetation and soil will be collected simultaneously and stored with the topsoil.

Topsoil collection will occur between July and December. Soil organisms are typically dormant at this time of year and are less likely to be damaged by the salvage. Any salvaged material will be stored in areas that will not be disturbed during the storage period. Both the mulch and the topsoil will be applied to the restoration areas, if technically feasible, within six months of initial removal. These materials can be stockpiled at no more than two feet deep for up to six months if they are kept dry. This depth prevents compaction and composting which destroy beneficial soil organisms and the seed bank within the topsoil. Additional measures (e.g. covering) may be necessary to keep the stockpiled materials dry.

Collection, storage and installation of mulch and topsoil will need to be conducted under the direction of the restoration specialist.

C. CONTAINER STOCK SPECIFICATIONS

Container stock (deep liner or one-gallon) will be grown from seeds collected on or in the immediate vicinity of the Saddleback Meadows property to preserve the genetic material for this site. Seedlings should be planted between November and January to maximize the benefit from winter rains. All container grown plants will be inoculated with mycorrhizal fungi before delivery to the site; inoculum will be produced from fungal propagules collected in the existing sage scrub on site. If no viable propagules of mycorrhizal fungi can be found on site, the nearest available source in a similar soil type will be used. Native fungi from several on-site soils may be combined for inoculum production. Proof of inoculation must be provided by the plant nursery. Table 2 provides a list of container stock recommended for sage scrub restoration.

Table 2
SAGE SCRUB CONTAINER PLANT PALETTE

Scientific Name	Common Name	Size	#/Acre*
		1-gallon	75
Heteromeles arbutifolia	toyon	1-gallon	30
Malosma laurina	laurel sumac	1-gallon	30
Rhamnus californica	California coffeeberry	1-gallon	30
Ribes speciosum	fuschia-flowering currant	1-gallon	30
		TOTAL	195

*Number per acre will vary within disturbed sage scrub areas to be enhanced.

All plants determined to be dead or terminally diseased by the restoration specialist should be replaced 90 days after installation or as soon as they die (whichever comes first), and then as required by the maintenance program. Unless substitutions are approved by the restoration specialist, the replacement plants will be of the same species and at least the same size as originally planted.

D. SEED SPECIFICATIONS

It is preferred that all propagules used at the site be from within the site or from wild sources within Orange County and as close to Saddleback Meadows as possible. Seeds should be collected several different areas in the vicinity of the site in the summer and early fall at the direction of the restoration specialist. Using different collection sites will ensure natural genetic variability and protect donor habitats. The seed collector will attempt to obtain equal amounts of seed from each collection site in an environmentally sensitive manner. Donor plants will not be excessively degraded by the collection methods. Collection areas and approximate quantities obtained from each site will be noted and mapped by the seed collector.

Each day's collections will be removed from the site and stored in a cool, dry place protected from rodents. Seed will be cleaned to a grade normally acceptable in the seed trade with all sticks and large plant parts removed. Storage costs and insurance will be included in the price per pound of seeds. Seeds will be tested for percent purity, percent germination, and the number of live seeds per pound. Testing costs will be included in the seed costs per pound and will be the responsibility of the seed supplier. Results of the seed tests should be made available to the restoration specialist prior to seed delivery. Seed collections, handling, and storage techniques may be observed by the restoration specialist.

Table 3 presents the list of species to include in the seed mix, subject to availability. Modifications to the list may be necessary based on availability and specific site conditions and may include substitute species in the mix and/or modification of the pounds per acre of available seed. If adequate seed is not available from local sites, a commercial source may be used to supplement seed supply. The seed material must be approved by the restoration specialist prior to installation at the restoration site.

Table 3
SAGE SCRUB SEED MIX[1]

Scientific Name	Common Name	LBS/Acre
Artemisia californica	California sagebrush	1
Bromus carinatus	California brome	3
Eriogonum fasciculatum	California buckwheat	3
Eriophylum confertiflorum	golden yarrow	2
Gnaphalium californicum	California everlasting	1
Isocoma menziesii	California goldenbush	1
Lasthenia chrysostoma	goldfields	2
Lotus scoparius	deerweed	5
Lupinus succulentus	succulent lupine	3
Nassella pulchra	purple needlegrass	4
Sisyrinchium bellum	blue-eyed grass	3
	TOTAL	28

[1] will vary within disturbed sage scrub areas to be enhanced.

E. CONTRACT GROWING/PLANT SOURCES

Arrangements will be made by the installation contractor or the project proponent, at least nine months prior to construction, to acquire seed required for restoration. An additional 15 percent of the total amount of seed mix will be procured. A copy of this contract will be submitted to the restoration specialist by the owner or installation contractor as verification. Seed collection/acquisition will be conducted by an experienced native plant nursery or seed company such as, but not limited to, S&S Seeds of Carpinteria, California.

The contract grower will provide the restoration specialist with information on the sources of all plant and seed materials grown/collected for the project for final approval. If necessary, the restoration specialist will help the grower locate local sources for plant materials.

F. SUBSTITUTIONS

The installation contractor is expected to secure all plant materials well in advance of the expected planting date. No species should be substituted without approval of the restoration specialist. If the installation contractor is unable to obtain the proper species specified by the time of planting, commencement of the guarantee period will be delayed until all plants specified are planted for a particular project phase. Substitution of seed species at the time of seeding will be at the discretion of the restoration specialist in consultation with the landscape architect. All approved substitutions will be documented by the installation contractor in the final set of "as-built" plans. Lack of planning (i.e., insufficient lead time for seed collection) will not be accepted as justification for substitutions.

G. PLANT INSPECTION

All container stock delivered to the site must be inspected by the restoration specialist prior to installation. No root bound, dead, or diseased material will be accepted from the nursery supplier.

H. SOILS AND SITE PREPARATION

Weed control at the restoration/enhancement sites must be addressed at least six months prior to revegetation. Methods for weed control in these areas will be determined after site inspections by the revegetation specialist but may include the following either individually or in combination:

- Forced germination followed by removal.
- Mechanical removal (e.g. large weedy areas can be tilled or weed-whipped).
- Treatment with herbicide. Spot treatment with herbicide is the best way to control highly invasive perennial weed species. Repeated follow-up treatments, spaced at least three weeks apart, may be required to fully control these species.
- Manual weeding.

Following any required exotic species removal and perennial weed treatment, proposed restoration areas shall be ripped to eight inches whenever feasible. These areas will then be covered with three inches of salvaged topsoil and, if determined necessary and feasible by the restoration specialist, ripped in to a depth of six inches. Lastly, a second three inches of salvaged topsoil will be placed over the top and track-walked.

I. PLANTING/SEEDING TIMING AND METHODS

Container stock will be planted during October through January, prior to seeding. Container stock will be installed at a density of approximately 195 plants per acre. Plantings will be planted in a few dense groupings or "islands" with scattered individuals between the groupings. Planting of container stock shall be conducted as follows (see also Figure 6).

I. The host area should be prepared by clearing weeds. Start by digging a hole twice as deep and twice as wide as the plant container. Break up large dirt clods and try to avoid letting the hole be too smooth sided.

II. Prepare the fill dirt. Native soil should be used as fill dirt and should be free of large rocks and dirt clods.

III. Fill planting hole with water and allow it to drain.

IV. Refill the hole using the following process:

- A. Spill some of the fill dirt into the hole, moisten it, and set the plant root ball on top of the moistened soil so that the plant collar is one inch higher than the finished grade of the planting area.
- B. Replace some backfill material up to 2/3 the height of the root ball while allowing water to slowly flow into the hole. At this point install a protective screen around the plant. The preferred type of screening is corrugated mylar, which is clear and rodent-resistant.
- C. Place the remaining fill dirt in the hole, making sure that the plant collar is still higher than the final grade. Fill dirt should hold the protective screen in place.

V. Create an irrigation basin by mounding dirt considerably outside of the hole dimensions.

VI. Apply at least one inch of organic, disease and weed free mulch in remainder of basin around plant collar and within the entire irrigation basin. Irrigate from the top, filling the basin with water, to settle the fill dirt and mulch. Repeat this at least once.

To take advantage of the rainy season and minimize seed predation, all seeding will occur between November 15 and January 15. After topsoil has been installed, seed can be applied in one of two ways: (1) hand or mechanically distribute seed, then press down the soil with a lightly loaded sheepsfoot, or (2) simultaneous seeding and compacting with an imprinting device. If hydroseed is applied to the site, planted oak trees and other shrubs must be protected during the application process.

J. PROTECTION FROM HERBIVORY

The revegetation will occur in an area potentially used by mule deer (*Odocoileus hemionus*) and brush rabbits (*Sylvilagus audubonii*). Protective fencing or enclosures will be maintained around container stock as long as the container stock remain vulnerable to herbivory. Any protective measures around the plantings will be maintained so that they do not interfere growth. For example, if wire enclosures are used and the plantings begin to send branches through the wire, the enclosure will be replaced with a wire enclosure of larger mesh that provides enough room for plant growth.

K. HYDROLOGY

The sage scrub restoration sites are located in areas that are suitable for sage scrub habitat with respect to local hydrologic conditions such as surface runoff and groundwater levels. Specifically, the proposed restoration sites encompass areas that have been disturbed by previous agricultural or development activities, or that support non-native species (i.e., *Eucalyptus* ssp.), or areas proposed for remedial grading but outside of fuel management limits. A number of site-specific measures related to hydrologic

conditions will also be implemented as part of the restoration effort or adjacent landscaping plans. Specifically, these include the limiting on-site irrigation (i.e., within the upland restoration sites), and directional irrigation techniques in adjacent areas to avoid over-watering the upland restoration sites.

L. SOILS

While the physical and chemical nature of topsoils in the areas proposed for sage scrub restoration have likely been modified by previous agricultural and/or other development activities, soils in these areas are mapped predominantly as Balcom clay loam, 30-50% slopes, Basanko clay, 9-15%, 15-30% and 30-50% slopes, and Calleguas clayloam, 3075% slopes. As described in Section VI.B. of this report, proposed upland restoration will include the application of salvaged topsoil from portions of the site that are proposed for development and currently sage scrub habitats. Specifically, mapped topsoils in the areas proposed for soil collection and salvage include primarily Calleguas clayloam, 30-75% slopes and Basanko clays. Based on the noted soil and habitat data, the described restoration sites and topsoil salvage are considered suitable for the proposed sage scrub restoration program.

M. PROTECTION OF RESTORED AREAS

All restoration areas will be clearly marked with flagging and, if possible, with orange construction fencing during the installation phase, and with a temporary 4-foot chain link or snow fence for the duration of the monitoring period, or until the restoration specialist considers it no longer necessary. Additional fencing may be required at any time if considered necessary by the restoration specialist to protect open space vegetation.

Work will be monitored by the restoration specialist to ensure that construction does not exceed these limits. If unanticipated impacts do occur, the affected areas will be restored as recommended by the restoration specialist and to the satisfaction of the County of Orange.

N. "AS-BUILT" PLANS

The installation contractor will prepare a set of "as-built" plans showing the restoration project as it was actually installed. If the installation exactly reflects the construction plans, then a letter to this effect will be sent to the County of Orange.

VII. MAINTENANCE

A. GENERAL MAINTENANCE

Planted areas will be kept free of debris and will be checked for vandalism, plant material condition, the need for irrigation modifications, scheduling, and weeding.

Damage to plants, irrigation systems, and other facilities occurring as a result of unusual weather or vandalism will be repaired as directed by the restoration specialist. The cost of such repairs will be paid for as extra work, although the contractor should provide the typical replacement costs as part of his/her contract.

Any damage caused by the maintenance contractor's inadequate maintenance, as determined by the restoration specialist, will be repaired by the contractor at his/her expense.

B. MAINTENANCE SCHEDULE

The installation and maintenance contractors will inspect planted areas and perform maintenance activities as needed according to the schedule in Table 4.

Table 4
MAINTENANCE SCHEDULE

PHASE	SCHEDULE
Installation	Daily
Post Installation	
Year 1 (February-May)	Semi-Monthly
Year 1 (June-January)	Monthly
Year 2	Monthly
Years 3-5	Bi-Monthly

C. WEEDING

Weed eradication will be conducted as necessary to minimize competition that could prevent the establishment of native species. As weeds become evident, they should be removed by hand, mechanical means, or controlled with the proper systemic herbicides. No weed whips will be permitted after installation of the container stock and seed mixes. Regular weeding will be the responsibility of the maintenance contractor. The restoration specialist will determine the need for any additional weeding and will notify the project proponent and maintenance contractor of any required work.

Maintenance personnel will be trained to distinguish weed species from desirable native vegetation. Examples of weeds to be controlled include, but are not limited to: artichoke thistle (*Cynara cardunculus*), fennel (*Foeniculum vulgare*), tree tobacco (*Nicotiana glauca*), yellow star thistle (*Centaurea melitensis*), mustard (*Brassica* spp.), filaree (*Erodium* spp.), tumbleweed (*Salsola iberica*), and oats (*Avena* spp.). Artichoke should receive a foliar application and fennel and tree tobacco should be cut and stump treated with herbicide. Multiple herbicide applications may be necessary for perennial species. A minimum gap of three weeks should occur between applications.

D. REPLACEMENT PLANTING

As discussed in Section VIII, remedial measures may be required if any of the restored areas are not successfully approaching the year-five standards.

E. TRASH AND DEBRIS REMOVAL

Planted areas will be kept free of trash and debris and will be checked according to the maintenance schedule (Table 4) by the installation contractor.

F. PEST CONTROL

Insects, vertebrate pests, and diseases will be monitored. Generally speaking, a high threshold of tolerance will be permitted before control measures are considered. All specific recommendations will only be made by a licensed pest control adviser as required by law. All applicable federal and state laws

and regulations will be closely followed. The restoration specialist will be consulted on any pest control matters.

G. FERTILIZATION

Fertilizer will not be applied, except in extraordinary circumstances, and only at the written direction of the restoration specialist.

H. PRUNING

No post-installation pruning will be performed unless directed by the restoration specialist.

I. IRRIGATION

After the initial plant establishment period, water will be applied infrequently and only as needed to prevent the mortality of container stock. Irrigation will not be used in the disturbed sage scrub enhancement areas. The irrigation schedule will attempt to develop deep root structure, by infrequent, deep applications of water. To obtain deep penetration of water, the irrigation system may be activated several times in one 24-hour period. The goal is to obtain germination and growth with the least amount of irrigation. Frequent irrigation encourages weed invasion and leaches nutrients from the soil. Native plantings that are infrequently irrigated may grow more slowly initially, but will ultimately develop better. Once the container stock are established and do not require supplemental irrigation, the system will be removed. The restoration specialist will determine how and when the system will be removed.

VIII. MONITORING

A. SCHEDULE

The restoration specialist will monitor the site preparation, seeding, subsequent establishment, and growth in an effort to detect any problems at an early stage (Table 5). Potential problems could arise from weed competition, erosion, vandalism, and unacceptable levels of disease and predation.

The restoration specialist's maintenance monitoring program will begin with the construction process. Upon completion of the installation phase of the restoration effort, the restoration specialist will prepare a letter report indicating that the installation is finished and that the five-year monitoring period has begun. The report will be sent to the client and to the County representative overseeing the project. Final acceptance of the installation will be verified during a site visit with the restoration specialist, landscape architect and County staff.

During the five year monitoring period, the restoration specialist will conduct regular monitoring of the restoration site (Table 4). After completing each inspection the restoration specialist will file a written report to the project proponent. Each of these reports will identify maintenance concerns including mortality, vandalism, and weed-related issues. Conditions such as disease, stress, loss of leaves, etc., of the planted oak trees will be noted during each assessment. These reports will facilitate communication and coordination with the installation contractor who will be responsible for implementing the maintenance program. Regular monitoring reports will be submitted to the project proponent and the maintenance contractor.

Table 5 MAINTENANCE MONITORING SCHEDULE	
PHASE	SCHEDULE
Grading/Site Preparation/Installation	2 times per week
Post Installation	
Year 1	Monthly
Year 2	Bi-Monthly
Years 3-5	Quarterly

In addition to regular monitoring, annual technical monitoring will be conducted in July, at the end of the growing season. These annual reports will be submitted to the project proponent, maintenance contractor, and the County within six months of the monitoring event. Annual monitoring will continue until the project has met final success criteria and received official County sign-off.

B. CONTENT OF MONITORING REPORTS

Annual technical monitoring is used to evaluate the success of the restoration effort. The annual reports will include quantitative measurements of native and non-native species cover, observations of plant and animal species diversity, and general qualitative observations of site conditions including trash or debris, erosion, irrigation, herbivory, etc. A summary of whether the project is meeting incremental success criteria and whether it appears to be on trajectory to meet final success criteria will be included. The annual reports will also include remedial recommendations for any observed problems.

C. SUCCESS CRITERIA

The purpose of this section is to define specific performance standards by which to evaluate project progress. Success criteria for sage scrub restoration will be determined with quantitative measurements of native species cover and diversity that approach conditions occurring in undisturbed sage scrub habitat remaining on site.

Percent Cover

Cover by Target and Other Native Species. Cover by native vegetation should increase over time and ultimately approach that of the existing habitats on site. Development of cover in newly created sage scrub is often slow at first as the roots become established, but with sufficient rainfall it should approach 80 percent of the existing on-site habitats in five years. Cover should be measured and evaluated separately for shrub and herbaceous life forms as compared to established reference sites (as described above). The annual milestones for these parameters are presented in Table 6.

If the restoration area's criteria are measured to be 100 percent of the reference site, then the two sites are the same. For example, if the native species cover of the reference site is 60 percent and the native species cover of the restoration site is 42 percent, the restoration site has 70 percent of the reference site's native cover. Similarly, if weed cover at the reference site is 10 percent and weed cover at the restoration site is 12 percent, the restoration site has 120 percent of the reference site's weed cover.

Cover by Exotic Species (Weeds). Weeds are typically a problem with habitat restoration, particularly at the outset of the project. As the restoration takes hold, the problems with weeds should decrease. Many local weeds have become naturalized, and therefore the tolerance for weeds should reflect what is present

at the existing habitats on site. The measure for tolerance should be total cover of weed species. Although weeds are expected to be a problem, it doesn't mean they are to be accepted. Weeds should be controlled as specified in the maintenance monitoring section.

Species Diversity and Recruitment

Species diversity and recruitment are closely linked, and diversity increases with recruitment. Species diversity is the number of species in a given area. The higher the number of species, the higher the diversity. Recruitment is the successful, natural reproduction and/or establishment of plants in a given area. Recruitment should increase diversity such that it approaches the number of species in the existing habitat on site (reference site[s]). Ultimately, the restored areas should reach 80 percent of the species diversity of the reference site(s). If natural recruitment is deficient in any area of the project by the third year after planting, then appropriate remedial actions will be taken to remedy the situation.

Table 6
SPECIES DIVERSITY AND COVER CRITERIA MILESTONES FOR SADDLEBACK MEADOWS

CRITERIA	YEAR				
	1	2	3	4	5
Percent Cover by Native Species Relative to the Reference Site	20	35	55	70	100
Percent Cover by Weeds Relative to the Reference Site	50	50	120	110	100
Percent Species Diversity Relative to the Reference Site	40	50	60	70	80

D. POTENTIAL REMEDIAL ACTIONS

The County may terminate monitoring earlier than five years if it is recommended first by the restoration specialist in a year-end report. Likewise, if at the end of five years, any of the restored areas fail to meet the year-five standards, then the monitoring and maintenance period will be extended one full year, and a specific set of remedial measures (approved by the County) will be implemented. Only areas which fail to meet the success standards will require additional work, that is, not all of the areas originally restored. This process will continue until all year-five standards are met, or as otherwise provided in this document, the County determines that other mitigation measures are appropriate.

IX. COMPLETION OF MITIGATION

A. NOTIFICATION OF COMPLETION

The County shall be notified of completion of the mitigation effort through the submittal of the five-year monitoring report.

B. COUNTY CONFIRMATION

If the project meets all success standards at the end of the five-year-monitoring period then the mitigation will be considered a success. If not, the maintenance and monitoring program will be extended one full year at a time and a specific set of remedial measures (approved by the County) will be implemented until the standards are met. This process will continue until all year-five standards are met or until the County determines that other mitigation measures are appropriate. Should the mitigation effort meet all goals prior to the end of the five-year-monitoring period, the County, at their discretion, may terminate the monitoring effort. Alternatively, a subsequent agreement may be negotiated with the County. Only areas that fail to meet the success standards will be subject to any subsequent agreement.

Re: Biological Opinion on the Saddleback Meadows Residential Development Project, Orange County, California (1-6-01-F-1023)

Dear Colonel Thompson:

This document transmits our biological opinion based on our review of the proposed Saddleback Meadows Residential Development Project located in Orange County, California and its effects on the federally endangered Riverside fairy shrimp (*Streptocephalus woottoni*, "fairy shrimp") and its designated critical habitat, and designated critical habitat for the threatened coastal California gnatcatcher (*Polioptila californica californica*, "gnatcatcher"), in accordance with section 7 of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*). Your requests for formal consultation on the fairy shrimp and gnatcatcher critical habitat, and conference on proposed critical habitat for the fairy shrimp, were received on September 8 and December 25, 2000, respectively. On May 30, 2001, the U.S. Fish and Wildlife Service (Service) published a final rule designating critical habitat for the fairy shrimp (66 FR 29384). Therefore, this biological opinion will include a formal consultation on the proposed project's effects on designated critical habitat for the fairy shrimp.

This biological opinion is based on information provided in the: 1) *Draft Biological Resources Technical Report for the Saddleback Meadows Property Orange County, California* (Chambers Group, June 1999); 2) *Saddleback Meadows Conceptual Mitigation and Monitoring Plan* (Helix Environmental Planning, Inc. (Helix), April 13, 2000); 3) *Saddleback Meadows Biological Assessment* (Helix, July 6, 2000); 4) Helix letter and attachments to the U.S. Army Corps of Engineers (Corps) dated October 6, 2000; 5) Helix notice of transmittal and attachments to the Service dated November 10, 2000; 6) *2000 Annual Report U.S. Fish and Wildlife Service Protocol Level Dry Season Survey for San Diego and Riverside fairy shrimp (Branchinecta sandiegonensis and Streptocephalus woottoni)* (Helix, December 19, 2000); 7) Helix

memorandum and attachments to the Service dated December 20, 2000; 8) *Saddleback Meadows Coastal Sage Scrub Restoration Plan* (Helix, February 26, 2001); 9) Corps Pre-Construction Notification for No. 199915117-YJC dated March 12, 2001; 10) Helix notice of transmittal and attachments to the Service dated March 14, 2001; 11) G. A. Nicoll and Associates, Inc. letter to TPG Management Inc. (TPG) dated April 4, 2001; 12) TPG memorandum and attachments to the Service dated April 11, 2001; 13) Helix letter and attachments to the Service dated May 23, 2001; 14) electronic mail from Barry Jones of Helix to the Service dated May 25 and June 27, 2001; 15) TPG letter to the Corps and Service dated July 26, 2001: 16) Helix notice of transmittal and attachments to the Service dated June 28, 2001; 17) McCollum Associates electronic mail and attachment to the Service dated August 15, 2001; 18) Helix memorandum to the Service dated August 23, 2001; 19) electronic mail from Joe LaCava of TPG to the Service dated September 19, 2001; 20) *2001 Gnatcatcher Survey Report for Saddleback Meadows* (Helix, September 26, 2001); 21) Helix notice of transmittal and attachment to the Service dated September 20, 2001; 22) a field investigation conducted on June 15, 2000, with the Corps and the applicant's representatives; 23) meetings and telephone conferences with the Corps and/or applicant's representatives held on October 10 and November 16, 2000, March 14, April 5, May 7, June 5, July 17, August 14, and October 9, 2001; and other sources of information. A complete administrative record of this consultation is on file at this office.

CONSULTATION HISTORY

The Service has been working with the Corps and applicant, California Quartet, Ltd., on the proposed Saddleback Meadows Development Project since 1999. The Corps is reviewing a permit application (Corps No. 199915117-YJC) for discharge of fill into jurisdictional waters of the United States (U.S.), including three ephemeral ponds (i.e., Ponds A, B and E) and two breached ponds (i.e., Ponds C and F) occupied by the fairy shrimp and/or their cysts, for a proposed residential development. We participated in a field investigation of the proposed development site and mitigation areas with the Corps and applicant's representatives on June 15, 2000.

On September 8, 2000, we received a request from the Corps dated September 5, 2000, to initiate formal consultation on the effects of the Saddleback Meadows Residential Development Project on the fairy shrimp. Enclosed with the letter was the *Saddleback Meadows Biological Assessment* (Helix, July 6, 2000).

On October 6, 2000, we received a facsimile of a letter of the same date sent to the Corps from Helix that included a series of technical papers. The letter also included information on proposed impact minimization measures and a summary of gnatcatcher survey results for the Saddleback Meadows property. No gnatcatchers were found on the property during Service protocol surveys done in 1998, nor reconnaissance-level surveys done in 1993 and 1994.

On October 11, 2000, we participated in a meeting with the Corps, Regional Water Quality Control Board (RWQCB), California Department of Fish and Game (CDFG), and applicant's representatives to discuss the proposed project. The applicant's representatives stated that the

proposed project would impact all but two of the existing nine fairy shrimp ponds and offset the loss of these ponds by pond creation onsite and offsite acquisition of vernal pools (one occupied by the fairy shrimp) on the Viejo property in Orange County. We then informed the Corps and applicant that the Service had serious concerns about the proposed project and its impacts to the long-term survival of the fairy shrimp and its proposed critical habitat. We asked the applicant if the proposed project could be redesigned to avoid more of the fairy shrimp ponds, and in particular Pond E, or to phase impacts. In response, the applicant's representatives stated that it would not be practicable to avoid more of the fairy shrimp ponds or phase impacts and that they would provide a more detailed evaluation of why this could not be done.

Initiation of formal consultation was acknowledged by the Service in a letter to the Corps dated October 24, 2000, with a completed biological opinion due January 22, 2001. In that letter, we also requested information needed to complete our analysis of the effects of the project on the fairy shrimp, stated that the Corps should determine whether the proposed project will adversely effect critical habitat for the gnatcatcher, and recommended that the Corps conference on the proposed critical habitat for the fairy shrimp.

On November 13, 2000, we received from Helix all of the information requested in our initiation letter, except for a map and table of the watersheds of the existing and proposed ponds.

On November 16, 2000, we participated in a meeting with the Corps, CDFG, and applicant's representatives to discuss the proposed project. At the meeting, exhibits showing potential sites for fairy shrimp pond creation were presented by the applicant's representative. We also discussed further avoidance and/or minimization of impacts to fairy shrimp habitat and phasing of unavoidable impacts until viable fairy shrimp populations are demonstrated to be established in the created ponds based on set criteria (e.g., presence of a viable cyst bank or of fairy shrimp during multiple wet seasons). In addition, the applicant agreed to complete fairy shrimp cyst surveys in breached Ponds C and F and to provide a map and table of the watersheds of the existing and proposed ponds and a plan for delaying/phasing fairy shrimp pond impacts in relation to fairy shrimp pond creation. We also discussed potential impacts to critical habitat for the gnatcatcher, and the applicant agreed to provide information on the amount and location of proposed coastal sage scrub impact, preservation and restoration.

On December 21, 2000, we received confirmation from Helix that surveys found fairy shrimp cysts in both breached ponds. Helix also provided a map and table of watersheds of the existing ponds, a table of the watersheds of the proposed created ponds, and a proposed phasing plan for fairy shrimp pond impacts and creation.

On December 25, 2000, we received a request from the Corps dated December 19, 2000, to initiate formal consultation on designated critical habitat for the gnatcatcher and to conference on proposed critical habitat for the fairy shrimp. Initiation of formal consultation on the effect of the proposed project on designated critical habitat for the gnatcatcher, and conference on proposed critical habitat for the fairy shrimp was acknowledged by the Service in a letter to the Corps dated January 25, 2001. In that letter, we requested a 60-day extension to the consultation period

until March 22, 2001, and again requested information on the amount and location of proposed coastal sage scrub impact, preservation and restoration. On February 27, 2001, we received from Helix a coastal sage scrub restoration plan dated February 26, 2001.

On March 9, 2001, we forwarded by facsimile and electronic mail three project alternatives to the Corps and applicant that addressed our concerns for adequate avoidance, project phasing, and creation to ensure that the existing population of fairy shrimp is sustained onsite.

On March 12, 2001, we received from the Corps a facsimile of a Pre-Construction Notification (PCN) of the same date for the proposed project. The PCN proposed that impacts to 7 seasonal ponds occupied by the fairy shrimp (including breached Ponds C and F) and to 2.35 acres of other waters of the U.S. be authorized under Nationwide Permit 26.

On March 14, 2001, we participated in a conference call with the Corps and the applicant's representatives to discuss the alternatives we had previously submitted. During the call, the applicant's representatives stated that while it would be possible to avoid Pond E and build the rest of the project, development of the northeast portion of the property where Pond E is found is needed to pay for the substantial remedial grading required to stabilize an existing landslide through the property. The applicant's representatives also stated that it would be possible to phase project grading to allow some fairy shrimp pond creation and demonstration of success before impacting all seven ponds within the project footprint. On March 15, 2001, we received a notice of transmittal from Helix dated March 14, 2001, with a map of the extant ponds and their watersheds, the potential avoidance area around Pond E, and the proposed project phasing.

On March 21, 2001, we received a verbal request from the applicant's representative, Mike McCollum, to meet with us and the Corps on April 5, 2001, to allow the applicant's representatives to present additional project information and to further discuss the proposed conservation measures for fairy shrimp. In our letter to the Corps dated March 29, 2001, we concurred that such a meeting would be beneficial and therefore requested an extension of the consultation period until May 5, 2001.

At the April 5, 2001, meeting, the applicant's representatives stated that due to geotechnical issues the previously proposed project phasing and avoidance of Pond E could not be done without losing 72 more housing lots. We reiterated our concerns about the project's impacts to the long-term survival of the fairy shrimp population onsite. The applicant's representatives agreed to our request to extend the consultation period until May 5, 2001, and to provide a letter documenting the changes in the project description.

On April 17, 2001, we received a document from TPG dated April 11, 2001, that summarized the changes in the project description and timing of fairy shrimp pond creation efforts in relation to project impacts. The document also included a map showing the 72 housing lots that would lost if Pond E was avoided.

In our letter to the Corps dated April 18, 2001, we informed the Corps that we were working with the Department of Justice to extend the completion date for publication of the final rule designating critical habitat for the fairy shrimp and thus had agreed not to issue any biological opinions within the boundaries of the proposed critical habitat until the final rule went into effect. We verbally informed the applicant's representatives of this issue on the same day.

On April 27, 2001, we forwarded by facsimile a draft project description for the biological opinion to the Corps and applicant's representatives for their review and comment. On May 7, 2001, we participated in a conference call with the Corps and the applicant's representatives to discuss the draft project description for the biological opinion.

On May 9, 2001, we forwarded by electronic mail a recommendation to the Corps and applicant's representatives that updated gnatcatcher surveys be done because of the three-year time period since the last protocol surveys were done on the Saddleback Meadows property.

On May 24, 2001, we received a letter from Helix dated May 23, 2001, that provided: 1) an updated figure showing the watersheds of the proposed creation ponds; 2) an explanation on how drainage into the basins will be protected from irrigation and urban runoff; 3) an updated vernal pool restoration plan for the Viejo parcel that reduced restoration from approximately 0.16 acres to 0.03 acres; and 4) comments on the draft project description.

On May 31 and June 1, 2001, we forwarded by electronic mail to the Corps and applicant's representatives comments and questions on the proposed conservation measures for impacts to coastal sage scrub.

On June 1, 2001, we received a notice from Helix by electronic mail that the additional gnatcatcher surveys we recommended would be completed by June 22, 2001.

On June 27, 2001, we received from Helix an electronic mail that addressed our comments and questions on the proposed conservation measures for impacts to coastal sage scrub.

In our letter dated July 17, 2001, we informed the Corps that the Service published a final rule designating critical habitat for the fairy shrimp, and that our biological opinion would include a formal consultation on the proposed project's effects on designated critical habitat for the fairy shrimp

We also met with the Corps and applicant's representatives on July 17, 2001, to discuss the contents of our letter. At the meeting, the applicant's representatives proposed to perform a pilot program to demonstrate their ability to create ponds that hold water for sufficient duration for the fairy shrimp prior to initiating impacts to the extant fairy shrimp ponds.

On July 30, 2001, we received a letter from TPG outlining their proposed pilot program which would create 3 ponds and demonstrate their ability to hold water for a minimum of 60 days at

depths appropriate for the fairy shrimp, prior to initiating impacts to the extant fairy shrimp ponds.

On August 14, 2001, we met with the applicant's representatives to discuss further minimization of impacts to the fairy shrimp pools, including the avoidance of Ponds D and G.

On August 15, 2001, we received from McCollum Associates by electronic mail a proposal to avoid direct impacts to Ponds D and G by removing up to 20 lots from the development and to remove Basins 3, 4, 6 and 7 from the proposed pond creation plan, while retaining Basins 4, 6 and 7 as backup locations. Also, the electronic mail stated that the applicant no longer proposed to acquire and preserve the one vernal pool on the Viejo property occupied by the fairy shrimp.

On August 21, 2001, we forwarded by electronic mail to the applicant's representatives comments and questions on the new proposal for minimizing impacts to fairy shrimp ponds.

On August 23, 2001, we received from McCollum Associates by electronic mail a memorandum prepared by Helix that responded to our comments and questions on the new proposal for minimizing impacts to fairy shrimp ponds.

On September 13, 2001, we made a verbal request to McCollum Associates and Helix for: 1) a map showing the new fairy shrimp pond avoidance/creation plan, project grading footprint and watersheds of the avoided and created ponds; and 2) the 2001 gnatcatcher survey results.

On September 19, 2001, we sent an electronic mail to the applicant's representatives asking if the applicant still proposed: 1) the pilot fairy shrimp pond creation as outlined in TPG's July 30, 2001, letter; and 2) to acquire and preserve 13 acres of coastal sage scrub on the Viejo property.

On September 20, 2001, we received: 1) a notice of transmittal from Helix that included a map showing how the project had been reduced from 299 units to 283 units to avoid Ponds D and G. The map also showed all the extant ponds to be avoided (i.e., Ponds D, G, H and I) and their watersheds, the fairy shrimp ponds to be created (i.e., Basins 1, 2, 5 and 8) and their watersheds, and the reduced project grading footprint; 2) an electronic mail from Helix with updated habitat impacts acreages and coastal sage scrub mitigation acreages for the reduced project; and 3) an electronic mail from Joe LaCava of TPG stating that the project no longer includes the pilot fairy shrimp pond creation because of the significant financial burden of the reducing the project to 283 units, but that it still includes acquisition and preservation of coastal sage scrub at the Viejo property, or other location approved by the Service.

On September 27, 2001, we received a report from Helix dated September 26, 2001, which states that no gnatcatchers were found on the property during Service protocol surveys done in 2001.

On October 5, 2001, we forwarded a draft biological opinion to the Corps. On October 9, 2001, we received a letter from McCollum Associates via facsimile that presented the applicant's comments regarding the draft biological opinion, and participated in a telephone conference with

the applicant's representatives to discuss the applicant's comments. On October 22, 2001, we forwarded a revised draft biological opinion to the Corps and applicant that incorporated changes agreed to during our October 9th telephone conference. On October 23 and 25, 2001, we received an electronic mail from McCollum Associates and the Corps, respectively, that concurred with the revised draft biological opinion.

BIOLOGICAL OPINION

DESCRIPTION OF THE PROPOSED ACTION

The proposed action is the issuance of a permit by the Corps under section 404 of the Clean Water Act that would authorize fill into waters of the U.S., including five ephemeral ponds occupied by the fairy shrimp and/or containing its cysts, for construction of the Saddleback Meadows Residential Development Project. The 225-acre Saddleback Meadows site is located east of El Toro Road just south of its intersection with Live Oak Canyon Road in the Foothill Trabuco Specific Plan area of Orange County, California (Figure 1). The site has historically been used for livestock grazing and limited agriculture. The proposed project would construct a 283-unit residential development on approximately 127.6 acres through conventional and remedial grading for houses and associated roads, utilities and a water tank (Figure 2). The remedial and manufacture slopes created for the development will be revegetated and, in some areas permanently irrigated, to provide fire protection. Brush management to provide fire protection will also be done in areas outside of the grading footprint. Approximately 97.4 acres of biological open space will be established by the project, including native habitat restoration on areas of the manufactured slopes outside the limits of fire protection measures.

Habitat types onsite include seven vernal pool-like ephemeral ponds (0.48 acres) occupied by the fairy shrimp; two breached ponds (0.27 acres) that contain fairy shrimp cysts; Venturan-Diegan transitional/disturbed coastal sage scrub (57.8/14.4 acres); coast live oak woodland (12.9 acres), southern mixed chaparral (7.6 acres), agriculture (5.4 acres), mule fat scrub (3.2 acres), ornamental (0.5 acres), southern sycamore woodland (0.3 acres), non-wetland waters of the U.S. (3.72 acres dispersed within the other habitat types), and non-native annual grassland (122.3 acres). The entire project site falls within designated critical habitat for the fairy shrimp and gnatcatcher.

The project proposes to fill three of the seven unbreached fairy shrimp ponds (i.e., Ponds A, B, and E; 0.24 acres) and both breached ponds (i.e., C and F; 0.27 acres). Direct impacts to Pond D, G, H and I will be avoided, but project grading will occur within their watersheds to within approximately 75 to 125 feet of the ponds. The project also proposes to grade approximately 155.4 acres of other vegetation types including: 38.4 acres of coastal sage scrub and clear for fire management an additional 2.3 acres, for a total impact to 40.7 acres of coastal sage scrub; 5.12 acres of coast live oak woodland; 3.9 acres of southern mixed chaparral; 1.63 acres of mule fat scrub; 0.14 acres of southern willow scrub; 0.4 acres of agriculture; and 103.5 acres of annual grassland.

The following conservation measures are proposed to be implemented as part of the proposed action to mitigate impacts to Corps and CDFG jurisdictional areas under section 404 of the Clean Water Act and section 1600 of the California Fish and Game Code and to minimize potential adverse effects of the action on listed species and their designated critical habitats.

1. Onsite avoidance and preservation of Ponds D, G, H and I with a total basin area of 0.24 acres. All grading directly adjacent to Ponds D, G, H and I will be done from May 15 to November 15 outside the rainy season unless erosion control measures approved by the Service and Corps are in place.

2. Onsite creation of four ephemeral ponds with a total basin area of 0.82 acres. Fairy shrimp will be introduced into the created ponds via inoculum (i.e., soil bearing cysts) collected from the impacted ponds.

3. Placing approximately one-fifth of the salvaged soil and cysts in appropriate storage at the San Diego Zoological Society's Center for the Reproduction of Endangered Species (CRES) until either the created ponds have met predetermined success criteria or the Service determines that it is reasonable to assume that they will. This *ex situ* storage will ensure that viable genetic material remains in case the created pools were unsuccessful. Once creation success is determined, the remainder of the salvaged soil and cysts will then be added to the created pools, used for other restoration projects in the region, and/or used for scientific purposes at the discretion of the Service.

4. Implementation of a 10-year fairy shrimp pond creation, maintenance and monitoring plan approved by the Service and Corps that includes: success criteria for establishing viable fairy shrimp populations, and the hydrology necessary to support them, in the created ponds; success criteria for establishing coastal sage scrub or other native habitats within the watersheds of the avoided and created ponds; and contingency measures in the event of creation failure.

5. Onsite avoidance and preservation of 31.5 acres of coastal sage scrub, restoration/preservation of 36.0 acres of coastal sage scrub, and enhancement/preservation of 6.5 acres of disturbed coastal sage scrub. If artificial irrigation is used in coastal sage scrub restoration efforts, appropriate measures will be taken to ensure that irrigation water does not enter the avoided and created fairy shrimp ponds.

6. Offsite acquisition and preservation of 6 acres of coastal sage scrub on the Viejo property, or other site approved by the Service and Corps within Unit 6 of the designated critical habitat for the gnatcatcher.

7. Clearing of coastal sage scrub will not be done during the gnatcatcher breeding season (i.e., February 15 to August 31).

8. Implementation of a 5-year coastal sage scrub restoration/enhancement, maintenance and monitoring plan approved by the Service and Corps that includes: success criteria for establishing coastal sage scrub; and contingency measures in the event of creation failure.

9. Fairy shrimp pond creation and watershed restoration, and coastal sage scrub restoration/enhancement grading, weed control, planting and irrigation outside of the graded development footprint will be initiated prior to or concurrently with fairy shrimp pond and coastal sage scrub impacts and will be completed within 120 days, while that within the graded development footprint will be initiated within 30 days and completed within 120 days of finishing development grading. Any temporal loss of fairy shrimp ponds caused by delays in fairy shrimp pond creation and watershed restoration will be offset as determined by the Service and Corps. Any temporal loss of coastal sage scrub caused by delays in restoration and enhancement will be offset through coastal sage scrub preservation, restoration and/or enhancement at a 0.5:1 ratio for every six months of delay (i.e., 1:1 for 12 months delay, 1.5:1 for 18 months delay, etc...).

10. Fencing (with silt barriers) the limits of construction and implementation of other erosion control measures deemed necessary by the Service and Corps for the duration of project construction to prevent additional fairy shrimp pond and coastal sage scrub impacts and the spread of silt from the construction zone into adjacent fairy shrimp ponds, coastal sage scrub and other habitats. The project proponent will submit to the Service and Corps for approval final construction plans and photographs for each phase showing fenced limits of impact and all fairy shrimp ponds and coastal sage scrub areas to be impacted and preserved at least 7 days prior to the planned date of initiating fairy shrimp pond or coastal sage scrub impacts. If fairy shrimp pond or coastal sage scrub impacts occur outside of these limits, all work will cease until the problem has been remedied to the satisfaction of the Service and Corps. Any fairy shrimp pond or coastal sage scrub impacts that occur outside of the approved fenced limits will be mitigated at a minimum 5:1 ratio.

11. Staffing of a qualified biologist onsite during fairy shrimp pond and coastal sage scrub grading and during work adjacent to fairy shrimp ponds and coastal sage scrub to be preserved to ensure compliance with all conservation measures and to produce reports that document compliance with these measures. The project proponent will submit the biologist's name, address, telephone number, and work schedule on the project to the Service and Corps at least 7 days prior to the planned date of initiating fairy shrimp pond and coastal sage scrub impacts. The biologist will report any violation to the Service and Corps within 24 hours of its occurrence and submit weekly compliance reports (including photographs of impact areas) to the Service and Corps. The biologist will also submit a final report to the Service and Corps within 60 days of project completion that includes: as-built construction drawings with an overlay of fairy shrimp ponds and coastal sage scrub areas that were impacted or preserved, photographs of the preserved fairy shrimp ponds and coastal sage scrub, and other relevant information documenting that authorized fairy shrimp pond and coastal sage scrub impacts were not exceeded.

12. Posting a bond or letter of credit in favor of the Service and the Corps for site preparation, planting, irrigation, and 10 years of maintenance and monitoring of the fairy shrimp pool creation and watershed restoration and 5 years maintenance and monitoring of the coastal sage scrub restoration/enhancement (including a 20 percent contingency to be added to the total costs). This bond or letter of credit is to guarantee the successful implementation of the fairy shrimp pond creation and watershed restoration, coastal sage scrub restoration/enhancement, and the maintenance and monitoring component of the plans. The project proponent will submit a draft bond or letter of credit with an itemized cost list to the Service and Corps for approval at least 60 days prior to the planned date of initiating fairy shrimp pond and coastal sage scrub impacts. The project proponent will submit the final bond or letter of credit for the amount approved by the Service and Corps within 20 days of receiving approval of the draft bond or letter of credit.

13. Executing and recording an irrevocable offer to dedicate or other form of mutually acceptable instrument offering to dedicate 97.4 acres of biological open space, including the avoided and created fairy shrimp ponds and their watersheds and the 64.7-acre coastal sage scrub preservation, restoration and enhancement areas. The irrevocable offer to dedicate, or other form of instrument, will provide for the transfer of fee title to the 97.4-acre area to the County of Orange or other agent approved by the Service and the Corps when final maps for the project are recorded. The irrevocable offer of dedication or other instrument will include a perpetual conservation easement for biological conservation purposes in favor of the County of Orange or other agent approved by the Service and the Corps. The form and content of the easement will be approved by the Service and Corps prior to its execution. The easement will state that no other easements or activities (e.g., fuel modification zones, public trails, drainage facilities, walls, and/or maintenance access roads) which would result in soil disturbance and/or vegetation removal, except as approved by the Service and Corps, will be allowed within the biological conservation easement area. The project proponent will provide evidence of recordation of the irrevocable offer of dedication or other instrument, including the biological conservation easement, to the Service and the Corps at least 60 days prior to the planned date of initiating impacts to any fairy shrimp ponds and their watersheds. The biological conservation easement and fee title will remain in favor of the County of Orange or other agent approved by the Service and Corps until a reserve is established for the Southern NCCP Subregion of Orange County, at which point the conservation easement and fee title will be transferred to the reserve manager as directed by the Service and Corps.

14. Implementing a perpetual maintenance and monitoring plan approved by the Service and Corps for the 97.4 acres of biological open space. A non-wasting endowment will be established to finance the plan. The plan will include construction and maintenance of interceptor ditches to divert water from irrigated fuel management slopes away from the avoided and created ponds and fencing or otherwise protecting the biological conservation area from pet and human disturbance. The project proponent will submit a draft perpetual management, maintenance and monitoring plan with an itemized cost list

for the non-wasting endowment fund to the Service and Corps for approval at least 60 days prior to the planned date of initiating impacts to any fairy shrimp pools or their watersheds. The project proponent will submit to the Service and Corps the final perpetual management, maintenance and monitoring plan and transfer the non-wasting endowment fund to the County of Orange or other approved agent for the amount approved by the Service and Corps within 20 days of receiving approval of the draft plan and fund. The management responsibilities and non-wasting endowment will remain with the County of Orange or other agent approved by the Service and Corps until a reserve is established for the Southern NCCP Subregion of Orange County, at which point the management responsibilities and endowment will be transferred to the reserve manager as directed by the Service and Corps.

15. Developing a resident education program in coordination with the Service. The program will advise residents of the potential impacts to the listed species and the potential penalties for taking such species. The program will include, but not be limited to, information pamphlets and signage of the fencing between the development and the preservation area. Pamphlets will be distributed to all residences. At a minimum, the program will include the following topics: occurrence of the listed and sensitive species in the area, their general ecology, sensitivity of the species to human activities, impacts from free-roaming pets (particularly domestic and feral cats), legal protection afforded these species, penalties for violations of Federal and State laws, reporting requirements, and project features designed to reduce the impacts to these species and promote continued successful occupation of the preserved areas.

16. Ensuring that the residential development landscape will not include exotic or native plant species that may be invasive to native habitats. The Service and Corps will be provided a list, for review and approval, of species to be included in the landscaping, at least 60 days prior to initiating impacts to fairy shrimp ponds and coastal sage scrub.

17. Onsite creation of 0.86 acres of mule fat scrub around the perimeter of the created ponds. If artificial irrigation is used, appropriate measures will be taken to ensure that irrigation water does not enter the created ponds.

18. Onsite creation of 0.44 acres of non-wetland waters of the U.S. consisting of 0.17 acres of vegetated waters and 0.27 acres of non-vegetated waters.

19. Offsite acquisition and creation of 0.9 acres and enhancement of 0.87 acres of riparian habitat on the Hidden Ranch property.

20. Offsite acquisition of 1.05 acres of non-wetland waters of the U.S. on the Viejo, Hidden Ranch property or other site approved by the Service and Corps.

STATUS OF THE SPECIES/CRITICAL HABITAT

Riverside fairy shrimp and its designated critical habitat

The Riverside fairy shrimp is a small freshwater crustacean in the family Streptocephalidae that is restricted to vernal pools and ephemeral basins. Adults are between 13 to 25 mm long. The males and females have red colored cercopods (anterior appendages) on all of the ninth and 30 to 40 percent of the eighth abdominal segments, which helps to distinguish this species from closely related species. The species is relatively long-lived, requiring 48 to 56 days to reach maturity, in contrast to other fairy shrimp that can reach sexual maturity in less than 2 weeks (Hathaway and Simovich 1996). Riverside fairy shrimp cysts can survive for several years until conditions are favorable for successful reproduction. Not all cysts are likely to hatch in a season, thus providing a mechanism for survival if the inundation period is too short in a given year (Simovich and Hathaway 1997).

Because of its long maturation, the fairy shrimp is found in relatively deep (>30 centimeters), cool water vernal pools that are inundated for at least 60 days. They also are found in disturbed vernal pool habitats where basins have been compacted or artificially deepened and, therefore, hold water for longer periods of time. Although basins supporting populations often appear to be artificially created or enhanced, such basins still are located within soils that are capable of seasonal ponding and are often surrounded by naturally occurring vernal pool complexes. These "artificial basins" function in the same manner as naturally occurring vernal pools by filling with late fall, winter and/or spring rains that gradually dry up during the spring and/or summer.

Water within pools supporting fairy shrimp may be clear, but more commonly it is moderately turbid (Eriksen and Belk 1999). Typically, pools supporting this species have low total dissolved solids and alkalinity (means of 77 and 65 parts per million, respectively), corroborated by pH at neutral or just below (7.1-6.4) (Eng *et al.* 1990, Gonzalez *et al.* 1996, Eriksen and Belk 1999).

Fairy shrimp play an important role in the community ecology of vernal pools (Loring *et al.* 1988). They are fed upon by waterfowl (Driver 1981, Krapu 1974, Swanson *et al.* 1974) and other vertebrates, such as western spadefoot toad tadpoles (*Spea hammondi*) (M. Simovich, pers. comm. 1991).

At the time of listing, the fairy shrimp was known from four vernal pools in a 37-square mile (91-square kilometer) area near Temecula in Riverside County, one population in Orange County, one vernal pool on Naval Air Station Miramar, and in numerous vernal pools on Otay Mesa in San Diego County. The species was also known from two locations, Valle de las Palmas and at Baja Mar north of Ensenada, in Baja California, Mexico (Brown *et al.* 1993). Subsequent to its listing, a more northerly population was documented in Moorpark, Ventura County. Fairy shrimp cysts were also found within a series of depressions among flight runways at the Los Angeles International Airport. Other populations of the fairy shrimp documented since the 1993 listing include an ephemeral pond on Marine Corps Air Station (MCAS) El Toro, a vernal pool on the Viejo property in central Orange County, 16 vernal pools/ponds in southern Orange

County (including the 9 ponds on the Saddleback Meadows property), numerous pools on Marine Corps Base Camp Pendleton, a vernal pool complex within Carlsbad in central San Diego County, additional pools on Otay Mesa in southern San Diego County, and several detention basins in Riverside County.

The Service listed the Riverside fairy shrimp as an endangered species on August 3, 1993 (58 FR 41391) because of habitat loss and degradation due to urban and agricultural development, off-road vehicle use, trampling, and other factors. At the time of the listing, the Service concluded that the designation of critical habitat was not prudent. However, on February 15, 2000, the Service entered into a settlement agreement, with the plaintiff in a lawsuit filed in the Federal District Court for the Northern California District, to issue a new decision regarding the prudency of designating critical habitat for the fairy shrimp. The proposal to designate critical habitat for the fairy shrimp was published on September 21, 2000 (65 FR 57136). On May 30, 2001, the Service published a final rule designating critical habitat for the fairy shrimp that encompasses approximately 6,870 acres of land in Los Angeles, Orange, Riverside, San Diego, and Ventura counties, California (66 FR 29384). The proposed development project is located in the foothills of the Santa Ana Mountains within Unit 2: Los Angeles Basin-Orange Management Area (1,080 acres) of this designation (66 FR 29388).

The Orange County portion of Unit 2 includes vernal pools and vernal pool-like ephemeral ponds at the MCAS El Toro, the Viejo property, Saddleback Meadows, Tijeras Creek, and Chiquita Ridge. The Orange County pools represent the vast majority of Riverside fairy shrimp habitat within this critical habitat unit. The Riverside fairy shrimp habitat in Orange County is geographically distinct from other pools within the species range and is essential to the overall long-term conservation of the species. Therefore, the conservation of these vernal pools is necessary to reduce the risk of extinction through random and natural events to fairy shrimp populations in Orange County and throughout its current range.

A total of 20 historic or extant pools/ponds known to be occupied by the fairy shrimp and/or cysts occur within Unit 2 (Table 1), including two that were discovered in southern Orange County after the designation of critical habitat for the fairy shrimp. One of these pools was filled by the Antonio Parkway project, and the pond at Live Oak Canyon has been authorized to be filled by the Corps under section 404 of the Clean Water Act. Another pool was negatively impacted by restoration efforts for the Antonio Parkway project and no longer retains water for sufficient duration for fairy shrimp cysts to hatch. Of the remaining pools, the two on Chiquita Ridge have been preserved to offset the loss of the pool previously authorized to be filled by the Antonio Parkway project; the pool on the Viejo property is to be part of a mitigation bank; and we are not aware of any projects proposed for the MCAS El Toro and Radio Tower Road pond/pools. The 9 ponds at Saddleback Meadows represent 53 percent of the 17 remaining occupied pools/ponds, making it the largest fairy shrimp habitat complex found in Unit 2.

The primary constituent elements for Riverside fairy shrimp are those habitat components that are essential for the primary biological needs of foraging, sheltering, reproduction, and dispersal. These primary constituent elements are found in areas that support vernal pools or other

ephemeral ponds and depressions and their associated watersheds. The primary constituent elements are: small to large pools with moderate to deep depths that hold water for sufficient lengths of time necessary for fairy shrimp incubation and reproduction, but not necessarily every year; the associated watershed(s) and other hydrologic features that support pool basins and their related pool complexes; flat or gently sloping topography; and any soil type with a clay component and/or an impermeable surface or subsurface layer known to support vernal pool habitat.

Vernal pools have a discontinuous occurrence in several regions of California. Although the pools of southern California share some wide-ranging temporary wetland species with pools in other parts of the state, southern California pools support unique species including both the Riverside and San Diego fairy shrimp (*Branchinecta sandiegonensis*), spreading navarretia (*Navarretia fossalis*), and San Diego button-celery (*Eryngium aristulatum* var. *parishii*). These species are among a number of other aquatic invertebrate and indigenous plant species that have evolved to occupy the extreme environmental conditions found in vernal pool habitats (Stone 1990).

Threats to vernal pools can be divided into three major categories: 1) direct destruction of vernal pools such as construction, vehicle traffic, domestic animal grazing, dumping, and deep plowing; 2) indirect threats that degrade or destroy the vernal pool over time such as altered hydrology (e.g., altering a pools watershed), invasion of alien species, habitat fragmentation, and associated deleterious effects resulting from adjoining urban land uses; and 3) potentially catastrophic long-term threats including the effect of isolation on genetic diversity and locally adapted genotypes, air and water pollution, drastic climatic variations, and changes in nutrient availability (Bauder 1986).

Loss of historic vernal pool habitat in San Diego County is estimated at around 95 to 97 percent because of intensive cultivation and urbanization (Bauder and McMillan 1998). Lack of historical data precludes the same depth of analysis for Los Angeles, Riverside, Orange, or San Bernardino counties, but losses are considered nearly 100 percent (58 FR 41384). The vernal pool habitat type has been ranked in the California Department of Fish and Game's Natural Diversity Data Base in priority class G1-S1, which denotes communities that occur in California and over less than 2,000 acres globally.

Designated Critical Habitat for the gnatcatcher

The coastal California gnatcatcher (*Polioptila californica californica*) is a recognized subspecies of the California gnatcatcher (*Polioptila californica* [Brewster]) and is endemic to southern California and northwestern Baja California, Mexico (Atwood 1990). It is a nonmigratory, resident species that is found on the coastal slopes of southern California, ranging from southern Ventura County southward through Los Angeles, Orange, Riverside, San Bernardino, and San Diego counties into Baja California, Mexico, to approximately 30 degrees North latitude near El Rosario (Atwood 1980, 1990). Gnatcatchers were considered locally common in the mid-1940's,

but by the 1960's this subspecies had declined substantially in the United States owing to widespread destruction of its habitat (Atwood 1980).

The gnatcatcher occurs in several subassociations of the coastal sage scrub plant community. Coastal sage scrub vegetation is composed of relatively low-growing, dry-season deciduous, and succulent plants. The coastal sage scrub formation is generally characterized by California sagebrush (*Artemisia californica*), several species of sage (*Salvia* spp.), California encelia (*Encelia californica*), and California buckwheat (*Eriogonum fasciculatum*), interspersed with species such as lemonadeberry (*Rhus integrifolia*) and various species of cactus and cholla (*Opuntia* spp.) (O'Leary 1990). Coastal sage scrub often occurs in a patchy or mosaic distribution pattern throughout the range of the gnatcatcher.

Gnatcatchers are typically found in moderately dense stands of vegetation (40-70 percent cover) below 620 meters (Atwood 1980). Density of vegetation, however, does not necessarily predict suitability of habitat but rather influences territory size. Territory size increases as vegetation density decreases, probably due to food resource availability. Gnatcatchers will use sparsely vegetated coastal sage scrub for shelter and foraging as long as perennial shrubs are available.

Gnatcatchers also use chaparral, grassland, and riparian plant communities where they occur adjacent to or intermixed with sage scrub. The use of these habitats appears to be most frequent during late summer, autumn, and winter, with smaller numbers of birds using such areas during the breeding season. However, breeding territories have been documented in non-sage scrub habitats (e.g. chaparral). Potential factors contributing to the gnatcatcher's use of alternative habitats may include more abundant food resources, higher survival rates during dispersal, fire avoidance, and cooler microclimate during heat stress (Campbell *et al.* 1998).

Little is known about dispersal in juvenile gnatcatchers. Due to limited resources, the young disperse, or leave the area occupied by the adults, to find other territories in which to forage and raise young. Fledglings may disperse long distances from their natal territory, up to 5 kilometers (km) (3.1 miles), but data from limited studies indicate that the median dispersal distance is 1 km (0.6 miles) (Braden *et al.* 1997; Braden 1998 pers. com, Bailey and Mock 1998). Some gnatcatcher juveniles will stay much closer to the site where they fledged. Dispersing gnatcatchers are apparently able to traverse highly human-modified landscapes for at least short distances, and spatially isolated occurrences of gnatcatchers suggest juvenile dispersal capability is greater than that shown by studies using banded birds (Bailey and Mock 1998).

Historically, gnatcatchers occurred from southern Ventura County southward through Los Angeles, Orange, Riverside, San Bernardino, and San Diego counties, and into Baja California, Mexico (Atwood 1980, 1990). They were considered locally common in the mid-1940's, but by the 1960's this subspecies had declined substantially in the United States owing to widespread destruction of its habitat (Atwood 1980). Today, approximately 99 percent of the gnatcatchers in the United States are found in Orange, western Riverside, and San Diego counties. Small, isolated populations remain in portions of its former range in Los Angeles, San Bernardino, and

Ventura counties. Most unprotected populations of gnatcatchers in the United States occur on private lands and have undergone declines in recent years.

In 1993, we estimated that approximately 2,562 pairs of gnatcatchers remained in the United States. Of these, 757 pairs occurred in Orange County, 261 pairs occurred in Riverside County, and 1,514 pairs occurred in San Diego County. Within Los Angeles County, from 26 to 56 pairs have been documented on the Palos Verdes peninsula, and 41 pairs are at Montebello.

The Service listed the gnatcatcher as threatened on March 30, 1993 (58 FR 16742). Pursuant to section 4(d) of the Act on December 10, 1993, the Service defined specific conditions associated with certain land use activities under which incidental take of gnatcatchers and their habitat would not be a violation of section 9 of the Act (58 FR 65088).

Based on data collected since the time of its listing, we estimated the total number of gnatcatchers in the United States to be 2,899 pairs, after subtracting the gnatcatcher pairs lost via habitat loss permits, approved natural community conservation/habitat conservation plans, and section 7 consultations (U.S. Fish and Wildlife Service 1996, 1999). The increased number of gnatcatchers since its listing is believed to be a result of surveys occurring within previously unsurveyed areas. These data should not be construed to represent an increase in the gnatcatcher population but merely represent a snapshot in time and do not account for natural fluctuations in a population (Atwood *et al.* 1998). Overall, the area of coastal sage scrub available to gnatcatchers has decreased due to habitat loss. The overall average gnatcatcher population through time will be limited by the decreased area of habitat within which annual population changes can occur.

Though the Service concluded that the designation of critical habitat was not prudent at the time of listing, on May 21, 1997, the U.S. Court of Appeals for the Ninth Circuit Court ordered the Service to issue a new decision regarding the prudency of determining critical habitat for the gnatcatcher. On February 8, 1999, the Service concluded that designation of critical habitat on lands within the United States portion of the range of the gnatcatcher was prudent (64 FR 5957). The proposal to designate critical habitat for the gnatcatcher was published February 7, 2000 (65 FR 5946). On October 24, 2000, the Service published a final rule designating critical habitat for the gnatcatcher that encompasses approximately 513,650 acres of land in Los Angeles, Orange, Riverside, San Bernardino, and San Diego counties, California (65 FR 63680). The proposed development project is located in the foothills of the Santa Ana Mountains within Unit 6 of this designation (65 FR 63686).

Unit 6 encompasses approximately 55,880 acres within the Orange County Southern Subregion Natural Communities Conservation Plan (NCCP) planning area and the San Onofre State Park in northwestern San Diego County. Unit 6 contains significant core populations of gnatcatchers and provides the primary linkage for core populations on Camp Pendleton and in the Southern NCCP Subregion to those further north in Central NCCP Subregion of Orange County.

The primary constituent elements of the critical habitat for the gnatcatcher are those habitat components that are essential for the primary biological needs of foraging, nesting, rearing of young, intra-specific communication, roosting, dispersal, genetic exchange, or sheltering. Primary constituent elements can be provided in undeveloped areas that support various types of sage scrub or chaparral, grassland and in riparian habitat where they may be utilized for biological needs such as breeding and foraging.

ENVIRONMENTAL BASELINE

Regulations implementing the Act (50 CFR § 402.02) define the environmental baseline as the past and present impacts of all Federal, State, or private actions and other human activities in the action area. Also included in the environmental baseline are the anticipated impacts of all proposed Federal projects in the action area that have undergone section 7 consultation and the impacts of State and private actions that are contemporaneous with the consultation in progress.

Riverside fairy shrimp and its designated critical habitat

Riverside fairy shrimp have been found in all seven ponds on Saddleback Meadows that still retain water, and soil samples taken from breached Ponds C and D tested positive for fairy shrimp cysts (Helix 2000). All of the ponds are within designated critical habitat for the fairy shrimp. The origin of ponds and fairy shrimp on Saddleback Meadows is of some debate. The project applicant maintains that all the ponds, except potentially Pond E, are man-made, while our *Recovery Plan for Vernal Pools of Southern California* (U.S. Fish and Wildlife Service 1998) states that the Saddleback Meadows ponds are likely the result of landslide topography. Six of the ponds (i.e., Ponds A, B, C, D, F and I) appear to have been created within existing ephemeral streams by the construction of earthen berms at their downstream extent. These ponds are found in areas with sandy soils typical of natural streams that have likely been made impervious through gradual deposition of fines behind their berms. Although in an area with clay soils, Pond F is also in an existing drainage and was likely man-made. Pond F and C have been breached and no longer retain water, and the other four (i.e., Ponds A, B, D and I) are subject to breaching in the future .

Ponds E, G and H are either natural depressions or were created in upland areas. Ponds E and H are found in clay soils that form an impervious layer typical of vernal pools, while Pond G is found in sandy soils that appear to have been made impervious through gradual deposition of fines eroded from its watershed. Pond E appears to be the most natural of the three and the result of landslide topography. Pond E also has been observed to contain a diverse invertebrate fauna, including one of the few known populations of the California clam shrimp (*Cyzicus californicus*) in the Orange County. Regardless of their origin, all the Saddleback Meadows ponds function as habitat for fairy shrimp and/or contain its cysts.

The Saddleback Meadows property has historically been, and remains, subject to livestock grazing. Because the onsite ponds hold water and are shaded from the sun by willows, mulefat, and other large stature vegetation (e.g., coast live oak), livestock often congregate around the

ponds for water and/or shade. Intensive use of these areas by livestock subjects the ponds to physical and water quality degradation through trampling of soils and inputs of excrement. Trampling by livestock can result in the direct mortality of fairy shrimp, particularly when eggs are wet and vulnerable to damage. Livestock movement in the ponds may degrade their soils or water quality. Sensitivity of this species to alkalinity, salts and dissolved solids (Eriksen and Belk 1999) suggests that inputs of waste by livestock into these ponds may also degrade the quality of these ponds for this species over time.

Designated critical habitat for the gnatcatcher

All of the Saddleback Meadows property is within Unit 6 of designated critical habitat for the gnatcatcher. No gnatcatchers were found on the property during Service protocol surveys done in 1998 and 2001, nor reconnaissance-level surveys done in 1993 and 1994. However, a juvenile and an adult male gnatcatcher were observed in the southeast corner of the site on September 23, 1998 (RBRiggan and Associates 1998). Habitat occupied by gnatcatcher is located in O'Neill Regional Park immediately south of the Saddleback Meadows property. Therefore, it appears that while the Saddleback Meadows site is not now occupied, gnatcatchers can disperse through or otherwise use the site during the non-breeding season. Also, the Saddleback Meadows site represents the only low elevation wildlife corridor/linkage between the Central and Southern Subregions of the Orange County NCCP planning areas.

EFFECTS OF THE ACTION

Effects of the action refer to the direct and indirect effects of an action on the species or critical habitat, together with the effects of other activities that are interrelated and interdependent with that action, that will be added to the environmental baseline. Interrelated actions are those that are part of a larger action and depend on the proposed action for their justification. Interdependent actions are those that have no independent utility apart from the action under consideration. Indirect effects are those that are caused by the proposed action and are later in time but are still reasonably certain to occur.

The action area is defined as all those areas subject to direct and indirect effects of the project. Areas subject to direct effects include all those areas within the construction footprint including construction vehicle access routes, staging areas, grading areas, building pads, trails, roadways, and other constructed project features. Indirect effects include degradation of adjoining habitat through edge effects, habitat isolation, and fragmentation.

Riverside fairy shrimp and its designated critical habitat

Implementation of the proposed project will result in the permanent loss, through project grading and discharge of fill, of three ponds (i.e., Ponds A, B and E) occupied by the fairy shrimp totaling 0.24 acres, and two breached ponds (i.e., Ponds C and F) that contain fairy shrimp cysts totaling 0.27 acres. This represents a 56 percent loss of fairy shrimp ponds, and a 68 percent loss of the pond basin area, onsite.

Prior to their filling, soil containing fairy shrimp cysts will be salvaged from Ponds A, B, C, F and E for use as inoculum in the ponds to be created onsite. In addition, approximately one-fifth of the salvaged soil and cysts will be transferred to the CRES for storage for later use as approved by the Service. Cysts not salvaged from the extant ponds will be destroyed. In addition, it is not anticipated that 100 percent of the salvaged cysts will survive the salvage process.

Direct impacts to Pond D, G, H and I will be avoided; however, project grading will create artificial slopes within substantial portions of their watersheds (e.g., 40 percent for Pond D and 20 percent for Pond G) to within approximately 75 to 125 feet of the ponds. Silts and irrigation water from the artificial slopes could enter into the avoided ponds and cause indirect impacts to their fairy shrimp populations.

Conservation Measures

The applicant will implement several conservation measures as outlined above in the "Description of the Proposed Action" to minimize the effects of the project on the fairy shrimp and its designated critical habitat.

The project proposes onsite avoidance and preservation of Ponds D, G, H and I with of total basin area of 0.24 acres, which represent 45 percent of the total ponds, and 32 percent of the total pond basin area, onsite. This constitutes avoidance of a substantial portion of the extant fairy shrimp ponds onsite, which is consistent with avoidance achieved on other projects impacting fairy shrimp habitat. In addition, impacts to Ponds A, B, C, E and F will be offset by creating four ephemeral ponds with a total basin area of 0.82 acres. Therefore, the overall compensation to impact ratio is 2 to 1, which is consistent with compensation ratios achieved on other projects impacting fairy shrimp habitat of similar quality.

Although project grading will create artificial slopes within substantial portions of the avoided and created ponds' watersheds, the remaining watersheds are expected to provide sufficient hydrology to sustain the fairy shrimp populations in these ponds. The applicant will also implement the following measures to minimize indirect impacts to the fairy shrimp populations in the avoided and created ponds: 1) restore coastal sage scrub and other native vegetation on the artificial slopes (other the fuel modification clearing and irrigated zones); 2) place silt fences or other erosion control measures around the ponds to ensure silt from the newly graded slopes does not enter the created ponds; and 3) construct interceptor ditches to divert runoff from the irrigated fuel management and/or coastal sage scrub restoration areas away from the preserved and created ponds' watersheds, and manage these ditches so they remain functional.

Although the project proponent is confident that fairy shrimp ponds can be successfully created onsite, fairy shrimp pond creation is still experimental in nature with many uncertainties. For example, most of the new ponds will be located in areas of sandy soils and require the construction of an artificial impervious layer to retain water for a minimum of 60 days, which has never been done successfully. Because a limited quantity of clay soil is available from the

existing 0.51 acres of ponds to be impacted, the applicant proposes to use native clays found elsewhere onsite to construct an impervious layer in most of the created basins. Also, all but one of the created ponds will be constructed in existing tributaries/erosional channels, which could cause breaching of these ponds, similar to what has occurred in the breached extant Ponds C and D. To address this concern, the applicant proposes to develop and fund the implementation of a management plan that will ensure the long-term viability of the created ponds.

In addition, Basin 5 will be 0.37 acres with a watershed of only approximately 1 acre (i.e., watershed to basin ratio of approximately 3:1), in contrast to the extant ponds which have much higher watershed to basin ratios (e.g., 76:1 for Pond D and 110:1 for Pond G). However, the applicant is confident that Pond 5 will have adequate hydrology because it is being created in an erosional channel that receives significant amounts of water, and nearby Pond D is approximately 14 feet deep when full and retains water longer than any pond onsite.

The applicant will also implement several other conservation measures to minimize impacts to fairy shrimp and its designated critical habitat and to help ensure the success of creation efforts, including: implementing a 10-year fairy shrimp pond creation, maintenance and monitoring plan; posting a bond or letter of to guarantee the successful implementation of the fairy shrimp pond creation; staffing a qualified biologist onsite to ensure compliance with all conservation measures; placing a 97.4-acre area (including the avoided and created fairy shrimp ponds and their watersheds) in a biological conservation easement, and transferring fee title of the area to the County or other agent approved by the Service and Corps; implementing and funding a perpetual maintenance and monitoring plan for the avoided and created fairy shrimp ponds and their watersheds; developing a resident education program that will advise residents of the potential impacts to the listed species and the potential penalties for taking such species; and insuring that the residential development landscape will not include exotic or native plant species that may be invasive to native habitats. Implementation of these and other proposed conservation measures discussed above, along with the substantial avoidance of fairy shrimp ponds impacts, will help ensure that the long-term viability of the fairy shrimp population at the Saddleback Meadows site.

Phasing/delaying impacts until restoration efforts are deemed successful, or at least demonstrating the created ponds can retain water for a minimum of 60-days, would be the optimum way to address the uncertainties inherent in proposed pond creation. However, the applicant has stated that this is not economically feasible, and proposes to place approximately one-fifth of the salvaged soil and cysts in appropriate storage at the CRES for use in the event of pond failure. In addition, the applicant proposes to create additional ponds onsite if the originally created ponds fail.

As with onsite, there is limited opportunity for offsite contingency measures. The only known pool occupied by Riverside fairy shrimp available for purchase in Orange County is on the Viejo property. There are also two occupied pools each on the Tijeras Creek and Radio Tower Road properties that may be available for purchase in the event of onsite pond creation failure. The few remaining unprotected vernal pools and potential restoration areas outside of Orange County

that are occupied by the fairy shrimp are too distant and geographically distinct from the Saddleback Meadow ponds to be considered for offsetting fairy shrimp impacts by this project.

Designated critical habitat for the gnatcatcher

The subject property is located in the foothills of the Santa Ana Mountains within Unit 6 of the designated critical habitat for the gnatcatcher. The proposed project will impact approximately 155.6 acres of various habitat/vegetation types, including 40.7 acres of coastal sage scrub potentially suitable for gnatcatchers. All 155.6 acres would be considered primary constituent elements as they provide essential foraging, nesting, roosting, dispersal, breeding and/or sheltering habitat for the gnatcatcher. As stated above, habitat occupied by gnatcatcher is located in O'Neill Regional Park immediately south of the Saddleback Meadows property, and gnatcatchers apparently dispersing from this nearby habitat have been observed on the Saddleback Meadows site. A canyon rises to the north from O'Neill Regional Park and continues to the east of the undulating ridgeline along the southern border of the Saddleback Meadows property. The proposed development could substantially hinder gnatcatchers from moving across the Saddleback Meadows property and likely force them to move around the edge of this property. Rather than moving through coastal sage scrub and other habitats at the low points of the undulating ridge line at approximately 1,200 feet AMSL for dispersal, gnatcatchers will likely be forced to move through coastal sage scrub and chaparral in the canyon along the eastern border of the property at approximately 1,600 feet AMSL. However, since this effect will extend only approximately 0.8 km (0.5 mile) of the entire 32 km (20 mile) length of this critical habitat unit, the proposed project should not significantly impair movement or increase the mortality rate of dispersing gnatcatchers across this critical habitat corridor.

The project will increase the fragmentation of low elevation coastal sage scrub patches along the Santa Ana Mountain foothills. In Southern California, effects of fragmentation have been shown to decrease the number of resident bird species, decrease the diversity of small rodents, and decrease the diversity and cover of native plant species (Soulé *et al.* 1988; Bolger *et al.* 1991; Alberts *et al.* 1993; Bolger *et al.* 1997). These alterations to the species assemblage, especially the reduction in native plant species diversity and cover, will decrease the quality of the habitat for gnatcatchers over time. This will occur as the arthropod abundance and diversity decline in correlation with the decline in their native plant hosts, decreasing the food supply of the insectivorous gnatcatchers.

The fragmentation of natural habitats in the project area will also negatively affect the quality of remaining habitat by facilitating the invasion of natural communities by exotic plant and animal species. Invasive, alien plants may alter the species composition and structure of the remaining habitat, which may make it less suitable to the gnatcatcher. Invasive ant species such as the Argentine ant (*Linepithema humile*) are known to be abundant in residential areas and invade habitat edges (Suarez *et al.* 1998). This species alters the native arthropod community, significantly reducing their diversity and abundance (Bolger *et al.* 2000). Any reduction in the native arthropod community related to invasion by Argentine ants as a result of the project is likely to reduce food resources for arthropod predators, including the gnatcatcher.

As stated earlier, the Saddleback Meadows site represents the only low elevation wildlife corridor/linkage between the Central and Southern Subregions of the Orange County NCCP planning areas. Orange County's Central/Coastal NCCP identifies the Saddleback Meadows site as a key corridor/linkage between the subregions, as do all preliminary reserve designs to date for the Southern NCCP. The proposed development along the eastern and northern portions of the site would substantially eliminate this corridor/linkage, and thereby severely constrain wildlife movement from O'Neill Regional Park in the Southern NCCP to the Central NCCP reserve and Cleveland National Forest. Impacts to this corridor/linkage will be evaluated under State of California's Coastal Sage Scrub NCCP Process Guidelines.

Conservation Measures

The applicant will implement several conservation measures as outlined above in the "Description of the Proposed Action" to minimize the effects of the project on designated critical habitat for the gnatcatcher. These measures include: onsite avoidance/preservation of 31.5 acres, onsite restoration/enhancement/preservation of 42.5 acres, and offsite acquisition/preservation of 6 acres of coastal sage scrub, which is consistent with mitigation required under State of California's Coastal Sage Scrub NCCP Process Guidelines; implementing a 5-year coastal sage scrub restoration/enhancement plan; posting a bond or letter of credit to guarantee the successful implementation of the restoration/enhancement plan; staffing a qualified biologist onsite to ensure compliance with all conservation measures; placing the a 97.4-acre area (including the avoided and restored/enhanced coastal sage scrub areas) in a biological conservation easement, and transferring fee title of the area to the County or other agent approved by the Service and Corps; implementing a perpetual maintenance and monitoring plan for the preserved open space, and establish a non-wasting endowment fund to finance its implementation; developing a resident education program that will advise residents of the potential impacts to the listed species and the potential penalties for taking such species; and ensuring that the residential development landscape will not include exotic or native plant species that may be invasive to native habitats. Implementation of these conservation measures will help this critical habitat unit to continue its function of providing linkage for gnatcatcher movement and dispersal between core populations within the Southern and Central/Coastal NCCP Subregions of Orange County.

CUMULATIVE EFFECTS

Cumulative effects include the effects of future State, tribal, local or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the Act.

Riverside fairy shrimp and its designated critical habitat

We are not aware of any future actions within the action area.

Designated critical habitat for the gnatcatcher

Several other projects are proposed within Unit 6 of the designated critical habitat for the gnatcatcher including the Arroyo Trabuco Golf Course, Rancho Potrero Youth Academy, Saddlecreek/Saddlecrest Residential Development Project, Whispering Hills Development Project, Talega Development Project, and Capistrano Valley Water District Pipeline Project.

Impacts to designated critical habitat for the gnatcatcher by the Arroyo Trabuco Golf Course, Rancho Potrero Youth Academy, and Talega Development Project will be addressed through separate section 7 consultations with the Corps.

At this time, we do not have adequate information to fully evaluate the potential impacts of the Saddlecreek/Saddlecrest Residential Development Project, Whispering Hills Development Project, and Capistrano Valley Water District Pipeline Project on designated critical habitat for the gnatcatcher.

CONCLUSION

Riverside fairy shrimp and its designated critical habitat

After reviewing the current status of fairy shrimp and its designated critical habitat, the environmental baseline for the action area, effects of the proposed action and cumulative effects, it is the Service's biological opinion that the Saddleback Meadows Development Project is not likely to jeopardize the continued existence of the fairy shrimp and is not likely to destroy or adversely modify designated critical habitat for the gnatcatcher. We reached this conclusion because:

1. The proposed project will maintain a viable fairy shrimp population on the Saddleback Meadows site by avoiding 45 percent of the extant ponds (i.e., 38 percent of the pond basin area) and creating 0.82 acres of new ponds. The avoided and created ponds will be protected from direct and indirect impacts associated with project construction.

2. The proposed project will implement a 10-year fairy shrimp pond creation, maintenance and monitoring program that includes success criteria, and post a bond or letter of credit to ensure its success.

3. The proposed project will place a 97.4-acre area (including the avoided and created fairy shrimp ponds and their watersheds) in a biological conservation easement and transfer fee title of the area to the County or other agent approved by the Service and Corps, to ensure its long-term protection. The open space will be of sufficient size and appropriate configuration to minimize edge effects and buffer the fairy shrimp ponds from indirect impacts associated with the developed areas.

4. The proposed project will implement and fund a perpetual maintenance and monitoring plan for the 97.4-acre conservation area, and establish a non-wasting endowment for an amount approved by the Service and Corps to finance the perpetual management, maintenance and monitoring of the 97.4 acres of dedicated biological open space by the County of Orange or other agent approved to the Service and Corps upon transfer of the deed.

5. The proposed project will place approximately one-fifth of the salvaged soil and cysts in appropriate storage at the CRES for use in the event of created pond failure.

Designated critical habitat for the gnatcatcher

Although the proposed Saddleback Meadows Residential Development Project will alter critical habitat, we conclude, on the basis of project-related impact avoidance, minimization, and conservation measures that such alteration will not result in the adverse modification of designated critical habitat for the gnatcatcher. We reached this conclusion because:

1. The proposed project will not significantly impair movement or increase the mortality rates of dispersing gnatcatchers between the Southern and Central NCCP Subregions of Orange County across the foothills of the Santa Ana Mountains.

2. The proposed project will restore and enhance 36 acres and 6.5 acres of coastal sage scrub onsite, respectively, within the critical habitat boundary, which will provide dispersal habitat for the gnatcatcher.

3. The proposed project will preserve 97.4 acres of critical habitat (including 31.5 acres of avoided, 36 acres of restored, and 6.5 acres of enhanced coastal sage scrub) as biological open space.

4. The proposed project will place a 97.4-acre area (including the avoided, restored and enhanced coastal sage scrub) in a biological conservation easement and transfer fee title of the area to the County or other agent approved by the Service and Corps, to ensure its long-term protection. The open space will be of sufficient size and appropriate configuration to minimize edge effects and buffer the coastal sage scrub from indirect impacts associated with the developed areas.

5. The proposed project will implement a perpetual management, maintenance and monitoring plan, and establish of a non-wasting endowment for an amount approved by the Service and Corps to finance the perpetual management, maintenance and monitoring of the 97.4-acres of dedicated biological open space by the County of Orange or other agent approved to the Service and Corps upon transfer of the deed.

6. The proposed project will acquire and preserve 6 acres of coastal sage scrub at the Viejo property, or other location approved by the Service within Unit 6 of the designated critical habitat for gnatcatcher.

INCIDENTAL TAKE STATEMENT

Section 9 of the Act and federal regulation pursuant to section 4(d) of the Act prohibit the take of endangered and threatened species, respectively, without special exemption. Take is defined as harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in any such conduct. Harm is further defined by us to include significant habitat modification or degradation that actually kills or injures a listed species by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering. Harass is defined by us as an action that creates the likelihood of injury to a listed species by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding, or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. Under the terms of section 7(b)(4) and 7(o)(2) of the Act, such incidental take is not considered a prohibited taking under the Act, provided that such taking is in compliance with this incidental take statement.

The measures described below are nondiscretionary and must be undertaken by the Corps and/or applicant, California Quartet, Ltd., as appropriately defined in the Corps' scope of analysis, in order for the exemption in section 7(o)(2) to apply. The Corps has a continuing duty, subject to their jurisdictional authority, to regulate the activity situated within their scope of analysis and covered by this incidental take statement. Within their scope of analysis, if the Corps (1) fails to assume and implement the terms and conditions or (2) fails to require the applicant to adhere to the terms and conditions through enforceable terms that are added to the permit or grant document, the protective coverage of section 7(o)(2) may lapse. Outside the Corps' scope of analysis, if the applicant fails to assume and implement the terms and conditions of the incidental take statement, the protective coverage of section 7(o)(2) may lapse. To monitor the impacts of incidental take, the applicant must report the progress of the action and its impact on the species to our agency as specified in the incidental take statement [50 CFR § 402.14(i)(3)].

AMOUNT OR EXTENT OF TAKE ANTICIPATED

The Service anticipates that the majority of fairy shrimp and/or cysts within Ponds A, B, C, E and F will be salvaged as inoculum from these ponds and that a small portion of these fairy shrimp and/or cysts will be taken in the form of direct mortality and/or injury through the collection of inoculum and its use in the created ponds onsite, and/or offsite as approved by the Service. In addition, the Service anticipates that the relatively few fairy shrimp and/or cysts remaining within Ponds A, B, C, E and F after the collection of inoculum will be taken in the form of direct mortality through filling of these ponds by the proposed project.

EFFECT OF THE TAKE

In the accompanying biological opinion, the Service determined that this level of anticipated take is not likely to result in jeopardy to the Riverside fairy shrimp or destruction or adverse modification of its designated critical habitat.

REASONABLE AND PRUDENT MEASURES

The Service believes the following reasonable and prudent measures are necessary and appropriate to minimize impacts of incidental take of Riverside fairy shrimp:

1. The Corps and/or California Quartet, Ltd., will minimize the effects of the project on Riverside fairy shrimp and its habitat during project construction.

2. The Corps and/or California Quartet, Ltd., will minimize the effects of the project on Riverside fairy shrimp during collection of inoculum and its use in the created fairy shrimp ponds, or as approved by the Service.

3. The Corps and/or California Quartet, Ltd., will coordinate with and report to this office on the status of the conservation measures.

TERMS AND CONDITIONS

In order to be exempt from the prohibitions of section 9 of the Act, the Corps and/or California Quartet, Ltd., must comply with the following terms and conditions, which implement the reasonable and prudent measures described above and outline required reporting/monitoring requirements. These terms and conditions are non-discretionary.

1.1 The Corps and/or California Quartet, Ltd., will ensure implementation of the project as described in this biological opinion, including all proposed conservation measures.

I.2 Grading activities within the watersheds of the fairy shrimp ponds will be done outside the rainy season (i.e., from May 15 to November 15) to minimize potential impacts (e.g., siltation) to the avoided and created ponds unless erosion control measures approved by the Service and Corps are in place.

1.3 The project proponent will submit final development grading plans to the Service and Corps for approval at least 60 days prior to the planned date of initiating impacts. Approval will be limited to a determination of conformance with Figure 2 and that avoidance areas are clearly delineated on the grading plans. If the Service and Corps have not provided comments within 60 days of receipt, then the grading plans shall be deemed approved.

1.4 Silt fencing will be installed and/or appropriate measures implemented along the footprint of project grading and around the avoided and created fairy shrimp ponds to prevent silt from entering into the ponds during construction.

1.5 Any unauthorized fill into extant vernal pond basin areas will be offset at a 5:1 ratio (3:1 restoration/creation and 2:1 preservation). Any additional restoration/creation will be held to the same standards as the already required creation efforts.

1.6 All equipment maintenance, staging, and dispensing of fuel, oil, coolant, or any other such activities will occur in designated areas. These designated areas will be located in such a manner as to prevent any run-off from entering the avoided and created fairy shrimp ponds.

1.7 A construction employee education program will be developed and implemented. For the life of the project, each employee (including temporary, contractors, and subcontractors) will receive a training/awareness program within two weeks of working on the proposed project. They will be advised of the potential impacts to the fairy shrimp and the potential penalties for taking this species. At a minimum, the program will include the following topics: occurrence of the fairy shrimp in the area; their general ecology, sensitivity to human activities and Federal protection; penalties for violations of Federal laws; reporting requirements; and project features designed to reduce the impacts to the fairy shrimp and promote continued successful occupation of the preserved areas.

1.8 The project proponent will staff a qualified biologist with a minimum three years of vernal pool experience who will be responsible for overseeing compliance with protective measures for the fairy shrimp. The biologist will approved by the Service and Corps, and have the authority to halt all associated project activities which may be in violation of the terms and conditions of this biological opinion. The biologist will notify the Service and Corps within 24 hours of any observed violation.

1.9 The Service and Corps will be given the right to access and inspect the project site for compliance with the proposed project description and with the terms and conditions of this biological opinion during the all construction phases.

2.1 The project proponent will prepare and implement a final Biological Mitigation and Monitoring Plan (Plan) that has been reviewed and approved by the Service and Corps. The project proponent will submit the Plan to the Service and Corps for approval at least 60 days prior to the planned date of initiating impacts to Ponds A, B, C, E and F. The Plan will contain but is not limited to the following conditions and information:

a. A hydrologic evaluation and map of the preserved and created fairy shrimp pond watersheds. The evaluation must demonstrate that the watersheds will provide the appropriate amount of water for fairy shrimp and will not receive non-point source discharges from the irrigated slopes or developed areas.

b. An evaluation of soil percolation rates within areas proposed for pond creation by a qualified soil scientist and/or hydrologist. If ponds are created in drainages by constructing a berm, this will include an evaluation of the potential for berm erosion. The evaluation must demonstrate that: 1) percolation rates are sufficiently slow to support ponding of water for a minimum of 60 days during an average rainfall year, and at an appropriate depth to support the fairy shrimp; and 2) measures will be taken to prevent berm erosion.

c. The grading for the created ponds will be conducted under the direction of a qualified biologist with a minimum of three years of vernal pool restoration experience approved by the Service.

d. Grading plans for the created ponds with 0.5-foot topographic contours. The grading plans will specify the areas of existing habitat which are to remain unaffected by creation activities. Grading will be done using small tracked dozers with ripping tines and slope boards, rubber-tired loaders, and a sheeps-foot for mound construction.

e. Fairy shrimp pond soil (inoculum) will be collected when it is dry to avoid damaging or destroying fairy shrimp cysts which are fragile when wet. A hand trowel or similar instrument will be used to collect the soil. Whenever possible, soil will be collected in chunks. The trowel will be used to pry up intact chunks of soil, rather than loosening the soil by raking and shoveling which can damage cysts. Soil will not be collected from any onsite ponds until approved by the Service and Corps.

f. The soil from each pond will be stored individually in labeled bags or boxes that are adequately ventilated and kept out of direct sunlight in order to prevent the occurrence of fungus or excessively heating the soil. Approximately one-fifth of the salvaged soil and cysts in appropriate storage will be transferred to the CRES within 2 weeks of collection, and documentation of the soil transfer will be submitted to the Service and Corps within 1 week of its transfer. The soil transferred to the CRES may only be withdrawn upon approval of the Service and Corps.

g. Inoculum will not be introduced into the created ponds until after the created ponds have been demonstrated to retain water for a minimum 60 days, and will be placed in a manner that preserves, to the maximum extent possible, the orientation of the fairy shrimp cysts within the surface layer of soil (e.g., collected inoculum will be shallowly distributed within the pond so that cysts have the potential to be brought into solution upon inundation).

h. Creation of 0.82 acres of fairy shrimp habitat will begin before or concurrent with initiating impacts to Pond A, B, C, E and F and their watersheds. Creation success will be determined by measuring the ponding, and density of viable cysts, hatched fairy shrimp and gravid females, within the created ponds. Water measurements will be taken in the impacted, preserved and created ponds to determine the depth, duration and quality (i.e., pH, temperature, total dissolved solids and salinity) of ponding. Dry samples will be taken in the impacted, preserved and created ponds to determine the density of viable cysts in their soils. Wet samples will also be taken in both the impacted, preserved and created ponds to determine the density of hatched fairy shrimp and gravid females. The created ponds must pond for a minimum 60 days during an average rainfall year and at an appropriate depth and quality to support the fairy shrimp. The created pond's average viable cyst, hatched fairy shrimp and gravid female density must not differ significantly ($p < 0.05$) from the ponds to be impacted or preserved for at least three wet seasons before a determination of success can be made.

i. Contingency measures in the event of creation failure.

j. Native plants and animals will be restored within the avoided and created ponds and their watersheds. This can be accomplished by redistributing topsoil containing seeds, spores, bulbs, eggs, and other propagules from the fairy shrimp ponds and watersheds to be impacted; by the translocation of the propagules of individual species from offsite habitats; and by the use of commercially available native plants for upland habitats. Topsoil and plant materials from the native habitats to be impacted onsite will be applied to the watersheds of the avoided and created ponds to the maximum extent practicable. Exotic weed control will be implemented within the avoided and created ponds and their watersheds to protect and enhance habitat remaining onsite. The Plan will include success criteria for restoration of native plants and animals.

k. A 10-year maintenance and monitoring program for the avoided and created ponds and their watersheds. The monitoring program will consist of quantitative hydrological, viable cyst, hatched fairy shrimp and gravid female measurements as required in 2.1.h., complete floral and fauna inventories, quantitative vegetation transects, and photographic documentation.

l. If a performance criterion as defined in 2.1.h. is not met for any of the created ponds in any year, or if the final success criteria are not met, the project proponent will prepare an analysis of the cause(s) of failure and, if determined necessary by the Service and Corps, propose remedial actions for approval. If any of the created ponds have not met a performance criterion during the initial 10-year period, the project proponent's maintenance and monitoring obligations will continue until the Service and Corps deem the created ponds successful, or that contingency measures must be implemented.

m. A map showing the configuration of the fairy shrimp pond preserve. Buffers between the avoided and created ponds and developed areas shall be in conformance with Figure 2.

n. Plans for fencing and/or other measures for protecting the fairy shrimp pond preserve from human disturbance. Curbs and/or gutters will be constructed along the edge of the roads and homes located adjacent to the pond preserve to direct runoff from the roads and homes away from the pond watersheds.

o. Annual reports will be submitted to the Service and the Corps by August 1. These reports will assess both the attainment of yearly success criteria and progress toward the final success criteria. They will also summarize the project's compliance with the conservation measures, reasonable and prudent measures and the terms and conditions of this biological opinion.

3.1 The project proponent will submit monthly reports during project construction to the Service and Corps on the status of the conservation measures, reasonable and prudent measures, and terms and conditions of this biological opinion.

Disposition of Sick, Injured, or Dead Specimens: The Service's Carlsbad Fish and Wildlife Office is to be notified within three working days should any endangered or threatened species be found dead or injured during this project. Notification must include the date, time, and location of the carcass, and any other pertinent information. Dead animals may be marked in an appropriate manner, photographed, and left on-site. Injured animals should be transported to a qualified veterinarian. Should any treated animals survive, the Service should be contacted regarding the final disposition of the animals. The Service contact person is David Zoutendyk and he may be contacted at (760) 431-9440.

The Service believes that a small portion of the fairy shrimp and/or cysts within Ponds A, B, C, E and F will be incidentally taken through the collection of inoculum and its use in the created ponds onsite, and/or offsite as approved by the Service. In addition, the Service believes that the relatively few fairy shrimp and/or cysts remaining within Ponds A, B, C, E and F after the collection of inoculum will be incidentally taken through filling of these ponds by the proposed project. The reasonable and prudent measures, with their implementing terms and conditions, are designed to minimize the impact of incidental take that might otherwise result from the proposed action. If, during the course of the action, this level of incidental take is exceeded, such incidental take represents new information requiring reinitiation of consultation and review of the reasonable and prudent measures provided. The Federal agency must immediately provide an explanation of the causes of the taking and review with the Service the need for possible modification of the reasonable and prudent measures.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of the Act directs Federal agencies to utilize their authorities to further the purposes of the Act by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans or to develop information.

1. Although this biological opinion addresses impacts to the Riverside fairy shrimp and its designated critical habitat and designated critical habitat for the gnatcatcher, we still have concerns regarding the proposed impacts to Pond E, which is the highest functioning pond on the Saddleback Meadows site, and the action's probable significant impacts to wildlife movement between the Southern and Central NCCP Subregions of Orange County. In light of these concerns, we believe that the proposed action warrants a full public interest review and 404(b)(1) alternatives analysis to demonstrate that the proposed action is in the public's interest and is the least environmentally damaging practicable alternative. Therefore, we recommend that the Corps require an individual permit for the proposed action.

2. Given the scarcity of Riverside fairy shrimp habitat in Orange County, we recommend that the Corps carefully examine the cumulative impacts to vernal pools and/or vernal pool-like ephemeral ponds, the availability of acquisition and/or restoration sites, and whether vernal pools and/or vernal pool-like ephemeral ponds within Orange County should be withdrawn as a disposal site under section 404(c) of the Clean Water Act.

3. Lighting adjacent to open space areas will be shielded so as not to illuminate native habitats.

In order for the Service to be kept informed of actions minimizing or avoiding adverse effects or benefitting listed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

REINITIATION NOTICE

This concludes formal consultation on the actions outlined in the request. As provided in 50 CFR §402.16, reinitiation of formal consultation is required where discretionary Federal agency involvement or control over the action has been retained (or is authorized by law) and if (1) the amount or extent of incidental take is exceeded; (2) new information reveals effects of the agency action that may affect listed species or critical habitat in a manner or to an extent not considered in this opinion; (3) the agency action is subsequently modified in a manner that causes an effect to the listed species or critical habitat not considered in this opinion; or (4) a new species is listed or critical habitat designated that may be affected by the action. In instances where the amount or

extent of incidental take is exceeded, any operations causing such take must cease pending reinitiation.

Sincerely,

Karen A. Evans

RE: Saddleback Meadows Cultural Resources Update

The following is a brief status report for the Saddleback Meadows cultural resources program. Eight tasks have been identified for the project. Tasks 1 and 2 concern the Hausauer Ranch (CA-ORA-1435H), Task 3 is the determination of eligibility of the sites. Task 4 is the test excavation of CA-ORA-1437. This site is not under Corps of Engineers jurisdiction. Task 5 is the production of a research design/treatment plan for sites deemed eligible for listing on the National Register of Historic Places (NRHP). Task 6 involves the data recovery excavation of eligible sites. Task 7 is the monitoring of grading and Task 8 is the final report for the project.

Task 1: Testing Plan for CA-ORA-1435H

This plan was completed and submitted in May 2001. The Corps and SHPO accepted the document shortly afterward and directed us to proceed with the work.

Task 2: Test Excavation and Archival Research for CA-ORA-1435H

The archival research for this task was completed by Tim Gregory, architectural historian, and submitted to RMW in August 2001. The field work for this task was completed in September 2001. The report has been completed. We are recommending that the site be deemed not eligible for listing on the NRHP. It is recommended that the site be monitored by a qualified archaeologist during grading activities

Task 3: Determination of Eligibility for Saddleback Meadows Sites

A large packet of previous Saddleback Meadows reports, along with a summary of the work, was submitted to the Corps several months ago. A letter to the SHPO from Mark Sudol, Chief of the Regulatory Branch, Corps of Engineers, dated 14 June 2001, determined that only CA-ORA-711 is eligible for listing on the NRHP. I assume CA-ORA-710 would also be eligible, but it will be preserved. The SHPO responded to the letter on 13 July 2001, requesting additional information.

The Corps also directed RMW/SWCA to contact the Native American Heritage Commission for a listing of Native American Groups to be contacted. The list was sent to us on 14 September 2001. Several of the groups were contacted in October 2001 and sent packets with relevant site information. They were each encouraged to comment on the information to the Corps.

Task 4: Test Excavation and Evaluation of CA-ORA-1437

This site is not under Corps jurisdiction and was accomplished under CEQA. A test excavation of the site was undertaken on 8 and 9 November 2001. A surface collection yielded ten artifacts. Subsurface hand excavation produced only four additional artifacts. It is recommended that CA-ORA-1437 be determined not significant. It is further recommended that the site be monitored by a qualified archaeologist during grading activities.

Task 5: Treatment Plan and Research Design

The development of the treatment plan/research design is currently underway. It involves the completion of a literature review at the South Central Coastal Information Center, California State University, Fullerton and the development of the research design/treatment plan document to mitigate the effects of the development on the site.

Task 6: Mitigation of Effects

The data recovery excavation of CA-ORA-711 will proceed when the Corps and SHPO have signed off on the treatment plan.

Task 7: Monitoring of Grading

Obviously, this will not occur until grading of the property commences.

Task 8: Final Report

The final report, after the grading has been completed, will include a summary of work accomplished for the project including test excavations, the excavation of eligible sites, monitoring, etc.

I hope this is sufficient for your needs. Let me know if you need additional information.

Sincerely,

Patrick Maxon, RPA
Project Manager / Cultural Resources

MANAGEMENT SUMMARY/ABSTRACT

Purpose and Scope: California Quartet and TPG Management propose development of the 299 unit Saddleback Meadows residential community on a 222 acre parcel in an unincorporated portion of Orange County. The Saddleback Meadows property lies immediately east of El Toro Road, a short distance south of the intersection with Live Oak Canyon and Santiago Canyon Roads. RMW Paleo Associates, Inc. was retained by TPG Management to complete the cultural resources studies related to the project. The study consists of several tasks:

Task 1: Draft Testing Plan (CA-ORA-1435H)
Task 2: Test Excavation/Archival Research (CA-ORA-1435H)
Task 3: Eligibility Determination (all sites)
Task 4: Test Excavation (CA-ORA-1437)
Task 5: Draft Treatment Plan/Research Design (all eligible sites)
Task 6: Data Recovery Excavation (CA-ORA-711, and possibly CA-ORA-710 and CA-ORA-1437)
Task 7: Monitoring
Task 8: Final Report

This report documents the test excavation and archival research accomplished under Task 2, based on the treatment plan (Task 1) developed for the historic Hausauer Ranch - CA-ORA-1435H. The development of Saddleback Meadows will result in the destruction of the resource located immediately east of St. Michaels Priory

Dates of Investigation: Archival research was begun on 25 May 2001 and completed on 13 August 2001. The test excavation was undertaken on 18 and 19 September 2001.

Findings: Archival research findings are summarized below. Backhoe trenching failed to produce any significant historic cultural material.

Significance Determination: Archival research revealed that the Hausauer Ranch (CA-ORA-1435H) is of no appreciable significance in the context of local Orange County history. Architectural historian Tim Gregory (see Appendix B) determined that the site is of no local significance under *National Register of Historic Places* Criterion A (patterns of settlement) and B (significant persons) and was thus assigned **Evaluation Code 6Z** (Found ineligible for listing on the National Register of Historic Places).

Undertaking Effects: The development of Saddleback Meadows will result in the destruction of archaeological site CA-ORA-1435H.

Recommendations: Archival research and subsurface backhoe exploration has mitigated the adverse effects of the proposed development on CA-ORA-1435H. No further cultural resources investigation is necessary for the site.

Disposition of Data: This report will be filed with the South Central Coastal Information Center, California State University, Fullerton (SCCIC), the Los Angeles District, United States Army Corps of Engineers (USACE), with TPG Management and with RMW Paleo Associates/SWCA, Inc., Mission Viejo. All field notes and study related documents are on file at RMW Paleo Associates/SWCA, Inc.

I. CONTRACTING INFORMATION/INTRODUCTION

Contract Data: California Quartet and TPG Management have produced plans to develop the Saddleback Meadows property. RMW Paleo Associates/SWCA, Inc. was retained by TPG Management to complete the cultural resources studies related to the project.

Purpose: The Saddleback Meadows project requires a permit pursuant to Section 404 of the Clean Water Act of 1977, under which adverse impacts to *significant* cultural resources, and their consideration in the planning process, are within purview of the U. S. Army Corps of Engineers and are subject to Section 106 of the *National Historic Preservation Act (NHPA)* (36CFR800). The NHPA authorizes the maintenance of a *National Register of Historic Places (NRHP)* that facilitates the preservation of properties possessing integrity and meeting at least one of four criteria delineated by Section 106 (Advisory Council on Historic Preservation 2000).

The quality of *significance* in American history, architecture, archaeology, engineering and culture is present in districts, sites, buildings, structures and objects that possess *integrity* of location, design, setting, materials, workmanship, feeling and association and:

A. that are associated with events that have made a significant contribution to the broad patterns of our history; or
B. that are associated with the lives of persons significant in our past; or
C. that embody the distinctive characteristics of a type, period or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
D. that have yielded, or may be likely to yield, information important in prehistory or history.

CA-ORA-1435H was evaluated for significance in accordance with the National Register Criteria for evaluation (36CFR60.4), to determine if it satisfies any of the four significance criteria. The property is potentially eligible for listing on the *National Register of Historic* if any criterion is satisfied.

Undertaking: The proposed Saddleback Meadows development will consist of the construction of 299 single-family homes on the property. The effort will result in the destruction of all but one of the archaeological sites on the property: CA-ORA-710 will remain in open space.

Maps: Map 1 is a portion of the USGS 7.5 Minute Quadrangle, Santiago Peak, California, 1954; Photorevised 1982, depicting the project area. An inset map shows the project area vicinity.

Personnel: Architectural historian, Tim Gregory, also known as The Building Biographer, conducted the archival research for the resource. RMW/SWCA archaeologists Anna Hoover and Steve McCormick conducted the subsurface backhoe trenching work. Principal Investigator was Patrick Maxon, who also authored this report. Resumes for all individuals indicated are located in Appendix A.

Scale 1:24,000

II. SETTING

Natural Setting

Physiography

The Saddleback Meadows project area lies in the foothills of the Santa Ana Mountains in Orange County, California. Aliso Creek flows southward along the property's western margin. The property is in Section 4 of Township 6 South, Range 7 West and is accessible via El Toro Road, which extends parallel to and west of Aliso Creek, adjacent to the property.

The project area consists of narrow, rugged ridges and rounded knolltops separated by steep sided and narrow canyons. A central northeast/southwest trending canyon drains into Aliso Creek. Elevations range from approximately 1,040 feet where the main drainage empties into Aliso Creek to approximately 1,640 feet along portions of the ridges in the northeastern portion of the property. Santiago Peak, the highest in Orange County at over 5,000 feet, is approximately three kilometers northwest of the property.

Geology

Geologic formations exposed in the Saddleback Meadows study area are the Sespe Formation, the undifferentiated Sespe and Vaqueros Formations, and the Topanga Formation (Raschke 1995). The oldest unit is the late Eocene to early Miocene Sespe Formation and is restricted to the northeastern corner of the property. Overlying and interbedded with the Sespe Formation is the early Miocene age, undifferentiated Sespe-Vaqueros Formation. This unit underlies all except the northeast corner of the Saddleback Meadows property where there appears to be a small exposure of the middle Miocene age (15 million years ago) Topanga Formation. Within the study area there are numerous occurrences of vertebrate fossils in boulders that have apparently eroded from the subsurface. These include a variety of large and small fragments of marine mammal bones (Raschke 1995).

Climate

The climate of the Saddleback Meadows vicinity can be described as mild, uniform and semi arid. Temperatures rarely exceed 33 degrees Celsius or drop below five degrees Celsius. Rainfall occurs primarily between November and April and averages between 25 and 40 centimeters per year. The current climatic conditions did not prevail during the entire span of time that man has been present in the area. Heusser (1978) suggests that pine forests may have occupied the coastal regions from roughly 10,000 to 6,000 years B.C. The climate then became warmer and drier, resulting in replacement of the pine forests by oak woodland and grassland communities. Coastal Sage Scrub and Chaparral communities became pronounced during the few centuries preceding the Christian era.

Flora/Fauna

Several of the ecological communities existing in southern California are present at Saddleback Meadows. Those in the immediate vicinity of Saddleback Meadows include the Riparian Woodland Community, the Grassland Herbland Community the Oak Woodland Community, the Coastal Sage Scrub Community and the Chaparral Community (Drover, Koerper & Langenwalter 1983).

Current

A majority of the property has in recent times been used as a cattle ranch and is presently covered predominantly by grasslands, including introduced grasses, wild mustard and artichoke thistle. The slopes and ridges support remnants of the Coastal Sage Scrub Community, composed of sage, buckwheat, chamise, sumac, prickly pear cactus and other low growing, woody plants. A riparian community exists along the Aliso Creek drainage supporting rushes, tules and willows. Mature oaks and sycamores are found in the valleys, drainages and on some of the ridges and knolltops. CA-ORA-1435H, along the property's main drainage that empties into Aliso Creek, is surrounded by introduced eucalyptus trees as well as a large olive grove containing nearly 100 trees (See Map 2, below).

Cultural Setting

Historic Setting

Juan Rodriguez Cabrillo sailed along the California coast in 1542 and, according to available records, stopping only at San Diego and the Channel Islands, was the first European to come into contact with the Gabrielino and Juaneño. The first Europeans to visit Orange County arrived in 1769 when Gaspar de Portola led an overland expedition from San Diego to Monterey. This expedition of 63 persons passed near the study area, using Arroyo Trabuco as a route to the north (Cramer 1988). Mission San Gabriel, in Los Angeles County, was founded in September 1771 and all the Native Americans from the Los Angeles plain were persuaded to settle in its vicinity. The first permanent settlement in Orange County came when San Juan Capistrano was selected as the site for a Mission in the spring of 1775. By the early 1820s, all the native Americans from the coastal plains and foothills of what is now Orange County had been settled on Mission lands or on the growing rancho system.

The missions were charged with administering to the Indians within their areas. Mission life did give the Indians some skills needed to survive in their rapidly changing world, but diseases for which they had no immunity, decimated the population. After 1810, mission population declined faster than it could be replenished. The Mexican Revolution, beginning in 1821, overthrew Spanish control and the new Mexican government had a very different outlook on mission activities. Secularization of the missions, planned under the Spanish, was greatly accelerated by the Mexican government. Plans to provide land, training and living quarters for the Indians never

developed and the mission lands were soon under the control of a relatively few influential Mexican families.

The Mexican-American war ended on 2 February 1848 with the signing of the treaty of Guadalupe Hidalgo. The treaty established California as a United States possession and provided for the retention of private lands held by the conquered Mexicans; however, in 1851 the United States required that all Hispanic land grants be approved by the courts. As a result, many of the land grants were not approved and the division of many of the larger ranchos occurred.

The effects of mission influence upon the local native populations were devastating. The reorganization of their culture alienated them from their traditional subsistence patterns and social customs. European diseases, against which the natives had no immunities, reached epidemic proportions and Gabrielino populations were decimated (Johnston 1962:135). Although most Gabrielino submitted to the Spanish and were incorporated into the mission system, some refused to give up their traditional existence and escaped into the interior regions of the state.

Local History

The study area was never a part of a Spanish or Mexican land grant. The foothill area was not good grazing terrain. Instead, the Santa Ana Mountain area was to be ungranted and for the use of all. The Rancho Canada de los Alisos (Canyon of the Sycamores) abuts a portion of the study area.

Present day Lake Forest was part of this grant; the last of Serrano's adobes is still preserved there. The drought of the early 1860s forced Serrano to give up on the rancho. It was broken up into smaller parcels and sold piecemeal; the bulk of the land forming the city of El Toro (now Lake Forest). By the 1880s much of the area had been settled by Anglo-American families.

Closest to the project area, approximately one mile east of the intersection of Santiago Canyon and Live Oak Canyon Roads, the first Anglo resident of Live Oak Canyon settled there in 1873. Within six years, a village had sprung up around what is now Trabuco Oaks. Settlers in the area tended to be miners, beekeepers, homesteaders and stock farmers. The major agricultural products were barley and oat hay (Gregory 2001:8). See Gregory (2001) for more details on local history.

The Hausauer Ranch (CA-ORA-1435H), the subject of this report, dates to the late 1920s and was an active ranch into the 1970s. It was occupied by Arthur Hausauer and his family in 1929. After his death in 1964, Arthur's wife, Edna May, remained at the ranch with her son Arthur Fred until the late 1970s (Gregory 2001:3). The ranch's main reservoir and olive orchard have been in existence since at least 1939 (Dillon 1989:32).

III. PREVIOUS ARCHAEOLOGICAL RESEARCH

Early reconnaissance operations were conducted near the present project area that only partially extended onto the Saddleback Meadows property. The first was a reconnaissance by Howard (1975). Other studies include: Tadlock and Tadlock (1978), Breece and Padon (1982), Dillon (1989), Bissell (1984), Maxon (1995; 1997)

These studies resulted in the recording of twelve archaeological sites and the subsequent testing of ten of them (Maxon 1995). The historic Hausauer Ranch was located and described in some detail by Dillon (1989), although not formally recorded until the Maxon (1995) study. It was then assigned the trinomial CA-ORA-1435H.

Extant Site Information: CA-LAN-1435H

The Arthur Hausauer Ranch lies in the main canyon on the subject property, southeast of St. Michael's Priory and approximately 600 meters east of El Toro Road. It lies on a broad ridge between two drainages, tapering to the northwest, and encompasses an area of some 250 meters in length and 40 to 60 meters in breadth. The heavily vandalized and deteriorating site consists of 14 features including an olive grove of approximately 100 trees, a holding pond still containing water, a main residence, a barn, metal water basins, a cattle chute, several animal pens and other outbuildings. Most of the site's structures have collapsed or have nearly collapsed. The main residence is still standing, but it is completely gutted and the majority of the walls have disappeared. Piles of debris consisting of milled wood, metal fragments, chicken wire, plastic, etc. were noted in several locations. See Gregory (2001) in Appendix B for a detailed description of the site and its components

In 1995, concurrent with test excavations at several of the prehistoric sites on the property, the Hausauer Ranch was formally recorded and assigned the trinomial CA-ORA-1435H (Knell and Maxon 1995). While the site is in an advanced state of decay, RMW researchers completed a fairly detailed site record of the resource. During the current study, this site record was adapted by the project historian to produce an up to date record of the site (see Appendix B).

IV. RESEARCH DESIGN

A research design is a means by which to ensure that the undertaking of an archaeological investigation (in this case archival research and a test excavation at CA-LAN-1435H) is accomplished as a scientific endeavor, with the purpose of linking the material remains recovered from a site with past human behavior (Schiffer 1976 & 1987 in Grenda 1992:33). This applies to prehistoric as well as historic resources.

Research Assumptions

Theoretical Basis

The theoretical background directing the conduct of this research is primarily cultural ecological: the level of a culture's technological innovations and the physical and biological environment in which the culture exists operate together in determining the nature of social organization and the arrangement of resource exploitation and management. These elements are, in turn, a major factor in formulating a particular culture's ideological and political patterning (Steward 1955).

Humans are part of the ecological system in which they exist. Their patterns of behavior are restricted by ecological constraints, originating in their natural and social environment, and expressed through culture. Similarly, human populations have an effect, either intentionally or accidentally, on the natural environment, and precipitate ecological change (Jochim 1981:6). This applies to prehistoric as well as historic times.

Research Problems

The purpose of this study is to determine the significance of historic archaeological site CA-ORA-1435H, per the National Register Criteria for evaluation (36CFR60.4), based on its meeting at least one of four significance criteria. Meeting at least one criterion would potentially make it eligible for listing on the *National Register of Historic Places*.

Because the present study is evaluative in nature, research problems are designed to determine whether the site has integrity and if it is associated with significant aspects of local and/or regional history. The problems to be studied include:

- Is the site associated with significant events or individuals in local or regional history?
- Do site features embody distinctive architectural characteristics?
- Does the site have the potential to yield information important in history?
- What are the vertical and horizontal boundaries of the site?
- Are discrete concentrations of artifacts present at the site?
- Are existing structures present at the site?
- What is the range and variability of artifacts present at the site?

V. STUDY METHODS

Archival Research

Tim Gregory, professional architectural historian, evaluated the structures related to CA-ORA-1435H. The evaluation consisted of an initial field survey to examine, describe and photograph the site features, followed by an examination of the County Assessor records to determine improvements to the site, the Orange County Archives to determine the chain of ownership of the property and local libraries, historical societies and personal interviews as appropriate to document the history of the site and area. A final technical report (see Appendix B) was produced by the historian. It describes the site in detail, provides a developed historic context, evaluates the historic significance of the property per NHPA and CEQA and recommends mitigation measures for the resource. The DPR 523 site recording form(s), including photographs and maps, is appended.

The archival research was accomplished as the first phase in this study. The purpose was to gather data to determine what role, if any, the Hausauer Ranch played in the development of the El Toro area and thus was the primary method used in making a determination of eligibility for listing the site on the *National Register of Historic Places.*

Field Methods

Methods developed for the field study included clearing/grubbing of the site to remove vegetation, collection of all diagnostic artifacts exposed on the ground surface, excavation of backhoe trenches to locate subsurface features and hand excavation if intact cultural deposits were discovered.

Clearing/Grubbing

Initially, the site area was cleared and the vegetation removed to facilitate examination of the ground surface, particularly in areas that were proposed for trenching. This was accomplished by utilizing a dozer blade to remove artichoke thistle, grasses, bushes, small trees, etc.

Surface Collection

The surface collection method was designed to be employed immediately after clearing of the site to recover diagnostic artifacts that may aid in significance determinations. The implementation of this method was not necessary as no significant artifacts were discovered.

Backhoe Trenching

A series of ten trenches excavated by backhoe were placed around the site area for the purpose of locating subsurface piping, privies, trash pits or other features. After excavation was completed,

the trench's stratigraphic profile was recorded, necessary photographs taken, provenience recorded using a hand-held GPS receiver, and the trench backfilled.

Data Synthesis and Report

All field data and historical archival research was used to evaluate the questions contained in the research design. The testing and evaluation report follows the *Archaeological Resource Management Reports (ARMR): Recommended Contents and Format* (Office of Historic Preservation 1990. Copies of all field and laboratory documents and photographs are on file at RMW Paleo Associates/SWCA, Inc.

VI. FINDINGS

Archival Findings

Tim Gregory, an architectural historian, carried out a field visit on 25 May 2001. The purpose was to observe, describe and photograph the buildings, structures and amenities (Gregory 2001:2). The subsequent archival research included: a search of recorded deeds at the Orange County Recorder to investigate the site's chain of ownership, consultation of historical files at the History Room of the Santa Ana Public Library, and the central branch of the Los Angeles Public Library. A search of various on-line historical and biographical databases available on the Internet was also accomplished. No personal interviews were conducted. The history and physical description of the site are contained in Mr. Gregory's report in Appendix B and will not be repeated here.

Using the criteria of the *National Register of Historic Places*, the Hausauer Ranch is of no appreciable significance within the broad context of local Orange County history. Other, more intact cattle ranches can still be found in the area (Gregory 2001:9).

The property was abandoned by 1980 and all improvements have either been vandalized or have decayed as a result of the elements. Therefore, the integrity of the site is poor. An **Evaluation Code of 6Z** (*Found ineligible for listing on the National Register of Historic Places*) was assigned to the resource (Gregory 2001:9).

Field Findings

Ten trenches of varying length and depth were excavated within the ranch complex. All trenches had a width of one meter (see Map 3, below). The following section describes each trench and any relevant observations.

Trench 1

Depth: 3.2 meters
Length: 20.3 meters

This trench was excavated between Feature 3 (possibly a small laundry) and Feature 4 (a cattle chute). The upper 90 centimeters of the subsurface was a dark, organically rich soil, very compact and dry. The next 20 centimeters, to 1.1 meters depth, was grayish-white sand. From 1.1 to 3 meters depth, the soil was reddish, fine-grained, very compact silty-sand. Below three meters the soil changed to medium dark-grey clay.

The upper meter of trench produced only scattered broken glass and metal fragments, none of which was recovered. No other cultural material was observed in the trench.

Trench 2

Depth: 2 meters
Length: 13.4 meters

This trench was also excavated between Features 3 and 4, perpendicular to and approximately two meters north of Trench 1. The stratigraphy of soils in Trench 2 was nearly identical to that in Trench 1. No cultural material was recovered from this trench.

Trench 3

Depth: 1.97 meters
Length: 12.3 meters

This trench was excavated immediately west of Feature 7 (animal pens). Excavation was terminated when the white sand (non-cultural) was reached. No cultural material was recovered.

Trench 4

Depth: 1.4 meters
Length: 12.6 meters

Map 3. Site CA-ORA-1435H Trenches

Map Source: Hunsaker and Associates

This trench was excavated through the collapsed barn (Feature 10). It was thought that the best chance for discarded ranching material would be found here. However, no cultural material was recovered before reaching the culturally sterile (sand) stratum.

Trench 5

Depth: 2.5 meters
Length: 12.1 meters

This trench was the second excavated through the collapsed barn. No cultural material was recovered before reaching the culturally sterile (sand) stratum

Trench 6

Depth: 1.7 meters: south end;
2.5 meters: north end
Length: 12.6 meters

This trench was excavated immediately southwest of Feature 6 (a two room workshop shed). The 30-40 centimeter level contained one-half inch, plastic PVC pipe. The upper 90 centimeters uncovered a one-half inch diameter iron water pipe that appeared to lead to the main residence.

Trench 7

Depth: 2 meters: south end;
3.76 meters: north end
Length: 14.7 meters

This trench was excavated immediately northwest of Feature 11 (the ranch's main residence). It ran parallel to the structure's northwest wall. Subsurface sediments consist of alluvial, grey sand. There were apparently two or three old erosional channels that had been filled in the past by natural processes. No cultural material was recovered from this trench.

Trench 8

Depth: 2.23 meters
Length: 8.23 meters

This trench was also excavated northwest of Feature 11 and perpendicular to Trench 7. The south end of Trench 8 connected with Trench 7. Subsurface sediments were light grey sand that, like Trench 7, exhibited old erosional channels filled with alluvial material. Gravel seen in the trench is probably the result of the installation of leach lines for an adjacent septic tank.

Trench 9

Depth: 2.1 meters
Length: 16.4 meters

This trench was excavated east of Feature 14 (a collapsed garage and animal hutch) in the extreme northwest end of the site. Light grey sand was noted in the majority of the trench. Some dark alluvium was present in the east end of the trench closest to the residence (Feature 11). No cultural material was recovered from this trench.

Trench 10

Depth: 1.62 meters
Length: 13.14 meters

This trench was excavated south east of Feature 10 (the barn) near what appeared to be an animal pen. The sediments in the upper portion of the trench consisted of dark brown alluvium. At 1.6 meters, grey sand was encountered and the trench abandoned. No cultural material was recovered.

VII. DISCUSSION/INTERPRETATION

In the research design, a set of seven research questions was formulated to determine significance of the site. These are repeated below:

- Is the site associated with significant events or individuals in local or regional history?
- Do site features embody distinctive architectural characteristics?
- Does the site have the potential to yield information important in history?
- What are the vertical and horizontal boundaries of the site?
- Are discrete concentrations of artifacts present at the site?
- Are existing structures present at the site?
- What is the range and variability of artifacts present at the site?

It is clear from the archival research performed by Tim Gregory (Gregory 2001) that the site has no significance relative to significant events, significant individuals or that there is no real potential for the site to yield information important in history. Because the property was abandoned by 1980 and all improvements have either been vandalized or have decayed as a result of the elements, the site holds little integrity.

The subsurface (backhoe) work failed to reveal any subsurface deposits such as privies, trash pits, or any other features. The site boundaries should remain as they were plotted during recording of the site.

In summary, using the criteria of the *National Register of Historic Places*, the Hausauer Ranch is of no appreciable significance within the broad context of local Orange County history.

VIII. RECOMMENDATIONS

All appropriate cultural resources research was accomplished during the current study. Archival research and subsurface backhoe exploration has mitigated the adverse effects of the proposed development on CA-ORA-1435H. No further cultural resources investigation is necessary for the site.

Patrick O. Maxon, RPA
Project Manager / Cultural Resources

Personnel Qualifications

Patrick O. Maxon, M.A., RPA
RMW Paleo Associates/SWCA, Inc.
Certified Archaeologist

Professional Experience

1994 - present	Project Manager/Field Director of Archaeology, RMW Paleo Associates, Mission Viejo, California. Responsibilities include project management, development of project proposals, client relations, conducting research, accomplishing field work (survey, excavation, monitoring), mapping and production of technical reports.
1990 - 1994	Behavioral Specialist/Job Trainer, Vantage Foundation, Costa Mesa, California.
1989 - 1990	House Manager, Pearlmark Group Home, Anaheim, California.
1988 - 1989	Instructor, United Cerebral Palsy, Santa Ana, California.

Selected Technical Reports

1995 Archaeological Test Excavation of Cultural Resources Located Within the Saddleback Meadows Planned Development, Orange County, California.

1996 Cultural Resources Reconnaissance and Impact Assessment of Proposed Development for the California State University, San Bernardino Master Plan.

1997 Archaeological Test Excavation of a Prehistoric Cultural Deposit at Butterfield Ranch, Tract 14425, Chino Hills, San Bernardino County, California.

I. Project Description

This is a technical report on the historic resources found in an approximately 5.25-acre parcel currently a part of the Saddleback Meadows project site and historically known as the Hausauer Ranch. It is located about one mile east of El Toro Road in unincorporated Orange County territory, about one mile north of Mission Viejo, and across El Toro Road from an area known as Portola Hills. The client has requested an evaluation of the historic resources discovered there and a summary of any alternatives which may be needed to reduce project impacts on these resources if they are found to be significant.

The purpose of this report is to assist the property owner, RMW Paleo/SWCA, and the U.S. Army Corps of Engineers in their determination of the historical significance of the resources. Also to be determined: if any future changes to the resources will constitute a significant environmental impact and, if so, what mitigation measures may be necessary.

The five steps necessary in such a study are: 1) identification of the resources; 2) identification of the resources' historic context; 3) evaluation of the historic significance of the resources; 4) determination (findings) of the proposed project's effect on any significant resources; and 5) recommendation of project alternatives or mitigation measures to minimize the project's possible negative effects.

In summary, this technical report contains the synopsis of the consultant's cultural resources identification and evaluation investigation. Sections of this report discuss the Identification of the Resources, the Historic Context, Evaluation of Historic Resources, Findings of Effect and Recommended Mitigation Measures, and Sources. A California Historic Resources Inventory (DPR 523) form, prepared as a result of the investigation, is appended.

II. Identification of the Resources

(Please see Appendix 1 for a background discussion on the identification and historic context phase.)

A field visit to the project site was carried out on May 25, 2001. The buildings, structures and amenities were observed, described, and photographed.

Research was undertaken before and after the site visit in order to further identify the history of the resources and their context. The first step was an investigation of the site's chain of ownership through a search of recorded deeds housed at the office of the Orange County Recorder. Historical files were also consulted at the History Room of the Santa Ana Public Library and the central branch of the Los Angeles Public Library (the oldest public library collection in Southern California). A search was also made in various on-line historical and biographical databases available on the Internet. The focus of this research was to determine if the history of the site had any connection to a person or event of national, state-wide or local

significance during its period of habitation. As many documentary resources as possible within realistic time and budget constraints were investigated and are listed under Sources (Section VI).

The research on the site is reported below and is also summarized on a DPR 523 form appended at the end of this report. In completing the forms, the consultant followed the "Instructions For Recording Historical Resources" issued by the California State Office of Historic Preservation (SHPO) in March 1995.

The historical resources on the site consist of a ranch-house and a number of out-buildings and agricultural structures and features. All the resources have long been abandoned and are in bad shape, having lost most of their integrity.

History: This site is known historically as the Arthur Hausauer family cattle ranch, according to the Saddleback Historical Society. Arthur P. Hausauer was born in South Dakota on June 19, 1890. In 1905 he moved to Santa Ana with his parents Fred and Matilda Hausauer and his sister, also named Matilda. Local directories reveal that by 1915 the family was living at 612 East 6th Street and Arthur was employed in a packing house. Fred Hausauer died in 1919. In 1925, Arthur, by then married to his wife Edna May Hausauer, was working as a foreman. Until 1928, they lived at 825 East 1st Street. In 1929 the Hausauers moved to their ranch in El Toro. Their property was eventually given the address 19356 Los Alisos (later changed to El Toro Road), Trabuco Canyon. Arthur Hausauer died on April 2, 1964 at the age of 73. (A copy of his obituary can be found in Appendix 5.) It appears that Mrs. Hausauer stayed on at the ranch with her son Arthur Fred Hausauer until the late 1970s. By the early 1980s, the ranch was owned by the first in a series of investment and development firms.

Physical Description: The site is located approximately .1 mile south of the intersection of El Toro Road and Live Oak Canyon Road and approximately .4 mile east of El Toro Road. It stretches in a southeasterly direction for approximately 1,700 feet and varies between 250 and 800 feet in width. (Note: the codes following the names of the resources listed below refer to the map found in Appendix 4. The resources are listed as they were discovered, moving generally in a northwesterly direction.)

Olive grove (F1)–Located at the southeasterly end of the property, the grove consists of approximately one hundred trees. Extending to the east, south and west of the holding pond (F2), its most dense growth is towards the east.

Holding pond (F2)–Currently overgrown with algae, the pond measures approximately 400 feet north-south by 100 feet east-west.

Laundry (F3)–This is a small wooden one-room structure that measures 12.5 feet east-west by 10 feet north-south. Constructed of horizontal boards nailed with wire nails to vertical supports, this structure has mostly collapsed. The roof is of corrugated metal. Shelving appears around the inside walls of the structure, which has fixed windows on the south and east walls and a door in the west wall. The structure is wired for electricity and a laundry appliance was found inside. A

collapsed wooden structure with metal rain gutters is located about 20 feet to the south. Barbed wire extends along the eastern side of the main structure of F3, and wood posts are evident at two of the corners. It appears this feature was fenced in at one time.

Cattle chute (F4)–This structure, measuring approximately 4 feet wide by 4.5 feet long by 5.5 feet tall, is constructed of four large vertical wooden beams bolted to smaller horizontal beams on the top and sides. Two large doors are evident: one to the northwest which is still on its hinges and has large metal bars, and the other to the southeast which is on the ground. It appears this feature led into a fenced compound based on the presence of fences and a gate.

Deep water basins (F5)–There are two basins, both about 2 feet deep and 6.5 feet in diameter. They are made of corrugated metal reinforced with poured concrete containing small boulders and rocks. A metal water pipe connects F5 to F6 and F7. F5 has almost been swallowed up by a large gully, carved out by rainwater runoff, that has extended in its direction.

Workshop (F6)–This is a rectangular, two-room building that measures 8 feet wide by 30 feet long. It is constructed of milled wood, wire nails and corrugated metal. The westerly room has walls of clapboard siding (painted red) and has a flat roof of corrugated metal. Waist-high shelves are evident along the interior walls. The easterly room appears to have been an addition, and consists of a wood-frame with walls of corrugated metal. A workbench, shelving, and a broken cabinet are located inside this room, as well as electrical outlets. A 3.5-foot diameter by 3.8-foot tall rusted water drum is located near the southeast corner of F6.

Animal pens (F7)–Containing several pens, this wooden structure measures approximately 10 feet north-south by 40 feet east-west. It is constructed of milled wood and wire nails, and has a corrugated metal roof. The main structure has vertical wood beams and a roof that extends to the ground. The southerly facade may have been added and is constructed of milled boards and is covered with chicken-wire. At least four separate pens are evident in this structure: the spaces on the westerly half are completely covered with chicken-wire and may have been chicken coops, while the pens in the easterly half are divided by waist-high barriers and may have housed other types of animals, perhaps pigs. This structure has disintegrated badly.

(According to a 1995 report by RMW Paleo Associates, directly associated with F7 to the south was a small A-frame structure measuring 6 feet north-south by 10.5 feet east-west by 3.5 feet tall. It was constructed of milled wood with chicken-wire walls and a sheet-metal roof. It may have been a chicken coop. This structure had completely disappeared by the time of this consultant's visit.)

Animal pen (F8)–Measuring 23 feet east-west by 12 feet north-south, this structure has an associated A-frame coop located directly to the east. The main pen is constructed with 2-by-4 boards and is covered with chicken-wire. A metal water pipe extends from F8 towards the vicinity of the water drum near F6. Much of F8 has now disappeared.

Hutch (F9)–Located on the west side of a north-south running fence, this structure had a water holding tank adjacent to its east side. The fence is constructed of wood and chicken-wire. The hutch is 10 feet north-south by 8 feet east-west and is constructed of milled wood, wire nails, sheet metal, corrugated metal, and chicken-wire. The structure has collapsed. The water holding tank associated with this structure, mentioned in the earlier RMW Paleo report, was constructed of metal and was lined with cemented cobblestones on the outside. The basin was 6 feet in diameter with a pipe extending northwards to the tank. The tank is now at the bottom of a gully that has extended into the area.

Barn (F10)–This structure, now completely collapsed, measured approximately 40 feet north-south by 45 feet east-west. It was constructed of horizontal wood boards and wire nails and had a corrugated metal roof supported by 1-by-3 wood boards. The barn had a front-facing gable roof. The foundation consisted of poured concrete. A door was positioned in the southwest corner. A fence constructed of milled wood extended around the south and west sides of the barn. Two gates were placed on the south side.

Ranch-house (F11)–The house is basically square, measuring 31 feet north-south by 26.5 feet east-west. The gabled roof is low-pitched and covered with composition shingles. The open eaves contain exposed rafter-tails. Most of the wall covering has been removed, but intact areas indicate its was clapboard siding, painted green. A total of six wood-framed double-hung windows are evident in the house, but all the glass has disappeared. (However, several metal window frames were found on the ground around the house.) A single door is positioned in the center of the south side of the house, set back about 6 feet to create a raised porch. The porch is approached by a poured-concrete and cobblestone stairway. Along the east wall of the house is a cobblestone and cement fireplace. The foundation of the house consists of a thin layer of cement footings surmounted by 1.5 foot tall posts. Pipes running along the outside of the easterly wall indicate the house had running water. In addition, there is a circular cement water-holding cistern on the north side of the house. Several ceramic insulators and knob-and-tube components located on the rafter-tails are evidence that the house was wired for electricity as well. A door on the north side of the house leads to two later additions: a pantry on the westerly end and a bathroom on the easterly end. These additions, located at the northwest corner of the house, both extend 11 feet north-south and about 13 feet east-west. Another door on the easterly end of the north wall leads to a back porch. The pantry in the northwestern portion of the house has shelves and is separated from the main house by another room leading into it. The walls of the bathroom addition are constructed of plaster over chicken-wire, unlike the other walls of the house which are clapboard. Located adjacent to the pantry, it can be accessed only through a door on the north side of the house. It has a window on its east wall. A fence and retaining wall extend around the western and southern sides of the house. The wall is constructed of cement and cobblestone, while the fence consists of steel rods, chicken-wire, and wooden stakes. Eucalyptus and pepper trees shade the house.

Animal pen (F12)–This rectangular structure measures 7 feet north-south by 5.5 feet east-west and is about 10 feet south of the house. It is constructed of 3.5-inch-square wood posts with chicken-wire wrapped around them and has a corrugated metal roof. The entrance is narrow and

is located in the southwest corner. A cracked and faded piece of rubber is located above the entrance and could have served as a name plate, which might mean this enclosure was meant for a pet

Shed (F13)–This structure has totally collapsed, so that its original use can only be speculated. Four cement pillars are evident, spaced 11 feet from each other. The structure was built of horizontal boards with vertical supports and wire nails. The roof was made of wood and corrugated metal. It was built adjacent to an asphalt road, although the angle of the road and the steepness of the slope would have made access difficult.

Garage (F14)–This structure has also collapsed, but its use appears to have been as a garage. U-shaped and constructed of wood, it was about 20 feet square. It was constructed of vertical boarding with two horizontal braces and wire nails. It may have had a corrugated metal roof.

Adjacent to F14 on the north side is an animal hutch. Constructed of wood, it has four pens separated by chicken-wire. The hutch is approximately 12 feet east-west by 3 feet north-south. Some other similarly constructed hutches are scattered around the general vicinity. Approximately 7 feet west of F14 is a set of chicken coops suspended in the air by a steel frame with wood boards extending across the top. A grape arbor runs along the westerly roof. There are 32 individual pens on the south side and 24 pens on the north side.

Photographs of these historic resources can be found in Appendix 6 and on the DPR form following Appendix 6.

III. The Historic Context

As discussed in Appendix 1, in order to assess previously recorded and as yet unevaluated cultural resources, a historic context must be developed, revolving around a theme, place, and time. Then, it is possible to evaluate and study the identified cultural resources within the research framework of the historic context.

Before the arrival of the Europeans, the area around the project site was settled by two prehistoric cultures: the "Juaneno" and the "Gabrielino". The former term is given to those people who would later come under the control of the Mission San Juan Capistrano and the latter term refers to those who were later controlled by the Mission San Gabriel. These names were imposed by later settlers, and we do not know by what names the native tribes identified themselves. Both cultures were eventually wiped out by European settlement and disease.

The first Europeans to enter the area were Gaspar de Portola and an overland expedition he was leading under the Spanish flag from San Diego to Monterey in 1769. He named several local sites, including "Trabuco" which means "blunderbuss"--the place where one of his party's weapons was lost. Mission San Juan Capistrano was established in 1775, becoming operational in 1776. An earlier site further inland in San Juan Canyon was abandoned, but the name "Mission

Viejo" given to the surrounding lands did survive. During the mission period, up to 14,000 cattle and 16,000 sheep grazed on the Mission San Juan Capistrano's lands in the Trabuco and Mission Viejo areas.

After Mexico won its independence from Spain in 1821, mission lands were secularized and huge estates, or ranchos, were granted by the Mexican governor to prominent citizens and soldiers. Among the southern Orange County ranchos closest to the project site were: Rancho Canada de los Alisos (10,668 acres); Rancho Trabuco (22,184 acres); Rancho Mission Viejo (also known as La Paz--47,452 acres); and Rancho Los Potrero los Pinos (1,167 acres). Rancho Canada de los Alisos ("the glen of the alders") was granted to Jose Serrano in 1842. Supplemented by a later grant in 1846, the property eventually became known as the Whiting Ranch in the 1880s. John Forster, an English trader and brother-in-law of governor Pio Pico, eventually gained ownership of the other three ranchos. With the end of the Mexican War and the subsequent "invasion" of the Americans in 1848, Forster also fell heir to Pico's huge rancho to the south of Mission Viejo, called Santa Margarita y Las Flores. (The strip of "independent" land between Rancho Trabuco and Rancho Mission Viejo, which includes the subject property, was made available to homesteaders as early as 1880.)

Forster's family was not able to afford the expense of maintaining over 200,000 acres (all known as Rancho Santa Margarita at that time). Upon his death, his sons sold the huge landholding to Richard O'Neill, an Irish cattleman in partnership with a well-known San Francisco financier, James C. Flood. O'Neill improved the Rancho's cattle and sheep stock (the latter tended by Basque shepherds), covered the Trabuco Mesa with wheat fields, invested in mining activities, and even developed a tourist resort at San Juan Hot Springs. The building of the Santa Fe Railway through the Rancho in 1888 improved the marketability of the Rancho's many products. By the late 1920s, the O'Neill family controlled an agricultural empire of 230,000 acres which included vast tracts of sugar beets and 15,000 head of cattle.

In 1940, the Rancho Santa Margarita was divided at the San Diego County line, the property to the south reverting to the Flood family, and a year later purchased by the U.S. Navy for what is still known as Camp Pendleton. The O'Neill family retained ownership of the Orange County part of the old ranch, which they renamed Mission Viejo. The land remained in agricultural use until the mid-1960s, when the planned 10,000-acre community of Mission Viejo was developed, in response to the growing need for housing in southern Orange County. Since that time, development has been steadily progressing over lands still largely controlled by the O'Neill family. The planned development of 5,000 acres on Trabuco Mesa, or Plano Trabuco, resurrected the old Rancho Santa Margarita name in 1985. Mission Viejo and Rancho Santa Margarita are now the urbanized sectors closest to the project site, the latter having already reached a population of 20,000 by 1993. Areas inland of the Mesa retain their rural appearance, with cattle-raising still a major activity.

Lands of steep terrain, such as those of the project site, were often not included in the original Spanish land-grants, but were kept for common grazing by the nearby ranchos. (The current intersection of Live Oak Canyon Road, Santiago Canyon Road (also known historically as the

"Modjeska Grade"), and El Toro Road is only about 1,000 feet east of the boundary of the Rancho Canada de los Alisos and about a mile north of the boundary of Rancho Trabuco.) The first Anglo resident of Live Oak Canyon (which had been called Black Oak Canyon by the Mexicans, and the Harris Grade by early settlers) was Henry Pankey, a beekeeper who, in 1873, settled about one mile in from Cook's Corner. Within six years, a tiny village had sprung up around what is now Trabuco Oaks. Among these early settlers was A. S. Hamilton for whom a still-extant truck trail is named. He later became a liveryman in the City of Orange. The discovery of a lode of tin in 1877 helped to attract more residents to the Canyon, although the mine was never successful. Trabuco got its first permanent schoolhouse in 1888 which also served as church, social hall and post office. Histories of the area describe most of the first residences as "cabins".

Drawn by the beauty and isolation of the area and the availability of cheap government land, settlers of Live Oak, Santiago, and Trabuco Canyons tended to be an assortment of miners, beekeepers, homesteaders and stock farmers. Almost every ranch, no matter its size, would have a few head of cattle and several horses. The major agricultural products were barley and oat hay. Settlers were also attracted by a plentiful supply of game, including quail, deer, doves, and rabbits. Trout abounded in Trabuco Creek as well. Deer, mountain lions, and grizzly bears (doubtless attracted by the many apiaries in the canyons) were also prevalent. Until the 1920s, Live Oak Canyon served as the main route of grain wagons hauling wheat from Trabuco Mesa to the railroad spur at El Toro. (Later, the Mesa would revert to cattle grazing.) In 1930, the Trabuco Oaks subdivision was created, but was not a financial success, largely due to the Great Depression. In 1938, the canyons got a permanent post office. The O'Neill family donated land for O'Neill Park in 1948, assuring that much of Live Oak Canyon would remain as open space. Cook's Corner has occupied the triangle of land between Live Oak Canyon and Santiago Canyon Roads since the 1930s and became an important social center for the entire rural area around it.

Terry Stephenson described Trabuco Canyon as follows in 1948 (a description that could also apply in some measure to the other nearby canyons, such as Live Oak and Santiago):

> ...beautiful every foot of the way from San Juan Capistrano, where the creek joins the San Juan, along its foothills to the western edge of the Santiago ridge; beautiful as it curves around the ridge, entering the Narrows where the steep broken sides of the canyon are covered with live oaks; beautiful at the old tin mines and public camp grounds at the forks, where Holy Jim canyon reaches upward to the summit of Santiago peak; beautiful as the road grows more difficult, passing over loose rock in the creek bottom; beautiful for its views of the higher brushy mountains, for its clumps of oaks, for its alder-lined stream, for its sycamores, its flowers and its sage, so much a part of landscapes familiar to those who know open places of California. (p. 145)

Theme of the Historic Context: Agriculture, 1920- , Trabuco Canyon

Resource Attribute: Farm/ranch

IV. Evaluation of the Historic Significance of the Resources

(Please see Appendix 2 for a background discussion on the evaluation phase.)

Using the criteria of the National Register of Historic Places, the consultant must determine the significance of identified resources on the project site.

Within the broad historic context of local Orange County history, the Hausauer ranch is of no appreciable significance. Other, more intact, family cattle ranches can still be found in the area.

Summary of Significance:

As a site: of no local significance under criterion A (patterns of settlement) and B (significant persons).

Integrity: Poor. The property was apparently abandoned by 1980 and the improvements have either been vandalized or have fallen victim to the elements. Over the last few years, a large gully has formed which has swallowed up several of the ranch's outbuildings.

Evaluation code: 6Z (Found ineligible for listing in the National Register)

V. Findings of Effect and Recommended Mitigation Measures

(Please see Appendix 3 for a background discussion on this phase of the process.)

If the consultant finds that a proposed project will have an adverse effect on any significant resource situated on the project site, he must assess the extent of the effect and recommend possible mitigation measures which could range from "No Project" to documentation before demolition.

Findings Of Effect: The proposed project will remove all the historic resources now on the site, and so will definitely have an adverse effect on them.

Recommended Mitigation Measures: In view of the site's ineligibility for the National Register, no mitigation measures need be considered.

Appendix 1

Identification of Existing Resources and Their Historic Context (Background)

Federal guidelines require that the first step in the review process should be the identification of cultural resources (i.e., historic properties). Various levels of preliminary archival research and on-site survey investigations for cultural resources can be applied during this step. This evaluator normally chooses a mid-range level of archival research in order to facilitate the preparation of the "historic context" and eligibility evaluations for the National Register of Historic Places (NRHP), the next steps in the process.

A research methodology is developed to comply with federal mandates and guidelines for identifying cultural resources, be they in the form of buildings, sites, structures, objects, or contributors to historic districts. A thorough field visit, including the preparation of a written and photographic record, is the best foundation for identifying and later evaluating any cultural resources found on the project site.

Historic research based on a sound methodology is crucial at this stage of the investigation. Architectural history and analysis may be necessary for sites with extant buildings and structures. Physical characteristics such as site structure, content, and integrity are crucial variables in later evaluation of the resource's eligibility for the NRHP.

Architectural components of extant or relic buildings, structures, and/or objects within the project area should be sufficiently preserved to contain data for research and interpretation. Ideally, the original design and subsequent alterations should be identifiable as discrete occupational episodes associated with a temporally defined occupation. Architecture should represent identifiable functional association. Archival materials should be available to reconstruct a partial or complete history of the project area.

The National Park Service (NPS) stipulates that the significance of any historic property should be made within the "historic context" developed for that area (Parker 1985; Interagency Resources Division, Bulletin 16A, 1991). "Historic context" is defined as the sum of information pertaining to an area, organized by theme, place, and time.

The NHRP suggests that "a theme is the equivalent of a research problem, and an historic context is developed by placing the problem in an appropriate setting in both time and space" (Interagency Resources Division, Bulletin 16A, 1991). For instance, a broad historic context might be identified as "Western U.S. Expansion, Mid-19th Through 20th Centuries." A more focused historic context might be "Early to Mid 20th Century Agricultural Development of the (locality)."

A "historic context" is associated with identified cultural resources through the concept of "resource attributes" (called "property types" by the NRHP). These attributes allow geographically diverse historic properties that share physical and associative characteristics to be linked together under a set of commonly agreed-upon descriptive terms and compared as to their relative significance within the historic context. As an example, an appropriate resource attribute for the sites associated with the contexts mentioned above, given the agricultural theme, might be "Farm/Ranch."

Major themes have evolved during the past two decades of cultural resources investigations at various 19th and 20th century sites in southern California. Possible research themes and their associated resource attributes, adapted from the "Areas of Significance" and "Functions and Uses" for eligibility evaluations for the NRHP, are listed on the following page:

EXAMPLES OF POTENTIAL RESEARCH (HISTORIC CONTEXT) THEMES

Agriculture
Architecture
Archaeology: Prehistoric
Aboriginal
Non-aboriginal
Art
Chronology
Commerce/Trade

Theater
Train
Trees/Vegetation
Urban Open Space
Women's Property

More than one research theme might be applicable. Further research within and adjacent to the project area could build on these themes and develop them into a historic context that characterizes the cultural development of the entire community.

Many of the research themes are inter-related. The analysis of architectural, archival, and oral history data for one theme will simultaneously address several other themes. For instance, the study of historical material culture (i.e., artifacts) provides a wealth of information concerning subsistence patterns, household composition (e.g., gender, adults, children, infants), socioeconomic status, trade networks and commodity flows (local, regional, national, and international), historical site use and activity, spatial inter-relationships of features and buildings, site evolution, and other themes. The documentary record by itself may not contain sufficient data to provide answers for all the research questions arrived at. Other data generated through architectural, archaeological, oral history and specialized analysis may provide complementary information which will provide answers to these and other research questions.

Research questions pertaining to the themes are developed prior to and during the course of fieldwork. Other research questions arise during the subsequent analysis of the field and historic research data.

A multi-disciplinary approach is used during the identification and historic context phase of the cultural resource investigation project. Archival documents and cartographic sources, oral history interviews, as well as field surveys are all used to locate, define, and provide interpretations for the cultural resources within the project area. Furthermore, this data is combined to reconstruct the most accurate picture of the project area. In turn, the research data is useful in the construction of the historic context and in evaluating the significance of the sites identified within and adjacent to the project area.

Appendix 2

Evaluation of Historic Resources (Background)

Evaluation of sites is the second step in the review process. The first step, "Identification", has been accomplished through research, development of an historic context, and a field survey of cultural resources within the project area. In making an evaluation of a resource's significance, the consultant refers to National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation.

A cultural resource's significance must be established before project impacts to the resource can be assessed. All data gained from the field survey, architectural analysis, research, and historic context will be assembled and interpreted with respect to each site. In turn, the multi-disciplinary data will be used to evaluate the individual site's potential eligibility for the NRHP.

In order to accomplish this, evaluative investigations must begin at the sites themselves. Field investigations should document cultural features, site boundaries, and the nature and association of site features within each lot or property of the project area. The integrity of the cultural resource (i.e., its state of intactness and the extent of alteration from its original appearance either deliberately made or the result of deterioration over time) must also be addressed. Such changes will then be documented by historic research and, where applicable, architectural research. (It should be noted that while interior modifications of a historic property may affect its integrity, in most cases exterior integrity is considered the foremost determinant of whether a property still retains enough of its original significance.)

During the evaluation phase of the investigations, the resources are assessed and evaluated for their potential to address and exemplify important historic themes. The intent of the evaluation is to assess the presence/absence of data that is needed to answer research questions. A site that has lost substantial integrity through deterioration or alteration may thereby have lost much of its significance. If similar, more intact, sites have been identified in close proximity to the subject site, the site may be considered of lesser value than if it is the only such site found locally, and therefore unique, even if of poor integrity.

Criteria for Evaluating the Significance of Historical Resources

National Register Bulletin 15 states that the "quality of significance...is present in sites that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

A. That are associated with events that have made a significant contribution to the broad patterns of our history; or

B. That are associated with the lives of persons significant in our past; or

C. That embody the distinctive characteristics of a type, period, region, or method of construction, or that represent the work of a master, or that possess high artistic

values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. That have yielded, or may be likely to yield, information important in prehistory or history."

Thus, Criterion A is usually associated with "events," Criterion B is associated with "persons," Criterion C is associated with "design/construction," and Criterion D is associated with "information potential." Some historical archaeological sites may be evaluated for eligibility under Criteria A, B, and/or C, but most are evaluated under Criterion D.

Criterion A. Events. Properties are considered important if they are associated with significant events. Association through the historic context has to be demonstrated. Providing evidence of direct association of the events with the historic property is necessary. Properties can also be considered important if they are the best examples of the result of historic settlement patterns ("event," in this case, being rather broadly defined).

Criterion B. Person. "Persons significant in our past" refers to individuals whose activities are demonstrably important within a national, state, or local context. Correlation of an individual within the framework of the historic context is crucial. Also, his/her ties with a specific property and/or an event is important.

Criterion C. Design/Construction. Resources represented by extant architecture are evaluated under this criterion. Elements that are important under Criterion C include distinctive characteristics of a type, period, or method of construction, or the work of a master, possessing high artistic value. Integrity of the property is an especially important factor under this criterion.

Criterion D. In order to qualify for eligibility for the NRHP under this criterion, the archaeological site (i.e., historic property) has to meet two conditions: 1) the site must have yielded or be likely to yield information such as archaeological data or historic data that will have potential to answer research questions; and 2) the yielded information must be important with respect to historical archaeology and other related historic preservation fields.

Related Criteria--Generally, a historic property, to be considered eligible, should be of a certain age, not be a reconstruction, and have never been moved from its original location. Federal guidelines have traditionally prescribed a 50-year age for cultural resources evaluated for eligibility for the NRHP (36 CFR 60.4); however, a 45-year age threshold is becoming increasingly acceptable due to delays in project implementation which can often stretch five years or more beyond the evaluation date. The California State Office of Historic Preservation has stated that, minimally, a site "must be at least 45 years of age" (1989:3). However, the National Park Service and the State Office of Historic Preservation do recognize special sites that have achieved significance even though they may be less than 45 years old, have been reconstructed, or have been relocated (Sherfey and Luce 1979; Interagency Resources Division 1987).

The NRHP has developed a chart of seven numerical evaluation codes for pinpointing the status of a historic resource. These are to be entered onto the DPR 523 forms.

1 Listed in the NRHP
2 Determined eligible for the NRHP in a formal process involving federal or state agencies
3 Appears eligible for listing in the NRHP in the judgment of the professional evaluator
4 Might become eligible for listing in the NRHP when certain conditions are met
5 Not eligible for the NRHP but may be significant at the local level
6 None of the above
7 Undetermined

These numerical codes can be further sub-classified by adding a letter code. Among the most commonly used letter codes are:

S Resource is separately listed in the NRHP
D Resource is included as a contributor to a NHRP-listed district
B Both S and D above
M Resource may become eligible as a contributor to a NRHP-listed district when more documentation is found or restoration work performed

Refinements may be made to these alphanumeric codes by adding still more letters and/or digits to cover all categories of actual or potential National Register eligibility. These finer divisions are not listed here in view of space limitations.

Appendix 3

Findings of Effect and Recommended Mitigation Measures (Background)

Based on the eligibility evaluations for the NRHP, a findings of effect (i.e., "no effect", "no adverse effect", or "adverse effect") will be prepared for any sites eligible for the NRHP within the project area. This is the third step of the review process. Sites that will not be adversely affected by the proposed project will be preserved in place and "no effect" or "no adverse effect" will occur. Sites that cannot be preserved in-situ within the project area will suffer adverse effects by the proposed project and will require treatment or data recovery to mitigate the loss of that site data. Recommendations for treatment and data recovery are to be proposed for each project. A report containing all germane information relevant to the study is to be prepared and submitted to the lead agency. (In a case where a local historic preservation ordinance has not been enacted, the evaluation report is designed to be of sufficient comprehension, in terms of the identification, evaluation, and treatment of cultural resources, to be of value in the context of any future ordinance the locality may enact within its jurisdiction.)

A significant impact is that which eliminates the resource or alters the characteristics that made the property eligible for the NRHP. Impacts can sometimes be mitigated by utilizing the Secretary of the Interior's Standards for Rehabilitation.

A project area represents the Area of Potential Effect (APE). As a result of a proposed project, the APE will undergo direct and/or indirect changes with impact on cultural resources that may have been evaluated as eligible or potentially eligible for the NRHP.

The evaluator must determine whether the demolition or alteration of existing architectural, landscape, and/or archaeological features constitute an effect on any significant cultural resources within the project area. If there is an effect, the evaluator must decide whether the effect is adverse or not adverse.

Federal, state, and local historic preservation procedures for assessing effects and mitigation of adverse effects from a proposed project on cultural resources eligible for the NRHP call for prudent and feasible alternatives. Planned construction, usually an adverse effect, may not always permit in-situ preservation of the historic cultural resources within and directly adjacent to the project area. Therefore, project alternatives or mitigation measures must be proposed to preserve and/or document the significant cultural resources that will be destroyed by a project.

Project Alternatives or Mitigation Measures

Among the alternatives or mitigation measures which can be considered for a significant site are:

1. No Project (no construction of the planned development); or

2. Mitigation of the Project's Effect on the Cultural Resources by:

2a. Adaptive reuse of the historic resource(s) within the project. Such reuse of building facades and architectural features has become an innovative and highly successful means of mitigating impacts on historic buildings in numerous cities with historic buildings. The facades should be restored in conformance with the Secretary of the Interior's Standards. Adaptive reuse may also involve the construction of new buildings, sometimes as in-fill between existing historic structures. Guidelines for the design of new buildings should include such concerns as architectural style, materials, height, setbacks, colors, textures, street-scape patterns, matching of the existing overall rhythm of new development to the surrounding area, structural detailing, signage, and exterior treatments.

Various incentives exist for the adoption of this mitigation measure, such as use of the State Historical Building Code (Health and Safety Section 18950, et seq.) instead of the Uniform Building Code; and financial incentives such as local property tax relief through the Mills Act (Revenue and Taxation Code Sections 439 et seq.), the Marks Historical Rehabilitation Act, and federal investment tax credits for the rehabilitation of income-producing property. Other incentives such as facade easements or low-interest construction loans may also be available through the local jurisdictions.

2b. Relocation of the resource(s). This mitigation is a problematical one. The majority of historic buildings will lose their significance when removed from their original setting or context. Relocation is usually preferable to demolition from the purely historic preservation standpoint, but the National Register will rarely maintain a relocated structure's listing and then only if it meets rigid criteria, such as prior application, re-creation of the original setting at the new site, and the retention of the structure's original compass orientation. Buildings that are significant under Criterion C are the most likely to retain significance after moving.

2c. HABS-level architectural documentation. The Historic American Building Survey is a program of the National Park Service that documents historic resources in great detail. It requires measured drawings, intensive historical research, large format photographs, and prescribed procedures for transmission and archival preservation. Published guides to HABS are available from the National Park Service.

2d. Less thorough architectural documentation. This normally includes complete photographic documentation of the site and a detailed historical report. This permanent record shall include a history of the site, documentation of the building itself, adjacent structures, and street-scapes. The record should be made publicly accessible by placing it in the care of a local historical society, academic institution, or public library.

Newsclipping

ARTHUR HAUSAUER

HAUSAUER, ARTHUR, age 71, 19356 El Toro Road, El Toro, California. Passed away April 2, 1964. Survived by his wife, Edna May Hausauer of the home. One son, Arthur Fred Hausauer of El Toro; three steps-sons, Allen Breedlove of Medford, Oregon, Edward Breedlove and LeRoy Breedlove both of Los Angeles. One step-daughter, Lola Ustariz of Riverside and 13 grandchildren also survive Mr. Hausauer come to Santa Ana in 1905 and moved to El Toro 35 years ago. He was a member of Santa Ana Elks Lodge No. 794. Funeral services will be conducted in BROWN COLONIAL CHAPEL at 1:30 p.m. Monday afternoon. Interment will follow in El Toro District Cemetery.

P3. Description (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The historical resources on the site consist of a ranch-house and a number of out-buildings and agricultural structures and features All the resources have long been abandoned and are in bad shape, having lost most of their integrity.

The site is located approximately .1 mile south of the intersection of El Toro Road and Live Oak Canyon Road and approximately .4 mile east of El Toro Road. It stretches in a southeasterly direction for approximately 1,700 feet and varies between 250 and 800 feet in width. (Note: the codes following the names of the resources listed below refer to the appended map. The resources are listed as they were discovered, moving generally in a northwesterly direction.)

Olive grove (F1)–Located at the scutheasterly end of the property, the grove consists of approximately one hundred trees. Extending to the east, south and west of the holding pond (F2), its most dense growth is towards the east. (see continuation sheet)

(Discuss importance in terms of historical or architectural context as defined by theme, period and geographic scope. Also address integrity.)

This site is known historically as the Arthur Hausauer family cattle ranch, according to the Saddleback Historical Society. Arthur P. Hausauer was born in South Dakota on June 19, 1890. In 1905 he moved to Santa Ana with his parents Fred and Matilda Hausauer and his sister, also named Matilda. Local directories reveal that by 1915 the family was living at 612 East 6th Street and Arthur was employed in a packing house. Fred Hausauer died in 1919. In 1925, Arthur, by then married to his wife Edna May Hausauer, was working as a foreman. Until 1928, they lived at 825 East 1st Street. In 1929 the Hausauers moved to their ranch in El Toro. Their property was eventually given the address 19356 Los Alisos (later changed to El Toro Road), Trabuco Canyon. Arthur Hausauer died on April 2, 1964 at the age of 73. It appears that Mrs. Hausauer stayed on at the ranch with her son Arthur Fred Hausauer until the late 1970s. By the early 1980s, the ranch was owned by the first in a series of investment and development firms.

Historic Context: Before the arrival of the Europeans, the area around the project site was settled by two prehistoric cultures: the "Juaneno" and the "Gabrielino". The former term is given to those people who would later come under the control of the Mission San Juan Capistrano and the latter term refers to those who were later controlled by the Mission San Gabriel. These names were imposed by later settlers, and we do not know by what names the native tribes identified themselves. Both cultures were eventually wiped out by European settlement and disease. (see continuation sheet)

P3. Description

Holding pond (F2)–Currently overgrown with algae, the pond measures approximately 400 feet north-south by 100 feet east-west.

Laundry (F3)–This is a small wooden one-room structure that measures 12.5 feet east-west by 10 feet north-south. Constructed of horizontal boards nailed with wire nails to vertical supports, this structure has mostly collapsed. The roof is of corrugated metal. Shelving appears around the inside walls of the structure, which has fixed windows on the south and east walls and a door in the west wall. The structure is wired for electricity and a laundry appliance was found inside. A collapsed wooden structure with metal rain gutters is located about 20 feet to the south. Barbed wire extends along the eastern side of the main structure of F3, and wood posts are evident at two of the corners. It appears this feature was fenced in at one time.

Cattle chute (F4)–This structure, measuring approximately 4 feet wide by 4.5 feet long by 5.5 feet tall, is constructed of four large vertical wooden beams bolted to smaller horizontal beams on the top and sides. Two large doors are evident: one to the northwest which is still on its hinges and has large metal bars, and the other to the southeast which is on the ground. It appears this feature led into a fenced compound based on the presence of fences and a gate.

Deep water basins (F5)–There are two basins, both about 2 feet deep and 6.5 feet in diameter. They are made of corrugated metal reinforced with poured concrete containing small boulders and rocks. A metal water pipe connects F5 to F6 and F7. F5 has almost been swallowed up by a large gully, carved out by rainwater runoff, that has extended in its direction.

Workshop (F6)–This is a rectangular, two-room building that measures 8 feet wide by 30 feet long. It is constructed of milled wood, wire nails and corrugated metal. The westerly room has walls of clapboard siding (painted red) and has a flat roof of corrugated metal. Waist-high shelves are evident along the interior walls. The easterly room appears to have been an addition, and consists of a wood-frame with walls of corrugated metal. A workbench, shelving, and a broken cabinet are located inside this room, as well as electrical outlets. A 3.5-foot diameter by 3.8-foot tall rusted water drum is located near the southeast corner of F6.

Animal pens (F7)–Containing several pens, this wooden structure measures approximately 10 feet north-south by 40 feet east-west. It is constructed of milled wood and wire nails, and has a corrugated metal roof. The main structure has vertical wood beams and a roof that extends to the ground. The southerly facade may have been added and is constructed of milled boards and is covered with chicken-wire. At least four separate pens are evident in this structure: the spaces on the westerly half are completely covered with chicken-wire and may have been chicken coops, while the pens in the easterly half are divided by waist-high barriers and may have housed other types of animals, perhaps pigs. This structure has disintegrated badly.

(According to a 1995 report by RMW Paleo Associates, directly associated with F7 to the south was a small A-frame structure measuring 6 feet north-south by 10.5 feet east-west by 3.5 feet tall. It was constructed of milled wood with chicken-wire walls and a sheet-metal roof. It may have been a chicken coop. This structure had completely disappeared by the time of this consultant's visit.)

Animal pen (F8)–Measuring 23 feet east-west by 12 feet north-south, this structure has an associated A-frame coop located directly to the east. The main pen is constructed with 2-by-4 boards and is covered with chicken-wire. A metal water pipe extends from F8 towards the vicinity of the water drum near F6. Much of F8 has now disappeared.

Hutch (F9)–Located on the west side of a north-south running fence, this structure had a water holding tank adjacent to its east side. The fence is constructed of wood and chicken-wire. The hutch is 10 feet north-south by 8 feet east-west and is constructed of milled wood, wire nails, sheet metal, corrugated metal, and chicken-wire. The structure has collapsed. The water holding tank associated with this structure, mentioned in the earlier RMW Paleo report, was constructed of metal and was lined with cemented cobblestones on the outside. The basin was 6 feet in diameter with a pipe extending northwards to the tank. The tank is now at the bottom of a gully that has extended into the area.

Barn (F10)–This structure, now completely collapsed, measured approximately 40 feet north-south by 45 feet east-west. It was constructed of horizontal wood boards and wire nails and had a corrugated metal roof supported by 1-by-3 wood boards. The barn had a front-facing gable roof. The foundation consisted of poured concrete. A door was positioned in the southwest corner. A fence constructed of milled wood extended around the south and west sides of the barn. Two gates were placed on the south side.

P3. Description

Ranch-house (F11)–The house is basically square, measuring 31 feet north-south by 26.5 feet east-west. The gabled roof is low-pitched and covered with composition shingles. The open eaves contain exposed rafter-tails. Most of the wall covering has been removed, but intact areas indicate its was clapboard siding, painted green. A total of six wood-framed double-hung windows are evident in the house, but all the glass has disappeared. (However, several metal window frames were found on the ground around the house.) A single door is positioned in the center of the south side of the house, set back about 6 feet to create a raised porch. The porch is approached by a poured-concrete and cobblestone stairway. Along the east wall of the house is a cobblestone and cement fireplace. The foundation of the house consists of a thin layer of cement footings surmounted by 1.5 foot tall posts. Pipes running along the outside of the easterly wall indicate the house had running water. In addition, there is a circular cement water-holding cistern on the north side of the house. Several ceramic insulators and knob-and-tube components located on the rafter-tails are evidence that the house was wired for electricity as well. A door on the north side of the house leads to two later additions: a pantry on the westerly end and a bathroom on the easterly end. These additions, located at the northwest corner of the house, both extend 11 feet north-south and about 13 feet east-west. Another door on the easterly end of the north wall leads to a back porch. The pantry in the northwestern portion of the house has shelves and is separated from the main house by another room leading into it. The walls of the bathroom addition are constructed of plaster over chicken-wire, unlike the other walls of the house which are clapboard. Located adjacent to the pantry, it can be accessed only through a door on the north side of the house. It has a window on its east wall. A fence and retaining wall extend around the western and southern sides of the house. The wall is constructed of cement and cobblestone, while the fence consists of steel rods, chicken-wire, and wooden stakes. Eucalyptus and pepper trees shade the house.

Animal pen (F12)–This rectangular structure measures 7 feet north-south by 5.5 feet east-west and is about 10 feet south of the house. It is constructed of 3.5-inch-square wood posts with chicken-wire wrapped around them and has a corrugated metal roof. The entrance is narrow and is located in the southwest corner. A cracked and faded piece of rubber is located above the entrance and could have served as a name plate, which might mean this enclosure was meant for a pet

Shed (F13)–This structure has totally collapsed, so that its original use can only be speculated. Four cement pillars are evident, spaced 11 feet from each other. The structure was built of horizontal boards with vertical supports and wire nails. The roof was made of wood and corrugated metal. It was built adjacent to an asphalt road, although the angle of the road and the steepness of the slope would have made access difficult.

Garage (F14)–This structure has also collapsed, but its use appears to have been as a garage. U-shaped and constructed of wood, it was about 20 feet square. It was constructed of vertical boarding with two horizontal braces and wire nails. It may have had a corrugated metal roof.

Adjacent to F14 on the north side is an animal hutch. Constructed of wood, it has four pens separated by chicken-wire. The hutch is approximately 12 feet east-west by 3 feet north-south. Some other similarly constructed hutches are scattered around the general vicinity. Approximately 7 feet west of F14 is a set of chicken coops suspended in the air by a steel frame with wood boards extending across the top. A grape arbor runs along the westerly roof. There are 32 individual pens on the south side and 24 pens on the north side.

B10. Significance

The first Europeans to enter the area were Gaspar de Portola and an overland expedition he was leading under the Spanish flag from San Diego to Monterey in 1769. He named several local sites, including "Trabuco" which means "blunderbuss"–the place where one of his party's weapons was lost. Mission San Juan Capistrano was established in 1775, becoming operational in 1776. An earlier site further inland in San Juan Canyon was abandoned, but the name "Mission Viejo" given to the surrounding lands did survive. During the mission period, up to 14,000 cattle and 16,000 sheep grazed on the Mission San Juan Capistrano's lands in the Trabuco and Mission Viejo areas.

After Mexico won its independence from Spain in 1821, mission lands were secularized and huge estates, or ranchos, were granted by the Mexican governor to prominent citizens and soldiers. Among the southern Orange County ranchos closest to the project site were: Rancho Canada de los Alisos (10,668 acres); Rancho Trabuco (22,184 acres); Rancho Mission Viejo (also known as La Paz–47,452 acres); and Rancho Los Potrero los Pinos (1,167 acres). Rancho Canada de los Alisos ("the glen of the alders") was granted to Jose Serrano in 1842. Supplemented by a later grant in 1846, the property eventually became known as the Whiting Ranch in the 1880s. John Forster, an English trader and brother-in-law of governor Pio Pico, eventually gained ownership of the other three ranchos. With the end of the Mexican War and the subsequent "invasion" of the Americans in 1848, Forster also fell heir to Pico's huge rancho to the south of Mission Viejo, called Santa Margarita y Las Flores. (The strip of "independent" land between Rancho Trabuco and Rancho Mission Viejo, which includes the subject property, was made available to homesteaders as early as 1880.)

Forster's family was not able to afford the expense of maintaining over 200,000 acres (all known as Rancho Santa Margarita at that time). Upon his death, his sons sold the huge landholding to Richard O'Neill, an Irish cattleman in partnership with a well-known San Francisco financier, James C. Flood. O'Neill improved the Rancho's cattle and sheep stock (the latter tended by Basque shepherds), covered the Trabuco Mesa with wheat fields, invested in mining activities, and even developed a tourist resort at San Juan Hot Springs. The building of the Santa Fe Railway through the Rancho in 1888 improved the marketability of the Rancho's many products. By the late 1920s, the O'Neill family controlled an agricultural empire of 230,000 acres which included vast tracts of sugar beets and 15,000 head of cattle.

In 1940, the Rancho Santa Margarita was divided at the San Diego County line, the property to the south reverting to the Flood family, and a year later purchased by the U.S. Navy for what is still known as Camp Pendleton. The O'Neill family retained ownership of the Orange County part of the old ranch, which they renamed Mission Viejo. The land remained in agricultural use until the mid-1960s, when the planned 10,000-acre community of Mission Viejo was developed, in response to the growing need for housing in southern Orange County. Since that time, development has been steadily progressing over lands still largely controlled by the O'Neill family. The planned development of 5,000 acres on Trabuco Mesa, or Plano Trabuco, resurrected the old Rancho Santa Margarita name in 1985. Mission Viejo and Rancho Santa Margarita are now the urbanized sectors closest to the project site, the latter having already reached a population of 20,000 by 1993. Areas inland of the Mesa retain their rural appearance, with cattle-raising still a major activity.

Lands of steep terrain, such as those of the project site, were often not included in the original Spanish land-grants, but were kept for common grazing by the nearby ranchos. (The current intersection of Live Oak Canyon Road, Santiago Canyon Road (also known historically as the "Modjeska Grade"), and El Toro Road is only about 1,000 feet east of the boundary of the Rancho Canada de los Alisos and about a mile north of the boundary of Rancho Trabuco.) The first Anglo resident of Live Oak Canyon (which had been called Black Oak Canyon by the Mexicans, and the Harris Grade by early settlers) was Henry Pankey, a beekeeper who, in 1873, settled about one mile in from Cook's Corner. Within six years, a tiny village had sprung up around what is now Trabuco Oaks. Among these early settlers was A. S. Hamilton for whom a still-extant truck trail is named. He later became a liveryman in the City of Orange. The discovery of a lode of tin in 1877 helped to attract more residents to the Canyon, although the mine was never successful. Trabuco got its first permanent schoolhouse in 1888 which also served as church, social hall and post office. Histories of the area describe most of the first residences as "cabins".

Drawn by the beauty and isolation of the area and the availability of cheap government land, settlers of Live Oak, Santiago, and Trabuco Canyons tended to be an assortment of miners, beekeepers, homesteaders and stock farmers. Almost every ranch, no matter its size, would have a few head of cattle and several horses. The major agricultural products were barley and oat hay. Settlers were also attracted by a plentiful supply of game, including quail, deer, doves, and rabbits. Trout abounded in Trabuco Creek as well. Deer, mountain lions, and grizzly bears (doubtless attracted by the many apiaries in the canyons) were also prevalent. (see continuation sheet)

B10. Significance

Until the 1920s, Live Oak Canyon served as the main route of grain wagons hauling wheat from Trabuco Mesa to the railroad spur at El Toro. (Later, the Mesa would revert to cattle grazing.) In 1930, the Trabuco Oaks subdivision was created, but was not a financial success, largely due to the Great Depression. In 1938, the canyons got a permanent post office. The O'Neill family donated land for O'Neill Park in 1948, assuring that much of Live Oak Canyon would remain as open space. Cook's Corner has occupied the triangle of land between Live Oak Canyon and Santiago Canyon Roads since the 1930s and became an important social center for the entire rural area around it.

Terry Stephenson described Trabuco Canyon as follows in 1948 (a description that could also apply in some measure to the other nearby canyons, such as Live Oak and Santiago):

> ...beautiful every foot of the way from San Juan Capistrano, where the creek joins the San Juan, along its foothills to the western edge of the Santiago ridge; beautiful as it curves around the ridge, entering the Narrows where the steep broken sides of the canyon are covered with live oaks; beautiful at the old tin mines and public camp grounds at the forks, where Holy Jim canyon reaches upward to the summit of Santiago peak; beautiful as the road grows more difficult, passing over loose rock in the creek bottom; beautiful for its views of the higher brushy mountains, for its clumps of oaks, for its alder-lined stream, for its sycamores, its flowers and its sage, so much a part of landscapes familiar to those who know open places of California. (p. 145)

Summary of Significance:

Within the broad historic context of local Orange County history, the Hausauer ranch is of no appreciable significance. Other, more intact, family cattle ranches can still be found in the area.

As a site: of no local significance under criterion A (patterns of settlement) and B (significant persons).

Integrity: Poor. The property was apparently abandoned by 1980 and the improvements have either been vandalized or have fallen victim to the elements. Over the last few years, a large gully has formed which has swallowed up several of the ranch's outbuildings.

Evaluation code: 6Z (Found ineligible for listing in the National Register)

6 August 2001

Ms. Deanna Hansen
HDR/Urban Vision
707 Wilshire Blvd
Suite 5320
Los Angeles, CA 90017

RE: Saddleback Meadows Archaeology

Dear Ms. Hansen:

Saddleback Meadows, a proposed residential community in an unincorporated portion of Orange County, is located near the northeastern end of El Toro Road, immediately south and east of its intersection with Live Oak Canyon and Santiago Canyon Roads. The proposed development will result in the destruction of several archaeological sites located on the property.

This document is submitted by RMW Paleo Associates, Inc. (RMW) to HDR Engineering, Inc., and will serve as a summary of previous cultural resources work conducted on the Saddleback Meadows property and provide management recommendations as to the sites' eligibility for listing on the National Register of Historic Places.

The U.S. Army Corps of Engineers has determined that the Saddleback Meadows development project is subject to Corps review because of the project's encroachment on waters of the United States. The Corps extends jurisdiction to upland areas under the "but for" clause and The National Historic Preservation Act's "whole of action principal." Therefore, Section 106 of NHPA (36CFR800) applies to archaeological sites in proximity to such waters.

Archaeological Sites

Six of the 12 archaeological sites on the Saddleback Meadows property fall under Corps jurisdiction and must be evaluated for eligibility. Those sites are:

- CA-ORA-711
- CA-ORA-713
- CA-ORA-715
- CA-ORA-1255
- CA-ORA-1256
- CA-ORA-1435H

CA-ORA-710, located in the western corner of the property, will not be damaged during construction activities and could be preserved in place; however, secondary impacts could be an issue in this case because of the sites' proximity to the development. Possible mitigation measures could be capping the site with sterile fill to protect it from adverse effects or to accomplish data recovery and controlled grading at the site.

The following table lists each site on the property, names the recorder and date, summarizes previous work accomplished at the site and provides a recommended significance designation. Army Corps jurisdiction sites are labelled with an asterisk:

Archaeological Sites at Saddleback Meadows

Site	Recorder	Work Accomplished	Recommendation
CA-ORA-710*	Tadlock & Tadlock 1978	Test Excavation (Maxon 1995)	Significant
CA-ORA-711*	Tadlock & Tadlock 1978	Test Excavation (Maxon 1995)	Significant
CA-ORA-712	Tadlock & Tadlock 1978	Surface Examination; destroyed (Dillon 1989))	Not Significant
CA-ORA-713*	Tadlock & Tadlock 1978	Test Excavation (Maxon 1995)	Not Significant
CA-ORA-714	Tadlock & Tadlock 1978	Surface Collection (Maxon 1995)	Not Significant
CA-ORA-715*	Tadlock & Tadlock 1978	Test Excavation (Maxon 1995)	Not Significant
CA-ORA-716	Tadlock & Tadlock 1978	Surface Examination; destroyed (Dillon 1989)	Not Significant
CA-ORA-1255*	Dillon 1989	Test Excavation (Maxon 1995)	Not Significant
CA-ORA-1256*	Dillon 1989	Surface Examination; destroyed (Maxon 1995)	Not Significant
CA-ORA-1257	Dillon 1989	Surface Examination; noncultural (Maxon 1995)	Not Significant
CA-ORA-1435H*	Knell & Maxon 1995	Testing proposed	Not yet determined
CA-ORA-1437	Maxon 1995	Testing proposed	Not yet determined

The following sites: CA-ORA-713, CA-ORA-715, CA-ORA-1255 and CA-ORA-1256 are recommended to be determined *not significant/eligible* for listing on the NRHP. It is recommended that only CA-ORA-711 (and CA-ORA-710) be deemed *significant/eligible.* CA-ORA-1435H has not yet been evaluated for significance (Maxon 1995). Mitigation measures for these sites include test excavation of CA-ORA-1435H to determine its significance and data recovery excavation at CA-ORA-711 (and CA-ORA-710) to mitigate the effects of their destruction.

Of the remaining archaeological sites on the Saddleback Meadows property (those not under Corps jurisdiction): CA-ORA-712, CA-ORA-714, CA-ORA-716 and CA-ORA-1257 are recommended to be determined *not significant/eligible* for listing on the California Register (per CEQA statutes). CA-ORA-1437 has yet to be evaluated for significance (this will be accomplished under CEQA).

Federal Legal Context

The Saddleback Meadows development project requires a permit pursuant to Section 404 of the Clean Water Act of 1977, under which adverse impacts to *significant* cultural resources fall within purview of the U.S. Army Corps of Engineers and subject to Section 106 of the *National Historic Preservation Act (NHPA)*. The NHPA authorizes the maintenance of a *National Register of Historic Places (NRHP)* which facilitates the preservation of properties that possess integrity and meet at least one of the following four criteria delineated by Section 106 (Advisory Council on Historic Preservation 2000).

The quality of *significance* in American history, architecture, archaeology, engineering and culture is present in districts, sites, buildings, structures and objects that possess *integrity* of location, design, setting, materials, workmanship, feeling and association and:

A. that are associated with events that have made a significant contribution to the broad patterns of our history; or
B. that are associated with the lives of persons significant in our past; or
C. that embody the distinctive characteristics of a type, period or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
D. that have yielded, or may be likely to yield, information important in prehistory or history.

State Legal Context

State legal mandates fall under the provisions of the *California Environmental Quality Act* (CEQA). Public Resources Code SS5024.1, Section 15064.5 of the Guidelines and Sections 21083.2 and 21084.1 of the Statutes of CEQA are the basic guidelines used for cultural resources studies (Governor's Office of Planning and Research 1998).

Public Resources Code SS5024.1 requires evaluation of historical resources to determine their eligibility for listing on the *California Register of Historical Resources*. The purposes of the register are to maintain listings of the state's historical resources and to indicate which properties are to be protected from substantial adverse change (Office of Historic Preservation 1995a:1). The criteria for listing resources on the California Register were expressly developed to be in accordance with previously established criteria developed for listing on the *National Register of Historic Places* (NRHP).

According to Section 15064.5(a)(3)(A-D) in the revised CEQA guidelines (Governor's Office of Planning and Research 1998), a resource is considered *historically significant* if it meets at least one of the following criteria:

(A) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

(B) Is associated with the lives of persons important in our past;
(C) Embodies the distinctive characteristics of a type, period, region or method of construction, or represents the work of an important, creative individual, or possesses high artistic values;
(D) Has yielded, or may likely yield, information important in prehistory or history.

If a resource is negatively effected by a project, measures must be implemented to mitigate the project's negative effect on the resources to less than a significant impact [Section 15064.5(b)(3)]. Mitigation measures can include avoidance of sites, deeding of sites to conservation easements, capping of sites with culturally sterile soil, incorporation of sites into open space or excavation of those portions of sites effected by the project [Section 21083.2 (b & d)].

This letter is intended as a summary of cultural resources investigations at Saddleback Meadows and includes information from several sources (Tadlock & Tadlock 1978; Breece and Padon 1982; Dillon 1989; Maxon 1995).

Please contact me at RMW Paleo Associates, Inc. with any questions.

Respectfully,

Patrick O. Maxon, RPA
Archaeological Field Director

cc: Julie Wang, HDR San Diego

MANAGEMENT SUMMARY/ABSTRACT

Purpose and Scope: The Presidio Group has produced revised plans to develop Saddleback Meadows in the County of Orange for the purpose of constructing a residential community. The 229.2 acre site will see the construction of 705 manufactured, single-family residential units. EIR 566 will be prepared for the project.

This report has been undertaken for the purpose of inclusion into EIR 566, required for the current project. The report describes all past cultural resource investigation on the Saddleback Meadows property. It further recommends and describes the additional work to be accomplished before implementation of the above mentioned project can occur.

Dates of Investigation: This report was produced between 12 February and 14 March 1997.

Evaluation: Only CA-ORA-710 and CA-ORA-711 have been determined to be important according to Appendix K of the California Environmental Quality Act (Governor's Office of Planning and Research 1995) and significant as defined by the *National Historic Preservation Act* (see below). Although they lie in proposed open space, remedial grading will destroy them and thus data recovery excavation is required. The importance/significance of CA-ORA-713, -715, -1437 and -1435H has yet to be established and further work at these sites is necessary.

Undertaking Effects: The revised plans for construction of 705 manufactured, single-family residential units will require extensive grading in preparation for construction. As a result, every cultural resource previously identified on the property will be destroyed. The impacts to some of the sites must therefore be mitigated prior to development.

Recommendations: CA-ORA-710 and CA-ORA-711 have been determined to be important according to CEQA and significant as defined by the *National Historic Preservation Act* (see below). Although they lie in open space, remedial grading of the proposed open space will destroy the sites. Data recovery excavation of at least 30 one by one meter units at each site must be accomplished. CA-ORA-1437 is the site newly discovered during the previous project (Maxon 1995); no work has been accomplished at the site beyond mapping and recording. A surface examination and surface collection and a test excavation consisting of approximately ten, one by one meter units must be accomplished at the site. Additional work may become necessary after evaluation. CA- ORA-1435H has not yet been evaluated. Initial work will entail archival

UNDERTAKING INFORMATION/INTRODUCTION

The Presidio Group has produced revised plans to develop Saddleback Meadows in the County of Orange for the purpose of constructing a residential community.

In August 1978, the Orange County Board of Supervisors adopted the "Saddleback Meadows Mobile Home Subdivision" and certified Environmental Impact Report (EIR) 059. This authorized the development of a mobile home park of 617 dwelling units. The plan was never put into effect. In July 1996, The Presidio Group submitted a revised 318 unit Site Development Plan to the County of Orange and circulated EIR 561. In October 1996 the Board of Supervisors denied the 318 unit site development plan and did not certify EIR 561. Currently, The Presidio Group is again planning to revert to the August 1978 plans that have previously been approved and to develop the site for the construction of 705 manufactured, single-family residential units on the 229.2 acre site (see Figure 1 below). EIR 566 will be prepared for this project (Environmental Management Agency 1996:5-7).

A summary of this report will be included in EIR 566, required for the current project. The report describes all past cultural resource investigations on the Saddleback Meadows property. It further recommends and describes the additional work to be accomplished before implementation of the above mentioned project can occur and that which can be accomplished after grading is underway.

The Saddleback Meadows project requires a Section 404 permit. Under Section 404, impacts to cultural resources fall under the review of the U.S. Army Corps of Engineers and must be mitigated to be in compliance with Section 106 of the *National Historic Preservation Act* (NHPA). The NHPA authorizes the maintenance of a *National Register of Historic Places* (NRHP) which facilitates the preservation of properties that meet certain criteria delineated by Section 106 of the NHPA (The Advisory Council on Historic Preservation and the GSA Interagency Training Center 1994:II-26). Those criteria are:

> The quality of significance in American history, architecture, archaeology, engineering and culture is present in districts, sites, buildings, structures and objects that possess integrity of location, design, setting, materials, workmanship, feeling and association and

(a) that are associated with events that have made a significant contribution to the broad patterns of our history; or

(b) that are associated with the lives of persons significant in our past; or

(c) that embody the distinctive characteristics of a type, period or method of construction...; or

(d) that have yielded, or may be likely to yield, information important in prehistory or history.

Because the project must be in compliance with Section 106 guidelines, the present study automatically also falls under the provisions of the California Environmental Quality Act (CEQA) as well. Appendix K of CEQA requires that if development is unavoidable, significant impacts to important (CEQA definition) archaeological sites must be reduced to a level of insignificance, through avoidance, preservation or excavation. According to Appendix K, Section III of CEQA, "...an important archaeological resource" is one which:

A. Is associated with an event or person of:
   1. Recognized significance in California or American history, or
   2. Recognized scientific importance in prehistory

B. Can provide information which is both of demonstrable public interest and useful in addressing scientifically consequential and reasonable or archaeological research questions;

C. Has a special or particular quality such as oldest, best example, largest, or last surviving example of its kind;

D. Is at least 100 years old and possesses substantial stratigraphic integrity; or

E. Involves important research questions that historical research has shown can be answered only with archaeological methods.

Recently (September 1992) the *California Register of Historical Resources* (California Register) was created. Its purpose is to identify the state's historical resources and to indicate which properties are to be protected (Office of Historic Preservation 1995:1). The criteria for listing resources on the California Register were expressly developed to be in accordance with previously established criteria developed for listing on the *National Register of Historic Places* (NRHP). A property must be significant at the local, state or national level under the same (with minor variations) criteria as those for the NRHP (Office of Historic Preservation 1995:3). Those criteria are listed on pages one and two of this report.

Dillon (1989) has recommended that if subsurface deposits are discovered on any of the present sites, a formal salvage operation must be designed to mitigate any adverse impacts. The project described in this report accomplishes Dillon's recommendations.

The revised plans for construction of 705 manufactured, single family residential units will require extensive grading in preparation of construction. For this reason, every cultural resource previously identified on the property will be destroyed and impacts must therefore be mitigated prior to development. The schedule for completion of the project is unknown.

Figure 2 is a portion of the USGS quadrangle map, Santa Ana, California, depicting the general location of the project area. Figure 3 is a portion of the USGS quadrangle map Santiago Peak, California, depicting the specific location of the project area.

Ron Bissell served as Principal Investigator for the previous project (Maxon 1995), and will continue in that capacity for any further archaeological investigation. Patrick Maxon, the author of this report, served as Field Director for the previous project and will also continue in that capacity.

Paleontology Archaeology History 23392 Madero, Suite L Mission Viejo, CA 92691 (714) 770-8042 FAX (714) 458-9058 RMW Paleo Associates	Figure 3: PROJECT AREA MAP Portion of USGS 7.5 Minute, Santiago Peak, California, Quadrangle, 1954, Photorevised, 1982 Area shown lies in Township 6S, Range 7W Scale = 1:24,000

SETTING

Natural: The Saddleback Meadows project area lies in the foothills of the Santa Ana Mountains of Orange County, California. Aliso Creek flows southward along its western margin. The property is in Section 4 of Township 6 South, Range 7 West and can be reached via El Toro Road running adjacent to the property, parallel to and west of Aliso Creek. Santiago Peak, the highest in the county, is approximately three kilometers northwest of the property.

The project area consists of narrow, rugged ridges and rounded knolltops separated by steep sided and narrow canyons. A central east/west canyon drains into Aliso Creek. Elevations range from approximately 1,040 feet where the main drainage empties into Aliso Creek to approximately 1,640 feet along portions of the ridges in the north-western portion of the property.

Geologic formations exposed in the Saddleback Meadows study area are the Sespe Formation, the undifferentiated Sespe and Vaqueros Formations, and the Topanga Formation (Raschke 1995). The oldest unit is the late Eocene to early Miocene Sespe Formation and is restricted to the northeastern corner of the property. Overlying and interbedded with the Sespe Formation is the early Miocene age undifferentiated Sespe-Vaqueros Formation. This unit underlies all except the northeast corner of the Saddleback Meadows property where there appears to be a small exposure of the middle Miocene age (15 million years ago) Topanga Formation. Within the study area there are numerous occurrences of vertebrate fossils in boulders that have apparently eroded from the subsurface. These include a variety of large and small fragments of marine mammal bones (Raschke 1995). It is not known if these outcrops were utilized, to any extent, by prehistoric populations.

The climate of the Saddleback Meadows vicinity can be described as mild, uniform and semi arid. Temperatures rarely exceed 33 degrees Celsius or drop below five degrees Celsius. Rainfall occurs primarily between November and April and averages between 25 and 40 centimeters per year. The current climatic conditions did not prevail during the entire span of time that man has been present in the area. Heusser (1978) suggests that pine forests may have occupied the coastal regions from roughly 10,000 to 6,000 B.C.E. (Before Common Era). The climate then became warmer and drier, resulting in replacement of the pine forests by oak

and and grassland communities. Coastal sage scrub and chaparral communities became ounced during the few centuries preceding the Common Era (C.E.).

A majority of the property has in recent times been used as a cattle ranch and is therefore w covered predominantly by grasslands including introduced grasses, wild mustard and thistle. ne slopes and ridges support remnants of the coastal sage scrub community composed of sage, uckwheat, chamise, sumac, prickly pear cactus and other low growing, woody plants. A riparian community exists along the Aliso Creek drainage supporting rushes, tules and willows. Mature oaks and sycamores are found in the valleys, drainages and on some of the ridges and knolltops. Hausauer Ranch, along the main drainage emptying into Aliso Creek, is surrounded by introduced eucalyptus trees as well as a large olive grove containing nearly 100 trees.

Several of the ecological communities existing in southern California were readily accessible by the local prehistoric inhabitants of the Saddleback Meadows area, while others were reached only with some difficulty. The following discussion of the plant communities available to the local prehistoric inhabitants is based on Drover and Koerper (1983).

Saltwater Estuary Community and Bay: The estuary and bay communities provided shellfish for the prehistoric peoples. Waterfowl would also have been available, but few plants from the communities were known to have been utilized.

Access to the estuary and bay community was relatively easy for persons utilizing the current study area. Coastal regions were probably used during the winter months as part of the annual round and direct exploitation by people residing near the current study area could have been accomplished in a day's journey down the Aliso Creek drainage some 20 kilometers to the coast.

Beach and Coastal Strand Community: This community, including the beach and intertidal areas, provided a large variety of shellfish and areas for line fishing. Naturally occurring asphaltum occasionally washed ashore and was collected for use as an adhesive. Seaweed may have also been collected and used as food.

Access to the beach and coastal strand community was also feasible considering the nearness of Saddleback Meadows to the ocean.

Marine Community: A wide variety of sea mammals, fish and crustaceans were available in the marine community, but data regarding local prehistoric exploitation of this community is very scant. It is known that the Chumash, who lived farther up the California coast, made extensive use of marine community resources during the latter part of archaeological time. Such exploitation in the local area is not well documented. Perhaps this is a reflection of lack of data, rather than an indication that the marine community was not exploited in this area. Access to the marine community required some sophisticated technology in the form of watercraft, such as canoes or rafts, as well as fishing and hunting equipment. It is unknown if the inhabitants of the Saddleback Meadows area exploited this resource.

Riparian Woodland Community: This community exists along streams and around seeps and springs. Oaks, alders, willows, sycamores and cottonwoods are common trees associated with this community. A large variety of herbs, grasses, cattails and berries grow in the riparian woodland community. Animals and birds attracted by the water and the food resources offered by the vegetation provided ample sustenance for prehistoric and historic peoples. The riparian woodland offers a great variety of easily exploited resources.

The riparian woodland community was found along the local streams and existed throughout the current study area.

Freshwater Marsh Community: The major freshwater marshes near the study area would have been located within the Aliso Creek and Oso Creek flood plain. Freshwater marshes resemble the riparian community in terms of the plants and animals they host, but may be surrounded by a greater extent of forest growth. Migratory fowl are attracted to freshwater marshes and would have been an abundant resource during particular seasons of the year.

Access to the freshwater marshes would have been quite easy because they likely existed at various times along Aliso Creek.

Grassland Herbland Community: Located in the lower Aliso Creek valley, around some freshwater marshes and below the steeper foothills of Saddleback Meadows, the grassland herbland community contained a variety of resources. Seeds of many annual grasses would have been the primary resource of interest to the prehistoric peoples, but blossoms, greens, fruits, bulbs, the fleshy parts of prickly pear and occasional walnuts were also available, primarily during

spring. Animals including deer, rabbits, other rodents and quail are associated with this plant ɔmmunity.

Again, access to the grassland herbland community would have required only a short, relatively level walk from the study area.

Oak Woodland: The oak woodland occurs in sheltered valleys where the soil is deep. Oak trees can grow to as much as 20 meters in height in such conditions, and are surrounded by grasses and herbs. Acorns were a primary food resource for the native inhabitants, at least during the latter part of the archaeological sequence. Acorns become available in the fall, thus providing a rich resource during the time of year when other plants are far past their peak availability.

Access to the oak woodland was very simple since oaks grew in the local drainages of Aliso Creek and could have been exploited with little effort.

Coastal Sage Scrub Community: This community consists primarily of shrubs that seldom exceed a height of two meters. Various species of sage, buckwheat, some flowering plants and grasses form the primary vegetation. Seeds are the primary resource of the sage scrub community, but edible stems, stalks, shoots, greens, roots, bulbs and some berries can also be found. Rabbits and rodents abound in the sage scrub community. The sage scrub community covers the hills around and within the study area. The resources of the sage scrub community are primarily available in the spring. During prehistoric times the sage scrub covered a large percentage of the surface, representing a very rich resource.

Access to the sage scrub community required only ascending the hills and canyons of the study area.

Chaparral Community: The chaparral community consists of dense brush normally found on rocky slopes, usually at slightly higher elevations than the oak woodland community. Manzanita, chamise, mountain mahogany, scrub oak and ceanothus are typical constituents. Seeds, berries, bulbs, shoots and roots are the primary resources available in this community. The chaparral is a primary deer habitat (Moratto 1984).

The chaparral community was located on the higher elevated slopes north of the study area and would have required a day's walk to be reached by prehistoric populations.

Cultural: The current study area is inhabited by a Native American group ethnographically known as the Gabrielino. The generally accepted boundary with the Juaneño group to the south is Aliso Creek, flowing directly adjacent to the study area along its western margin (Bean and Smith 1978, Kroeber 1925). It is likely that the study area contains traces of both these cultures.

The names the Native American groups applied to themselves are largely unknown; they are known by the names the Spanish coined as they moved into Native American territories. The name "Gabrielino" identifies those people who were under the control of the Spanish Mission San Gabriel, while the name "Juaneño" denotes those people who were under the administration of the Spanish at Mission San Juan Capistrano.

The Juaneño and Gabrielino language, as well as that of the Luiseño to the south, was derived from the Takic family, part of the Uto-Aztecan linguistic stock, which can be traced to the Great Basin area (Driver 1969). This language group represents an origin quite different from that of the Chumash to the north and the Ipai and Tipai to the south. Their language is derived from the Hokan stock of the Yuman language family originating in the American southwest. Linguistic analysis suggests that at one time (probably before 500 B.C.E.) the entire southern California coastal region was populated by Hokan speakers who were gradually separated and displaced by Takic speaking immigrants from the Great Basin area. The timing and extent of the migrations and their impact on indigenous peoples is not well understood and any data related to it represents a valuable contribution to the understanding of local prehistory.

Prehistoric Era: The archaeological heritage of California is quite rich, probably more so than any other North American region north of Mexico. However, the archaeology of California is not well known. The native Californians were generally quite peaceful and did not often offer warlike resistance to European settlement. Consequently, they did not gain great notoriety during the settlement period. Also, the original Californians were first under the control of the Spanish and then the Mexican governments and only later, after much of their culture had been destroyed by disease and displacement, were they subsumed under the United States government. There was only a minor Native American presence remaining in California when it became a United States possession and massive development began. For this reason, very little interest in the natives and

ır prehistory was initially generated. It was many years later before the size, complexity, and ıtent of archaeological deposits in the state became apparent.

Homo Sapiens has been present in the New World since perhaps 10,000 to 11,000 years B.C.E. There is some evidence that humans were present long before this date, but it is inconclusive and has not yet been accepted by most archaeologists. The earlier sites are all controversial in that they lack definite dateable context and material. Such sites can be interpreted in various ways, particularly in relationship to their age. The few generally accepted remains indicate a very small, mobile population apparently dependant on hunting of large game animals as the primary subsistence strategy. Other sources were exploited, but the bulk of the traces remaining today are related to game hunting. (Chartkoff and Chartkoff 1984, Moratto 1984).

The Chartkoffs identify the earliest portion of the archaeological sequence - to about 9,000 B.C.E. - as the Paleo-Indian Period (Warren's 1968 San Dieguito Tradition). The surviving material culture of this period consists primarily of large, extremely well made projectile points and large but crude tools such as scrapers and choppers. Encampments were never permanent, based in part on the paucity of significant midden areas that would have degraded to ındetectability given the great age, and were probably sited near a major kill. Occupation would have persisted only until the resources of that kill were exhausted. Such an economy, using only a small fraction of the available resources, would not have supported a large population; therefore, it is probable that the Paleo-Indians lived in groups no larger than extended families and that contact with other such groups was infrequent.

A general chronology has been developed for the Southern California coastal region by Wallace (1955) for the ensuing periods.

The Millingstone Horizon (or Encinitas Tradition, as defined by Wallace (1968)) people (ca. 5500-1500 B.C.E.) practiced a mixed hunting and gathering food procurement strategy. Game hunting still played an important role in the economy, but by this time the Native Americans had learned to exploit the hard seed resources of the coastal sage scrub and chaparral ecological communities. The rapid extinction of the large mammals that the Paleo-Indian had previously been exploiting necessitated this shift in resource exploitation. The principle implements used to process the seeds, manos and metates, appear in large numbers for the first time in this horizon,

and are especially numerous near the end of this tradition. Other specialized tools were developed to process the increased resources utilized by Millingstone peoples. Settlement size seems to have increased and an annual round of seasonal migrations may have been practiced as movements coincided with ripening vegetal resources. Some formal burials are also evident.

The Intermediate Horizon, locally known as the Campbell Tradition (ca. 1500 B.C.E. to C.E. 1000), is characterized by a shift away from primarily vegetable food exploitation to a more maritime subsistence strategy. It is during this time that the mortar and pestle were introduced, enabling acorn processing to begin.

In the Late Prehistoric Horizon (or Shoshonean Tradition), groups began to center around trade routes and there was a greater use of food resources with more land and sea mammal hunting to complement collecting. The pattern of life in this Late Horizon was more complex. More classes of artifacts were being produced and they exhibited a more sophisticated degree of workmanship. The recovery of a greater number of small, finely chipped projectile points suggests a greater utilization of the bow and arrow. Other items include steatite containers, shell fishhooks, perforated stones, bone tools, personal ornaments, asphalt adhesive and elaborate mortuary customs. In addition, the population increased and larger villages evolved (Wallace 1955:223). It is during the Late Prehistoric that the emigrants from the Great basin appeared in the Los Angeles and Orange County area. These peoples were very quick to adopt most of the local traits, because it is difficult to separate the archaeological assemblages of the emigrants from those of the indigenous peoples on the basis of artifact typology alone.

The Moratto and Chartkoff chronologies are not the only ones in use and, in fact, are somewhat generalized because they address the entire state of California. The latest chronology to appear which has gained local acceptance is that of Koerper and Drover (1983). This chronology is based on extensive work at CA-ORA-119-A, a large multi-component site near the University of California, Irvine. The site contained archaeological evidence from the Millingstone to the Historic period. The Koerper and Drover chronology is summarized in Table 1 below.

Table 1:

CHRONOLOGY, BASED ON KOERPER AND DROVER (1983)

PERIOD*	TEMPORAL SPAN	MAJOR DIAGNOSTIC TRAITS
Early Man or Paleo-Indian	? to 7,500 B.C.E. +/- ?	1. Lack of grinding implements. 2. Large, well made projectile points.

Characteristics and adaptations:

1. Subsistence through hunting of large Pleistocene game animals.
2. Temporary camps at large kills.
3. Group no larger than extended family.
4. Widespread. Covered most of North American continent, but no sites known locally.
5. Very small total population.

Milling Stone or Encinitas	7,500 B.C.E. +/-? to 1,000 B.C.E. +/- 250	1. Predominance of manos and metates. 2. Ornaments made of stone. 3. Large and often crude projectile points 4. Cogstones and discoidals. 5. Charmstones. 6. Some mortars and pestles near the end of the period.

Characteristics and adaptations:

1. Heavy reliance on hunting in early part of period. Deer, rabbits and other small game associated with chaparral.
2. In middle to late part of period reliance was on hard seeds associated with chaparral.
3. Coastal groups utilized shellfish and near shore resources.
4. Annual round based on ripening vegetable resources rather than animal migrations. This caused increased isolation leading to noticeable differences in culture in much smaller geographic areas.
5. Probably about 50 persons in average group.
6. Very little noticeable change in last two thirds of period.
7. Colonization of Channel Islands near end of period.

*Both the Chartkoff and Koerper and Drover names are given for the various periods, with the Koerper and Drover names appearing first.

Table 1, continued:

CHRONOLOGY, BASED ON KOERPER AND DROVER (1983)

PERIOD	TEMPORAL SPAN	MAJOR DIAGNOSTIC TRAITS
Intermediate or Campbell	1,000 B.C.E. +/- 250 to C.E. 750 +/- 250	1. Bone ornaments. 2. Wide use of mortars and pestles along with manos and metates. 3. Use of steatite begins. 4. Many discoidals. 5. Large projectile points trending to smaller in the last part of the period.
		Characteristics and adaptations: 1. Heavy reliance on acorns as food resource. Hard seeds, small animals and coastal resources continue to be used. 2. Many more deep water ocean resources utilized. 3. First permanently occupied villages. 4. Large increases in local population. 5. Atlatl (spear thrower) in use. Bow and arrow probably introduced near end of period. 6. Some evidence of trade.
Late Prehistoric or Shoshonean	C.E. 750 +/- 250 to Spanish contact	1. Shell ornaments. 2. Mortar, pestle, mano and metate use continues. 3. Small, finely worked projectile points. 4. Wide use of steatite. 5. Some pottery vessels appear near the end of the period.
		Characteristics and adaptations: 1. Increased exploitation of all resources. 2. Large populations, some villages had as many as 1,500 persons. 3. Great increase in art objects. 4. Much evidence of trade.

Historic Era: Juan Rodriguez Cabrillo sailed along the coast of California in 1542 and, according to available records, stopping only at San Diego and the Channel Islands, was the first European to come into contact with the Gabrielino. The first Europeans to visit the Orange County area arrived in 1769 when Gaspar de Portola led an overland expedition from San Diego to Monterey. This expedition of 63 persons passed near the study area, using Arroyo Trabuco as a route to the north (Cramer 1988).

Mission San Gabriel, in Los Angeles County, was founded in September 1771 and all the Native Americans from the Los Angeles plain were persuaded to settle in its vicinity. The first permanent settlement in Orange County came when San Juan Capistrano was selected as the site for a Mission in the spring of 1775. By the early 1820s, all the native Americans from the coastal plains and foothills of what is now Orange County had been settled on Mission lands or on the growing rancho system.

The missions were charged with administering to the Indians within their areas. Mission life did give the Indians some skills needed to survive in their rapidly changing world, but the population was decimated by diseases for which they had no immunity. After 1810, mission population declined faster than it could be replenished. The Mexican Revolution, beginning in 1821, overthrew Spanish control and the new Mexican government had a very different outlook on mission activities. Secularization of the missions, planned under the Spanish was greatly accelerated by the Mexican government. Plans to provide land, training and living quarters for the Indians never developed and the mission lands were soon under the control of a relatively few influential Mexican families. The Mexican-American war ended on 2 February 1848 with the signing of the treaty of Guadalupe Hidalgo. The treaty established California as a United States possession.

The study area was never a part of a Spanish or Mexican land grant. The foothill area was not good grazing terrain. Instead, the Santa Ana Mountain area was to be ungranted and for the use of all. The Rancho Canada de los Alisos (Canyon of the Sycamores) abuts a portion of the study area to the west (Morgan 1973). This rancho was granted to José Serrano in 1842 and later expanded to 10,688 acres by Pio Pico (Smith 1977 in Dillon 1989). Present day Lake Forest was part of this grant; the last of Serrano's adobes is still preserved there. The drought of the early

1860s forced Serrano to give up on the rancho. It was broken up into smaller parcels and sold piecemeal; the bulk of the land forming the city of El Toro (now Lake Forest). By the 1880s much of the area had been settled by Anglo-American families. The Hausauer Ranch, within the property boundary, probably dates to the late 1920s and was an active ranch into the 1970s. The ranch's main reservoir and olive orchard have been in existence since at least 1939 (Dillon 1989:32).

RESEARCH DESIGN

Theoretical Basis: The theoretical approach of this report is primarily cultural ecological in nature. It is assumed that humans are part of the ecological system in which they exist and patterns of behavior are restricted by ecological constraints. Similarly, human populations have an effect on the environment as well and precipitate ecological change, either intentionally or accidentally (Jochim 1981). This approach applies to prehistoric as well as historic sites.

It is thought that Californians from the Middle Archaic Period up to the Pacific Period practiced an annual round adaptation. The major habitation camp would be moved periodically as resources ripened. The habitation camp would be surrounded by specialized work stations where resources were collected and initially processed. In general, it is thought that the major habitation camps were moved to progressively higher elevations as the year advanced, with a return to near-ocean locations for the winter season. The major habitations were occupied only for a few months each year, but the repeated use may have continued for many generations. By Pacific Period times, storage technology and a broadened resource base allowed settlements to be occupied throughout the year.

Pertinent Local Conditions: The Saddleback Meadows area is one of a series of ridges and rounded knolltops bisected by numerous drainages emptying into Aliso Creek. The creek makes its way some 20 kilometers southwest into the Pacific Ocean south of present day Laguna Beach. The area is ideally suited for exploitation of the range of resources available in the region. All could be reached within a day's travel by local inhabitants. Aliso, as well as Oso Creek, provided the inhabitants with a reliable, perennial source of water, an easy route leading to the coast and cobbles for lithic tool production.

ıe little available information indicates that major settlements were located near reliable
:s of water, but in areas that commanded a view of the surroundings. The area surrounding
campment or village was used for hunting, resource collecting and initial processing of those
ırces. Such resources included lithic material for stone tool manufacture, animal resources
vegetable resources (shoots, roots, bulbs, seeds, berries, fibers, nuts, etc.).

Collecting and initial processing of material for chipped lithic tool manufacture leaves
dence in the form of damaged surfaces where material was removed, chipping waste from
tial reduction of that material, hammerstones used in the reduction and cores from which viable
aterial had been removed. A prehistoric chert quarry (CA-ORA-507: The Hoopaugh site) lying
ess than one kilometer south of the project area, was studied and recorded by Van Horn (1986).
Milling tool production probably relied on the collection of suitable cobbles and would leave no trace. Hunting of game animals was an activity pursued in the Saddleback Meadows area. It is a well watered area that in prehistoric time hosted a wide variety of ecological communities. Game animals would have been abundant under these conditions and would certainly have been exploited by the prehistoric inhabitants. Evidence left by hunting activity may include blinds, lost or broken projectile points and animal bones within the habitation areas.

Vegetable resource collecting and initial processing was certainly an activity in the Saddleback Meadows area. Evidence for such is the abundance of grinding implements (manos and metates) found at area sites. These artifacts found by themselves are evidence of vegetable resource collecting and initial processing. Only with a wide range of other artifact varieties do they constitute evidence of substantial habitation.

It is therefore assumed that archaeological sites at Saddleback Meadows will include the possibility of relatively large seasonally occupied village sites located near a reliable water source as well as more numerous specialized use camps. Seed collecting and processing stations will be located in more or less level areas in the vicinity of the desired vegetable resources. Chipped lithic tool manufacturing stations will leave traces of chipping waste products and tools such as hammerstones and cores. They will either occur by themselves or within larger site complexes.

PREVIOUS RESEARCH

Early reconnaissance operations were conducted near the present project area that only partially extended onto the Saddleback Meadows property. A 1975 reconnaissance by Howard, concerned with the proposed realignment of El Toro Road, included the westernmost edge of the current property, just east of Aliso Creek. Howard reported no archaeological sites in the area, even though it is there that CA-ORA-710 and -711 lie.

Tadlock and Tadlock (1978): The first major archaeological investigation on the current project property was undertaken by Tadlock and Tadlock in 1978. The Tadlock's completed a surface examination of the project area - essentially the same boundary as the present project area - and discovered and recorded seven archaeological sites: CA-ORA-710, -711, -712, -713, -714, -715 and -716. The sites follow the more level hills and benches of the property's main ridge running from Aliso Creek, near the western property boundary, eastward to the eastern property boundary. These sites will be discussed in more detail below.

The Tadlock's recommended that a representative sample of artifacts be collected from the surface of each site as well as from the ridgetop between the sites. Test trenches were then to be excavated by backhoe to determine the depth and dimension of the sites (Tadlock and Tadlock 1978:9).

Breece and Padon (1982): In July 1982, William Breece and Beth Padon performed a cultural resource reconnaissance and literature review of the proposed Phase II Foothill Transportation Corridor study. The study encompassed approximately 23 miles of proposed corridor routes from Little San Joaquin Canyon and Irvine Lake to the northwest to Cañada Gobernardo Canyon to the southeast (Breece and Padon 1982:1). The current study area made up only a small portion of this reconnaissance. During the course of the reconnaissance, the authors relocated three of the sites on the current study area: CA-ORA-710, -711, and -713; although CA-ORA-711 was described as containing no artifactual material or midden soil. CA-ORA-710 contained chert flakes, a chert core and a possible chopper. CA-ORA-713 contained chert flakes and a chert core. CA-ORA-712 was also within the reconnaissance area but was not relocated by the researchers (Breece and Padon 1982:31&34).

The authors recommended controlled surface collection and test excavation followed by, if necessary, data recovery excavation at CA-ORA-710 (erroneously identified as -711). CA-ORA-711 was not relocated and was considered destroyed. No further work was deemed necessary (Breece and Padon 1082:33-34). No mention was made as to the recommendations for CA-ORA-713.

Dillon (1989): A cultural resources reconnaissance was undertaken by Brian Dillon in 1989 for Scientific Resource Surveys. Dillon was able to relocate CA-ORA-710, -713, -714, -715 and -716. CA-ORA-711 and -712 were not relocated. Dillon surmised that these two sites had been destroyed since they were originally recorded in 1978 (Dillon 1989:48). Dillon also discovered three new sites, now named CA-ORA-1255, -1256 and -1257. The historic Hausauer Ranch was located and described in detail, although not formally recorded. All sites on the property will be discussed in more detail below.

Dillon recommended that each of the sites on the property undergo a comprehensive surface collection and test excavation. Those sites determined to contain a subsurface deposit were to undergo a data recovery excavation that constituted mitigation of adverse impacts (Dillon 1989:92).

Bissell 1984: In October 1984, Ronald Bissell of RMW Paleo Associates discovered a major archaeological site on the grounds of Saint Michael's Priory. The site lies on a small knoll above Aliso Creek, adjacent to and immediately north of the current study area. The site consisted of a dense scatter of ground and chipped lithic tools, including manos, scrapers, choppers, modified flakes, cores, hammerstones and debitage, in an apparent midden (Bissell 1984:3). The large site is likely to be related to the other sites on the Saddleback Meadows property as it lies only some 200 meters north of CA-ORA-710.

Maxon (1995): The author of the present report performed an archaeological investigation at Saddleback Meadows between September and November 1995. Most previously recorded sites were relocated. Some were not relocated. The historic ranch was recorded and a new site was discovered and recorded. Six of the previously recorded sites underwent a surface collection and five of those underwent a test excavation. All sites at Saddleback Meadows are listed in Table 2 below.

Table 2: Archaeological Sites at Saddleback Meadows

Site	Recorder	Description	Importance/ Significance
CA-ORA-710	Tadlock & Tadlock 1978	Flakes, scrapers, choppers, hammerstones & manos	Important
CA-ORA-711	Tadlock & Tadlock 1978	Sparse flakes, cores & one chopper	Important
CA-ORA-712	Tadlock & Tadlock 1978	Flakes	Not important
CA-ORA-713	Tadlock & Tadlock 1978	Flakes, scrapers, cores, choppers & manos	Not yet determined
CA-ORA-714	Tadlock & Tadlock 1978	Flakes, cores, some quartz material	Not important
CA-ORA-715	Tadlock & Tadlock 1978	Flakes, cores, scrapers, choppers, hammerstones & manos. Sophisticated artifacts exhibiting patination	Not yet determined
CA-ORA-716	Tadlock & Tadlock 1978	Flakes, cores & one chopper	Not important
CA-ORA-1255	Dillon 1989	Metate, core, scraper/spokeshave, blade, flake	Not important
CA-ORA-1256	Dillon 1989	Scraper plane, scraper	Not important
CA-ORA-1257	Dillon 1989	Mano	Not important
CA-ORA-1435H	Knell & Maxon 1995	Ranch complex with olive grove and holding pond	Not yet determined
CA-ORA-1437	Maxon 1995	Groundstone, debitage & thermally modified rock	Not yet determined

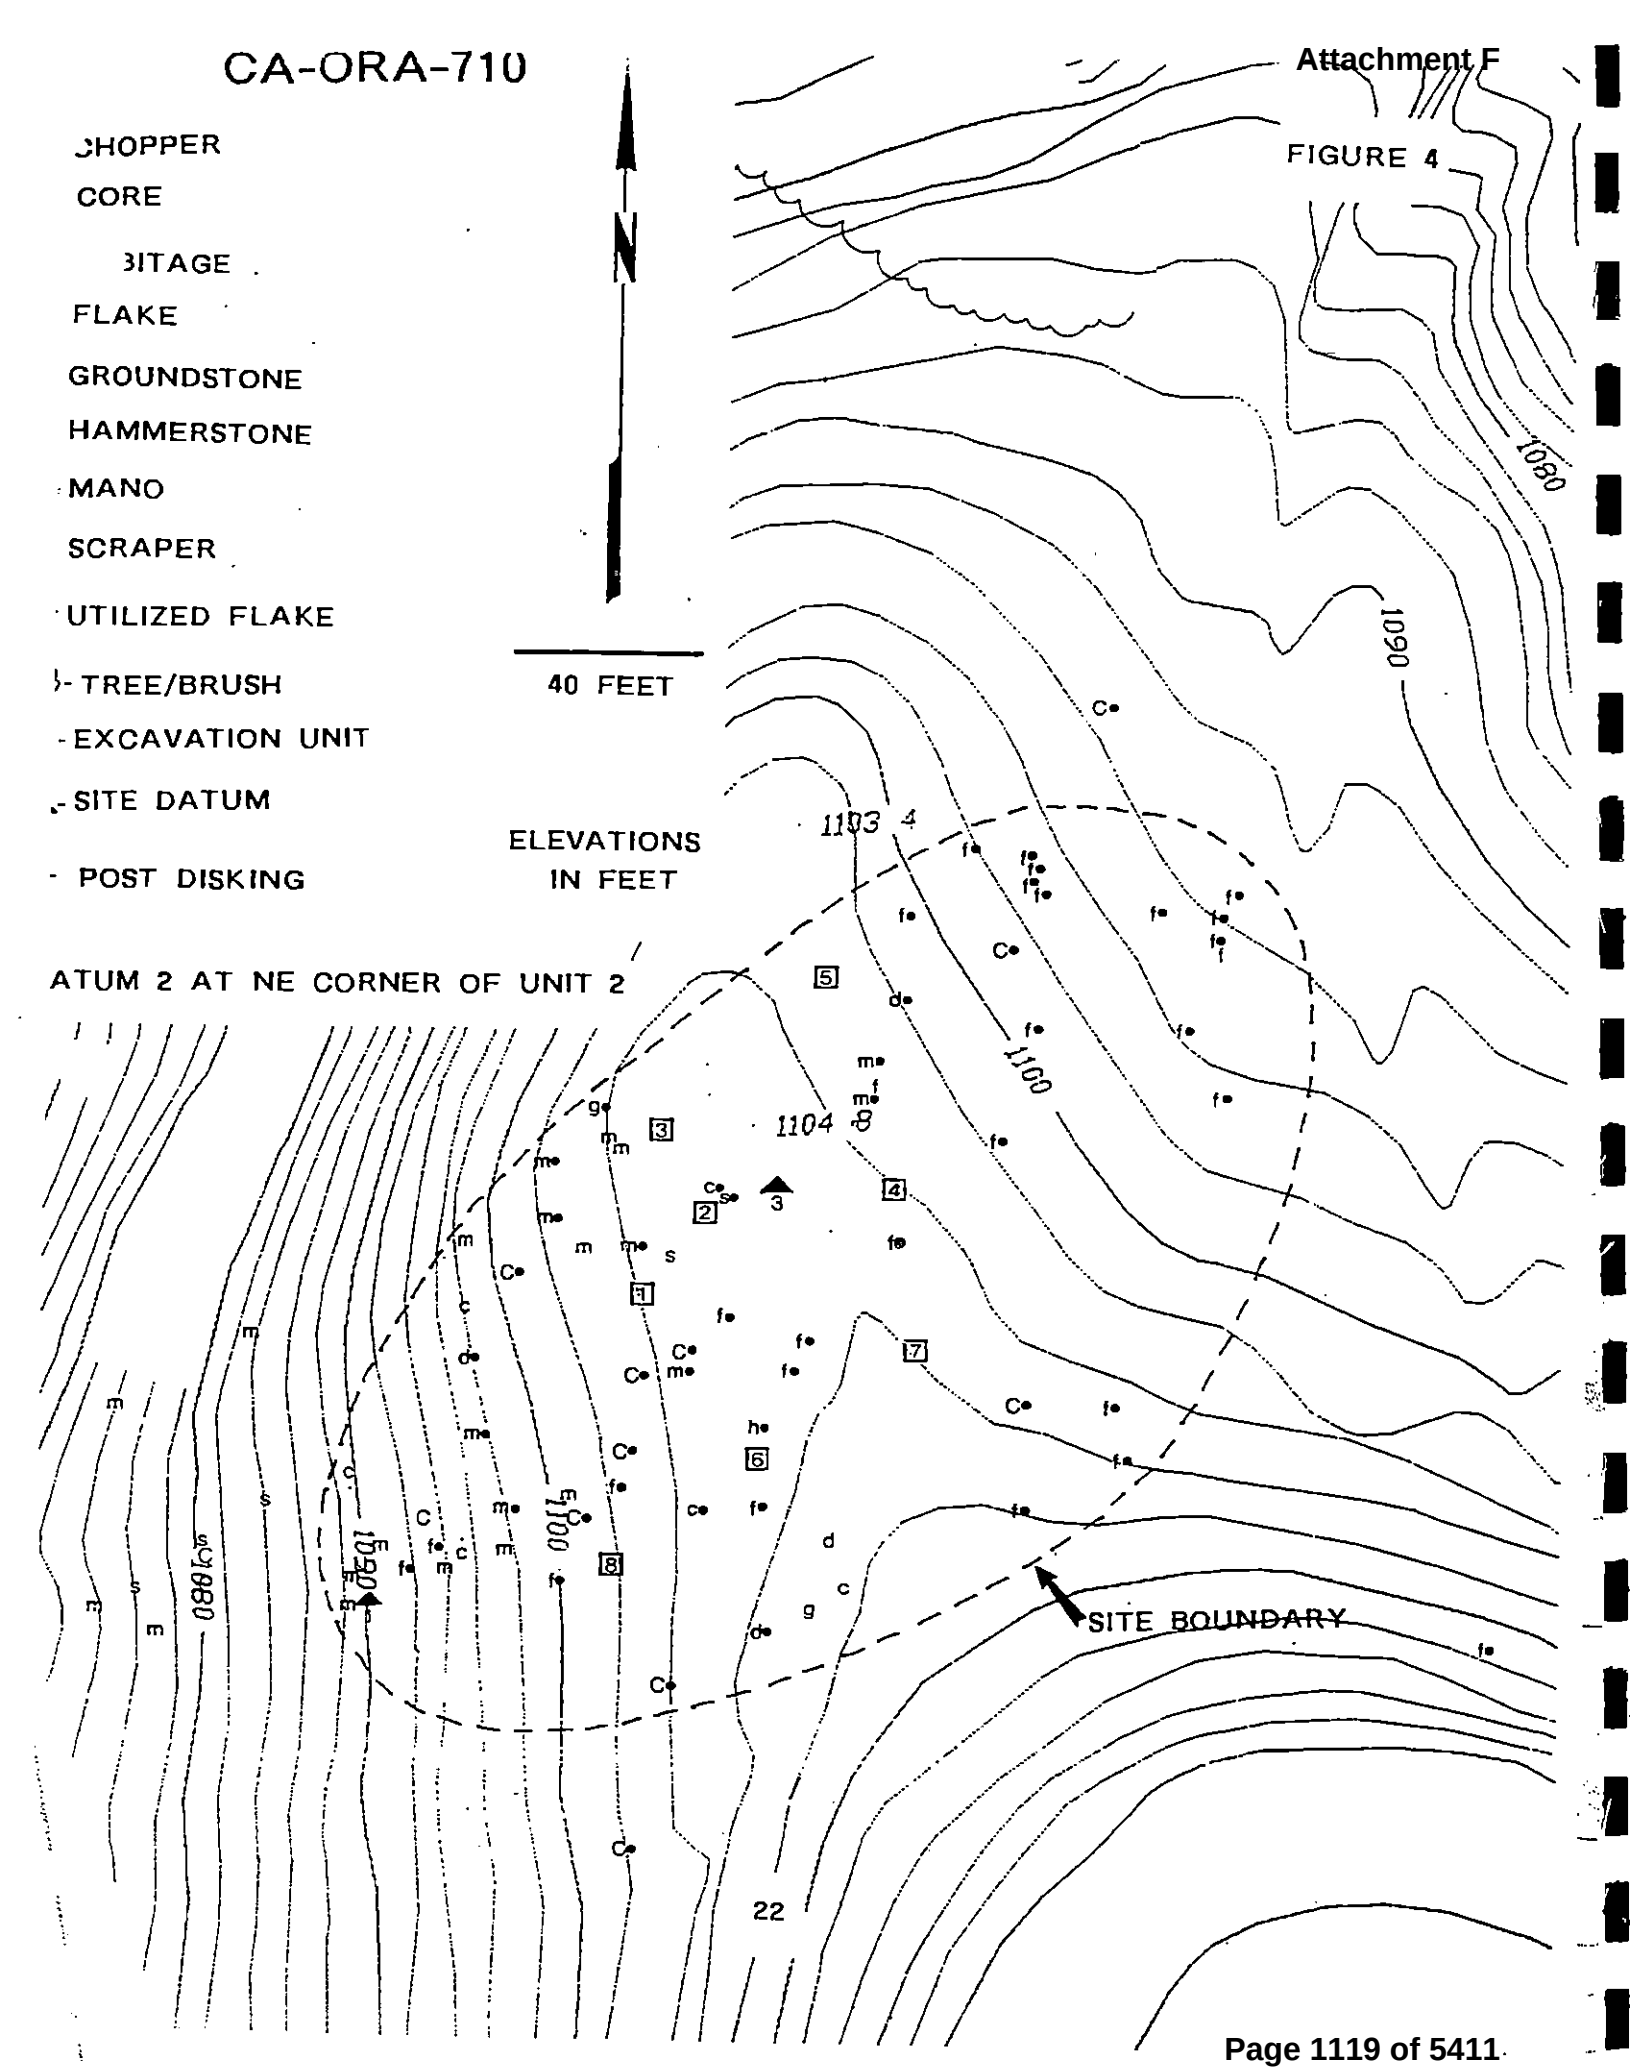
The revised plans for construction of 705 manufactured, single-family residential units will require extensive grading in preparation of construction. For this reason, every cultural resource previously identified on the property will be destroyed and impacts must therefore be mitigated prior to development. Each of the archaeological sites identified on the property will be discussed in detail below. Included will be a summary of work performed and recommendations proposed for each site.

CA-ORA-710

The site is located on a relatively flat knoll or terrace, directly east of, adjacent to and 12 meters above Aliso Creek in the northwestern portion of the property (see Figure 4 below). Boundaries of the core of the site are approximately 43 by 55 meters. Outcrops of fossiliferous bedrock are evident on the site's surface.

CA-ORA-710

FIGURE 4



The original recorders (Tadlock & Tadlock 1978) reported a wide range of artifacts over a rather large area. Subsequent archaeologists were not able to see artifacts to that extent. Dillon (SRS 1989) discovered a chalcedony core, a chert flake and a burned piece of chert shatter as well as three "truncated" manos, which he apparently collected and removed from the site during his reconnaissance investigation. Truncated manos are discussed by Van Horn and Murray (1984). These manos were recovered at CA-ORA-486, along Aliso Creek, just a short distance from site CA-ORA-710. The specimens had been "truncated" or broken off at one end and the rough end pounded smooth. They have been associated with the processing of "cacomites": a Spanish term referring to varieties of edible roots, bulbs and corms (bulb-like stems) that are found in the site vicinity.

Initial work supervised by the author at the site (Maxon 1995) consisted of a surface examination and surface collection. This resulted in the recovery of 26 artifacts including 16 uni- and bifacial manos (one possibly truncated) and mano fragments composed of porphyry, granite and metavolcanics, and chipped stone implements including three choppers, two hammerstones, one core, and four pieces of debitage. Material types include metavolcanics, quartzite and quartz. Subsequently, a disk pulled by a small bulldozer was employed to turn up the soil to a depth of approximately ten centimeters, for the purpose of uncovering near surface artifacts. This method, after a second surface collection, resulted in the recovery of an additional 56 artifacts including 11 groundstone implements: eight manos composed of granite and porphyry, and three metate fragments - two of granite and one quartzite. Chipped stone implements included 12 cores of metavolcanics, chert and quartzite; two hammerstones; two choppers; three scrapers and 25 pieces of debitage made primarily of chert and metavolcanics.

Eight one by one meter units were next excavated to determine the spatial extent of the site and verify the existence of a subsurface deposit. Fifty-four artifacts were recovered and two of the units produced in situ features. Results of the excavation are summarized in Table 3 below. A complete list of artifacts is provided in the artifact catalog in Appendix A.

Table 3: CA-ORA-710

Recovered Item	Depth (in centimeters)						Total Items

Metate			2	1			3
Scraper						1	1
Total Level	27	5	8	8	4	2	54

Even though the scope of the test excavation was limited to a small fraction of the total CA-ORA-710 site area, a relatively wide range of tool and material types was recovered. This indicates that a number of activities were performed on the site. Lithic tool production was evidently accomplished on site, based on the total recovery (surface collection and unit excavation) of 19 cores and a variety of waste flakes and other debitage as well as associated hammerstones. Scrapers and choppers were used for the processing of vegetable and wood fibers, as well as for working hides and bone. The processing of the hard seed resources associated with the coastal sage scrub and chaparral communities is evidenced by the recovery of 33 manos and mano fragments and six metates and metate fragments. The sites inhabitants were utilizing a range of material types to fashion tools: chert (31%), metavolcanics (23%), granite (15%), porphyry (11%), quartzite (9%), metasedimentary (7%) and smaller percentages of jasper, sandstone and quartz. Some of the chert may have been heat treated. Van Horn (1986) indicates that some (ca. 5-6%) of the chert at the nearby Hoopaugh site (CA-ORA-507) was heat treated and Dillon (SRS 1989) recovered a piece of burned white chert shatter at CA-ORA-710. Apparently, chert and other silicious materials are "annealed" or made stronger by being heat

treated. The material is heat treated and then slowly cooled to permit the molecular structure to rearrange itself resulting in material that is easier to flake. It has been shown that heat treatment can be used to produce larger flakes (Crabtree & Butler 1964) and thermally altered cores have been recovered at several sites in northern California (Gould 1976; Van Horn 1976). Bordaz (1970) has suggested that the Upper Paleolithic Solutrean points from France were made using thermal modification.

Thermally altered chert can be detected by luster, color change, crazing, potlidding and bleaching (Odell 1979). Van Horn (1986) described the amber chert from CA-ORA-507 as turning red, white and blue after being heated in a barbecue. Some of the chert at CA-ORA-710 shows evidence of being heat treated by a similar change in color and hairline fracturing.

Based on the characteristics of the artifacts recovered during the course of the test excavation, it is likely that the site is of Millingstone age. The lack of evidence of the mortar and pestle being used at the site further bolsters this hypothesis. The mortar and pestle technology is associated with the later Intermediate period when exploitation of the acorn became widespread.

A large portion of the artifacts were recovered from the western portion of the site in Units one through three. Units one and two produced the three in situ features; therefore, it is established that at a minimum, this portion of the site's subsurface remains intact. A feature consisting of two slab metates and a core was recovered from the 20-30 centimeter level of Unit 1. Two features were recovered from Unit 2: a mano, core and chopper from the 10-20 centimeter level and a slab metate, three manos and a chopper at the 30-40 centimeter level.

It is likely that a substantial subsurface deposit remains relatively undisturbed at the site; therefore, the site is deemed important/significant. Preservation of the site is warranted, but not possible based on the current 705 unit plan. Data recovery is therefore necessary before ground disturbing activities begin. It is recommended that a data recovery excavation of approximately 30, one by one meter units be accomplished at the site. The data recovery excavation should focus on the following research questions:

1. What is the date range of occupation of the site?
2. What activities were accomplished at the site?

3. What was the settlement pattern of the site? Was it used seasonally or occupied year around?
4. Can the chert recovered at the site be associated with the chert quarry (CA-ORA-507) located less than one kilometer from the site?
5. Are truncated manos present on the site that suggest "cacomite" processing (see above)?

CA-ORA-711

The site is located on a low, flat ridge directly east of Aliso Creek and just north of a smaller tributary drainage (see Figure 5 below). The core of the site measures approximately 27 by 30 meters. The original recorders (Tadlock & Tadlock 1978) reported a "sparse distribution of flakes, cores, and one chopper." Dillon (1989) was unable to relocate the site during his reconnaissance.

Initial work performed under the supervision of the author (Maxon 1995) consisted of a surface examination and surface collection. This resulted in the recovery of 30 artifacts including 12 uni- and bifacial manos (one or two possibly truncated) of granite, sandstone, metavolcanics and porphyry. Chipped stone implements recovered include two cores, two hammerstones, one uniface, one biface, one scraper plane and 11 pieces of debitage composed of chert, porphyry, metavolcanics and quartzite. Subsequent surface collection during the course of excavation produced 16 additional artifacts including three manos, one metate, four cores, one hammerstone and seven pieces of debitage. Material types included chert, metavolcanics, granite, porphyry and quartzite.

Ten 1 x 1 meter excavation units and one feature excavation were then placed in an attempt to delineate the site boundary and verify the existence of a subsurface deposit. One hundred-twelve artifacts, excluding historic or modern items, were recovered from the subsurface including four in situ features. Table 4 below summarizes this information.

As with CA-ORA-710, excavation at CA-ORA-711 was limited to a small fraction of the total site area. And similarly, a relatively wide range of tool and material types was recovered. This, again, indicates that a number of activities were performed on the site. Lithic tool production activities are evidenced by the recovery of 13 cores and a variety of waste flakes and other debitage, as well as associated hammerstones. The recovery of 39 manos and mano fragments and five metates and metate fragments is strong evidence that processing of the hard seed resources associated with the coastal sage scrub and chaparral communities was being accomplished. Scrapers and choppers were being utilized to process vegetable and wood fibers, as well as for working hides and bone. A single porphyry scraper plane was recovered from the surface of the site, suggesting the possible processing of agave/yucca (Kowta 1969) or other vegetal material (Salls 1985). The sites inhabitants were utilizing a wide range of material types for the manufacture of lithic tools: chert 31%, metavolcanics 25%, granite 17%, quartzite 11%, porphyry 9%, sandstone 5%, and schist 1%. Some of the chert recovered may have been heat treated (see discussion of CA-ORA-710 above).

Based on the characteristics of artifacts recovered at CA-ORA-711, as well as the lack of evidence of mortar and pestle technology, it is probable that the site is of Millingstone age.

A majority of artifacts recovered from CA-ORA-711 was located in units two, three, four, nine, ten and twelve on both sides of the property boundary fence on the lower, flatter area of the

knoll. Units five and six produced no prehistoric artifacts. The existence of in situ features in Units two, nine, ten and twelve suggests an intact subsurface deposit. All of the features contain an assortment of *in situ* lithic tools including manos and metates, hammerstones, cores and debitage. CA-ORA-711 is deemed an important/significant site and an intact subsurface deposit remains undisturbed on the site. Preservation of the site is warranted, but not possible based on the current 705 unit plan. Data recovery is therefore necessary before ground disturbing activities begin. It is recommended that a data recovery excavation of approximately 30 one by one meter units be accomplished at the site. The data recovery excavation should focus on the same research questions that were generated for CA-ORA-710.

CA-ORA-712

The site was first recorded by Tadlock and Tadlock (1978) and described as being on a relatively flat hill overlooking CA-ORA-710 and 711 and Aliso Creek. It was described as a chipped lithic scatter, heavily damaged by bulldozing. Cultural material could not be relocated by subsequent researchers. The site is therefore not important/significant, but the area should be monitored by a qualified archaeologist during mass grading operations. If artifacts are discovered, the site can be reevaluated.

CA-ORA-713

The site is located on a ridge between Oso and Aliso Creeks and on the ridge's north facing slopes as well as a relatively flat area at the slopes base (see Figure 6 below). The area measures approximately 150 by 215 meters and could comprise two or more sites. The original recorders of the site (Tadlock and Tadlock 1978) reported finding flakes, scrapers, cores, choppers and manos. Breece and Padon (1982) reported only three flakes. Dillon (SRS 1989) found no "portable artifacts", but discussed a sandstone concretion boulder with a cupule ground into its upper surface.

Initial work on the site (Maxon 1995) consisted of a surface examination and surface collection. This resulted in the recovery of 14 artifacts including two metavolcanic cores, a quartzite flake, a piece of metavolcanic shatter, a granite chopper, eight uni- and bifacial,

CA-ORA-713

FIGURE 6

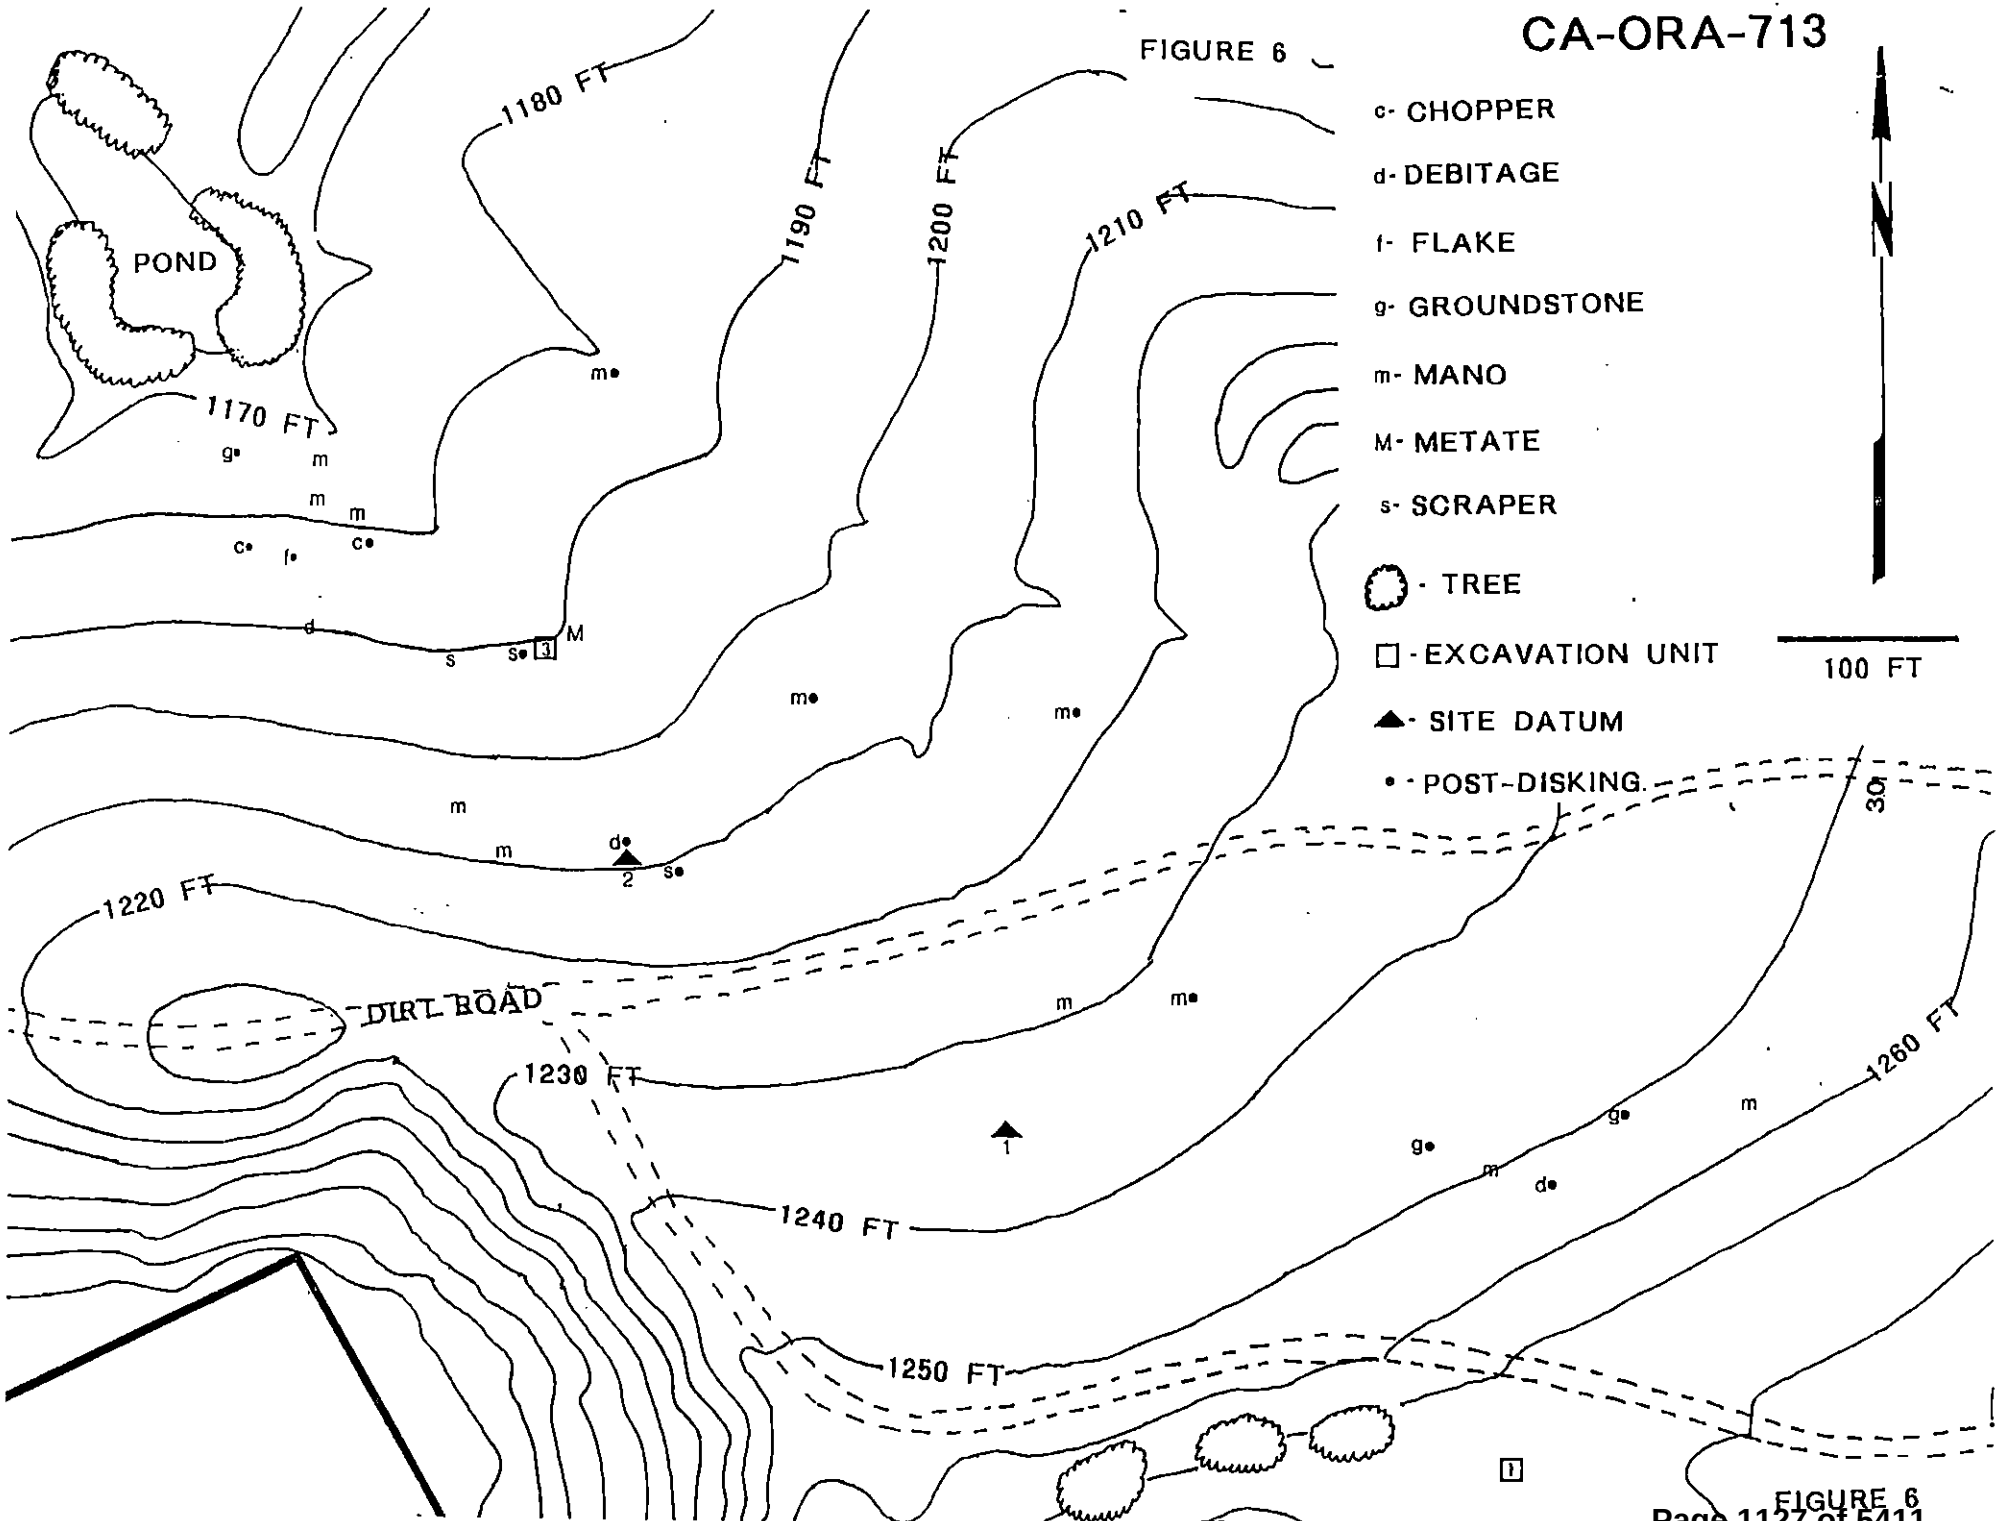

FIGURE 6

porphyry and granite manos and a granite basin metate fragment. The cupule noted by Dillon (SRS 1989) was seen, but the current researchers have serious reservations regarding the cultural nature of the cupule. Subsequently, a disk pulled by a small bulldozer was employed to turn up the soil to a depth of ten centimeters to expose near surface artifacts. This method resulted in the recovery of an additional 14 artifacts including three scrapers of metavolcanics and granite, two quartzite cores, three pieces of metavolcanic and quartzite debitage and six manos, uni- and bifacially ground, composed of granite and porphyry.

Three one by one meter units were excavated in distinct areas of the large site; two on the ridgetop and one at the base of the slope that yielded the majority of the surface artifacts. All three units were sterile - producing no cultural material.

Since artifacts were scattered over a large area, a number of unrelated encampments occupied over a period of time may be represented. The importance/significance of the site is as yet unknown. It is therefore recommended that controlled grading under the guidance of a qualified archaeologist be accomplished before the commencement of mass grading. Should clusters of artifacts be discovered, additional units could be excavated in those specific areas.

CA-ORA-714

The site is located on a domed hill on the ridge between Oso and Aliso Creeks, west of CA-ORA-713 and just to the south of a steep cliff leading down to a large Oso tributary drainage (see Figure 7 below). Tadlock and Tadlock (1978) called the site a probable quarry containing assayed stones, but Dillon (SRS 1989) reported two artifacts. The presence of bedrock near and at the site's surface eliminates the possibility of extensive subsurface deposits. Bleached cow bones litter the ridgeline indicating either a carcass dumping ground or a carnivore feeding area. The site measures some 60 by 30 meters.

Work undertaken at this site (Maxon 1995) was essentially a surface examination and surface collection. Twelve artifacts were recovered as a result of this procedure including three unmodified hammerstones of metavolcanics and porphyry, two cores of quartz and chert, four choppers of porphyry and metavolcanics and three uni- and bifacial manos of porphyry.

No units were excavated on the site because of the presence of bedrock at the surface, which eliminated the possibility of a significant subsurface deposit.

The site was probably a short term encampment, perhaps the result of a single occurrence and because of the presence of exposed bedrock, a subsurface deposit is not expected. The site is therefore considered not important/significant and it is recommended that the area be monitored by a qualified archaeologist during mass grading operations. If artifacts are discovered, the site can be reevaluated.

CA-ORA-715

The site is located on a relatively flat, rounded hill comprising the ridge above the headwaters of Oso Creek, overlooking Aliso Creek (see Figure 8 below). Site dimensions are approximately 55 by 65 meters. A bulldozer cut in the site area establishes that soils have considerable depth.

Initial work on the site (Maxon 1995) consisted of a surface examination and a surface collection. Thirty two artifacts were recovered including 13 uni- and bifacially ground manos, four of them fragments, composed of porphyry, sandstone, metavolcanics, quartzite and granite, four choppers of quartzite, metavolcanics, porphyry, and quartz, two bidirectional metavolcanic cores, one metavolcanic anvil, one metavolcanic hammerstone and eleven pieces of debitage of metavolcanics, chert, jasper and quartzite.

Subsequently, a disk pulled by a small bulldozer was employed to turn up any subsurface artifacts within ten centimeters of the surface. This procedure resulted in the recovery of nine additional artifacts including two choppers of metavolcanics and quartzite, one quartzite axe, one multidirectional metavolcanic core, two pieces of metavolcanic debitage, one bifacial quartzite mano and two unifacial porphyry mano fragments.

Next, four 1 x 1 meter units were excavated to determine if a subsurface deposit existed on the site . The existence of a subsurface deposit was not substantiated, because the excavation produced negligible artifacts. Those cultural materials recovered could have been deposited via rodent disturbance. Table 5 below, summarizes the excavation at CA-ORA-715.
